2020-2021**

**South Eastern Region
Bhubaneswar
JUNE 2021**

FOR E W O R D

Groundwater is a major natural replenishable resource to meet the water requirement for irrigation, domestic and industrial needs. It plays a key role in the agrarian economy of the state. Though richly endowed with various natural resources, the state of Odisha has a long way to go before it can call itself developed. Being heavily dependent on rain fed agriculture; the state is very often exposed to vagaries of monsoon like flood and drought. The importance of groundwater in mitigating the intermittent drought condition of a rain-fed economy cannot be over emphasized.

To monitor the effect caused by indiscriminate use of this precious resource on groundwater regime, Central Ground Water Board, South Eastern Region, Bhubaneswar has established about 1600 National Hydrograph Network Stations (NHNS) (open / dug wells) and piezometers in the state of Odisha. The water levels are being monitored four times a year. Besides, to study the change in chemical quality of groundwater in time and space, the water samples from these NHNS are being collected once a year (Pre-monsoon) and analysed in the Water Quality Laboratory of the Region. The data of both water level and chemical analysis are being stored in computers using industry standard Relational Database Management System (RDBMS) like Oracle and MS SQL Server. This is very essential for easy retrieval and long-term sustainability of data.

Dissemination of technical information in a way that is very useful to the user agencies is an important aspect that plays a vital role in the safe and optimal development of groundwater resources of our country. As an effort in this direction, Central Ground Water Board is bringing out "Groundwater Year Book" each year. The present report contains the observations and results of water levels in the state of Odisha for the year 2020 (April) - 2021 (January). It is sincerely hoped that this report will be immensely useful to various user agencies, Engineers, Scientists, Administrators, Planners and others involved in groundwater planning, development and management.

The present compilation is outcome of commendable efforts put in by **Smt. Sandhya Mohapatra Scientist-D and Ms Purba Bera, Scientist-B**. The maps included in the reports have been computer generated by them using sophisticated GIS software like MapInfo Professional and dedicated software GEMS. Water level monitoring and water sampling was carried out by the officers of the Region. The analysis of the water sample was done by Sh B.B Sahoo, Scientist D and Sh B N Dehury, Asst Chemist following the standard operating procedures and Ground Water quality for the state of Odisha has been compiled by **Sh B N Dehury, Asst Chemist**. Their efforts are also thankfully acknowledged.

Bhubaneswar

EXECUTIVE SUMMARY

The State of Odisha spreading over an area of 1,55,707 sq. Km is bounded between North latitude 17°49' to 22°34' and East longitude 81°24' to 87°29'. Success of agricultural operations and consequent economy of the state are related to the availability of water and its optimal utilization.

The average annual rainfall of the state is 1482 mm. Nearly 86% of the annual rainfall is contributed by the southwest monsoon. From the departure data it is discerned that from 1980 to 2020, negative departures is seen in most of the years.

The state is underlain by diversified rock types which range in age from Precambrian to the Cenozoic age. The Precambrians occupy nearly 80% of the total geological area of the state.

A total number of 1600 Hydrograph Network Stations have so far been established and are being monitored in the state.

During April 2020, the water level (meter below ground level) in the state varies from minimum of 0.04 mbgl in Cuttack district to a maximum of 14.17 mbgl in Koraput district and water levels mostly range from 2 to 10 mbgl. Some wells in the hilly districts recorded water level in 10-20 m range.

During August 2020, the depth to water level ranges from 0.02 mbgl in Khordha district to 15.1 in mbgl in khordha district and in majority (62.44%) of NHS wells level was in the range of 0-2 m below ground level and 33.52% of wells in 2-5 m below ground level.

During November 2020, the depth to water level ranges from 0.01 mbgl in Nayagarh district to 12.76 mbgl in Koraput district and in majority (44.06%) of NHS wells level was in the range of 0-2 m below ground level and 47.64% of wells in 2-5 m below ground level. In general the water level in the state during November 2020 monitoring is found in the range of 0-2 m bgl especially in the coastal stretch and in parts of the hilly terrain, whereas 2-5 m bgl water level is found in the coastal and hard rock terrain.

During January 2021, the depth to water level ranges from 0.03 to 17.03 mbgl and in majority (60.21%) of NHS wells level was in the range of 2-5 m below ground level and 20.43% of wells in 0-2 m below ground level. In general the water level in the state during January 2021 monitoring is found in the range of 2-5 m bgl , whereas 0-2 m bgl water level is found in the coastal and command areas in the state.

