AQUIFER MAPS AND MANAGEMENT PLAN, MYSORE TALUK, MYSORE DISTRICT, KARNATAKA STATE

1. SALIENT FEATURES

Name of the Taluk	: Mysore
District	: Mysore
State	: Karnataka
Area	: 804 sq.km
Population (Census 2011)	: 3,88,706
Normal annual rainfall	: 831 mm

1.1 Study area

Aquifer mapping studies have been carried out in Mysore taluk, Mysore district, Karnataka State under National Aquifer Mapping Project. The taluk is covering an area of 804 sq.kms. The geographical extents of Mysore taluk of Mysore district is located between North Latitudes $12^{\circ} 07' 01.91''$ and $12^{\circ} 27' 07.39''$ and East Longitudes $76^{\circ} 27' 16.88''$ and $76^{\circ} 50' 11.80''$. The taluk is covered in parts of Survey of India Toposheet Nos. 57 D/7, D/11, D/15, D/8, D/2 and D/16. Mysore taluk is bounded by Pandavapura and Srirangapatna taluks towards North, T.Narasipura and Chamarajanagara taluks towards East, Nanjangud taluk towards South and H.D.Kote and Hunsur taluks towards West. Taluk administration of Mysore is divided into 4 Hoblies and 37 Grama Panchayaths. Mysore town is the taluk head quarter. There are 123 villages present in the taluk. Location map of Mysore taluk is presented in Fig. 1.

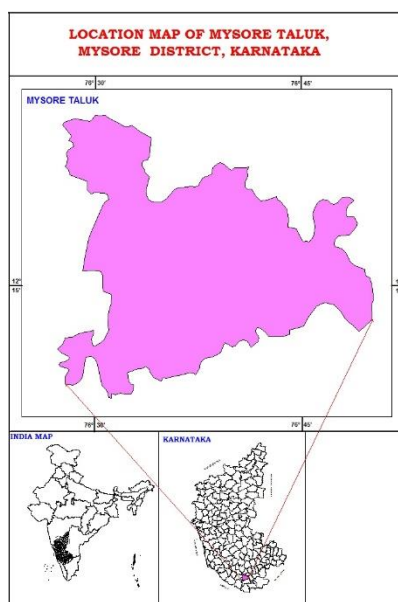

Fig. 1: Location Map

1.2 Population

According to 2011 census, the human population in Mysore taluk is 1281768 out of which 79% constitutes the urban population and only 21% constitutes the rural population. The taluk has an overall

population density of 1608 persons per sq.km. In Mysore taluk, the decadal variation in population from 2001-2011 is 23.42%. The population details are given in **Table-1**.

Table-1: Population details

Total	Male	Female	Share of the district population	Rural population	Urban population	Decadal change in population	Decadal change in rural population	Decadal change in urban population
1281768	645316	636452	42.71	267541	1014227	23.42	11.81	26.90

Source: District at a glance 2018-19, Govt. of Karnataka

1.3 Rainfall and Climate

The taluk enjoys the semi-arid climate and also quite moderate throughout the year with a fairly hot summer and cold winter. March to May is the summer months. The mean maximum temperature is 30.9°C and the minimum temperature is 21°C. Relative humidity ranges from 50.8 to 85.8%. The taluk enjoys semi-arid climate. Dry and hot weather prevails in major part of the year. The area falls under Southern Dry agro-climatic zone of Karnataka state. The taluk depends mainly on monsoon for agricultural operations. Rainfall is erratic, irregular and deficit in the taluk. The annual actual rainfall for the period from 2011 to 2018 is given in **Table-2a** and Rainfall pattern table is given in **Table-2b**. It shows that the lowest rainfall of 354 mm is noticed during the year 2016 and highest rainfall is 1624 mm in the year 2017. The annual average rainfall during this period is 831 mm. The rainfall trend analysis for the period 2008-2018 of Mysore taluk is presented in **Table-2c** and in **Fig 2**.

Table 2a: Monthly actual rainfall (in mm)

