FOREWORD

To understand spatio-temporal variations in existing hydrogeological regime, a network of Ground Water Monitoring Well (GWMW) has been set up all over West Bengal and Andaman Group of Islands by Central Ground Water Board, Eastern Region. These GWMWs are represented by various ground water abstraction structures as found suitable for prevailing aquifer systems of any area. Systematic and periodical monitoring of these GWMWs aid in identification and quantification of changes in groundwater availability and its quality, which is vital for ascertaining sustainable ground water development and efficient management of ground water resources.

At present a total of 1861 GWMWs are monitored representing almost all the blocks of nineteen districts of the state of West Bengal. Due to inaccessibility in Andaman group of Islands, initially the task was taken up with the help of a few GWMW but gradually the number of stations has been increased to 112. However, at present no GWMW has been established in Nicobar group of Islands, due to its inaccessibility. Periodic ground water level measurements were taken up four times in a year in 2016-2017, (i.e. in the month of April, August, November and January) in West Bengal and two times in a year (i.e. April and November) in Andaman group of Islands. The scientific officers and technical personnel of the Eastern Regional office, systematically collected field data throughout the year. While the chemists have analysed the water samples collected from GWMWs to adjudge the variation on chemical quality of groundwater in the state and occurrence of toxic minerals.

This report attempts to compile the collected data during 2016-2017 and present its detailed analysis in a comprehensive manner in the form of maps and statistical analyses and brought out in two sections, where Section A forms report for West Bengal and Section B forms report for Andaman group of Islands. Water level data has been collected by officers of CGWB, ER. Chemical analysis has been carried out by chemists of Chemical lab of CGWB, ER. Compilation of this report, evaluation of data and preparation of relevant maps and their reproduction in the form of present report has been carried out by Mrs Rose Anita Kujur, Sc. C. Mrs Sonam, Junior Hydrogeologist and Shri Alok Banerjee, Senior Surveyor assisted in water level data entry in the suitable software. The compilation and preparation of Andaman and Nicobar Islands was done by Mrs Sonam, Junior Hydrogeologist. While in the section pertaining to water quality has been prepared by Miss Manashi Bhattacharya, Assistant Chemist, Shri Atalanta Chowdhury, Assistant Chemist & Mrs Suparna Dutta, Assistant Chemist.

It is sincerely hoped that the appended write up, maps and basic information in this report would be very useful to the concerned beneficiaries.

(Amlanjyoti Kar)
Regional Director (I/C)

ABSTRACT

In West Bengal, ground water level monitoring is carried out by Central Ground Water Board, Eastern Region from 1861 Ground Water Monitoring Wells covering all districts of West Bengal under different hydrogeological and agro-climatic zones during the month of April, 2016, August, 2016, November, 2016 and January, 2017. In Andaman and Nicobar Islands, monitoring of water level is carried out from 112 nos. GWMSs established in different hydrogeological and agro-climatic zones. Out of 112 GWMS, 110 wells are open dug well and rest three are bore well. In Kolkata City, monthly monitoring of water level is carried out using 40 nos. GWMS.

Collected water level data were statistically analyzed and relevant maps depicting ground water scenario corresponding to various measurements were prepared. All datasets were compared and analyzed with pre-monsoon measurements and also with dataset of same period for previous year. Mean depth-to-water level for the period 2007-2016 was compared with corresponding measurements and analyzed to delineate the behavior of water levels. Status of Ground Water Monitoring Stations and number of the wells monitored during four water level measurements are also prepared. Statistical data incorporate ranges of water levels and water level fluctuations, minimum and maximum values of water level, number of wells measured, percentage of monitoring stations falling in different ranges with district-wise breakup in different pre-defined categories in compliance with national guideline. Along with the general well information, depth to water level data of all network hydrograph stations, are also presented. The water samples collected during April 2016 in West Bengal were chemically analyzed and the data generated has been presented.

Present report has been prepared on groundwater scenario of West Bengal and Andaman and Nicobar Islands reflecting the status of groundwater regime as revealed through ground water level during 2016-17.

GROUNDWATER SCENARIO IN WEST BENGAL AT A GLANCE

Location(bound)	N Latitudes, 21°31'0'', 27°33'15'', E Longitudes, 85°45'20'', 89°33'0'',
Geographical Area	88752 sq. km.

Section A

**GROUND WATER YEAR BOOK OF WEST BENGAL
(2016 – 2017)**

1.0 INTRODUCTION

Periodical monitoring of ground water regime covering different hydrogeomorphic, hydrogeological units is an effort to acquire information on behaviour of **ground water levels, chemical quality** and **temperature** of formation water through representative sampling. The process is essential in both spatial and temporal domain, to consolidate a detailed knowledge about ground water scenario of an area with respect to its behaviour, availability and quality. Thus, data so collected during monitoring becomes one of the most important inputs for an holistic ground water management.

Monitoring is carried out by establishing suitable *Ground Water Monitoring Stations* (GWMS) based on geomorphology, geology, hydrogeology and status of ground water resource of the area with a view to observe the trend of water level and change of chemical quality with space and time. It is also essential for estimation of ground water resources and to demarcate the water logging as well as drought prone areas.

In West Bengal, ground water monitoring was started since 1976 when most of the ground water structures were mainly dug wells and the development of the ground water resource was very limited. It is only after 1985, actual ground water development started in irrigational sector and took its full swing from 90s. Accordingly, network stations (GWMS) for monitoring of water level data were also changed in different periods. However, from late nineties, these old wells are being replaced by well-defined piezometers in phased manner with an expectation that in near future, this effort will provide better result.

1.1 BACKGROUND

The Central Ground Water Board, Eastern Region, is at present monitoring 1523 operational GWMS (network hydrograph stations) to delineate the behaviour of ground water level in spatio-temporal domain, covering entire state of West Bengal four times a year, viz. January (from 1st to 10th), April (from 20th to 30th), August (from 20th to 30th) and November (from 1st to 10th).

