FOREWORD

To understand the spatio-temporal variations in the existing hydrogeological regime, a network of Ground Water Monitoring Wells (GWMW) has been set up all over West Bengal and Andaman Group of Islands by Central Ground Water Board, Eastern Region. These GWMWs are represented by various ground water abstraction structures, as found suitable for prevailing aquifer systems of the area. Systematic and periodical monitoring of these GWMWs aids in the identification and quantification of changes in groundwater availability and its quality, which is vital for ascertaining sustainable ground water development and efficient management of ground water resources.

At present a total of 1500 GWMWs are monitored representing almost all the blocks of twenty three districts of the states of West Bengal. Due to inaccessibility in Andaman group of Islands, initially the task was taken up with the help of a few GWMWs but gradually the number of stations have been increased to 113. However, at present no GWMW has been established in Nicobar group of Islands and in Little Andaman, due to their inaccessibility. Periodic ground water level measurements were taken up four times in a year in 2020-2021, (i.e. in the month of April, August, November and January) in West Bengal and two times in a year (i.e. April and November) in Andaman group of Islands. The scientific officers and technical personnel of the Eastern Regional office, systematically collected field data throughout the year. While the chemists have analysed the water samples collected from GWMWs to adjudge the variation of chemical quality of groundwater in the state and occurrence of toxic minerals.

This report attempts to compile the collected data during 2020-2021 and present its detailed analysis in a comprehensive manner in the form of maps and statistical analysis and brought out in two sections, where Section-A embodies report for West Bengal and Section-B forms report for Andaman group of Islands. Water level data for all four measurements have been collected by the officers of CGWB, ER. Chemical analysis has been carried out by chemists Shri Atalanta Narayan Chowdhury, Assistant Chemist, and Dr. Suparna Dutta, Assistant Chemist at NABL accredited Chemical lab of CGWB, ER. Compilation of this report, evaluation of data and preparation of relevant maps and their reproduction in the form of present report is outcome of efforts put in by Mrs Rose Anita Kujur, Scientist D. I would also like to mention the contributions of Mr Niraj Kumar, MTS during compilation of the report. The section pertaining to Hydrochemistry has been prepared by Shri Atalanta Narayan Chowdhury, Assistant Chemist and Dr Suparna Dutta, Assistant Chemist. Their efforts are also thankfully acknowledged.

Due to the spread of Pandemic Covid-19 and inaccessibility to the area because of lockdown, the water level from Andaman and Nicobar Islands was not measured. Hence the report of 2019-2020 has been attached to complete the compilation of groundwater yearbook 2020-2021.

Dissemination of technical information in a very useful way to the user agencies is an important aspect that plays a vital role in the safe and optimal development of groundwater resources in our country. Central Ground Water Board is bringing out the "Groundwater Year Book" each year as an effort in this direction. It is sincerely hoped that this report will be immensely useful not only to various user agencies, Engineers, Scientists, Administrators, Planners and others involved in groundwater planning, development and management but also to the common man in need of such information to make themselves aware of the ground situation.

(Dr S.K.Samanta)
Regional Director

ABSTRACT

In West Bengal, ground water level monitoring is being carried out by Central Ground Water Board, Eastern Region from 1500 Ground Water Monitoring Wells covering all districts of West Bengal encompassing various hydrogeological and agro-climatic zones during the month of April, 2020, August, 2020, November, 2020 and January, 2021. In Andaman and Nicobar Islands, monitoring of water level is carried out from 113 nos. GWMSs established in different hydrogeological and geomorphic terrains. Out of 113 GWMS, 111 wells are open dug well and rest two are bore well. In Kolkata City, monthly monitoring of water level is carried out using 36 nos. GWMS.

Collected water level data were statistically analyzed and relevant maps depicting ground water scenario corresponding to various measurements were prepared. All datasets were compared and analyzed with pre-monsoon measurements and also with dataset of same period for previous year. Mean depth-to-water level for the period 2010-2019 was compared with corresponding measurements and analyzed to delineate the behavior of water levels. Status of Ground Water Monitoring Stations and number of the wells monitored during four water level measurements are also prepared. Statistical data incorporate ranges of water levels and water level fluctuations, minimum and maximum values of water level, number of wells measured, percentage of monitoring stations falling in different ranges with district-wise breakup in different pre-defined categories in compliance with national guideline. Along with the general well information, depth to water level data of all network hydrograph stations, are also presented. The water samples collected during April 2020 in West Bengal and Kolkata were chemically analyzed and the data generated has been presented.

Present report has been prepared on groundwater scenario of West Bengal reflecting the status of groundwater regime as revealed through ground water level during 2020-21.

GROUNDWATER SCENARIO IN WEST BENGAL AT A GLANCE

Location(bound)	N Latitudes, 21°31'0'', 27°33'15'', E Longitudes, 85°45'20'', 89°33'0'',
Geographical Area	88752 sq. km.

Section A

GROUND WATER YEAR BOOK OF WEST BENGAL (2020 – 2021)

1.0 INTRODUCTION

Periodical monitoring of ground water regime covering different hydrogeomorphic, hydrogeological units is an effort to acquire information on behaviour of **ground water levels**, **chemical quality** and **temperature** of formation water through representative sampling. The process is essential in both spatial and temporal domain, to consolidate a detailed knowledge about ground water scenario of an area with respect to its behaviour, availability and quality. Thus, data so collected during monitoring becomes one of the most important inputs for a holistic ground water management.

Monitoring is carried out by establishing suitable *Ground Water Monitoring Stations* (GWMS) based on geomorphology, geology, hydrogeology and status of ground water resource of the area with a view to observe the trend of water level and change of chemical quality with space and time. It is also essential for estimation of ground water resources and to demarcate the water logging as well as drought prone areas.

In West Bengal, ground water monitoring was started since 1976 when most of the ground water structures were mainly dug wells and the development of the ground water resource was very limited. It is only after 1985, actual ground water development started in irrigational sector and took its full swing from 90s. Accordingly, network stations (GWMS) for monitoring of water level data were also changed in different periods. However, from late nineties, these old wells are being replaced by well-defined piezometers in phased manner with an expectation that in near future, this effort will provide better result.

1.1 BACKGROUND

The Central Ground Water Board, Eastern Region, is at present monitoring 1810 operational GWMS (network hydrograph stations) to delineate the behaviour of ground water level in spatio-temporal domain, covering entire state of West Bengal four times a year, viz. January (from 1st to 10th), April (from 20th to 30th), August (from 20th to 30th) and November (from 1st to 10th).

The district-wise status of GWMS in West Bengal during the period from March 2020 to March 2021 is given in **Table 1**. The locations of GWMW are shown in **Plate - I**. To get a detailed water level

scenario in the urban area especially in metro city, CGWB, Eastern Region, is also monitoring monthly measurement from 35 monitoring stations in Kolkata City (**Plate - II**).

The district-wise water level data of GWMW for the period April, 2020; August 2020; November 2020; and January 2021 are given in **Annexure - I**. The results of chemical analysis of water samples collected during April 2020 are also discussed and analytical data are given in **Annexure - II**.

2.0 PHYSIOGRAPHY AND DRAINAGE

In general the state of West Bengal is a flat terrain, crisscrossed with rivers except the Himalayan foothills in the north and Chotanagpur plateau in the south-west. Southern flowing Ganga River and its numerous tributaries & distributaries mainly drain the State. The Ganga River system encompasses the catchment areas of the Mahananda, Jalangi, Bhairab etc. in the eastern part and the Mayurakshi, Ajoy, Damodar, Dwarakeshwar and Kasai in the western part. The Teesta, Torsa and Jaldhaka streams of the Brahmaputra river system originate in the Himalayas and drain the northern part of the State. Beside these, there is a small independent river basin, namely Subarnarekha basin covering southwestern part of the State in Medinipur district. Physiographically, the area incorporates extra – peninsular region of the north, peninsular mass of the south – west, and alluvial and deltaic plains of the south and south-east. The State can be broadly divided into four distinct physiographical divisions as:

- (i) Himalayan Region comprising Darjeeling, Jalpaiguri and Kochbehar districts;
- (ii) Eastern fringe of Chottanagpur Plateau comprising districts of Puruliya, western parts of Barddhaman, Paschim Medinipur, Birbhum and Bankura district;
- (iii) Coastal areas comprising of S 24 Parganas district and small part of North 24 Parganas, Purba Medinipur and Howrah districts;
- (iv) Alluvial terrains falling in the remaining parts of the state.

In each of above four areas ground water regime behaves differently.

3.0 HYDROMETEOROLOGY

The general climate of the state, except the Himalayan zone which lies in the extreme northern part, is tropical. The tropic of cancer passes across the middle of the districts of Nadia and Barddhaman and the northern part of the districts of Bankura and Purulia. The normal annual rainfall in the state varies from 1276 to 3608 mm. The Himalayan region in the northern parts of the state receives the maximum rainfall. The Actual rainfall of 2020 in different districts of West Bengal is presented below.

Actual Rainfall distribution in West Bengal-2020

Sl. No.	District	Cumulative Rainfall in mm		
		Monsoon	Non monsoon	Total
1	Malda	1242.8	360.4	1603.2
2	Nadia	920.9	403.1	1324
3	Coochbehar	3480.3	665.8	4146.1
4	North 24 Parganas	1294.4	639.9	1934.3
5	Dakshin Dinajpur	1264.6	586.1	1850.7
6	Uttar Dinajpur	1581.8	405.1	1986.9
7	Bankura	1067.2	463.9	1531.1
8	Purulia	1058.9	383.2	1442.1
9	Jalpaiguri	4238.6	736.9	4975.5
10	Burdwan	1027	452.8	1479.8
11	Murshidabad	1135.8	324.2	1460
12	Birbhum	1152.3	358.5	1510.8
13	Howrah	942.3	496.5	1438.8
14	Darjeeling	3230.1	569	3799.1
15	Hooghly	962.4	479.3	1441.7
16	Purba Medinipur	1004.1	813.7	1817.8
17	Paschim Medinipur	960.9	586.7	1547.6
18	Kolkata	1308.9	649.1	1958
19	South 24 Parganas	1150.4	535.4	1685.8

4.0 GEOLOGY:

The state of West Bengal is covered by diverse rock types ranging from the Archaean metamorphites to the Quaternary unconsolidated sediments (Plate-10). Approximately two - third area of the State is covered by alluvial and deltaic deposits of Sub – Recent to Recent time and the remaining part abounds in a wide variety of hard rocks.