Year	JAN	FEB	MAR	APR	MAY	PRE	JUN	JUL	AUG	SEPT	SWM	OCT	NOV	DEC	NEM	ANNUAL

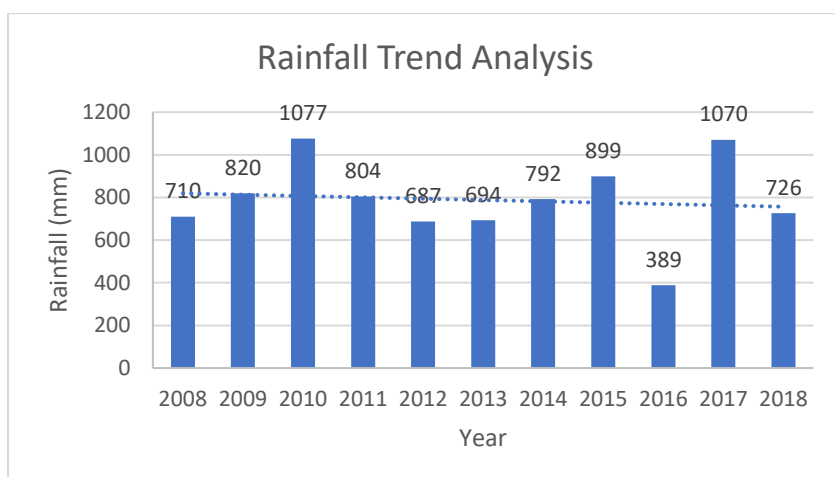

Fig. 2: Rainfall Trend Analysis

1.4 Agriculture & Irrigation

Agriculture is the main occupation in Mysore taluk. Major Kharif crops are paddy, maize, ragi and vegetables. Important crops of Rabi season are maize, vegetables and oilseeds (**Table-3**). Water intensive crops like sugarcane and paddy are grown in 1.04 and 7.5% respectively of the total crop area. However, paddy is grown during Kharif period and is mainly dependent on rain water. Jowar is grown in 1%, coconuts in 7.55% and oil seeds in 4.84% of total crop area in the taluk. Pulses are grown more of about 41.87% of the total area. The annual crop sugarcane is grown in 456 Ha (1.04%) and short duration crop vegetable is grown in 2235 Ha (5.13%) of the crop area which require ground water during post monsoon season especially during summer.

Table-3: Cropping pattern 2018-2019 (Ha)

Crop	Paddy	Maize	Bajra	Jowar	Ragi	Wheat	Pulses	Fruits	Vegetables	Oil seeds	Sugarcane	Cotton	Coconuts	Total crop
Area(ha)	3250	1288	0	434	7081	0	18217	2475	2235	2108	456	2670	3287	43501
Area %	7.5	2.96	0	1	16.30	0	41.87	5.68	5.13	4.84	1.04	6.13	7.55	100

Source: District at a glance 2018-19, Govt. of Karnataka

About 3.95% of the geographical area is covered by forest. It is observed that net sown area accounts for 49.76% and area sown more than once is 4.5% of total geographical area in Mysore taluk. Area not available for cultivation, the other uncultivable land and fallow land cover are 25.22%, 5.3% and 15.77% respectively of total geographical area. About 5.53% of net area irrigated is from wells, 11.7% are from bore wells and 71.57% from canals constituting 72% of irrigation is from surface water. Thus major source of irrigation is surface water (**Fig.-3**) and the irrigation from other sources is only 28%. The details of land use and the details of Irrigation are given in **Table 4 and 5** respectively. The land use pattern is given in **Fig.-4**.

Table-4: Details of land use 2018-2019 (Ha)

Total Geographical Area	Area under Forest	Area not available for cultivation	Other uncultivable land	Fallow land	Net sown area	Area sown more than once	Gross sown area
81740	3216	20620	4335	12891	40678	3684	44362

Total	3628	8693	8126	100

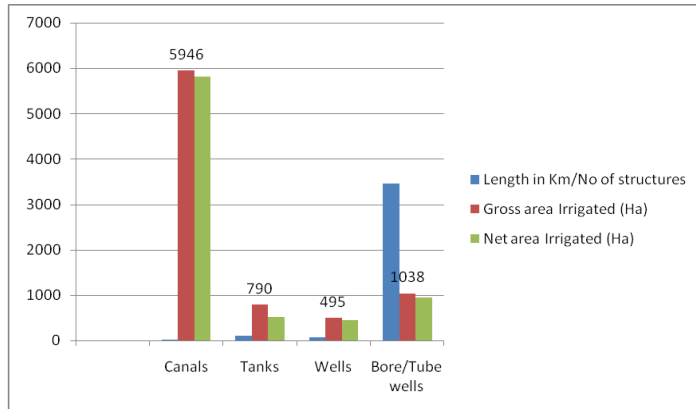

Fig. 3: Sources of Irrigation

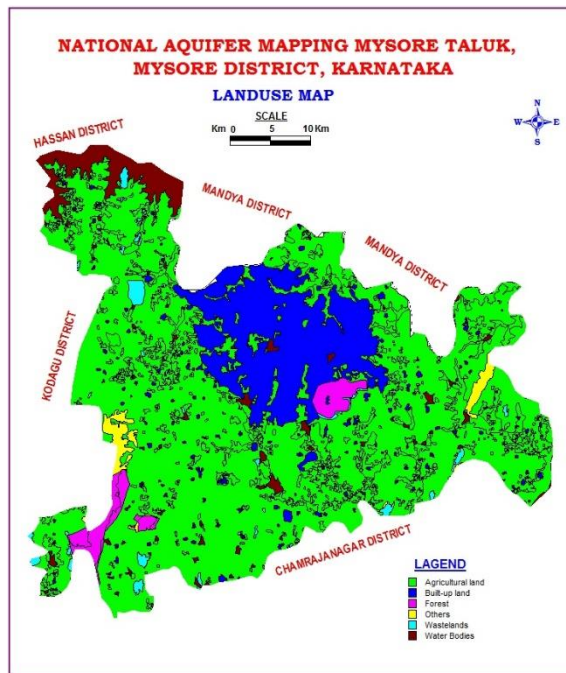

Fig. 4: Land use/land cover map

1.5 Geomorphology, Physiography & Drainage

Geomorphologically, the taluk is classified as denudational uplands with about 20-25% of the district falling in this category. The taluk shows various land forms like hills and plateaus, piedmont zone, plains, reservoir, reservoir islands, river/stream and tanks, etc. The next important geomorphological unit is older flood plains mainly in parts of Mysore taluk. Ridges and valleys form the third important unit and are mainly restricted to the north western part of the taluk. Flat valleys are not very common except