The district-wise status of GWMS in West Bengal during the period from April 2016 to January 2017 is given in **Table 1**. The locations of GWMW are shown in **Plate - I**. To get a detailed water level scenario in the urban area especially in metro city, CGWB, Eastern Region, is also monitoring monthly measurement from 40 monitoring stations in Kolkata City (**Plate - II**).

The district-wise water level data of GMMW for the period April, 2016; August 2016; November 2016; and January 2017 are given in **Annexure - I**. The results of chemical analysis of water samples collected during April 2016 are also discussed and analytical data are given in **Annexure - II**.

2.0 PHYSIOGRAPHY AND DRAINAGE

In general the state of West Bengal is a flat terrain, crisscrossed with rivers except the Himalayan foothills in the north and Chotanagpur plateau in the south-west. Southern flowing Ganga River and its numerous tributaries & distributaries mainly drain the State. The Ganga River system encompasses the catchment areas of the Mahananda, Jalangi, Bhairab etc. in the eastern part and the Mayurakshi, Ajoy, Damodar, Dwarakeshwar and Kasai in the western part. The Teesta, Torsa and Jaldhaka streams of the Brahmaputra river system originate in the Himalayas and drain the northern part of the State. Beside these, there is a small independent river basin, namely Subarnarekha basin covering southwestern part of the State in Medinipur district. Physiographically, the area incorporates extra – peninsular region of the north, peninsular mass of the south – west, and alluvial and deltaic plains of the south and south-east. The State can be broadly divided into four distinct physiographical divisions as:

- (i) Himalayan Region comprising Darjeeling, Jalpaiguri and Kochbehar districts;
- (ii) Eastern fringe of Chottanagpur Plateau comprising districts of Puruliya, western parts of Barddhaman, Paschim Medinipur, Birbhum and Bankura district;
- (iii) Coastal areas comprising of S 24 Parganas district and small part of North 24 Parganas, Purba Medinipur and Howrah districts;
- (iv) Alluvial terrains falling in the remaining parts of the state.

In each of above four areas ground water regime behaves differently.

3.0 HYDROMETEOROLOGY

The general climate of the state, except the Himalayan zone which lies in the extreme northern part, is tropical. The tropic of cancer passes across the middle of the districts of Nadia and Barddhaman and the northern part of the districts of Bankura and Purulia. The normal annual rainfall in the state varies from 1276 to 3608 mm. The Himalayan region in the northern parts of the state receives the maximum rainfall. The Average rainfall in different districts of West Bengal is presented in Table I.

Table I. Normal Rainfall distribution in West Bengal

Sl. No.	District	Normal Rainfall in mm		
		Monsoon	Non monsoon	Total
1	Malda	1116	337	1453
2	Nadia	1015	459	1474
3	Coochbehar	2753	855	3608
4	North 24 Parganas	1137	386	1523
5	Dakshin Dinajpur	1273	417	1690
6	Uttar Dinajpur	1648	439	2087
7	Bankura	1109	313	1422
8	Purulia	1028	248	1276
9	Jalpaiguri	2677	642	3319
10	Burdwan	1140	356	1496
11	Murshidabad	1053	364	1417
12	Birbhum	1009	280	1289
13	Howrah	1208	417	1625
14	Darjeeling	2319	510	2829
15	Hooghly	1137	386	1523
16	Purba Medinipur	1220	409	1629
17	Paschim Medinipur	1154	406	1560

4.0 CRITERIA FOR FIXING GWMS

Ground water monitoring is mainly done in the water table aquifer to categorize an area having excess or less withdrawal. This is useful to estimate the dynamic ground water resources and to demarcate the water logging as well as drought prone areas. To understand the correct water table aquifer in an area geomorphology and geology play a vital role. Therefore, for fixing GWMS in a district/block one has to consider the following factors:

4.1 FIXING GWMW BASED ON GEOMORPHLOGY

At least one GWMW in each geomorphic unit of more than 50 sq. km extent has been fixed.

4.2 FIXING GWMW BASED ON GEOLOGY

Minimum one GWMW in each geologic unit having more than 150 sq. km. in hard rock areas and 200 sq. km. in soft rock areas have been fixed.

4.3 FIXING GWMW BASED ON STATUS OF GROUND WATER RESOURCE

Category	Optimum no. of GWMW
SAFE	2
SEMI CRITICAL	3
CRITICAL	4
OVER EXPLOITED	4

The process has been started to fill up the data gap as per the requirement of criteria by establishing new GWMW in different geological/ geomorphological set up block-wise.

5.0 SCENARIO OF DEPTH TO WATER LEVELS IN WEST BENGAL DURING THE GROUND WATER YEAR 2016 – 2017

5.1 APRIL 2016

Depth to water level during April, 2016 was measured from 1338 ground water monitoring wells out of 1680 existing wells and newly established wells (Annexure I). A total of 342 nos. wells could not be measured due to various reasons, such as non-approachability, disturbed area and road blockage etc. Details given in Annexure I.

Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GWMW) fall under different ranges are given under:

Range of Water levels (m bgl)	Number of GWMW	%
0-2	69	6.2
2-5	401	30
5-10	572	42.8
10-20	263	19.7
>20	33	2.5

Being pre-monsoon season, majority of the well shows water level between 5-10 m (42.8%) closely followed by the 2-5 m (42.8%) and 10-20m (19.7%) ranges. In southern, northern and central part of West Bengal, deeper water level is observed in hard-rock covered parts of Bardhaman and West Medinipur district; within Bhabar zone of Jalpaiguri district; older alluvium covered areas of Hugli, Murshidabad districts, and Barind Tract of Uttar & Dakshin Dinajpur districts. Deepest water level has been recorded at Bolgona (26.45 mbgl) in Bardhaman district and Gunjaria in West dinajpur followed by Jaigaon (25.78 mbgl) in Jalpaiguru district and Pakuyahat (24.56 m bgl) in Malda District. Significantly, agriculture dominated districts show dominance in deeper water level e.g. Hugli, Purba Medinipur, Malda, Bardhaman, Murshidabad districts.