The State is divided into three distinct physiographic units, which are as follows.

- (i) Extra – peninsular region of the north,
- (ii) Peninsular mass of the south – west,
- (iii) Alluvial and deltaic plains of the south and east.

5.0 HYDROGEOLOGY

There are two broad hydrogeological units e.g. **Fissured formation and Porous Formation.**

a) Fissured formation :

Proterozoic gneisses and schists, younger Gondawanas Super group and Siwalik rocks of Extra-Peninsular region in Darjeeling and Jalpaiguri districts to the north and Archaean to Proterozoic gneisses and schists in Peninsular region occurring in western part of Bardhaman, Bankura, Birbhum and northern part of Medinipur and whole of Purulia districts and younger Gondwana and Purana sediments (Susunia quartzite of Bankura) deposited in the intra-cratonic basins in the shield area and Rajmahal basaltic tracts in the eastern fringe area of the shield fall under fissured formation.

Occurrence and movement of ground water in this formation is controlled by the following zones.

- i) Weathered Mantle
- ii) Saprolitic Zone
- iii) Zone of secondary porosity

b) Porous Formation :

Nearly two-third of the state is occupied by a thick pile of unconsolidated sediments laid down by the Ganga-Brahmaputra river system, the thickness of which increases from marginal platform area in the west towards the east and southeast in the central and southern part of the basin following the configuration of Bengal Basin. These unconsolidated sediments are made up of succession of clay, silt, sand and gravel of Quaternary age overlying Mio-Pliocene sediments. The Quaternary sediments are made up of Recent and Older Alluvium. Occurrence and movement of ground water in this hydrogeological unit is controlled by primary porosities of the sediments.

6.0 CRITERIA FOR FIXING GWMS

Ground water monitoring is mainly done in the water table aquifer to categorize an area having excess or less withdrawal. This is useful to estimate the dynamic ground water resources and to demarcate the water logging as well as drought prone areas. To understand the correct water table aquifer in an area geomorphology and geology play a vital role. Therefore, for fixing GWMS in a district/block one has to consider the following factors:

FIXING GWMW BASED ON GEOMORPHOLOGY

At least one GWMW in each geomorphic unit of more than 50 sq. km extent has been fixed.

FIXING GWMW BASED ON GEOLOGY

Minimum one GWMW in each geologic unit having more than 150 sq. km. in hard rock areas and 200 sq. km. in soft rock areas have been fixed.

FIXING GWMW BASED ON STATUS OF GROUND WATER RESOURCE

Category	Optimum no. of GWMW
SAFE	2
SEMI CRITICAL	3
CRITICAL	4
OVER EXPLOITED	4

The process to fill up the data gap as per the requirement of criteria by establishing new GWMW in different geological/ geomorphological setup block-wise is done wherever required.

7.0 SCENARIO OF DEPTH TO WATER LEVELS IN WEST BENGAL DURING THE GROUND WATER YEAR 2020 – 2021

The groundwater storage is largely controlled by the prevailing hydrogeological and geomorphic conditions. Besides, magnitude of input (recharge) to the ground water system and output (discharge) from it also influences the status of groundwater regime. In the State of West Bengal hydrogeological as well as the geomorphological conditions are highly variable as evident from earlier chapters. The chief source of recharge to storage is rainfall which is highly variable over space and time. The main source of discharge is ground water abstraction which is also varying and also growing exponentially. The regions having ground water as the main source for irrigation always remain under heavy stress. The imbalance between the recharge and discharge expresses itself in terms of variations in the ground water level. Thus, the water level is a very important parameter for ground water studies. The behavior of the water level in the state during year 2020-21 has been studied based upon the observations made on the permanent Ground Water Monitoring Wells and described in the following paragraphs.

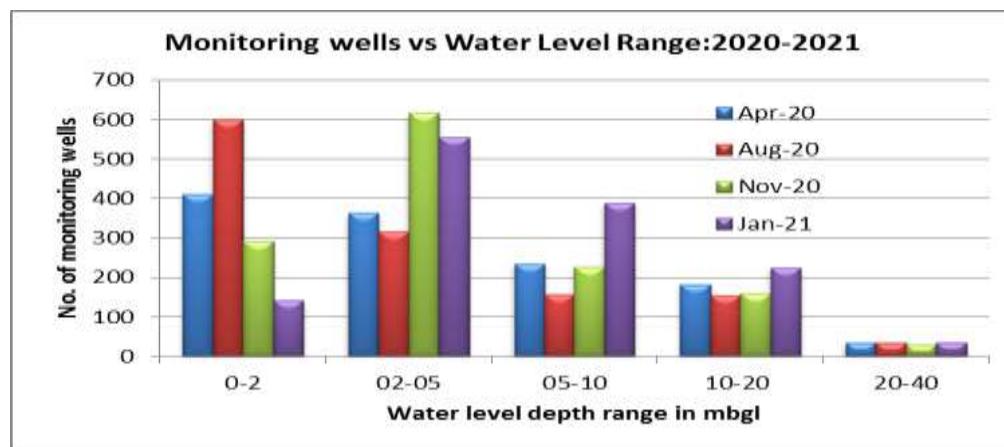

During 2020 - 2021 the existing 1500 National Hydrograph stations were monitored four times and behaviour of the ground water regime during the year was inferred comparing the same with the decade mean, corresponding previous year data and pre-monsoon water level data. The data from GWMS for the year 2020-21 was analysed and for every set of measurements, write up and maps were prepared and are presented here under various paragraphs. The analysis of water level data were done based on following criteria:

- i) Four measurements of depth to water level give an overall idea regarding the ground water level in the state during the year of measurement.

- ii) The fluctuation in comparison to the same month in the previous year gives an idea about the change in the ground water level for a particular period with respect to that of the level during the same month in the previous year. This gives an idea about the change in the amount of draft and rainfall between the two years.
- iii) The water level fluctuation during the pre-monsoon period in comparison to previous year gives an idea about the seasonal fluctuation, which ultimately reflects the change in dynamic ground water resources.
- iv) The water level fluctuation during a particular month of measurement with reference to the decadal mean for the same months gives an idea of the behaviour of the ground water level on long-term basis.

7.1 DEPTH TO WATER LEVEL

The graphical representation on analysis of number of monitoring wells in the different categories of the water levels for all four monitoring periods of year 2020-21 reveals that water level depth up to 5 meters varies considerably over all monitoring periods, which shows that dynamic changes in ground water levels are conspicuously deciphered in shallow water zones. For depth range of 5 to 10m and 10 to 20 m few locations were recoded at this range, Whereas numbers of monitoring station showing water level 20- 40 m remain almost same in all four-monitoring period, indicate stressed water conditions in deep aquifers of West Bengal, which is considerable very low with respect to other water level ranges.

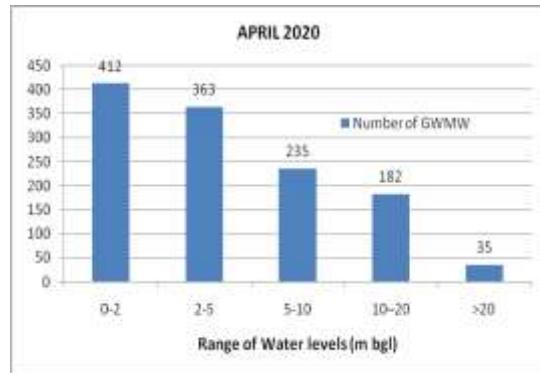

APRIL 2020

Depth to water level during April, 2020 was measured from 1227 ground water monitoring wells out of 1500 existing wells. Details given in Annexure I.

Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GWMW) fall under different ranges are given under:

Range of Water levels (m bgl)	Number of GWMW	%
0-2	412	33.6
2-5	363	29.6
5-10	235	19.2
10-20	182	14.8
>20	35	2.9

Due to pandemic Covid-19 state was under total lockdown (March to May 2020) hence the measurement started late. Generally during pre-monsoon season, majority of the well shows water level between 5-10 m but in 2020 water level recorded between 0 - 2 (33.6%) followed by the 2-5 m (29.6%). 5 – 10 (19.2) and 10-20m (14.8%) ranges. In southern and central part of West Bengal, deeper water level is observed in hard-rock covered parts of Barddhaman and Birbhum district; within older alluvium covered areas of West Medinipur, Hugli, Murshidabad districts, Bhabar zone of Jalpaiguri and Barind Tract of Malda districts. Deepest water level has been recorded at Bahari, Bolpur-Sriniketan (29.65 mbgl) in Birhum district. Significantly, agriculture dominated districts show dominance in deeper water level e.g. Hugli, Purba & Paschim Medinipur, Birbhum, Barddhaman, Murshidabad, North and South 24 Parganas districts.

In the state, shallow aquifers depth to water level ranges mainly between 0 – 2 & 2 – 5 m bgl. On the other hand, confined aquifers of Haora, East Medinipur, S 24 Parganas generally shows a deeper water level of the order of 5-10 m bgl and 10-20m.