for isolated appearances. In plain land, the master slope runs from central to north and central to south. The general topographic elevation ranges from 1021 to 681m amsl from north to south of the taluk. The Mysore taluk is endowed with a number of perennial and non-perennial rivers/streams. The taluk is drained by 1st to 4th order streams which flow towards central to north and central to south. The drainage system is well developed in the taluk. The general drainage pattern is dendritic to sub-dendritic in nature (Fig. 5 and 6).

Fig. 5: Drainage map

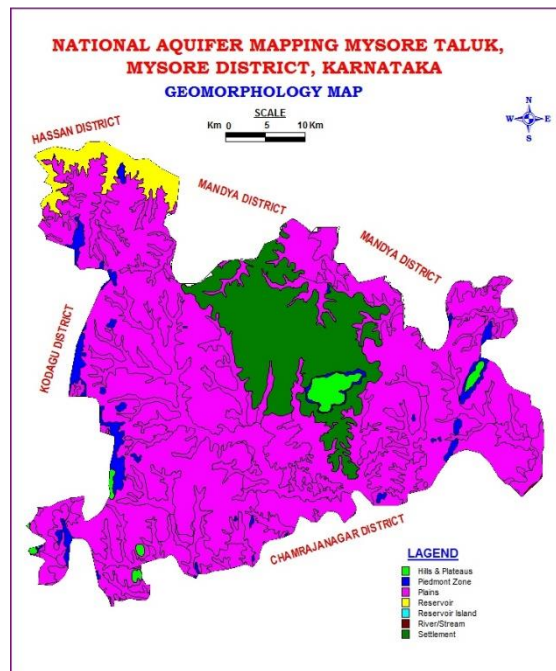

Fig. 6: Geomorphology map

1.6 Geology and Soils

Geologically, the taluk is mainly composed of igneous and metamorphic rocks of Pre-Cambrian age either exposed at the surface or covered with a thin mantle of residual and transported soils. The rock formation in the taluk falls into two groups, gneissic complex and schistose formation. Pegmatite veins and dolerite dyke are common in the taluk and this has a bearing on the tectonic history of the area as well. Prominent lineaments seen in the taluk are oriented in a NNW –SSE direction. Near Mysore town a big batholith is seen and is known as Chamundi granites. The identification of stream pattern in the taluk is helpful in identification and interpretation of many geological features. The soil types of the taluk are grouped into three viz., clayey, clayey sketal and rocky land. It is less permeable compare to the sandy soil. It is having good moisture holding capacity and is fertile. These soils are fertile and generally produce good yields. The geology and soil maps have been given in Fig. 7 and 8.