In the southern part of the state, in shallow aquifers depth to water level ranges mainly between 2-5 m bgl. On the other hand, confined aquifers of Haora, East Medinipur, S 24 Parganas generally shows a deeper water level of the order of 5-10 m bgl and 10-20m.

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 3**. Depth to water level map is given in **Plate-III**.

5.2 AUGUST 2016

Depth to water level during August, 2016 was measured from 1478 ground water monitoring wells out of 1680 existing wells. A total of 202 nos. wells could not be measured due to various reasons, such as non-approachability, water logged, disturbed area and road blockage etc.

Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GMMW) fall under different ranges are given under:

Range of Water levels (m bgl)	Number of GMMW	%
0-2	621	42
2-5	451	30.5
5-10	217	14.7
10-20	166	11.2
>20	23	1.6

Being monsoon season, most of the well shows water level between 0-2m (42%) or 2-5m (30.5%). In central part of West Bengal, deeper water level is observed in hard-rock covered parts of Barddhaman and West Medinipur district; within *Bhabar zone* of Jalpaiguri district; older alluvium covered areas of Hugli, Murshidabad districts. Deepest water level has been recorded at Bolgona (25.05 m bgl) in Barddhaman District. Confined aquifers of Haora, East Medinipur, S 24 Parganas generally show a deeper water level of the order of 5-10 m bgl and occasionally 10-20m.

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 4**. Depth to water level map is given in **Plate-IV**.

5.3 NOVEMBER , 2016

Depth to water level during November, 2016 was measured from 1583 ground water monitoring wells out of 1710 existing wells. A total of 127 nos. wells could not be measured due to various reasons, such as non-approachability, disturbed area and road blockage etc.

Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GMMW) fall under different ranges are given under:

Range of Water levels(m bgl)	Number of GMMW	%
0-2	160	10.1
2-5	745	47.1
5-10	403	25.5
10-20	231	14.6
>20	44	2.8

Being post-monsoon season, majority of the well shows water level between 2-5 m (47.1%) closely followed by the 5-10m (25.5%) ranges. In the central part of West Bengal, deeper water level is observed in hard-rock covered parts of Barddhaman and West Medinipur district; within *Bhabar zone* of Jalpaiguri district; older alluvium covered areas of Hugli, Murshidabad districts. Deepest water level has been recorded at Chanak (27.30 m bgl) in Murshidabad District.

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 5**. Depth to water level map is given in **Plate-V**.

5.4 JANUARY, 2017

Depth to water level during January 2017 was measured from 1517 ground water monitoring wells out of 1866 existing wells. A total of 349 nos. wells could not be measured due to various reasons, such as non-approachability, disturbed area and road blockage, non-receipt of data from participatory measurement etc. Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GWMW) fall under different ranges are given under:

Range of Water levels (m bgl)	Number of GWMW	%
0-2	88	5.8
2-5	565	37.2
5-10	548	36.1
10-20	273	18
>20	43	2.8

In northern parts of River Ganga comprising Malda, Uttar & Dakshin Dinajpur, Darjeeling, Kochbehar, Jalpaiguri districts, depth to water ranges mainly between 2-5 and 5-10 m bgl, though at few locations in 'Bhabar' zone and 'Barind' tract, depth to water level is deeper (10-20 m) which is attributed to geomorphological condition in the area.

In the southern part of the state, the depth to water level ranges mainly between 2-5 and 5-10 m bgl. A deeper water level of the order of 10-20 m bgl is recorded in all south bengal districts with significant numbers in older alluvium covering areas of East Medinipur, Bardhaman, Birbhum, West Medinipur, Murshidabad and Hugli districts. Deepest water level has been recorded at Hizrole (29.90 m bgl) in Murshidabad district

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 6**. Depth to water level map is given in **Plate-VI**.

6.0 SCENARIO FLUCTUATIONS IN INWEST BENGAL DURING THE GROUND WATER YEAR 2016 – 2017

The annual fluctuation in water levels for the periods (1) April 2015 and April 2016, (2) August 2015 and August 2016, (3) November 2015 and November 2016 and (4) January 2016 and January

2017 have been analysed to study the net status of ground water conditions during the previous and current year.

An attempt has been made to compare the pre-monsoon water levels of April, 2016 with water levels of August 2016 and November 2016 and January 2017 to delineate the impact of rainfall as well as ground water development on ground water regime in the state during the above period.

The water levels of last 10 years mean (decadal) of the four measurements has been compared with the corresponding months of current measurements to evaluate the decadal fluctuation scenario of the state. For this, the mean water levels of April, August, November and January have been computed for all the available Ground Water Monitoring Wells for the last 10 years and compared with the water levels of the same month of the current measurement.

6.1 WATER LEVEL FLUCTUATION BETWEEN APRIL 2015 AND APRIL 2016

Annual fluctuation in water level between April, 2015 and April, 2016 is mostly restricted within the range of 0-2 m. Out of 1120 analyzed wells, 530 wells are grouped under falling zone category and 590 wells are grouped under rising zone category. Of these, 80.9% wells falls under overall 0-2m category, which indicates that regional fluctuation of the state is mainly restricted within 2 m. 2-4 m fall in water level is observed in 59 wells and >4 m fall in water level is observed in 38 wells. More than 4m fall has been observed mostly in Dakshin Dinajpur, Paschim Medinipur, Murshidabad, Bankura, and Birbhum districts.. District-wise status of distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table-7**. Annual fluctuation in water level between April, 2014 and April, 2016 map is presented in **Plate - VII**.