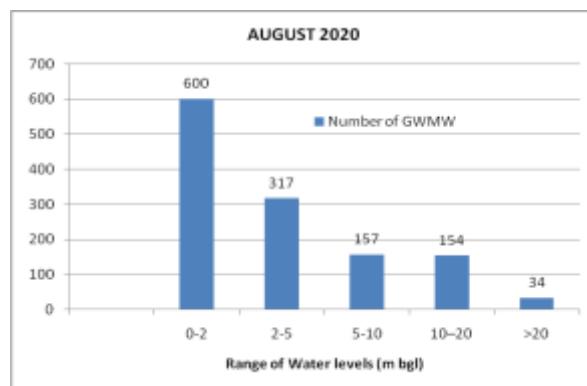

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 3**. Depth to water level map is given in **Plate-III**.

AUGUST 2020

Depth to water level during August, 2020 was measured from 1262 ground water monitoring wells out of 1500 existing wells.

Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GWMW) fall under different ranges are given under:

Range of Water levels(m bgl)	Number of GWMW	%
0-2	600	47.5
2-5	317	25.1
5-10	157	12.4
10-20	154	12.2
>20	34	2.7

Being monsoon season, most of the well shows water level between 0-2m (47.5%) or 2-5m (25.1%). In central part of West Bengal, deeper water level is observed in hard-rock covered parts of Birbhum, Barddhaman and West Medinipur districts; within *Bhabar zone* of Jalpaiguri district; older alluvium covered areas of Hugli, Murshidabad, North 24 Parganas districts. Deepest water level has been recorded at Bahari (28.99 m bgl) in Birbhum District. Confined aquifers of Haora, East Medinipur, S 24 Parganas generally show a deeper water level of the order of 5-10 m bgl and occasionally 10-20m.

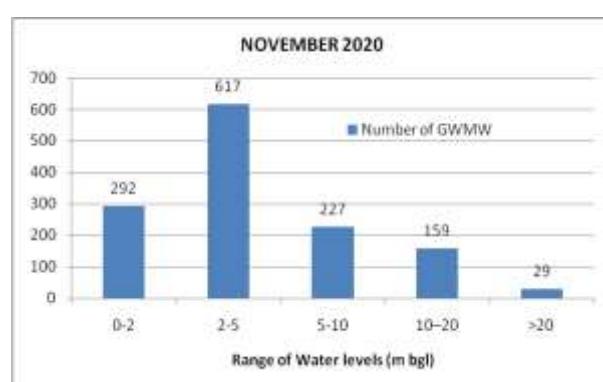

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 4**. Depth to water level map is given in **Plate-IV**.

NOVEMBER 2020

Depth to water level during November, 2020 was measured from 1324 ground water monitoring wells out of 1500 existing wells.

Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GWMW) fall under different ranges are given under:

Range of Water levels(m bgl)	Number of GWMW	%
0-2	292	22.1
2-5	617	46.6
5-10	227	17.1
10-20	159	12
>20	29	2.2

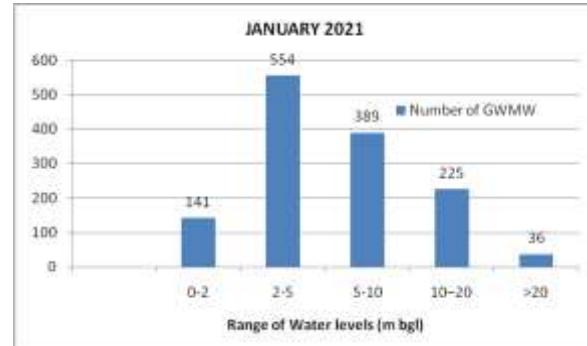

Being post-monsoon season, majority of the well shows water level between 2-5 m (46.6%), followed by the 0-2 m (22.1%) , 5-10 m (17.1%) 10-20 m (12.1%) ranges. In the central part of West Bengal, deeper water level is observed in hard-rock covered parts of Barddhaman, Birbhum and West Medinipur district; within *Bhabar zone* of Jalpaiguri district and Barin tract of Malda district; older alluvium covered areas of Hugli, Murshidabad districts. Deepest water level has been recorded at Kasba, Galsi I (29.38 m bgl) in Purba Barddhaman District. Confined aquifers of Haora, East Medinipur, S 24 Parganas generally show a deeper water level of the order of 5-10 m bgl and occasionally 10-20m.

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 5**. Depth to water level map is given in **Plate-V**.

JANUARY, 2021

Depth to water level during January 2021 was measured from 1345 ground water monitoring wells out of 1500 existing wells. Five groups were made based on the range of water levels, viz. 0-2, 2-5, 5-10, 10-20 and > 20 m bgl. The number of ground water monitoring wells (GWMW) fall under different ranges are given under:

Range of Water levels (m bgl)	Number of GWMW	%
0-2	141	10.5
2-5	554	41.2
5-10	389	28.9
10-20	225	16.7
>20	36	2.7

In northern parts of River Ganga comprising Malda, Uttar & Dakshin Dinajpur, Darjeeling, Kochbehar, Jalpaiguri districts, depth to water ranges mainly between 2-5 and 5-10 m bgl, though at few locations in 'Barind' tract, depth to water level is deeper (10-20 m, >20m) which is attributed to geomorphological condition in the area.

In the southern part of the state, the depth to water level ranges mainly between 2-5 and 5-10 m bgl. A deeper water level of the order of 10-20 m bgl is recorded in all south Bengal districts with significant numbers in older alluvium covering areas of East Medinipur, Bardhaman, Birbhum, West

Medinipur, Murshidabad and Hugli districts. Deepest water level has been recorded at Bhagwanpur Spz, Bhagwanpur I (35.24 m bgl) in Purba Medinipur District.

The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is given in **Table - 6**. Depth to water level map is given in **Plate-VI**.

8.0 FLUCTUATIONS SCENARIO IN WEST BENGAL DURING THE GROUND WATER YEAR 2020 – 2021

The fluctuation in comparison to the same month in the previous year gives an idea about the change in the ground water level for a particular period with respect to that of the level during the same month in the previous year. This gives an idea about the change in the amount of draft and rainfall between the two years. The annual fluctuation in water levels for the periods (1) April 2019 and April 2020, (2) August 2019 and August 2020, (3) November 2019 and November 2020 and (4) January 2020 and January 2021 have been analysed to study the net status of ground water conditions during the previous and current year.

The water level fluctuation during the pre-monsoon period in comparison to previous year gives an idea about the seasonal fluctuation, which ultimately reflects the change in dynamic ground water resources. An attempt has been made to compare the pre-monsoon water levels of April, 2020 with water levels of August 2020 and November 2020 and January 2021 to delineate the impact of rainfall as well as ground water development on ground water regime in the state during the above period. The water levels of last 10 years mean (decadal) of the four measurements has been compared with the corresponding months of current measurements to evaluate the decadal fluctuation scenario and the behaviour of the ground water level on long-term basis of the state. For this, the mean water levels of April, August, November and January have been computed for all the available Ground Water Monitoring Wells for the last 10 years and compared with the water levels of the same month of the current measurement.

WATER LEVEL FLUCTUATION BETWEEN APRIL 2019 AND APRIL 2020

Annual fluctuation in water level between April, 2019 and April, 2020 is mostly restricted within the range of 0-2 m. Out of 1074 analyzed wells, 155 wells are grouped under falling zone category and 919 wells are grouped under rising zone category. Of these, overall 54% of wells falls under 0-2 m category, which indicates that regional fluctuation of the state, is mainly restricted within 2 m. 2-4 m fall in water level is observed in 23 wells and >4 m fall in water level is observed in 15 wells. Which is mainly due to measurement done after lockdown because of pandemic was over. District-wise status of distribution of network hydrograph stations in different ranges of water level fluctuation is

presented in **Table-7**. Annual fluctuation in water level between April, 2019 and April, 2020 map is presented in **Plate – VII**

WATER LEVEL FLUCTUATION BETWEEN APRIL 2020 AND AUGUST 2020

Seasonal fluctuation in water level between April, 2020 and August, 2020 is dominated by rising pattern. Out of 1079 analyzed wells, 221 wells show falling trend and 858 wells are grouped under rising trend. Normal rainfall in present year resulted into rise in water level in all category dominated by 0 - 2 m (57.2 %) rising category, followed by 2 - 4 m (16.5 %) and > 4m (5.8%) rising category. Fall is mostly restricted within 0 - 2 m category (18.3 %) represented by 197 wells. Higher quantum of fall(>4m) is observed in 10 (0.9%) wells. Confined aquifers of Haora, East Medinipur, and S 24 Parganas rest areas shows a rise in water level of the order of 0-2 m. District-wise status of distribution of network hydrograph stations with different ranges of depth to water level is presented in **Table-8** map is presented in **Plate - VIII**.

WATER LEVEL FLUCTUATION BETWEEN APRIL 2020 AND NOVEMBER 2020

The seasonal fluctuation in water level between April 2020 and November 2020 indicates the change in water level from pre-monsoon measurement to post-monsoon measurement. The district-wise statement of distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table-9**.