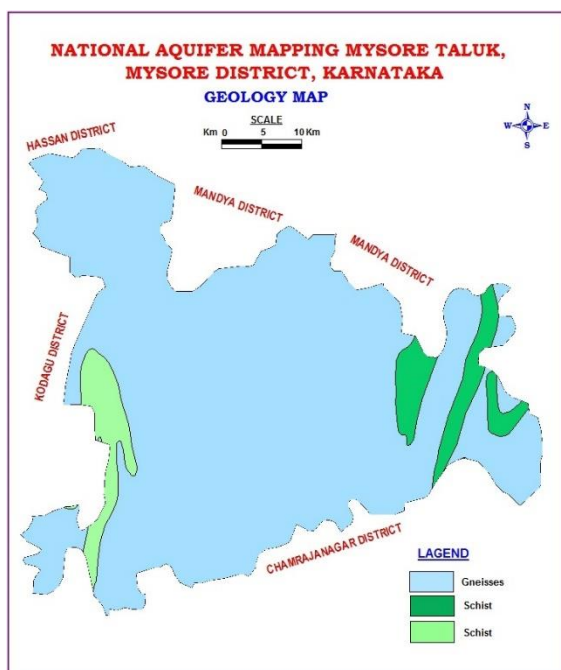

Fig. 7: Geology map

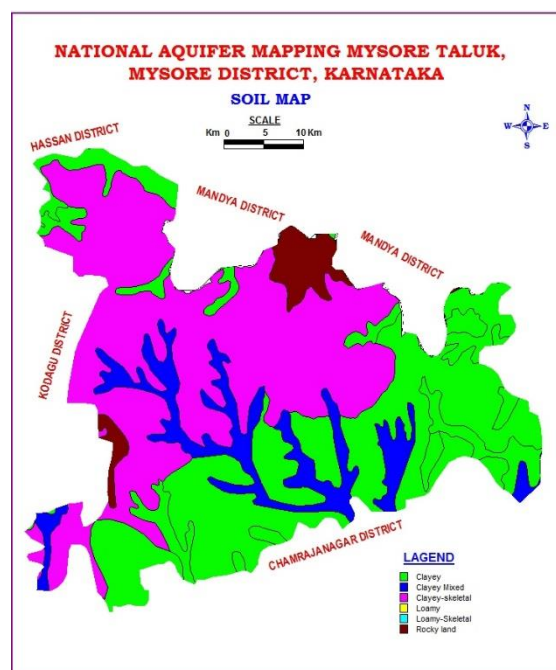

Fig. 8: Soil map

1.7 Ground water resource availability and extraction

As per the ground water resource estimation 2017 (Table 6a), the data on ground water resources shows that the net annual ground water availability is 6027 ham. The existing gross groundwater for irrigation is 1987 ham. The stage of groundwater development is 86% and falling under ‘Semi-Critical’ category.

Aquifer-wise total ground water resources down to 200 m depth are given in Table-6b below as per 2017 estimations.

Table.6.a Dynamic Ground Water Resource, (March 2017, Figures in Ham)

Net Annual Ground Water Availability	Existing Gross Ground Water Draft for Irrigation	Existing Gross GW Draft for Domestic and Industrial Water Supply	Existing Gross Ground Water Draft for All Uses	Allocation For Domestic and Industrial Use for Next 25 Years	Net Ground Water Availability for Future Irrigation Development	Existing Stage of Ground Water Development (%)	Category
6027	1987	3171	5159	3238	1045	86	Semi-Critical

Table 6.b Total Ground Water Resources (2017) (Ham)

Taluk	Annual replenishable GW resources	Fresh In-storage GW resources		Total availability of fresh GW resources
		Phreatic	Fractured (Down to 200m)	Dynamic + phreatic in-storage + fractured
Mysore	6027	4625	1845	12497

1.8 Existing and future water demands (as per GWRA-2017 and 2020)

As per the GWRA 2017, the net ground water availability is 6027 ham and the total ground water draft for all uses is 5159 ham with stage of development at 86% and the taluk falls in Semi-Critical category. The domestic (Industrial sector) demand for next 25 years is estimated at 1045 Ham.

The details of dynamic (Phreatic) ground water resources for Mysore taluk as on March 2020 is shown in **Table.7**. It is observed that the stage of ground water extraction is slightly gone down in the taluk from 86 % to 71.32 % from 2017 to 2020.

Table.7 Detail of Dynamic Ground Water resource, (as on March 2020)

Annual Extractable GW Resource (Ham)	GW Extraction for Irrigation Use (Ham)	GW Extraction for Industrial Use (Ham)	GW Extraction for Domestic Use (Ham)	Total Extraction (Ham)	Annual GW Allocation for Domestic Use as on 2025 (Ham)	Net GW Availability for future use (Ham)	Stage of GW Extraction (%)	Categorization
5745.71	2236.75	0	1861.31	4098.06	2928.90	1576.47	71.32	Semi-Critical

1.9 Water level behavior

The water level data have been monitored from the representative dug wells and borewells under NHS monitoring programme for both pre and post monsoon seasons during 2019 in Aquifer I (**Table 8**). During premonsoon season water level ranges from 2.8 to 14.65 mbgl, whereas in postmonsoon it varies from 0.96 to 11.18 mbgl. Whereas in Aquifer II, the water level ranges from 1.94 to 27.11 mbgl in premonsoon and 1.25 to 15.74 mbgl during post monsoon as per Ground water Department, Govt of Karnataka data. (**Table 9**) and the maps shown in **Fig 9 to 14**.

Table 8: Depth to water level of Pre and Post-monsoon (2019), CGWB

S. No.	SITE_TYPE	Location name	Depth (m bgl)	May-19	Nov-19
1	Bore Well	Mysore	52.00	13.40	9.30
2	Dug Well	Bevinahalli	15.00	4.20	1.90
3	Dug Well	Deveerammanahalli	19.34	3.82	2.05
4	Dug Well	Kalasthavadi	9.00	8.50	1.70
5	Dug Well	Kethupura	12.00	3.90	0.96
6	Dug Well	Mysore	20.00	14.65	11.18
7	Dug Well	Siddalingapura	5.00	2.80	1.45
8	Dug Well	Varuna	8.15	5.33	4.02

Table 9: Depth to water level of Pre and Post-monsoon (2019) (Ground Water Dept., Govt. of Karnataka)

S. No	Well Type	Location name	Depth (m bgl)	May-19	Nov-19
1	Bore Well	Bhogadi	129.27	27.11	15.74

2 AQUIFER DISPOSITION

The occurrence and movement of water in the subsurface is broadly governed by geological frameworks i.e., nature of rock formations including their porosity (primary and secondary) and permeability. The principal aquifers in the area are Gneisses and Schist and the occurrence and movement of ground water in these rocks is controlled by various factors and it primarily depends on the degree of interconnection of secondary pores/voids developed by fracturing and weathering in the hard rock.