6.2 WATER LEVEL FLUCTUATION BETWEEN APRIL 2016 AND AUGUST 2016

Seasonal fluctuation in water level between April, 2016 and August, 2016 is dominated by rising pattern. Out of 1170 analyzed wells, 79 wells show falling trend and 1091 wells are grouped under rising trend. Normal rainfall in present year resulted into rise in water level in all category dominated by 2 - 4 m (40.4 %) rising category, followed by 0 - 2 m (24.4 %) and > 4m (28.5%) rising category. Fall is mostly restricted within 0 - 2 m category (4.4 %) represented by 52 wells. Higher quantum of fall is observed in 15(1.3%) wells. Confined aquifers of Haora, East Medinipur, and S 24 Parganas also show a rise in water level of the order of 0-2 m. District-wise status of distribution of network hydrograph stations with different ranges of depth to water level is presented in **Table-8**. Fluctuation in water level between April, 2014 and August, 2016 map is presented in **Plate - VIII**.

6.3 WATER LEVEL FLUCTUATION BETWEEN APRIL 2016 AND NOVEMBER 2016

The seasonal fluctuation in water level between April 2016 and November 2016 indicates the change in water level from pre-monsoon measurement to post-monsoon measurement. The district-wise statement of distribution of network hydrograph stations in different ranges of water level fluctuation is presented in Table-9.

Seasonal fluctuation in water level between April, 2016 and November, 2016 is dominated by rising pattern. Out of 1210 analyzed wells, 201 wells show falling trend and 1009 wells are grouped under rising trend. There is an overall rise in water level. Rise in water level is dominated by 0 - 2 m (44.5 %) rising category, followed by 2 - 4 m (25.8 %) and > 4m (13.1 %) rising category. Fall is mostly restricted within 0 - 2 m category (12.6 %) represented by 153 wells. Higher quantum of fall is observed in 24 wells. Confined aquifers of Haora, S 24 Parganas also shows a rise in water level in the order of 0-2 m, 2-4m and in East Medinipur district shows rise in water level in the order of >4 m. Annual fluctuation in water level between April, 2016 and November, 2016 map is presented in **Plate – IX**

6.4 WATER LEVEL FLUCTUATION BETWEEN APRIL 2016 AND JANUARY 2017

The fluctuation in water level between April 2016 and January 2017 indicates the change in water level from pre-monsoon measurement to recession period of water level. Fluctuation in water level between April, 2016 and January, 2017 is mostly dominated by rise in water level. Out of 1150 analyzed wells, 425 wells are grouped under falling zone category and 725 wells are grouped under rising zone category. However fluctuation is mostly restricted within 2 m (76%). Significant fall 2-4 m and > 4 m has been observed sporadically in Murshidabad, Bardhaman, North 24 Parganas, S 24 Parganas and Birbhum districts. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-10. The fluctuation in water level between April, 2016 and January, 2017 map is presented in **Plate - X**

6.5 WATER LEVEL FLUCTUATION BETWEEN AUGUST 2015 AND AUGUST 2016

The fluctuation in water level between August 2015 and August 2016 indicates net status of ground water conditions during the previous and current year monsoon period. Annual fluctuation in water

level between August, 2015 and August, 2016 is mostly restricted within the range of 0-2 m. Out of 1311 analyzed wells, 580 wells are grouped under falling zone category and 731 wells are grouped under rising zone category. Of these, 40.4% wells falls under 0-2m falling category, and 33% wells falls under 0-2m risingcategory which indicates that regional fluctuation of the state is mainly restricted within 2 m. 2-4 m fall in water level is observed in 11.2 wells. More than 4m fall has been observed in sporadic patches in different districts.

The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-11**. Annual fluctuation in water level between August, 2015 and August, 2016 map is presented in **Plate - XI**

6.6 WATER LEVEL FLUCTUATION BETWEEN NOVEMBER 2015 AND NOVEMBER 2016

The Annual fluctuation in water level between November 2015 and November 2016 indicates the net status of ground water conditions during the previous and current post-monsoon year and the same is presented in Plate-IX. Fluctuation in water level have been analysed for 1336 wells. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-12**.

Annual fluctuation in water level between November, 2015 and November, 2016 is mostly restricted within the range of 0-2 m. Out of 1336 analyzed wells, 365 wells are grouped under falling zone category and 655 wells are grouped under rising zone category. All total, 61% wells falls under overall 0-2m category, which indicates that regional fluctuation of the state is mainly restricted within 2 m. 2-4 m fall in water level is observed in 91 wells and >4 m fall in water level is observed in 64 wells. Annual fluctuation in water level between August, 2015 and August, 2016 map is presented in **Plate - XII**

6.7 WATER LEVEL FLUCTUATION BETWEEN JANUARY 2016 AND JANUARY 2017

The annual fluctuation in water level between January 2016 and January 2017 indicates the net status of ground water condition during the previous and current measurement during recession period. Annual fluctuation in water level between January, 2016 and January, 2017 is mostly restricted within the range of 0-2 m. Out of 1321 analyzed wells, 447 wells are grouped under 0-2 m falling zone category and 524 wells are grouped under 0-2 m rising zone category. This indicates that the regional fluctuation of the state is mainly restricted within 2 m (73.5 %). Significantly more than 4 m rise is observed in 85 wells. This situation may be attributed to normal monsoon rainfall. More

than 4 m fall in water level is observed in 54 wells. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-13**

Annual fluctuation in water level between January, 2016 and January, 2017 map is presented in **Plate - XIII**

6.8 WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND APRIL 2016

The decadal fluctuation in water level by comparing the water level data for April Mean (2006-2015) with the depth to water level data of April 2016 indicates the long-term status of ground water condition during the previous and current measurement during Pre-monsoon period. In the State, out of 543 analyzed wells, 190 wells (34.99%) have shown rise where as 353 wells (65.00%) have shown fall. The rise and fall of water level is mostly restricted within 0-2 m (30.2% shows rise and 44.6% shows fall). Of remaining wells, 4.1% wells shows 2 – 4 m rise and 0.7% wells shows >4 m rise, 15.3 % wells shows 2 – 4 m fall and 5.2% wells shows >4m fall. Abnormal rise or fall in water level is observed only in few localized cases.