Seasonal fluctuation in water level between April, 2020 and November, 2020 is dominated by rising pattern. Out of 1106 analyzed wells, 506 wells show falling trend and 565 wells are grouped under rising trend. There is an overall rise as well as fall in water level through out the state. Rise in water level is dominated by 0 - 2 m (37.1 %) rising category, followed by 2 - 4 m (9.6%) and > 4m (4.4%) rising category. Fall is mostly restricted within 0 - 2 m category (38.9%) represented by 430 wells. Higher quantum of fall is observed in 22 (2 %) wells. Confined aquifers of Haora, S 24 Parganas also shows a rise in water level in the order of 0-2 m, 2-4m and in East Medinipur district shows rise in water level in the order of >4 m. A small patch of fall is recoded in S 24 Parganas district. Annual fluctuation in water level between April, 2020 and November, 2020 map is presented in **Plate – IX**

WATER LEVEL FLUCTUATION BETWEEN APRIL 2020 AND JANUARY 2021

The fluctuation in water level between April 2020 and January 2021 indicates the change in water level from pre-monsoon measurement to recession period of water level. Fluctuation in water level between April, 2020 and January, 2021 is mostly dominated by rise in water level. Out of 1099

analyzed wells, 789 wells are grouped under falling zone category and 310 wells are grouped under rising zone category. However fluctuation is mostly restricted within 2 m (68%). Significant fall 2-4 m and > 4 m has been observed in almost all districts . The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-10** and fluctuation in water level between April 2020 and January 2021 map is presented in **Plate – X**

WATER LEVEL FLUCTUATION BETWEEN AUGUST 2019 AND AUGUST 2020

The fluctuation in water level between August 2019 and August 2020 indicates net status of ground water conditions during the previous and current year monsoon period. Annual fluctuation in water level between August, 2019 and August, 2020 is mostly restricted within the range of 0-2 m. Out of 1137 analyzed wells, 204 wells are grouped under falling zone category and 933 wells are grouped under rising zone category. Of these, 13.6% wells falls under 0-2m falling category, and 47.3% wells falls under 0-2m rising category which indicates that regional fluctuation of the state is mainly restricted within 2 m rising category. 2-4 m rise in water level is observed in 271(23.8%) wells. More than 4m fall has been observed in sporadic patches in different districts.

The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-11**. Annual fluctuation in water level between August, 2019 and August, 2020 map is presented in **Plate – XI**

WATER LEVEL FLUCTUATION BETWEEN NOVEMBER 2019 AND NOVEMBER 2020

The Annual fluctuation in water level between November 2019 and November 2020 indicates the net status of ground water conditions during the previous and current post-monsoon year and the same is presented in **Plate-XII**. Fluctuation in water level have been analysed for 1190 wells. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-12**.

Annual fluctuation in water level between November, 2019 and November, 2020 is mostly restricted within the range of 0-2 m. Out of 1190 analyzed wells, 497 wells are grouped under falling zone category and 693 wells are grouped under rising zone category. 0-2m fall is observed in 286 wells (23.6%), 2-4 m fall in water level is observed in 33.6% wells and >4 m fall in water level is observed in 4.8%wells. 0-2m rise is observed in 570 wells (47.9%), 2-4 m rise in water level is observed in 77 wells and >4 m rise in water level is observed in 46 wells.

WATER LEVEL FLUCTUATION BETWEEN JANUARY 2020 AND JANUARY 2021

The annual fluctuation in water level between January 2020 and January 2021 indicates the net status of ground water condition during the previous and current measurement during recession period. Annual fluctuation in water level between January, 2020 and January, 2021 is mostly restricted within the range of 0-2 m. Out of 1209 analyzed wells, 478 wells are grouped under 0-2 m falling zone category and 482 wells are grouped under 0-2 m rising zone category. This indicates that the regional fluctuation of the state is mainly restricted within 2 m (78 %). Significantly more than 4 m rise is observed in 46 wells and fall in 56 wells. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-13**

Annual fluctuation in water level between January, 2020 and January, 2021 map is presented in **Plate – XIII**

WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND APRIL 2020

The decadal fluctuation in water level by comparing the water level data for April Mean (2008-2019) with the depth to water level data of April 2020 indicates the long-term status of ground water condition during the previous and current measurement during Pre-monsoon period. In the State, out of 793 analyzed wells, 703 wells have shown rise where as 90 wells have shown fall. The rise and fall of water level is mostly restricted within 0-2 m (280 wells (35.3%) have shown rise where as 53 wells (6.7%) have shown fall. Of the remaining wells, 33.7% wells shows 2 – 4 m rise and 19.7% wells shows >4 m rise, 3.4% wells shows 2 – 4 m fall and 1.3% wells shows >4m fall. In general there is rise through out the State. Impact of super cyclone Amphan (May 2020) may also affected the water level behavior.

Abnormal rise or fall in water level is observed only in few localized cases. The central and southern part of the state shows mainly falls in water level.

Water level fluctuation has been analyzed statistically by comparing the decadal mean water level data (April, 2008 - April, 2019) with depth to water level data of April, 2020 has been plotted and the map is presented in **Plate-XIV**. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-14.

WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND AUGUST 2020

The decadal fluctuation in water level by comparing the water level data for August Mean (2008-2019) with the depth to water level data of August 2020 indicates the long-term status of ground water condition during the previous and current measurement during monsoon period.

Water level fluctuation has been analyzed by comparing the decadal mean water level data (August, 2008 – 2019) with depth to water level data of August, 2020. In the State, out of 878 analyzed wells, 661 wells have shown rise where as 217 wells have shown fall. The rise and fall of water level is mostly restricted within 0-2 m (64.2 % show rise and 17.3 % show fall). The entire state in general show the rising category due to normal to heavy rainfall.

Water level fluctuation has been analyzed statistically by comparing the decadal mean water level data (Aug, 2008 - Aug, 2019) with depth to water level data of August, 2020 and the map is presented in **Plate-XV**. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-15.

WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND NOVEMBER 2020

The decadal fluctuation in water level by comparing the water level data for Decadal Mean (2008-2019) with the depth to water level data of November 2020 indicates the long-term status of ground water condition during the previous and current measurement during post-monsoon period.

Water level fluctuation has been analyzed by comparing the decadal mean water level data (November, 2008 - November, 2019) with depth to water level data of November, 2020. In the State, out of 958 analyzed wells, 613 wells have shown rise where as 345 wells have shown fall. The rise and fall of water level is mostly restricted within 0-2 m (55.5 % show rise and 28.5 % show fall). Remaining wells, 6.3 % wells shows 2 - 4 m rise and 2.2% wells show >4 m rise, 4.6 % wells shows 2 – 4 m fall and 2.9 % wells shows >4m fall. It indicates the was a rising water level trend with respect to post monsoon period. The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in Table-16. Water level fluctuation map has been prepared comparing the decadal mean water level data (Nov, 2008 - Nov, 2019) with depth to water level data of November, 2020 and the map is presented in **Plate-XVI**.

WATER LEVEL FLUCTUATION BETWEEN DECADAL MEAN AND JANUARY 2021

Water level fluctuation has been analyzed by comparing the decadal mean water level data (January, 2011 - January, 2020) with depth to water level data of January, 2021. In the State, out of 970 analyzed wells, 563 have shown rise where as 407 wells have shown fall. The rise in of water level is mostly restricted within 0-2 m (50.6% wells) with 2-4 m rise in 5.1% wells and >4 m rise in 2.4% wells. In fall of water level scenario, 33.8% wells shows 0 – 2 m l and 5.7% wells shows 2-4 m , and 2.5% wells shows >4 m. This may also to be pointed out that the major fall in water level is mostly restricted in Southern and central part of the State.

The district-wise frequency distribution of GWMS falling in different ranges of water level fluctuation is given in **Table-17**. The decadal fluctuation in water level map by comparing the water level data for January Mean (2011-2020) with the depth to water level data of January 2021, is presented in **Plate-XVII**.

9.0 SCENARIO OF WATER LEVELS IN KOLKATA CITY DURING THE GROUND WATER YEAR 2020 – 2021

Kolkata city area is underlain by Quaternary sediments consisting of silt, clay, various grades of sand, gravel and occasional pebbles, deposited in deltaic environment by Ganga- Bhagirathi river system. Here ground water occurs under confined condition and the piezometric level is significantly deep, ranging between 0.55 & 20.75 mbgl during pre-monsoon (June-2020) period and between 1.32 & 19.55 mbgl during post-monsoon period in major part of the city. This is due to huge withdrawal of groundwater for domestic and industrial uses.

Hydrographs of KMC area are given in **Plate-XXII**. Depth-to-water level categorization of pre and post monsoon is presented in **Table-18**. Depth to water level is depicted in **Annexure II**

10.0 HYDROCHEMISTRY

GROUND WATER QUALITY SCENARIO IN WEST BENGAL (2020-21)

Geochemistry of ground water is mainly dependent upon several factors like, soil or rock through which rain water percolates, depositional history of the rock types, composition of the rock types, climate of the area, role of microorganisms, topography of the area and the role of human activities etc.

To establish the ground water chemistry of the state, samples from different corners of West Bengal have been collected during the month of April/May (2020-21), which is generally a dry period, leading to maximum concentration of elements in the water samples. Representative samples, thus collected, have been subjected to chemical analysis in the Regional Chemical Laboratory, CGWB, ER, Kolkata (**NABL Accredited, Certificate No. TC-8390**). Analytical result thus obtained has been studied critically and interpretation made accordingly (**Annexure-III**).

Table 19: Chemical qualities of ground water samples of West Bengal (2020-21) showing the maximum and minimum values vis-à-vis drinking water standards (IS 10500:2012)

Constituents	West Bengal		IS 10500:2012	
	Min	Max	Acceptable Limit	Permissible Limit
pH	7.02	9.21	6.5-8.5	No Relaxation
EC ($\mu\text{s}/\text{cm}$) 25°C	48	4782	-	-
Total Hardness (as CaCO_3)	15	1125	200	600
Calcium(as Ca)	2	224	75	200
Magnesium (as Mg)	1	220	30	100
Sodium	1	739	-	-
Potassium	0.1	217	-	-
Carbonate alkalinity (as CaCO_3)	Trace	120	-	-
Bicarbonate alkalinity (as CaCO_3)	12	744	-	-
Total alkalinity (as CaCO_3)	10	700	200	600
Chloride	2	1212	250	1000
Nitrate	Trace	353	45	No Relaxation
Sulphate	Trace	342	200	400
Fluoride	Trace	5.60	1	1.5
TDS	27.357	3061	500	2000
Iron	Trace	11.99	1	No Relaxation

NOTE — It is recommended that the Desirable/Acceptable limit is to be implemented. Values in excess of those mentioned under 'Desirable/Acceptable' render the water not suitable, but still may be tolerated in the absence of an alternative source but up to the limits indicated under 'Permissible Limit' in the absence of alternate source' in col 4, above which the sources will have to be rejected.