2.1 Aquifer Types

In Mysore taluk, there are mainly two types of aquifer systems;

- Aquifer-I (Phreatic aquifer) comprising weathered Gneisses and schist.
- Aquifer-II (Fractured aquifer) comprising fractured Gneisses and schist.

In Mysore taluk, Gneisses and Schists are the two major water bearing formations. Ground water occurs within the weathered and fractured formations semi-confined condition. The borewells were drilled by CGWB under exploratory programme reveals that the depth range of 200 to 261 m bgl. Weathering varies from 17.8 to 33.3 m bgl with yield ranges from 1 to 13.3 lps. Most potential fractures noticed between the depth of 30 to 180 m bgl. The 3D aquifer disposition models, 2D aquifer sections and 3D aquifer fence diagrams have been prepared and presented in Fig. 15a, b and c.

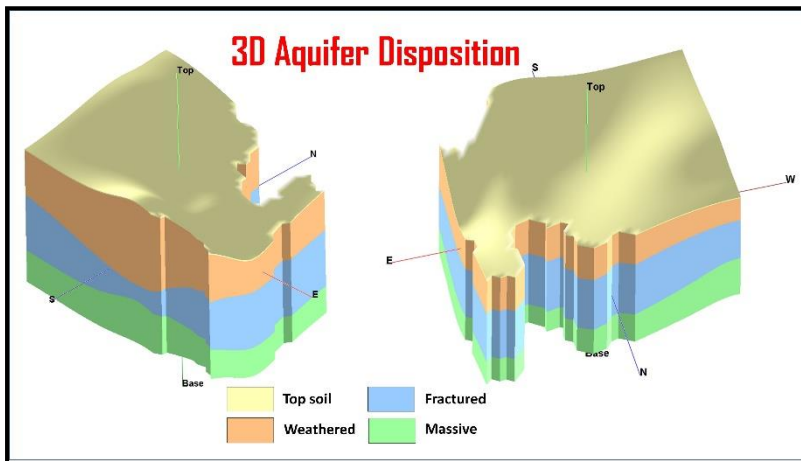

Fig. 15 a: 3D Aquifer model

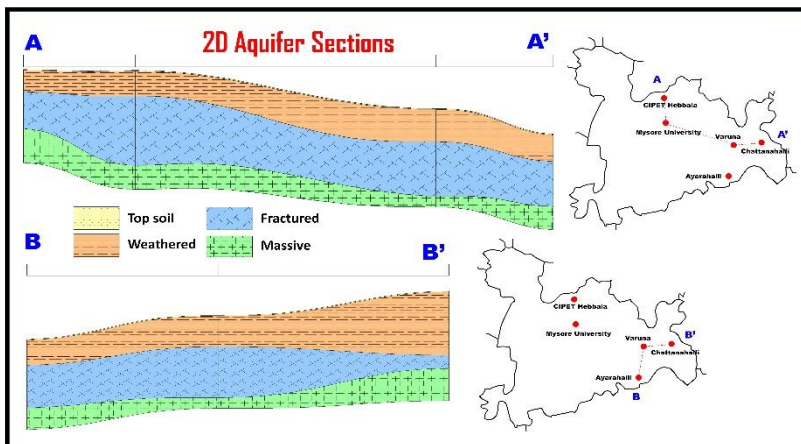

Fig. 15 b: 2D Aquifer section

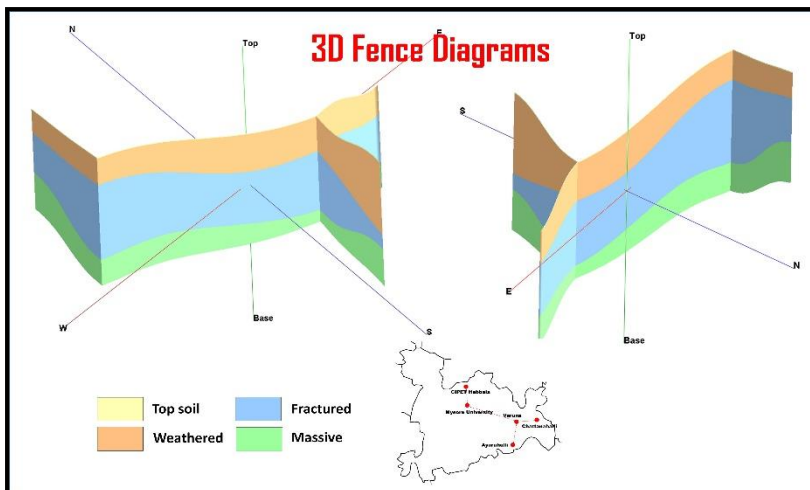

Fig. 15 c: 3D Aquifer fence diagram

3 GROUND WATER RESOURCE, EXTRACTION, CONTAMINATION AND OTHER ISSUES

The main ground water issues are over exploitation, Limited Ground Water Potential / Limited Aquifer Thickness / Sustainability, deeper water levels especially in Aquifer II, declining water level trend and urbanized areas of Mysore city thereby reducing the ground water recharge worthy areas which are all inter-related or inter dependent.