Water level fluctuation has been analyzed statistically by comparing the decadal mean water level data (April, 2006 - April, 2015) with depth to water level data of April, 2016 has been plotted and the map is presented in Plate-XIV. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-14.

6.9 WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND AUGUST 2016

The decadal fluctuation in water level by comparing the water level data for August Mean (2006 - 2015) with the depth to water level data of August 2016 indicates the long-term status of ground water condition during the previous and current measurement during monsoon period.

Water level fluctuation has been analyzed by comparing the decadal mean water level data (August, 2005 - 2014) with depth to water level data of August, 2016. In the State, out of 634 analyzed wells, 332 wells have shown rise where as 302 wells have shown fall. The rise and fall of water level is mostly restricted within 0-2 m (44.3 % show rise and 32.8 % show fall).

Water level fluctuation has been analyzed statistically by comparing the decadal mean water level data (Aug, 2006 - Aug, 2015) with depth to water level data of August, 2016 and the map is presented in Plate-XV. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-15.

6.10 WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND NOVEMBER 2016

The decadal fluctuation in water level by comparing the water level data for Decadal Mean (2006 - 2015) with the depth to water level data of November 2016 indicates the long-term status of ground water condition during the previous and current measurement during post-monsoon period.

Water level fluctuation has been analyzed by comparing the decadal mean water level data (November, 2006 - November, 2015) with depth to water level data of November, 2016. In the State, out of 579 analyzed wells, 223 wells have shown rise where as 231 wells have shown fall. The rise and fall of water level is mostly restricted within 0-2 m (38.5 % show rise and 39.9 % show fall). Of remaining wells, 1.6% wells shows 2 - 4 m rise and no wells were observed >4 m rise, 7.6 % wells shows 2 - 4 m fall and 12.4 % wells shows >4m fall. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-16. Water level fluctuation map has been prepared comparing the decadal mean water level data (Nov, 2006 - Nov, 2015) with depth to water level data of November, 2016 and the map is presented in Plate-XVI.

Water level fluctuation has been analyzed by comparing the decadal mean water level data (January, 2007 - January, 2016) with depth to water level data of January, 2017. In the State, out of 580 analyzed wells, 212 have shown rise where as 368 wells have shown fall. The rise in of water level is mostly restricted within 0-2 m (190 wells) with 2-4 m rise in 16wells and >4 m rise in 1 well. Of fall in water level scenario, 267 wells shows 0 – 2 m fall and 49 wells shows 2-4 m fall, and 52 wells shows >4 m fall. This may also to be pointed out that the major fall in water level is also mostly restricted in South Bengal districts.

The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-17**.The decadal fluctuation in water level map by comparing the water level data for January Mean (2007-2016) with the depth to water level data of January 2017, is presented in **Plate-XVII**. Fluctuation in water level have been analysed for 600 wells.

7.0 SCENARIO OF WATER LEVELS IN KOLKATA CITY DURING THE GROUND WATER YEAR 2016 – 2017

Kolkata city area is underlain by Quaternary sediments consisting of silt, clay, various grades of sand, gravel and occasional pebbles, deposited in deltaic environment by Ganga- Bhagirathi river system. Here ground water occurs under confined condition andthe piezometric level is significantly deep, ranging between 1.28 &20.48 mbgl during pre-monsoon period and between 1.16&19.15 mbgl during post-monsoon period. In major part of the city.This is due to huge withdrawal of groundwater for domestic and industrial uses.

Hydrographs of KMC area are given in **Plate-XIX**. Depth-to-water level categorization of pre and post monsoon is presented in **Table-18**. Trend in piezometric level has been analysed statistically and has been summarised in **Table-19**.

8.0 HYDROCHEMISTRY

In order to assess the chemical quality of ground water 1187no. samples from phreatic aquifers have been collected during the period April 2016 from Hydrograph Monitoring Stations of West Bengal. Groundwater samples are mainly analysed for 15 major parameters (viz. pH, EC, TH, Ca^{2+} , Mg^{2+} , Na^+ , K^+ , CO_3^{2-} , HCO_3^- , Cl^- , NO_3^- , SO_4^{2-} , F^- , PO_4^{3-} , SiO_2) along with Fe.

The chemical quality of groundwater is dependent on the source of water and on the course over which it flows.

The groundwater pH of the samples collected during AAP 2016 – 17 shows neutral to mildly alkaline in nature with pH value ranged from 6.60 to 8.90. Most of the samples contain no carbonate but are characterised by the presence of bi-carbonate. The maximum concentration of HCO_3^- was found as 1141 mg/l at village Makugram of Bakura district.

The wide range of electrical conductivity indicates wide variation in dissolved constituents in groundwater of West Bengal. The minimum conductivity value ($41 \mu\text{S cm}^{-1}$) has been observed at Nagrakata, Jalpaiguri district whereas maximum conductivity value ($5354 \mu\text{S cm}^{-1}$) has been observed at Domjur of Haora district. As per the salinity hazard classes only 3.64% analysed samples were found unsuitable (i.e. $\text{EC} > 2250 \mu\text{S cm}^{-1}$).

In general, the quality of groundwater in terms of Total Hardness as CaCO_3 has been found maximum 1440 mg l^{-1} at Pancha of Purulia. The maximum concentration of Ca^{2+} has been found as 440 mg l^{-1} at Makugram, Bakura district whereas the maximum concentration of Mg has been observed as 440 mg l^{-1} at Makugram, Bakura district.

The concentration of Na ranged from 0.2 mg l^{-1} to 690 mg l^{-1} (Domjur of Haora district) and of K ranged from 0.04 to 153 mg l^{-1} at Krishnaganj of Nadia District.