Hydrogen Ion Concentration (pH)

In West Bengal, the pH content of ground water varies from 7.02 (Rajnagar, Rajnagar Block, Birbhum District) to 9.20 (Lataguri, Mal Block, Jalpaiguri District), which indicates that ground water

is almost neutral to alkaline in nature. Few locations in Bankura, Darjeeling, Jalpaiguri, Coochbehar, North and South 24 Parganas have pH values exceeded the permissible limit of 8.5.

Table 20: Drinking Water Suitability and overview of the Physicochemical Constituents in West Bengal(2020-21)

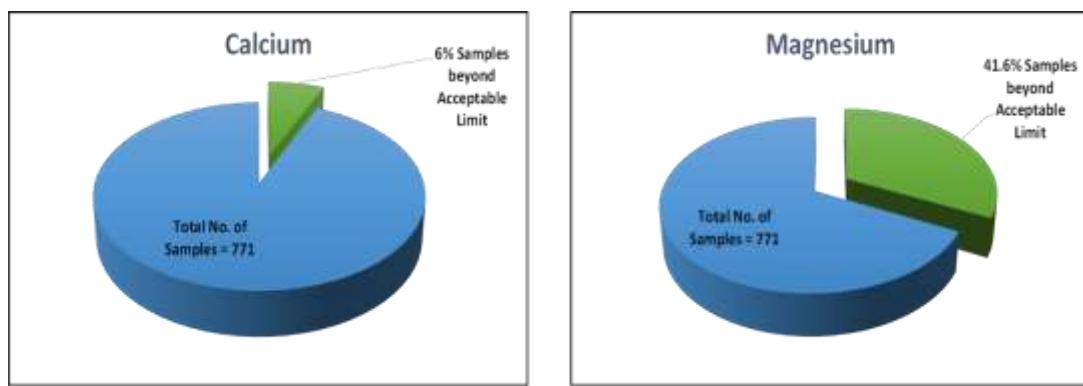

Constituents	Acceptable Limit	Permissible Limit	Total No. of Sample Analyzed	No. of Samples beyond Acceptable Limit	Samples beyond Acceptable Limit (%)	No. of Samples beyond Permissible Limit	Samples beyond Permissible Limit (%)
pH	6.5-8.5	No Relaxation	771	19	2.14	-	-
Total Hardness (as CaCO ₃)	200	600		408	46.00	22	2.48
Calcium (as Ca)	75	200		54	6.09	1	0.11
Magnesium (as Mg)	30	100		369	41.60	17	1.92
Total alkalinity as CaCO ₃	200	600		325	36.64	4	0.45
Chloride	250	1000		62	6.99	2	0.23
Nitrate	45	No Relaxation		60	6.76	-	-
Sulphate	200	400		4	0.45	0	0.00
Fluoride	1	2		68	7.67	28	3.16
TDS	500	2000		235	26.49	5	0.56
Iron	1	No Relaxation		201	22.66	-	-
NOTE — It is recommended that the Desirable/Acceptable limit is to be implemented. Values in excess of those mentioned under 'Desirable/Acceptable' render the water not suitable, but still may be tolerated in the absence of an alternative source but up to the limits indicated under 'Permissible Limit' in the absence of alternate source' in col 4, above which the sources will have to be rejected.							

Distribution of Major Cations

Calcium, Magnesium

The alkaline earth metals are two important Cations in ground water which have been analyzed. Calcium and Magnesium concentration in ground water varies from 2 to 224 mg/L and 1 to 220.2 mg/L respectively. 6% and 41.6% samples exceeded the Acceptable limit for Calcium and Magnesium respectfully. The maximum concentration for Calcium was detected in Halisahar,

Barrackpur I Block of North 24 Parganas district and in Polash Khola of Kashipur Block of Purulia District maximum concentration for Magnesium was detected.

Distribution of Calcium and Magnesium in the Ground Water of West Bengal (2020-21) Sodium, Potassium

The concentration of Na ranges from 1.17 mg/L at Jateswar, Falakat Block of Jalpaiguri District to 738.5 mg/L at Hatuganj, Kulpi I block of South 24 Parganas District and of K ranged from 0.1 to 216 mg/L. (Sonamukhi, Sonamukhi block, Bankura District

Distribution of Major Anions

Chloride, Bi-carbonate and Carbonate are the major anions present in ground water of West Bengal.

Chloride

Chloride content of ground water in West Bengal varies from 1.6 to 1212.39 mg/L at Hatuganj, Kulpi I block of South 24 Parganas. Ground water with very low chloride and sodium contents points towards remarkably fresh nature which is almost comparable with rain water. Ground water which is being replenished every year directly from rain water is not enriched with high chloride content.

As per BIS (2012), the Acceptable and Permissible Limits of Chloride in drinking water are 250 mg/L and 1,000 mg/L respectively. Presence of high concentration of Chloride affects taste and may make water corrosive. Higher concentration of Chloride may be injurious to people suffering from heart or kidneys. In West Bengal, out of 771 samples, 62 locations (6.98%) were found to have Chloride content more than Desirable limit and 2 locations were exceeding the Permissible limit.

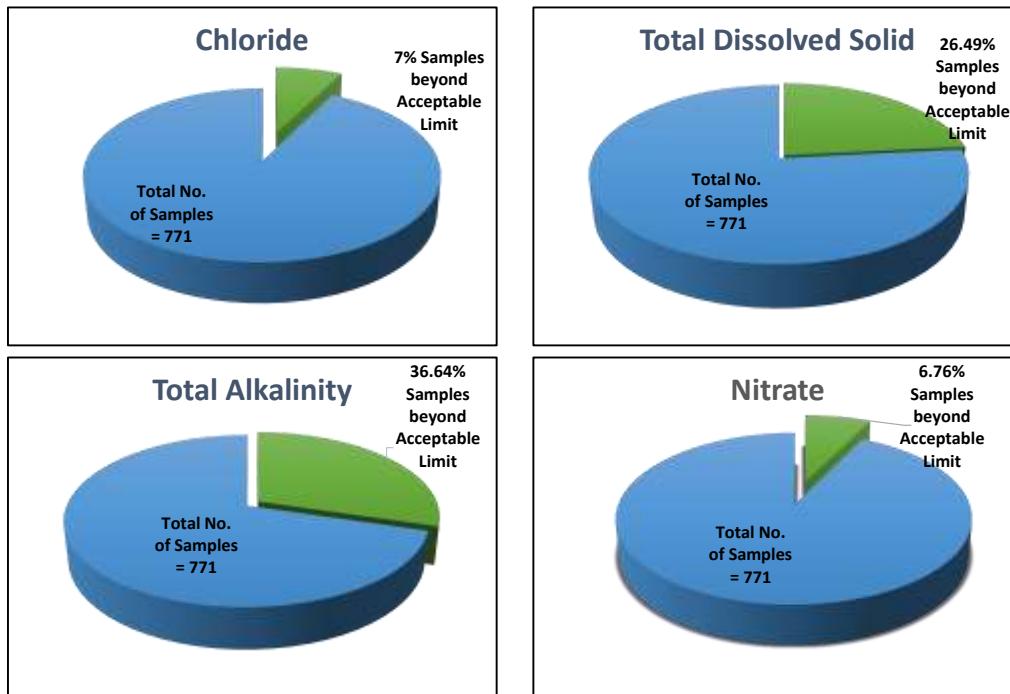

The districts containing chloride concentration more than Desirable limit reside mostly in the Southern part of the State and in coastal belt.

Bi-carbonate

Bicarbonate concentrations of ground water increase towards the valley possibly due to absorption of carbon dioxide from atmosphere. The direction of enrichment of bicarbonate ions coincides, by and large, with the direction of ground water flow. The value of Bi-carbonate alkalinity

in West Bengal ranges from 12.2 to 744.2 mg/L (Rajapur-Uttarpara, Hasnabad Block of North 24 Parganas District).

In ground water of West Bengal, concentration of bicarbonate ions higher than 500 mg/L has been noticed around North and South 24 Parganas, Purulia, Bankura, Murshidabad, Howrah, Hooghly, Kolkata, Barddhaman and Midnapur Districts. Such enrichment may probably be attributed to the dissolution of carbon dioxide from the soil air and interaction with soil minerals, accentuated by microbial action, Base Exchange and other associated interactions.

Distribution of Chloride, TDS, Total Alkalinity and Nitrate in the Ground Water of West Bengal (2020-21)

Nitrate

As per BIS (2012), the Permissible Limit of Nitrate in drinking water is 45 mg/L. In West Bengal, Nitrate content ranged between Trace to as high as 352.99 mg/L. The maximum concentration was found in Kenjakura, Bankura – I block of Bankura District. Out of 771 Nos. of analyzed samples, 60 samples (6.76%) of samples were found to have Nitrate concentration more than permissible limit (**Plate XVIII**). Maximum affected districts due to Nitrate hazards were found in Purulia, Bankura, Jalpaiguri and Coochbehar.

There are several negative health effects of nitrates in drinking water. High levels of nitrate can pose a risk to babies less than six months who are formula fed and the unborn foetus of pregnant women. Adults with specific rare metabolic disorders may also be at risk. Soil nitrogen and animal waste were the sources of nitrate in

groundwater under shrubland and grassland. Seepage of sewage wastes and nitrogen fertilizer are the major sources of nitrate contamination in groundwater.

Electrical Conductivity

The wide range of Electrical Conductivity as well as TDS values indicates wide variation in dissolved constituents in groundwater of West Bengal. The minimum conductivity value of $48 \mu\text{S cm}^{-1}$ at 25°C has been observed at Karbola, Dhupguri block of Jalpaiguri District whereas maximum conductivity value of $4782 \mu\text{S cm}^{-1}$ at 25°C has been observed at Hatuganj, Kulpi I block of South 24 Parganas District.