3.1 Comparison of Ground Water Resource and Extraction

The Dynamic Ground Water Resource 2017 and as on 2020 have already been summarised above and are shown in **Table 10**. It is observed that the ground water availability in 2020 is less compare to 2017 due to decrease in rainfall and in water table. It is attributable to the improvement in the irrigation practice, influence of command area and also due to the water conservation / recharge activities carried out in the taluk by various state govt. and other agencies.

Table 10 : Comparison of groundwater availability and draft scenario (in ham)

Taluk	March 2017			March 2020		
Mysore	GW availability	GW Extraction	Stage of GW development	GW availability	GW Extraction	Stage of GW development
	6027	5159	86%	5745.71	4098.06	71%

3.2 Chemical quality of ground water and contamination

The water samples were collected in different parts of Mysore taluk during May 2018 and the data is given below in **Table 11**. The results of quality parameters shows that the EC ranges from 1050 to 1300 while Fluoride ranges from 0.20 to 1.30 mg/l. The nitrate varies from 4 to 34 mg/l (**Fig 16 and 17**).

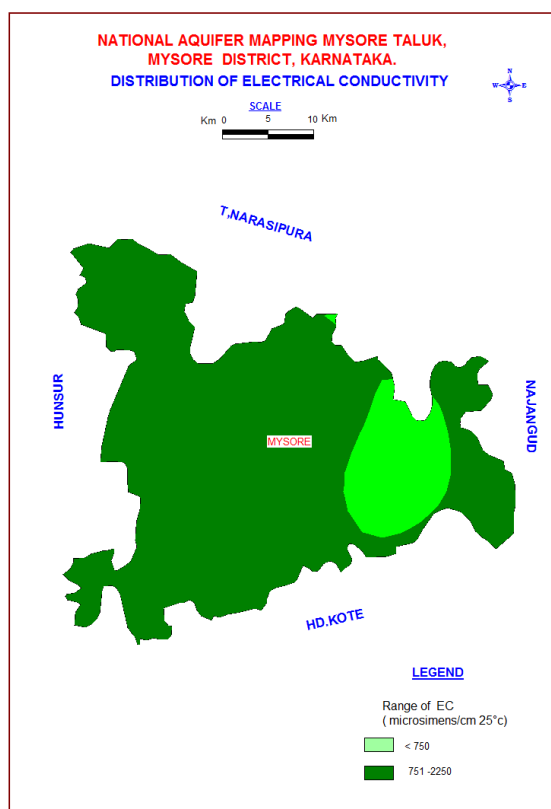

Fig. 16: EC distribution map

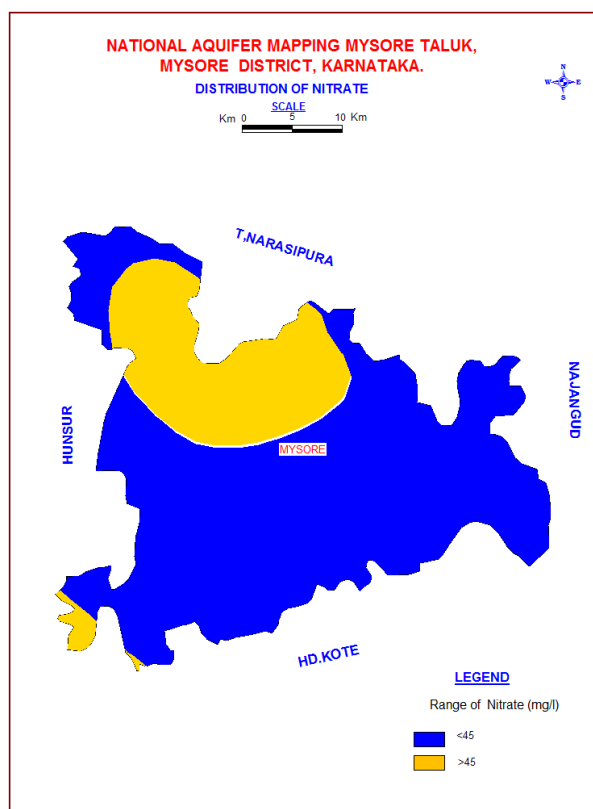

Fig. 17: Nitrate distribution map

In general, ground water quality in Mysore taluk is good for drinking purpose. Ground water samples have also been tested and found suitable for agriculture & irrigation purposes.