The comparison of April 2020 water level with that of the same period of the previous year shows that 31.64%, 2.02% and 0.16% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 56.22%, 7.32%, 0.84% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of August 2020 water level with that of the same period of the previous year shows 22.27%, 1.3%, 0.55% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m

respectively. Similarly, 57.71%, 5.2% recorded fall in water level in the range of 0-2, 2-4 respectively and 0.46% recorded more than 4m.

The comparison of November 2020 water level with that of the same period of the previous year shows that 50.43%, 2.97%, 0.47% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 41.34%, 1.92%, 0.08% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of January 2021 water level with that of the same period of the previous year shows that 31.83%, 1.41%, 0.39% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 61.22%, 2.91%, 0.23% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

A comparison of August 2020 water level with that of April 2020 shows that 25.76%, 44.05%, 29.79 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly only 0.39%, 0% and 0% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

A comparison of November 2020 water level with that of April 2020 shows that 36.53 %, 42.25 %, 18.72 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly only 2.3%, 0.09 % and 0 % recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

A comparison of January 2021 water level with that of April 2020 shows that 56.54%, 27.83%, 5.93 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly only 9.16%, 0.34% and 0% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of April 2020 water level with that of the decadal mean of the corresponding period shows that 44.23%, 0% and 0.08% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 45.5%, 2.78% and 0.32% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 45.4%, 0.08% and 0% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of August 2020 water level with that of the decadal mean of the corresponding period shows that 54.81%, 2.25% and 0.18% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 39.24%, 1.26% and 0.09% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of November 2020 water level with that of the decadal mean of the corresponding period shows that 63.46%, 3.87% and 0.48 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 30.24%, 1.61 % and 0.24% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of January 2021 water level with that of the decadal mean of the corresponding period shows that 54.64%, 4.49% and 0.67% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and

more than 4m respectively. Similarly, 37.93%, 1.72% and 0.37% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The shallow aquifers of inland zone of the state are mostly fresh and dominated by Ca-Mg-HCO₃ and mixed types of water. In the coastal plain where most of the wells are located in alluvium, the water is relatively saline. The shallow aquifers of the coastal plain are of NaHCO₃ type with some isolated patches of NaCl and Ca-Mg-HCO₃ types, which may be due to Base Exchange process and also due to the vicinity of the sea. These aquifers, at places, are of high Electrical Conductivity and high Chloride, Nitrate, and Fluoride content.

GROUND WATER YEAR BOOK

(2020 - 2021)

1.0 INTRODUCTION

The State of Odisha with a geographical area of 1,55,707 sq. km is bounded between North latitudes $17^{\circ} 49'$ and $22^{\circ} 34'$ and East longitudes $81^{\circ} 24'$ and $87^{\circ} 29'$. The State comprises of 3 revenue divisions, 30 districts, 58 subdivisions and 314 community development blocks. The state's population largely depends on agriculture. Success of agricultural operations and the consequent agrarian economy of the state are dependent on the availability of water and its optimal utilization. The total population of the state as per 2011 census is 419.73 lakhs, out of which the rural population is 349.70 lakhs and the urban population is 70.03 lakhs. The rural population is almost dependent on agriculture for their livelihood and the agriculture on availability of water. A consistent ground water database is inevitable for planning of judicious and optimal utilization of ground water through an efficient resource management system for which the prerequisite is a reliable monitoring system.

Keeping this perspective in view, Central Ground Water Board carries out the ground water monitoring through a network of observation wells - the National Hydrograph Network Stations. The National Hydrograph stations set-up is a system of spatially distributed observation points for ground water regime monitoring at which periodic monitoring is carried out viz. recording of water levels, temperature and collection of water samples for chemical quality analysis for building a robust database to cater to multitude of needs for ground water management.

Groundwater monitoring data so collected forms an important input for water management. One of the main objectives is the prediction of future conditions or future scenarios, based on background samples of historical data, which may consist of repeated measurements from a single monitoring well. Also the monitoring is being carried out with a view to observe the rise or fall of the ground water levels and change in quality of water with changing stress conditions.

The studies include periodic measurement of water levels, temperature, and collection of water samples for determination of chemical constituents. Apart from evaluation of groundwater resources from time to time for developmental planning, this also helps in forecasting groundwater regime behaviour with progressive development of groundwater or effects of other recharge or discharge conditions, which helps in adopting remedial measures when necessitated.