The concentration of Chloride ions in majority of the ground water samples (96%) has been found to be within the desirable limit for drinking purpose (250 mg l^{-1} , BIS: 2012). The maximum concentration of chloride has been found as 1312 mg l^{-1} at Domjur, Haora district. In case of Nitrate ions, none showed concentration higher than the permissible limit of 45 mg l^{-1} .

Concentration of Sulphate ion ranged from traces to 217 mg l^{-1} at Sundarpur of Dinajpur District. Fluoride ion concentration varied from Traces to 6 mg l^{-1} (detected from Kurumgram, Birbhum district).

Significant phosphate occurrence in groundwater samples of few districts has been observed. In more than 98% of the ground water samples phosphate was detected as trace. The silicate concentration was in the range of traces to 69 mg l^{-1} (Bhojerhat, S-24 pargana). Very few samples showed silicate concentration above the average of 28.1 mg l^{-1} .

Ground Water in West Bengal is mainly Ca-Mg-HCO₃. In some places, it is Na-Cl Type. Some places mixture of both type of water is present.

Sodium percentage(SP) shows only 5% water(greaterthan60) is not suitable for irrigation. Magnesium hazardous(MH) is very low(<50),so this parameter is suitable for irrigation. Base Exchange ratio shows most of location ground water is recharge zone. Residual sodium carbonate value shows most of tha water is suitable for irrigation.

Section B

GROUND WATER YEAR BOOK OF ANDAMAN AND NICOBAR ISLANDS

2016 - 2017

1.0 INTRODUCTION

Groundwater monitoring data form an important input for judicial ground water management & development. Yearly two water level measurements during pre- & post- monsoon period in the month of April and November respectively are taken in Andaman & Nicobar Islands. Since Andaman & Nicobar Islands experienced heavy rainfall during the month of November, post monsoon water level is generally taken during the month of December. Till march,2011 a total of 64 operational network hydrograph stations were monitored in Andaman Group of Islands. During 2012, additional 29 nos. network hydrograph stations have been established. At present, 112 operational network hydrograph stations are monitored in Andaman district (**PLATE-B I**) in various hydrogeological units and agro-climatic zones two times a year, viz. May and November. In Nicobar district, no network hydrograph stations have been established till date. During April-May, 2016 and November, 2016 depth to water level data were collected from 112 ground water monitoring wells.

2.0 GENERAL FEATURES

The Andaman and Nicobar Islands (A & N Islands) is one of the Union Territories of India and are situated as a dissected chain in an arcuate fashion oriented N-S in the Bay of Bengal off the Eastern Coast of India. These Islands are extended between 6° to 14° N and 92° to 94° E in between Myanmar and Sumatra (Indonesia) over a distance of 780 km. This Union Territory is divided into two districts, i.e. Andaman and Nicobar. The northern group of Islands forms the Andaman district, is further sub-divided into three parts namely, North Andaman, Middle Andaman And South Andaman. The southern group of islands is separated from the northern group by about 140 km deep sea, the 10° channel, forms the Nicobar district.

3.0 TOPOGRAPHY

The islands forming Great Andaman consist of a mass of hills enclosing very narrow valleys, the whole covered by dense tropical jungle. The hills rise, to a considerable elevation, the heights peak being in the North Andaman, Saddle Peak (732m); in the Middle Andaman, Mount Diavolo behind Cuthbert Bay (511m); in the South Andaman, Kojob (459m), Mount Harriet (364m) and the Cholunga range (324m); and in Rutland Island, Ford's Peak (433m). Little Andaman is practically flat. As such there are no rivers, however few perennial streams are present in the islands. Barring a few small

Islands in the Nicobar group, all the others have undulating terrain with main ridges running North-South. There are also spurs running East - West in between the main ridges. The submerged valleys form deep inlets and creeks. Flatlands are few and perennial streams non-existent in most of the Islands except in Great Nicobar where there are 5 perennial rivers. Coral reefs surround most of the islands.

4.0 PHYSIOGRAPHY

These Islands are in general characterized by undulating and rugged topography. Physiographically these Islands can be subdivided into three main parts

I)	Moderate to steep hill ranges
II)	Intermontane narrow valley
III)	Coastal tracts including swamps

The huge ranges generally covered by dense forest.

5.0 HARBOURS

Coasts are deeply indented, giving existence to a number of safe harbours, which are often surrounded by mangrove swamps.

6.0 DRAINAGE

Perennial streams of the status of river is absent in A & N Islands except in Kalpong in the North Andaman. In Great Nicobar, the important perennial streams are Galathea, Jubilee, Dark Anaing, Dark Tayal, Amrit Kaur.

7.0 SOILS

Soils of Andaman and Nicobar Islands have been classified into 3 orders, i.e. Entisols, Inceptisols and Alfisols. The main agricultural soils are found in the valleys and have alluvial and colluvial origin. The coastal areas prone to tidal floods may have acid sulphate soils. On the whole, soils of these Islands are nutritionally poor and their organic matter content is on decline.

8.0 CLIMATE

The climate of Andaman and Nicobar Islands is described as humid Tropical Climate. The Islands are situated in the Hot or Torrid Zone. Nearly 86 percent of total area in these Islands is covered by forest. There are only two seasons viz. Rainy Season and Summer Season and virtually there is no Winter Season. Islands are visited by South - West and North - East monsoons during the period from May to December. Average annual rainfall in these Islands is 3000 mm. The period from January to May is Summer Season. The mean relative humidity is 79% to 82%. The mean maximum temperature is 30.2°C and mean minimum temperature is 23.8°C.

9.0 GEOLOGY

The Islands are composed mainly of thick Eocene sediments consist of Pre-Tertiary sandstone, siltstone and shale with intrusions of basic and ultra-basic igneous rocks. In the geologically Younger Richie's archipelago, calcareous sand stones are more common.