4 GROUND WATER RESOURCE ENHANCEMENT

4.1 Resource Enhancement by Supply Side Interventions

Supply side interventions like recharge to phreatic aquifer (Aquifer-I) in the taluk are recommended through construction of artificial recharge structures, viz. check dams, percolation tanks & subsurface dykes. The choice of recharge structures should be site specific and such structures need

to be constructed in areas already identified as feasible for artificial recharge. Artificial Recharge Structures and Water Conservation Plans are proposed in the taluk through utilizing the uncommitted surface runoff of 52.23 MCM (**Table 12**). By constructing 270 check dams, 47 percolation ponds and 1 subsurface dyke in the taluk, 4700 hectares of additional irrigation potential can be created OR the existing 71.32% of stage of ground water extraction would reduce to 58.11% (**Table 13**). The tentative locations of proposed AR structures and area feasible for recharge is shown in **Fig.-18**, whereas the location details of check dams and percolation tanks are presented in **Annexure-I and II** respectively

Table 12: Quantity of non-committed surface runoff & expected recharge through AR structures (As per Master Plan on Artificial Recharge in Karnataka, 2020)

Artificial Recharge Structures Proposed	Mysore taluk
Non committed monsoon runoff available (MCM)	52.23
Number of Check Dams	270
Number of Percolation Tanks	47
Number of Subsurface dykes	1
Number of Filter beds	5
Tentative total cost of the project (Rs. in lakhs)	3675.17
Expected recharge (MCM)	1305
Additional irrigation potential (in hectares)	4700

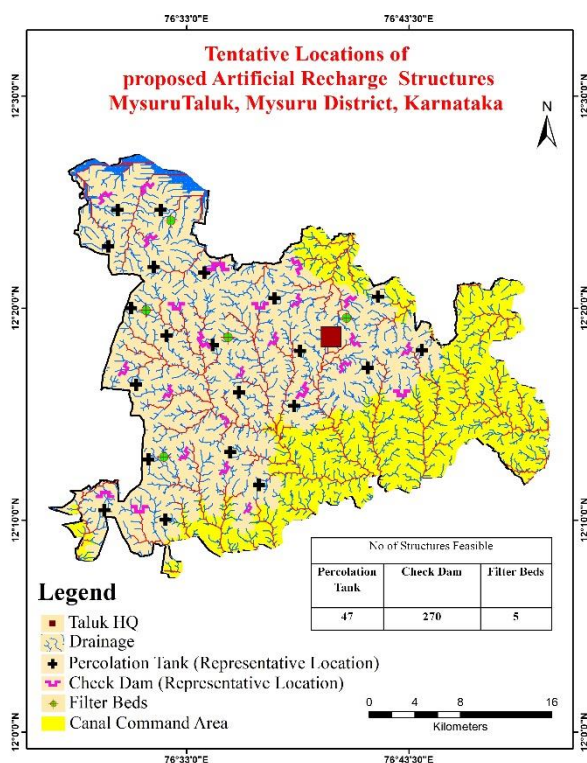

Fig. 18: Tentative locations of representative artificial recharge structures

4.1.1 Benefit of Artificial recharge scheme

Artificial recharge structures namely check dams and Nala bunds can be taken up on large scale in the over-exploited areas as a management plan to tackle falling ground water levels.

- These structures have proved in building-up of ground water levels and sustainability of ground water abstraction structures, mainly in bore wells.
- An increase in the area irrigated by ground water source is also observed in the area of influence.

- Such activities help in providing sustainable drinking water to the rural population. The qualitative result from farmer's perception indicate that, there is rising trend in ground water levels in the area of influence, productivity of crops enhanced and improvement in yield is observed in bore wells.
- The cropping pattern has shown that farm households have resumed growing crops such as grapes which were not previously grown in the area.

4.2 Resource Savings by Demand Side Interventions

4.2.1 Water Use Efficiency by Micro Irrigation Practices

It is observed that surface water is the major source for irrigation in the taluk. However, the irrigation also takes place through ground water in 1533 ha (17%) of irrigated area. Efficient irrigation practices like drip irrigation and sprinkler have to be adopted by the farmers in the existing 1533 ha of gross irrigated area. It is proposed to adopt micro irrigation (drip) techniques in water intensive sugarcane grown area 456 2316 ha. It is assumed that 50% of this area i.e., 228 ha is irrigated by ground water. Implementation of efficient irrigation techniques will contribute in saving ground water by 114 ham and thus enhancing the cumulative net availability of ground water from 7051 ham to 7165 ham. Efficient irrigation techniques will contribute in saving ground water and thus will improve stage of development in the long run.

4.2.2 Change in cropping pattern

Agriculture is the main occupation in Mysore taluk. Major Kharif crops are Paddy, Jowar and Pulses. Main crops of Rabi season are Ragi. The water intensive crops like fruits, vegetable and paddy are grown significantly in the taluk. However, the supply side and demand side interventions are able to bring the taluk in Safe category from Semi-Critical category, hence change in cropping pattern is not recommended.