For achieving these objectives 1600 nos. of observation wells have so far been established all over the state by CGWB, to serve as permanent Hydrograph Network Stations for the purpose of monitoring of groundwater

regime. In selecting hydrograph stations due consideration has been given to the hydrogeological, hydrochemical aspects and their location in river Basin/ Sub basin/ Watershed etc.

To strengthen the water level monitoring network and to avoid the possibility of dug wells used as NHNS being filled up due to extraneous activities, some purpose built piezometer have been constructed by the Central Ground Water Board under its normal activities as well as under World Bank Aided Hydrology Project. In course of time it is proposed to replace all the dug wells used as observation wells with piezometers for better monitoring.

2.0 PHYSIOGRAPHIC FEATURES

The State presents varied and picturesque landforms. The Southern and Central parts of the State in Rayagada, Kalahandi, Kandhamal and Gajapati districts present a rugged hilly tract. Plateau occupies the Northern districts of Sundergarh, Keonjhar and Mayurbhanj and parts of Nawarangpur district in the Southwest. Undulating plains characterizes the major river valleys. A narrow coastal plain borders the Bay of Bengal.

Physiographically the state can be divided into five distinct units, namely (i) Coastal plains, (ii) Northern uplands, (iii) The erosional plains of Mahanadi and other river valleys (iv) South Western hilly region and (v) Subdued plateaus. Physiography of the state has been presented in **Plate:-2.1**