10.0 HYDROGEOLOGY

The Andaman & Nicobar group of Islands are underlain by Late Cretaceous igneous rocks - the 'Ophiolite Suite', marine sedimentary group of Palaeocene to Oligocene age and Recent to Sub-Recent beach sand, mangrove clay, alluvium and coralline formations. The Ophiolite suite comprises a wide variety of acidic to ultra-basic plutonic rocks and their serpentinised equivalents and essentially basic volcanic rocks occur in South, Middle & North Andaman, in sporadic patches of Little Andaman, Kamorta and Bampooka Islands in Nicobar group. The marine sedimentaries comprise greywakes, graded sandstones, siltstones, black shales and volcanogenic sediments. These fine-grained deep-sea deposits are generally having predominantly clayey particles. The coralline formations are observable in coral islands (atolls) and they also occur in the fringe areas of the sedimentary and igneous formations and form the narrow beaches encircling the islands. The ophiolite and marine sedimentaries have undergone different phases of folding, faulting and upliftment; which is responsible for the development of fractures and fissures, as a result infiltrated rainwater percolates downwards.

Marine sedimentary rocks are located to an anomalous admixture of sand and clay where clayey residue are predominating since clayey product is poor water yielder, these sedimentary rocks, in majority of the cases, do not form potential aquifer system both in shallow and deeper horizons. Bore wells are not feasible in these formations and the yield of dugwells with a diameter of 4.5 to 5m and 6m depth tapping the weathered mantle varies from 3000 to 5000 lpd. Depth to water level in these formations varies from 0.2 to 4.4 mbgl. All the borehole drilled in these formations were unsuccessful except one borehole at Prothrapore, which is yielding brackish water (5500 EC) having discharge 17000 lph.

The igneous rocks also do not form potential aquifers, however in comparison to the sedimentaries they yield moderately. These rocks form aquifer both in weathered mantle and fractured basement rocks which are generally developed through dug well, ponds and private bore wells. Out of six successful bore wells drilled by CGWB, 5 nos. were constructed in igneous rock. The success may be due to partial clogging of fractures with clayey residue where it is fully sealing the fracture conduits in sedimentaries. The well at Calicut, constructed by CGWB, is now the only supplying well of APWD, A & N Administration. The fracture conduit is conjectured upto 45m depth. The discharge of Calicut well is 45000 lph.

The coralline limestone formations also form potential aquifer. They are distributed at shallow horizon and are developed through dug wells in many islands like Car Nicobar, Katchal, Neil, Havelock etc. Yield of these dugwells (commonly of 5m dia, 6m depth) varies from 15000 to 1 lakh lpd.

Recent studies of CGWB have revealed that the valley-fill alluvial deposits consisting of boulders, pebbles, cobbles, and sand, carry lot of water and saturate the near surface aquifer through out the year. Hence, such valley-fill deposits form potential aquifers in A & N Islands. CGWB constructed exploratory well at Beadnabad on valley-fill deposit, down to the depth of 17m, yielded 72000 lph water. This also indicated that Artificial Recharge and Conservation program might be successful in those areas. Pilot scale implementations of such structures by CGWB proved it highly successful.

11.0 SCENARIO OF DEPTH TO WATER LEVELS IN ANDAMAN DURING GROUND WATER YEAR 2016 – 2017

11.1 May, 2016

The Depth to water level generally varies, between 0-2m, 2-5m and 5-10m below ground level. Majority of the wells show water level between 2-5m (65.7%). The minimum water level at 0.74 mbgl was recorded at Southth Andaman and maximum 12.16 mbglat South Andaman. Depth to water levels mostly in the range of 2-5 mbgl (65.7%) followed by 0-2 mbgl (17.1%) and 5-10 mbgl (16.2%). The distribution of network hydrograph stations in different ranges of depth to water level is presented in Table - B1.

11.2 November, 2016

The Depth to water level generally varies between 0-2m, 2-5m and 5-10m below ground level. Out of 112 wells measured, water level in 95 wells varies in the range of 0-2 mbgl ,16 wells in the range of 2-5 m bgl and 1 well in the range of 5-10. The minimum water level was at 0.09bgl and recorded at Middle Andaman and maximum water level i.e. 7.51 mbgl at South Andaman. Depth to water levels mostly in the range of 0-2 m bgl (84.8%) followed by 2-5 m bgl (14.3%) and 5-10 mbgl (0.9%) .The distribution of network hydrograph stations in different ranges of depth to water level is presented in Table - B2. Depth to water level data of various network stations for the period May, 2016 and November, 2016 is given in Annexure- B I.

12.0 FLUCTUATION IN WATER LEVEL INANDAMAN DURING GROUND WATER YEAR 2016 – 2017

The pre-monsoon water levels of April, 2016 have been compared with post-monsoon water levels of November 2016 to delineate the impact of rainfall as well as ground water development on ground water regime in the state during the above period. Fluctuations in water levels for the periods of April 2015 and April 2016, and November 2015 and November 2016 have also been analyzed.

12.1 WATER LEVEL FLUCTUATION BETWEEN APRIL 2015 AND APRIL 2016

The fluctuation in water level between April 2015 and April 2016 indicates the net status of ground water conditions during the previous and current summer periods. Distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table – B3**. The

total analysed (103nos.) data of shows that scenario is dominated by fall in water level in the range of 0-2 m (64.1%) and 2-4 m (19.4%). The rise is observed in 15 wells in the range of 0-2 m (12.6%) ,2-4 m (1%) and ≥ 4 m (1.0%).

12.2 WATER LEVEL FLUCTUATION BETWEEN APRIL 2016 AND NOVEMBER 2016

The seasonal fluctuation in water level for April 2016 compared with November 2016 has been done and distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table – B4**. The fluctuation data of November 2016 in comparison with April 2016 shows a rise in water level in 102 wells and fall in 3 wells. However, in all cases the rise or fall in water level is restricted within 0-4m.