As per the salinity hazard classes twenty one (21) of the analyzed sample were found unsuitable (i.e. $\text{EC} > 2250 \mu\text{S cm}^{-1}$). 26.49% of the analyzed sample (Total 235 locations) showed TDS values ranged higher than Desirable Limit of 500 mg/L for drinking purpose (BIS: 2012).

High concentration of TDS can cause water to become corrosive, salty or develop a brackish taste. In a **study conducted by the World Health Organization (WHO)**, the palatability (acceptable taste) of drinking water has been rated by panels of tasters in relation to its TDS level as follows:

Table21: Palatability (acceptable taste) of drinking water in relation to its TDS level –

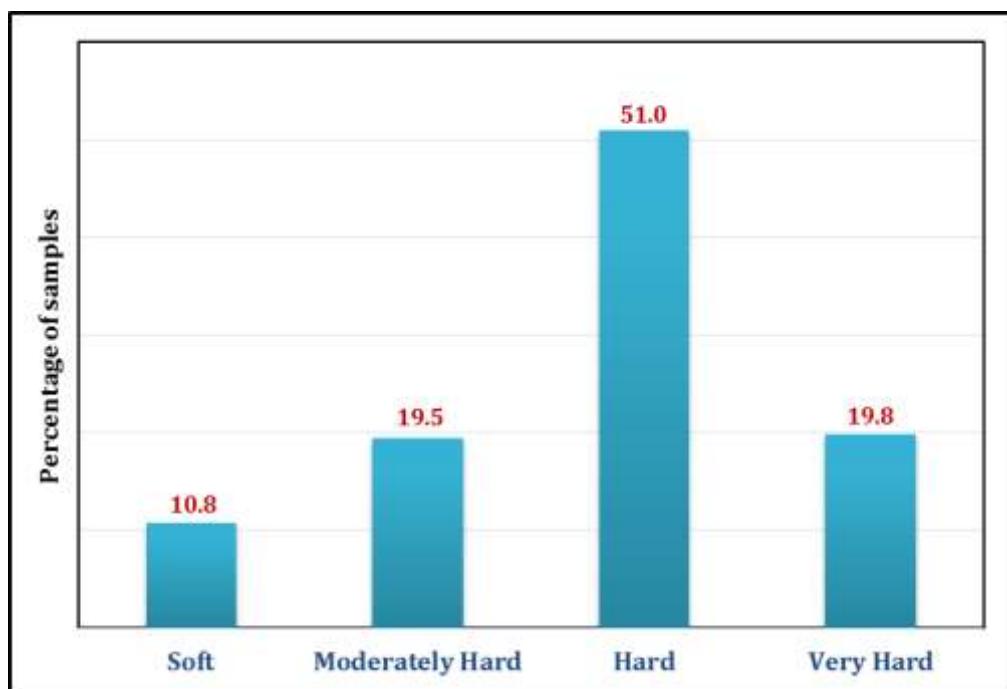

TDS Level (mg/L)	Rating
Less than 300	Excellent
300-600	Good
600-900	Fair
900-1200	Poor
Above 1200	Unacceptable

In ground water of West Bengal, concentration of TDS higher than the Desirable Limit has been noticed around North and South 24 Parganas, Purulia, Bankura, Murshidabad, Howrah, Hooghly, Kolkata, Bardhaman, Nadia and Midnapur Districts.

Hardness of Ground Water

Calcium and Magnesium, Carbonate and Bicarbonate are the important constituents that give a measure to hardness of ground water. The hardness (temporary hardness) as CaCO_3 in the ground water of West Bengal ranges from 15 to 1125 mg/L. The permanent hardness (non carbonate hardness) which is caused by those amounts of Calcium and Magnesium that normally combines with sulphate and chloride ions.

The quality of groundwater in terms of Total Hardness as CaCO_3 has been found as hard to very hard (51 % of total analyzed samples found as Hard and 19.8% of total analyzed samples found as Very Hard). The detail Distribution is as follows –

Suitability of groundwater of West Bengal based on Hardness (2020-21)

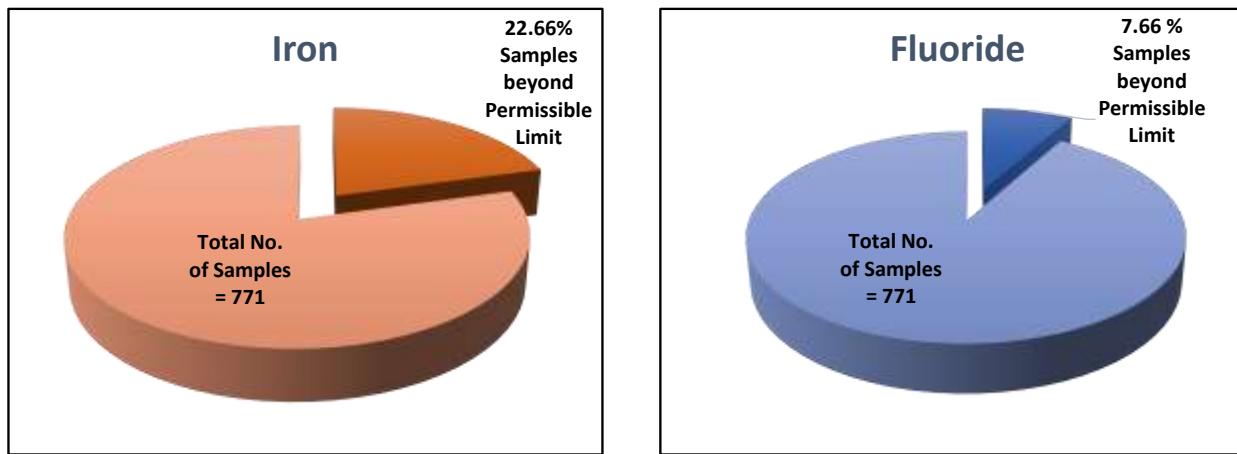

As per BIS (2012), the Permissible limit of Hardness in drinking water is 600 mg/l. Out of 771 Nos. of analyzed samples 408 Nos of samples (46%) were found to have Hardness more than the Acceptable Limit and 22 Locations (2.48%) were found to exceed the Permissible Limit.

Table 22: Hardness Classification of groundwater of West Bengal (2020-21)

Water Class	TH as CaCO_3 in mg /L	No. of Samples
Soft	<75	83
Moderately Hard	75–150	150
Hard	150–300	393
Very Hard	>300	153

Iron

As per BIS (2012), the Permissible Limit of Iron in drinking water is 1.0 mg/L. In West Bengal, Iron content ranged between Trace to as high as 11.99 mg/L. The maximum Concentration was found in Gopiballavpur, Gopiballavpur I block of Paschim Medinipur District. Out of 771 Nos. of analyzed samples, 22.66% of samples were found to have Fe concentration more than permissible limit (**Plate XX**).

Distribution of Iron and Fluoride in the Ground Water of West Bengal (2020-21)

Fluoride

BIS has recommended an upper desirable limit of 1.0 mg/L of F as desirable concentration of fluoride in drinking water, which can be extended to 1.5 mg/L of F in case no alternative source of water is available.

Water having fluoride concentration of more than 1.5 mg/L are not suitable for drinking purposes. Fluoride content in the analyzed samples of Ground Water of West Bengal was found to be ranged from Trace to 5.61 mg/L. In the districts of Uttar Dinajpur, Nadia, Birbhum, Bankura, Birbhum, Barddaman Fluoride concentration were found to have more than permissible limit.

Conclusion

The reflections from the overall survey carried out in West Bengal revealed that the water quality of West Bengal is questionable particularly in respect to Iron Concentration. Almost all of the districts depicted higher concentration of Iron exceeding the permissible limit of 1.0 mg/L with alarmingly high concentrations of Iron. Along with Iron, the districts of Uttar Dinajpur, Nadia, Birbhum, Bankura, Birbhum, Barddaman concentration were found to have Fluoride Concentration more than Permissible limit. Nitrate contamination was also spotted in some districts like Purulia, Bankura, Jalpaiguri and Cooch Behar with maximum concentration of 352.99 mg/L in Kenjakra, Bankura District.

In ground water of West Bengal, concentration of TDS higher than the Desirable Limit (26.49% of the samples) has been noticed around North and South 24 Parganas, Purulia, Bankura, Murshidabad, Howrah, Hooghly, Kolkata, Bardhaman, Nadia and Midnapur Districts. In the Southern part of the State and in coastal belt, in some patches, the Chloride concentration was also found beyond the Desirable Limit as per BIS (2012).

Section B

GROUND WATER YEAR BOOK OF ANDAMAN AND NICOBAR ISLANDS

2019 - 2020

1.0 INTRODUCTION

Groundwater monitoring data form an important input for judicial ground water management & development. Yearly two water level measurements during pre- & post- monsoon period in the month of April and November respectively are taken in Andaman & Nicobar Islands. Since Andaman & Nicobar Islands experienced heavy rainfall during the month of November, post monsoon water level is generally taken during the month of December. Till March, 2011 a total of 64 operational network hydrograph stations were monitored in Andaman Group of Islands. During 2012, additional 29 nos. network hydrograph stations have been established. At present, 113 operational network hydrograph stations are monitored in Andaman district (**PLATE-B I**) in various hydrogeological units and agro-climatic zones two times a year, viz. May and November. In Nicobar district, no network hydrograph stations have been established till date. During April-May, 2019 and November, 2019 depth to water level data were collected from 113 ground water monitoring wells.