Table 13: Details of Resource Enhancement after proposed supply side and demand side interventions

Sl. No.	Resource Details	As per 2020 Estimation
1.	Net Ground Water Availability in Ham	5746
2.	Existing ground water draft for all uses in Ham	4098
3.	Existing Stage of Ground Water Development in percentage %	71
4.	Expected Recharge from Artificial Recharge sources Ham	1305
5.	Cumulative Ground water availability after adopting AR in Ham	7051
6.	Expected improvement in stage of ground water development %	13.20
7.	50% of Sugarcane grown area (Ha)	228
8.	Expected Savings (m) (Surface irrigation – 2 m, Drip irrigation – 1.5)	0.50
9.	Saving due to adopting water Use Efficiency measures in Ham	114
10.	Saving due to adopting grey water in Ham	Nil
11.	Cumulative Ground water availability after adopting WUE and AR in Ham	7165
12.	Change in Cropping Pattern	Not Recommended
13.	Expected improved stage of ground water development after implementation of WUE and AR %	57 % from 71%
14.	Expected Change in Category	Semi-Critical to Safe

4.3 Regulation and Control

Mysore taluk has been categorized as **Semi-critical**, since the Stage of ground water development has reached 71% (GEC 2020), it may be encouraged to extract the ground water with care so that further ground water exploitation should not happen in the taluk. The Karnataka Ground Water Authority (KGWA) is tasked with regulation of groundwater and NOC has to be obtained for industrial/commercial purpose. Strict regulation has to be enforced by KGWA. Ground water recharge component needs to be made mandatory in the non-command area of the taluk for further development of ground water.

4.4 Other interventions proposed

- Periodical maintenance of artificial recharge structures should also be incorporated in the Recharge Plan.
- Roof top rain water harvesting.
- Micro irrigation.

5 SUMMARY AND RECOMMENDATIONS

The main ground water issues are over exploitation, Limited Ground Water Potential / Limited Aquifer Thickness / Sustainability, deeper water levels particularly in Aquifer II in some parts, urbanized areas of Mysore city thereby reducing the ground water recharge worthy areas which are all inter-related or inter dependent. The summary of ground water management plan of Mysore taluk is given in **Table-14**.

Table 14: Summary of Management plan

Stage of GW Extraction and Category (2020)	71%, Semi-Critical
Annual Extractable GW Resource (Ham)	5745.71
Total Extraction (Ham)	4098
Total GW Resources (Dynamic & Static up to the depth of 200 mbgl) (Ham)	12497

Total Estimated Expenditure (Rs. in Cr.)	36.75
Ground Water Resource Enhancement by Demand side Interventions	
Saving due to adopting water Use Efficiency measures in Ham	114
Saving due to adopting grey water in Ham	Nil
Expected improved stage of ground water development after implementation of WUE (%)	58% to 57%
Cumulative Ground water availability after adopting WUE and AR in Ham	7165
Change in Cropping Pattern	Not Recommended

Expected improved stage of ground water development after implementation of WUE and AR %	57 % from 71%
--	---------------

As per the resource estimation – 2020, Mysore taluk falls under Semi-Critical category with the stage of ground water extraction is 71.32%. Thus, there is need to formulate management strategy to tackle the over exploitation of ground water resources, mitigate water scarcity related issues in the taluk. It is suggested to adopt a scientific and multi-pronged ground water management strategy covering supply side interventions aspects as mentioned in the management plan suggested above.

Ground water resource enhancement by supply side interventions: Quantity of surface water available through non-committed surface run-off is estimated to be 5223 ham. This can be used to recharge the aquifer mainly through percolation tanks (47), check dams (270), filter beds (5) and sub surface dyke structures (1). However, the figures given are tentative and pre-field studies / DPR are recommended prior to implementation of these recharge structures. The volume of water expected to be conserved/recharged is 1305 ham through these AR structures. The approximate cost estimate for construction of these AR structures is Rs. 36.75 Cr. The additional area which can be brought under assured ground water irrigation will be about 4700 hectares OR the stage of ground water development can be reduced from 71% to 58%.

Ground water resource enhancement by demand side interventions: At present about 17% of irrigation is by wells and bore wells (ground water). The micro irrigation practices like drip and sprinkler irrigation are comparatively less practiced in comparison with traditional surface flooding mode of irrigation. The micro irrigation water efficient methodology needs to be adopted for growing water intensive sugarcane crop which is grown in 456 ha (1%) of the cropped area and is largely ground water dependent. It is assumed that 50% of this area i.e., 228 ha is irrigated by ground water. Implementation of efficient irrigation techniques will contribute in saving ground water by 114 ham and thus enhancing the cumulative net availability of ground water from 7051 ham to 7165 ham.

Change in cropping pattern: Agriculture is the main occupation in Mysore taluk. Major Kharif crops are Paddy, Jowar and Pulses. Main crops of Rabi season are Ragi. The water intensive crops like fruits, vegetable and paddy are grown significantly in the taluk. However, the supply side and demand side interventions are able to bring the taluk in Safe category from Semi-Critical category, **hence change in cropping pattern is not recommended.**

By adopting the supply side and demand side management plan itself, the stage of groundwater extraction decreases to 57% from 71% and the taluk falls under safe category.

Annexure-I : Tentative Locations of Proposed Check Dams, Mysuru Taluk, Mysuru District.