12.3 WATER LEVEL FLUCTUATION BETWEEN NOVEMBER 2015 AND NOVEMBER 2016

The fluctuation in water level between November 2015 and November 2016 indicates the net status of ground water conditions during the previous and current post-monsoon periods. Distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table - B5**. The total analysed (107 nos.) data indicates that scenario is dominated by fall in water level in the range of 0-2 m (52.3%) and 2-4 m (3.7%). In 46 wells rise within 0-2 m (45 wells) and 2-5 m (1 well) is observed.

12.4 GROUND WATER LEVEL TREND

The water level trend has been analysed for all measurements, which indicates the net status of ground water conditions during 2006 – 2016 and is presented in **Table - B6**. Out of 108 analysed well, 77 wells show rising trend of water level in the tune of 0.037 to 1.46 m/yr. Rest 31 wells show falling trend of water level in the tune of 0.015 to 0.53 m/yr.

13.0 HYDROCHEMISTRY

Hydrochemical Studies with Findings / Conclusions – Andaman & Nicobar Islands

1. The groundwater pH of the samples collected from Andaman and Nicobar Islands during AAP 2016 – 17 shows neutral to mildly alkaline in nature with pH value ranged from 7.35 to 8.26 (Mean: 7.86 ± 0.24). None of the samples contains carbonate but are characterised by

the presence of bi-carbonate. The maximum concentration of HCO_3 was found as 458 mg l^{-1} at Kalapathar of South Andaman with a range of 12 – 458 (Mean: 208 ± 108) mg l^{-1} . None of analysed samples showed alkalinity value higher than the permissible limit of 600 mg/l for drinking purpose (BIS: 2012).

- The wide range of electrical conductivity as well as TDS values indicates wide variation in dissolved constituents in groundwater of Andaman. The minimum conductivity value ($116 \text{ micro siemens cm}^{-1}$ at 25°C) has been observed at Mount Harriet, South Andaman whereas maximum conductivity value ($3874 \text{ micro siemens cm}^{-1}$ at 25°C) has been observed at Saitankhari of South Andaman district. As per the salinity hazard classes only one analysed sample was found unsuitable (i.e. $\text{EC} > 2250 \text{ }\mu\text{S cm}^{-1}$). 17% of the analysed sample showed TDS values ranged higher than Desirable Limit of 500 mg l^{-1} for drinking purpose (BIS: 2012).
- In general, the quality of groundwater in terms of Total Hardness as CaCO_3 has been found as hard to very hard (almost 68% of total analysed samples). The detail Distribution is as follows –

Suitability of groundwater based on hardness

TH as CaCO_3 in mg l^{-1}	Water Class	No. of Samples	% of Samples
<75	Soft	05	06
75–150	Moderately Hard	23	26
150–300	Hard	47	53
>300	Very Hard	13	15

Total hardness was found above the permissible limit of 600 mg l^{-1} at of South Andaman. The maximum concentration of Ca has been found as 136 mg l^{-1} at Tirur of South Andaman district; whereas the maximum concentration of Mg has been observed as 90 mg l^{-1} at Saitankhari of South Andaman district.

- The concentration of Na ranged from 5.0 mg l^{-1} at Mamyo, South Andaman District to 571 mg l^{-1} at Saitankhari of the same district and of K ranged from 0.6 mg l^{-1} to 14.6 mg l^{-1} at Sitanagar of South Andaman district.
- The concentration of Chloride ions in majority of the ground water samples (97%) has been found to be within the desirable limit for drinking purpose (250 mg l^{-1} , BIS: 2012). The maximum concentration of chloride has been found as 1132 mg l^{-1} at Saitankhari signifies tsunami effect. None of the analysed sample showed Nitrate concentration higher than the permissible limit of 45 mg l^{-1} . Nitrate concentration ranged from traces to 10 mg l^{-1} .
- Concentration of Sulphate ion ranged from traces to 99 mg l^{-1} at Subhashdram, North-Middle Andaman District. None of the analysed samples showed higher sulphate concentration than the desirable limit of 200 mg l^{-1} . Fluoride ion concentration varied from Traces to 0.80 mg l^{-1} (detected from Ferrargunj of South Andaman) with a mean of 0.28 ± 0.14

mg l⁻¹. None of the analysed sample showed higher Fluoride concentration than the permissible limit of 1.5 mg l⁻¹ (BIS: 2012).

7. Highest phosphate concentration of 3.10 mg l⁻¹ was found at Mohanpur of North-Middle Andaman District. In most of the ground water samples (80%) phosphate was detected as trace. The silicate concentration was in the range of 6 mg l⁻¹ to 30 mg l⁻¹.
8. Groundwater Iron concentration has been found in the range from Traces to 3.04 mg l⁻¹ detected from Manjeri, South Andaman. In 57% sample Iron has detected higher than the acceptable/permissible limit of 0.3 mg l⁻¹ for drinking purpose (BIS: 2012).
9. As per the Na% value the distribution is as follows -

Suitability of groundwater based on Na%

Na% Range	Water Class	No. of Samples	% of Samples
<20	Excellent	16	18
20–40	Good	43	49
40–60	Permissible	26	30
60–80	Doubtful	03	03
>80	Unsuitable	-	-

Only 3% samples were categorized as doubtful and none found unsuitable. As per Residual Sodium Carbonate 92% ground water samples were found safe for irrigation whereas none found unsuitable. As per Sodium hazard classes based on USSL classification all samples are categorized as excellent class having values less than 10. As per the permeability index the distribution is as follows –

Permeability Index	Water Class	No. of Samples	% of Samples
>75%	Class I	21	24
25–75%	Class II	67	76
<25%	Class III	-	-

10. Mostly no major threat has been identified according to analysed major parameters from drinking water perspective (Drinking water specification: BIS, 2012). Ground water in major part of Andaman and Nicobar Islands has also been found suitable for use in irrigation and allied purposes.

Table - B1

District wise Well Frequency for Different Ranges of Depth to Water Level Month / Year: Apr-2016