2.0 GENERAL FEATURES

The Andaman and Nicobar Islands (A & N Islands) is one of the Union Territories of India and are situated as a dissected chain in an arcuate fashion oriented N-S in the Bay of Bengal off the Eastern Coast of India. These Islands are extended between 6° to 14° N and 92° to 94° E in between Myanmar and Sumatra (Indonesia) over a distance of 780 km. This Union Territory is divided into two districts, i.e. Andaman and Nicobar. The northern group of Islands forms the Andaman district, is further sub-divided into three parts namely, North Andaman, Middle Andaman and South Andaman. The southern group of islands is separated from the northern group by about 140 km deep sea, the 10° channel, forms the Nicobar district.

3.0 TOPOGRAPHY

The islands forming Great Andaman consist of a mass of hills enclosing very narrow valleys, the whole covered by dense tropical jungle. The hills rise, to a considerable elevation, the heights peak being in the North Andaman, Saddle Peak (732m); in the Middle Andaman, Mount Diavolo behind Cuthbert Bay (511m); in the South Andaman, Koib (459m), Mount Harriet (364m) and the Cholunga range (324m); and in Rutland Island, Ford's Peak (433m). Little Andaman is practically flat. As such there are no rivers, however few perennial streams are present in the islands. Barring a few small Islands in the Nicobar group, all the others have undulating terrain with main ridges running North-South. There are also spurs running East - West in between the main ridges. The submerged valleys form deep inlets and creeks. Flatlands are few and perennial streams

non-existent in most of the Islands except in Great Nicobar where there are 5 perennial rivers. Coral reefs surround most of the islands.

4.0 PHYSIOGRAPHY

These Islands are in general characterized by undulating and rugged topography. Physiographically these Islands can be subdivided into three main parts

I)	Moderate to steep hill ranges
II)	Intermountain narrow valley
III)	Coastal tracts including swamps

The huge ranges generally covered by dense forest.

5.0 HARBOURS

Coasts are deeply indented, giving existence to a number of safe harbours, which are often surrounded by mangrove swamps.

6.0 DRAINAGE

Perennial streams of the status of river is absent in A & N Islands except in Kalpong in the North Andaman. In Great Nicobar, the important perennial streams are Galathea, Jubilee, Dark Anaing, Dark Tayal, AmritKaur.

7.0 SOILS

Soils of Andaman and Nicobar Islands have been classified into 3 orders, i.e. Entisols, Inceptisols and Alfisols. The main agricultural soils are found in the valleys and have alluvial and colluvial origin. The coastal areas prone to tidal floods may have acid sulphate soils. On the whole, soils of these Islands are nutritionally poor and their organic matter content is on decline.

8.0 CLIMATE

The climate of Andaman and Nicobar Islands is described as humid Tropical Climate. The Islands are situated in the Hot or Torrid Zone. Nearly 86 percent of total area in these Islands is covered by forest. There are only two seasons viz. Rainy Season and Summer Season and virtually there is no Winter Season. Islands are visited by

South -West and North - East monsoons during the period from May to December. Average annual rainfall in these Islands is 3000 mm. The period from January to May is Summer Season. The mean relative humidity is 79% to 82%. The mean maximum temperature is 30.2°C and mean minimum temperature is 23.8°C.

9.0 GEOLOGY

The Islands are composed mainly of thick Eocene sediments consist of Pre-Tertiary sandstone, siltstone and shale with intrusions of basic and ultra-basic igneous rocks. In the geologically Younger Richie's archipelago, calcareous sand stones are more common.

10.0 HYDROGEOLOGY

The Andaman & Nicobar group of Islands are underlain by Late Cretaceous igneous rocks - the 'Ophiolite Suite', marine sedimentary group of Palaeocene to Oligocene age and Recent to Sub-Recent beach sand, mangrove clay, alluvium and coralline formations. The Ophiolite suite comprises a wide variety of acidic to ultra-basic plutonic rocks and their serpentised equivalents and essentially basic volcanic rocks occur in South, Middle & North Andaman, in sporadic patches of Little Andaman, Kamorta and Bampooora Islands in Nicobar group. The marine sedimentaries comprise greywakes, graded sandstones, siltstones, black shales and volcanogenic sediments. These fine-grained deep-sea deposits are generally having predominantly clayey particles. The coralline formations are observable in coral islands (atolls) and they also occur in the fringe areas of the sedimentary and igneous formations and form the narrow beaches encircling the islands. The ophiolite and marine sedimentaries have undergone different phases of folding, faulting and upliftment; which is responsible for the development of fractures and fissures, as a result infiltrated rainwater percolates downwards.

Marine sedimentary rocks are located to an anomalous admixture of sand and clay where clayey residue are predominating since clayey product is poor water yielder, these sedimentary rocks, in majority of the cases, do not form potential aquifer system both in shallow and deeper horizons. Bore wells are not feasible in these formations and the yield of dugwells with a diameter of 4.5 to 5m and 6m depth tapping the weathered mantle varies from 3000 to 5000 lpd. Depth to water level in these formations varies from 0.2 to 4.4 mbgl. All the borehole drilled in these formations were unsuccessful except one borehole at Prothrapore, which is yielding brackish water (5500 EC) having discharge 17000 lph.

The igneous rocks also do not form potential aquifers, however in comparison to the sedimentaries they yield moderately. These rocks form aquifer both in weathered mantle and fractured basement rocks which are

generally developed through dug well, ponds and private bore wells. Out of six successful bore wells drilled by CGWB, 5 nos. were constructed in igneous rock. The success may be due to partial clogging of fractures with clayey residue where it is fully sealing the fracture conduits in sedimentaries. The well at Calicut, constructed by CGWB, is now the only supplying well of APWD, A & N Administration. The fracture conduit is conjectured upto 45m depth. The discharge of Calicut well is 45000 lph.

The coralline limestone formations also form potential aquifer. They are distributed at shallow horizon and are developed through dug wells in many islands like Car Nicobar, Katchal, Neil, Havelock etc. Yield of these dugwells (commonly of 5m dia, 6m depth) varies from 15000 to 1 lakh lpd.

Recent studies of CGWB have revealed that the valley-fill alluvial deposits consisting of boulders, pebbles, cobbles, and sand, carry lot of water and saturate the near surface aquifer throughout the year. Hence, such valley-fill deposits form potential aquifers in A & N Islands. CGWB constructed exploratory well at Beadnabad on valley-fill deposit, down to the depth of 17m, yielded 72000 lph water. This also indicated that Artificial Recharge and Conservation program might be successful in those areas. Pilot scale implementations of such structures by CGWB proved it highly successful.

11.0 SCENARIO OF DEPTH TO WATER LEVELS IN ANDAMAN DURING GROUND WATER YEAR 2019 – 2020

11.1 May, 2019

The Depth to water level generally varies, between 0-2m, 2-5m and 5-10m below ground level. Majority of the wells show water level between 0-2 m(76.6%). The minimum water level at 0.07mbgl was recorded at South Andaman and maximum 7.30mbgl at Neil Islands. Depth to water levels mostly in the range of 0-2 mbgl (76.6%) followed by 2-5mbgl (17.1%) and 5-10 mbgl (5.4%). The distribution of network hydrograph stations in different ranges of depth to water level is presented in Table - B1.

11.2 November, 2019

The Depth to water level generally varies between 0-2m, 2-5m and 5-10m below ground level. Out of 113 wells measured, water level in 66 wells varies in the range of 0-2 mbgl , 39 wells in the range of 2-5 m bgl, 4 wells in the range of 5-10 and 1 well in the range 10-20. The minimum water level was at 0.36 bgl and recorded at South Andaman and maximum water level i.e. 10.04mbgl at South Andaman. Depth to water levels mostly in the range of 0-2 m bgl (57.8%) followed by 2-5 m bgl (37.9%) and 5-10 mbgl (1.0%) .The distribution of network

hydrograph stations in different ranges of depth to water level is presented in Table - B2. Depth to water level data of various network stations for the period May, 2019 and November, 2019 is given in Annexure- B I.

12.0 FLUCTUATION IN WATER LEVEL IN ANDAMAN DURING GROUND WATER YEAR 2019 – 2020

The pre-monsoon water levels of April, 2019 have been compared with post-monsoon water levels of November 2019 to delineate the impact of rainfall as well as ground water development on ground water regime in the state during the above period. Fluctuations in water levels for the periods of April 2018 and April 2019, and November 2018 and November 2019 have also been analyzed.

12.1 WATER LEVEL FLUCTUATION BETWEEN APRIL 2018 AND APRIL 2019

The fluctuation in water level between April 2018 and April 2019 indicates the net status of ground water conditions during the previous and current summer periods. Distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table – B3**. The total analysed (1110nos.) data shows that scenario is dominated by fall in water level in the range of 0-2 m (50.0%) and 2-4 m (4.5%). The rise is observed in 43 wells in the range of 0-2 m (39.1%).

12.2 WATER LEVEL FLUCTUATION BETWEEN APRIL 2019 AND NOVEMBER 2019

The seasonal fluctuation in water level for April 2019 compared with November 2019 has been done and distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table – B4**. The fluctuation data of November 2019 in comparison with April 2019 shows fall in water level in 89 wells and fall in 21 wells. However, in all cases the rise or fall in water level is restricted within 0-4m.

12.3 WATER LEVEL FLUCTUATION BETWEEN NOVEMBER 2018 AND NOVEMBER 2019

The fluctuation in water level between November 2018 and November 2019 indicates the net status of ground water conditions during the previous and current post-monsoon periods. Distribution of network hydrograph stations in different ranges of water level fluctuation is presented in **Table - B5**. The fluctuation data of November 2018 in comparison with November 2019 shows fall in water level in 94 wells and a rise in only 7 wells. However, in all cases the rise or fall in water level is restricted within 0-4m.

12.4 GROUND WATER LEVEL TREND

The water level trend has been analysed for all measurements, which indicates the net status of ground water conditions during 2009 – 2019 and is presented in **Table - B6**. Out of 113analysed well, 67 wells show rising trend of water level in the tune of 0.001 to 0.60 m/yr. Rest 45 wells show falling trend of water level in the tune of 0.001 to 0.34 m/yr.

13.0 HYDROCHEMISTRY

13.1 GROUNDWATER QUALITY SCENARIO in Andaman & Nicobar Islands (2019-20)

To study the geochemical characteristics of groundwater and to carry outpotability analysis for detecting water contamination by harmful chemicals or pathogens in order to take preventive measures for providing the safe drinking water among population; 95 no. representative samples from different locations of entire Andaman & Nicobar Islands have been collected during the month of May 2019, *i.e.* the pre-monsoon season. Analytical result thus obtained on analysis has been studied critically and interpretation made accordingly (**Annexure-B II & B III**)

Chemical qualities of groundwater samples of Andaman & Nicobar Islands (2019-20) showing the maximum and minimum values vis-à-vis drinking water standards (IS 10500:2012)

Constituents	A&N Islands			IS 10500:2012	
	Min	Max	Average	Acceptable Limit	Permissible Limit
pH	6.29	8.07	7.51 ± 0.23	6.5-8.5	6.5-8.5

Sodium		5	923	70 ± 99	-	-
Potassium		0.1	30.6	3.6 ± 4.3	-	-
Iron		Traces	1.71	0.09 ± 0.25	0.3	0.3

Drinking Water Suitability as per the Physicochemical Constituents of Andaman & Nicobar Islands (2019-20)

Constituents	Acceptable Limit	Permissible Limit	No of Samples beyond Acceptable Limit	Percent of Samples beyond Acceptable Limit (%)	No of Samples beyond Permissible Limit	Percent of Samples beyond Permissible Limit (%)
pH	mg/L (ppm)	6.5-8.5	No Relaxation	01	1	01
TDS		500	2000	21	22	01
Total alkalinity as CaCO_3		200	600	52	55	01
Chloride		250	1000	02	2	01
Sulphate		200	400	06	6	02
Nitrate		45	No Relaxation	-	-	-
Fluoride		1	1.5	-	-	-
Total Hardness (as CaCO_3)		200	600	55	58	02
Calcium (as Ca)		75	200	10	11	-
Magnesium (as Mg)		30	100	40	42	02
Iron		1	No Relaxation	02	2	02

Hydrogen Ion Concentration (pH)

The groundwater pH of the samples collected from Andaman and Nicobar Islands during AAP 2019 – 20 shows neutral to mildly alkaline in nature with pH value ranged from 6.29 (Mohanpur, North and Middle Andaman) to 8.07 (Kishorinagar, North and Middle Andaman) with an average value of 7.51 ± 0.23 . pH values beyond the permissible limit of 6.5 - 8.5 were found only from one location.

Electrical Conductivity (EC) and Total Dissolved Solids (TDS)

The wide range of EC as well as TDS values indicates wide variation in dissolved constituents in groundwater of Andaman & Nicobar Islands. The minimum conductivity value of $84 \mu\text{S cm}^{-1}$ has been observed at Wrightmayo, South Andaman whereas maximum conductivity value $5507 \mu\text{S cm}^{-1}$ has been observed at Ograbraj, South Andaman district. As per the salinity hazard classes only one analysed sample was found unsuitable (i.e. $\text{EC} > 2250 \mu\text{S cm}^{-1}$). Only 22% of the analysed sample showed TDS values ranged higher than

Acceptable Limit of 500 mg/L and only one sample having TDS higher than the permissible limit of 2000 mg/L for drinking purpose (BIS: 2012). Samples having TDS value higher than the Acceptable limit are mostly (76%) from South Andaman District only 24% samples are from North and Middle Andaman District.

Major Cations

Calcium, Magnesium

Two alkaline earth metals Calcium and Magnesium have been analysed. Concentration of Ca^{2+} in groundwater varied from 8 to 132 mg/L (Kalapathar of SwarajDweep) and that of Mg^{2+} varied from 05 to 137 mg/L (Pahalgaoon of North and Middle Andaman).

Sodium, Potassium

The concentration of Na^+ ranges from 5 mg/L at Sitanagar, North and Middle Andaman District to 923 mg/L at Ograbraj, South Andaman district and of K^+ ranged from 0.1 mg/L at Kodiaghhat of South Andaman District to 30.60 mg/L at Ograbraj, South Andaman district.

Hardness of Groundwater

Calcium and Magnesium, Carbonate and Bicarbonate are the important constituents that give a measure to hardness of groundwater. Total hardness as CaCO_3 in the groundwater of A&N Islands ranges from 50 to 795 mg/L (Ograbraj, South Andaman district).

The quality of groundwater in terms of Total Hardness as CaCO_3 has been found as hard (58% of Total analysed samples) to very hard (51% of total analyzed samples). The detail distribution is represented in tabular form below:

Hardness Classification of groundwater of A&N Islands (2019 - 20)

Water Class	TH as CaCO_3 in mg/L	No. of Samples	% of Samples
Soft	<75	01	01
Moderately Hard	75–150	20	21
Hard	150–300	55	58
Very Hard	>300	19	20

As per BIS (2012), the permissible limit of Hardness in drinking water is 600 mg/l. Only two samples were found to have Total Hardness more than the Permissible Limit.

Iron

In A&N Islands, groundwater Iron content ranged between Traces to 1.71 mg/L detected from Kishorinagar, North and Middle Andaman District. Only 02% of analyzed samples were found to have Fe concentration more than permissible limit of 1.0 mg/L as per BIS (2012).

Major Anions

Chloride

Chloride content of groundwater in A&N Islands varies from 11 (Porlobjig, North and Middle Andaman) to 1397 mg/L (Ograbraj, South Andaman district). The concentration of Chloride ions in majority of the groundwater samples (98%) has been found to be within the Acceptable limit for drinking purpose (250 mg/L, BIS: 2012). Groundwater with low chloride and sodium contents signifies fresh nature which is in-turn characteristics of being replenished directly from rain water every year.

Carbonate & Bi carbonate

Carbonate has not been detected from groundwater of A&N Islands and Bicarbonate concentration ranged from 49 to 604 mg/L. The maximum concentration of HCO_3^- was found at Long Island of North and Middle Andaman district. Almost 55% of the analysed sample showed Total alkalinity value higher than Acceptable Limit of 200 mg/L and only one sample having value higher than the permissible limit of 600 mg/L for drinking purpose (BIS: 2012).

Sulphate, Nitrate & Fluoride:

Nitrate concentration of the analysed samples ranged from traces to 29 mg/L. No sample showed NO_3^- concentration higher than the permissible limit of 45 mg/L (BIS: 2012).

Concentration of Sulphate ion ranged from traces to 926 mg/L at Ograbraj, South Andaman district. Only 6% of the analysed samples showed higher sulphate concentration than the Acceptable limit of 200 mg/L (BIS: 2012).

Fluoride ion concentration varied from Traces to 0.72 mg/L, detected from Long Island of North and Middle Andaman district with a mean of 0.28 ± 0.21 mg/L. None of the analysed sample showed higher Fluoride concentration than the permissible limit of 1.5 mg/L (BIS: 2012).

Drinking Water Suitability as per the Heavy Metal Contamination of Andaman & Nicobar Islands (2019-20)

Constituents	A&N Islands		Samples beyond Permissible Limit		IS 10500:2012		
			Min	Max	Number	%	Acceptable Limit
Uranium [#] (as U)	mg/L (ppm)	Traces	0.006	00	00	0.03	No Relaxation
Total Arsenic (as As)		Traces	0.007	00	00	0.01	No Relaxation
Copper (as Cu)		Traces	0.012	00	00	0.05	1.5
Total Chromium (as Cr)		Traces	0.007	00	00	0.05	No Relaxation
Manganese (as Mn)		Traces	1.629	16	17	0.1	0.3
Zinc (as Zn)		Traces	0.194	00	00	5	15
Lead (as Pb)		Traces	0.005	00	00	0.01	No Relaxation

[#] As per WHO provisional guidelines

Heavy Metal:

Concentration of various Heavy Metals viz. Uranium, Total Arsenic, Copper, Total Chromium, Manganese, Zinc and Lead have been analysed from groundwater of Andaman and Nicobar Islands. Occurrence Ranges of various metals have been furnished in above table. The highest concentration of Uranium was observed at Kalapathar, Havelock Island as $6 \mu\text{g L}^{-1}$ and that of Total Arsenic was observed at Bharatpur, Neil Island as $7 \mu\text{g L}^{-1}$. Highest concentration of Copper, Total Chromium, Zinc and Lead was observed at Krishnanagar, Havelock Island ($12 \mu\text{g L}^{-1}$); Burmanala, South Andaman ($8 \mu\text{g L}^{-1}$); Milangram, North and Middle Andaman ($194 \mu\text{g L}^{-1}$); Stewartganj, South Andaman ($5 \mu\text{g L}^{-1}$) respectively. No sample showed occurrence of any analysed heavy metal higher than their respective permissible limit apart from Manganese. Manganese concentration in groundwater was observed in the range Traces to 1.63 mg L^{-1} (at Bakultala, North and Middle Andaman). Only 17% of analysed samples were found having Mn concentration above the permissible limit of 0.3 mg L^{-1} .

Conclusion:

Mostly no major threat has been identified according to analysed basic parameters **in the shallow aquifers of entire A&N Islands** from drinking water perspective (Drinking water specification: BIS, 2012). Particularly water quality is questionable in respect of high Manganese and Iron concentration at places of the entire islands. Ground water in major part of **A&N Islands** has also been found suitable for use in irrigation, Industry and allied purposes.

Table - B1**District wise Well Frequency for Different Ranges of Depth to Water Level Month / Year: Apr-2019**

District	No. of Wells analysed	Depth to Water level (mbgl)	No. / Percentage of Wells Showing Depth to Water Table (mbgl) in the Range of