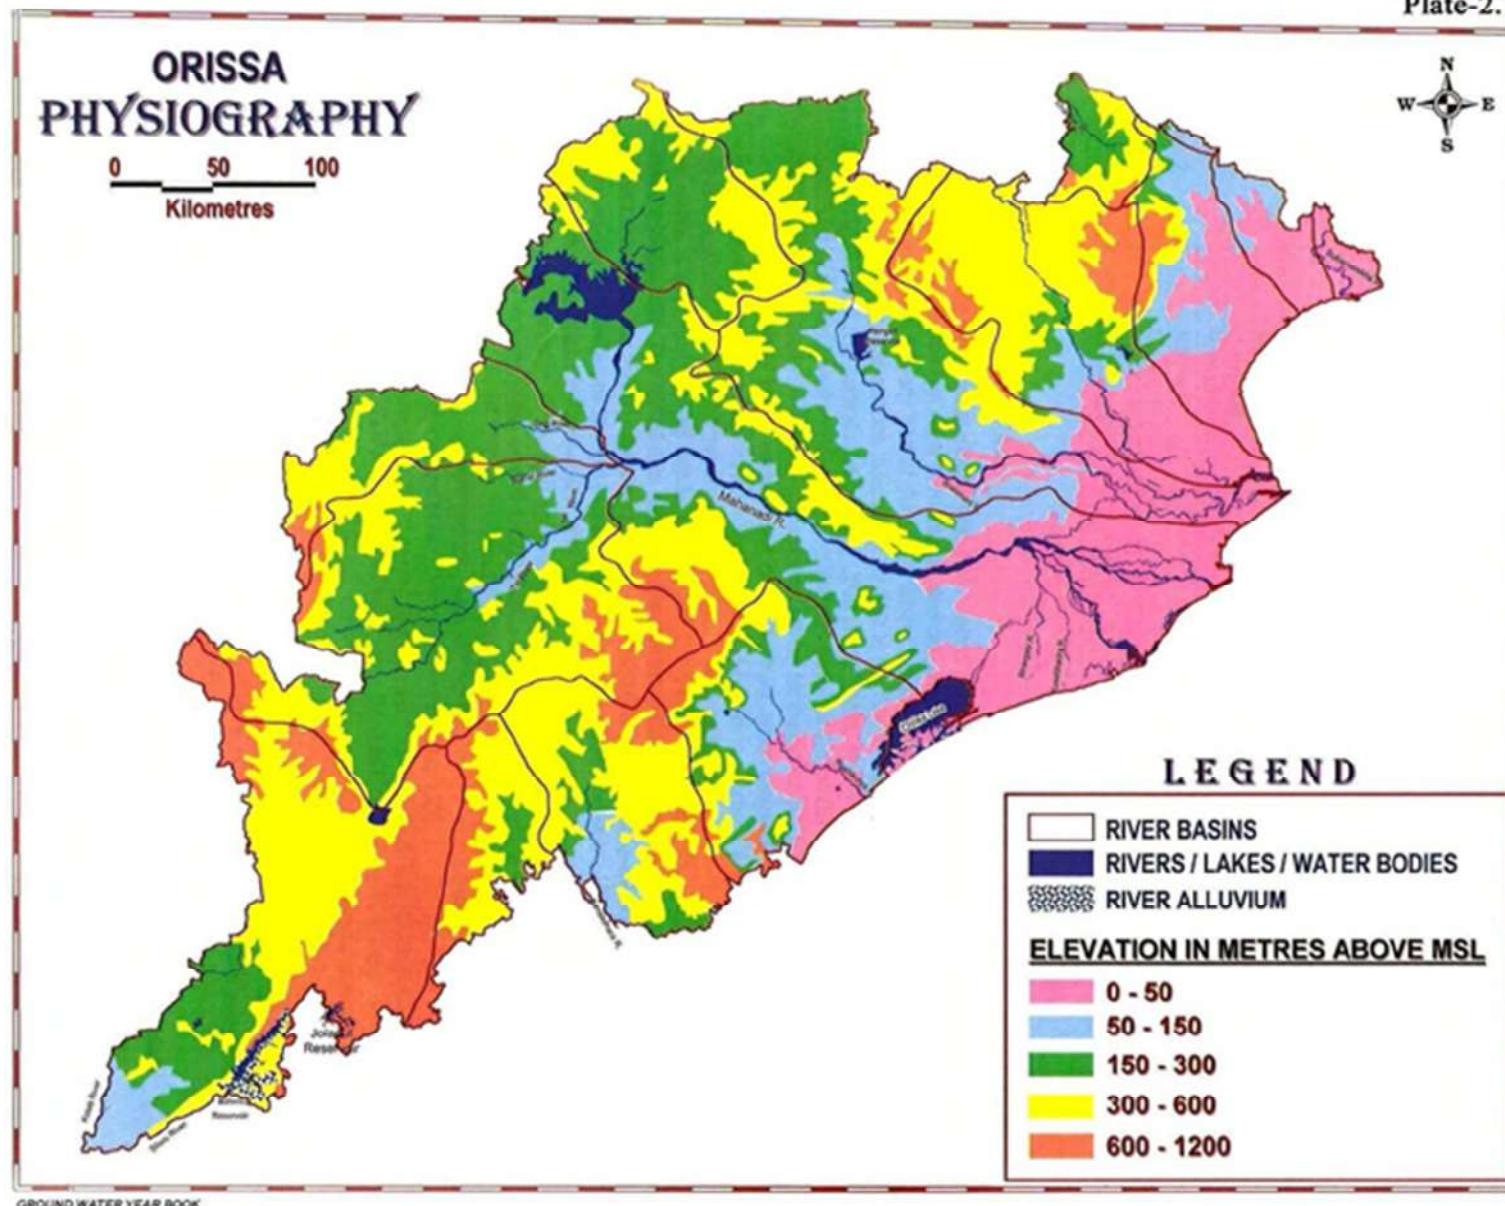

The coastal plains covering parts of Ganjam, Puri, Cuttack and Balasore districts from south to north form an extensive flat alluvial tract between the hills in the west and the coast in the east. It presents a flat topography gently sloping towards east with insignificant elevation difference. The general elevation of coastal plains varies from 1 to 10m above mean sea level (amsl).

Northern uplands covering Mayurbhanj, Keonjhar and Sundergarh districts and Pallahara subdivision of Dhenkanal district are undulating, frequently intersected by hill ranges with general slope from north to south. The elevation in the central part of the upland generally varies between 300 to 600 m and forms watersheds of Baitarani and Brahmani river systems. The erosional plains of Mahanadi river basin lie between the northern uplands and southern hilly region of the Eastern Ghats. The tract covers major parts of undivided districts of Sambalpur, Bolangir, Dhenkanal and northern parts of Kandhamal (Khandamal) and Western part of Puri districts. The altitude of this tract lies between 150 to 300 m above mean sea level (amsl).

Southwestern hilly region lies to the south and southwest of Mahanadi valley region stretching through Kandhamal, Ganjam districts and part of Koraput district. Major part of this region has an elevation over 600m, acting as the watershed of the two sets of rivers, one set flowing directly to the Bay of Bengal, namely Rushikulya, Nagavali and Vamsadhara and the others feeding the Godavari and Mahanadi river systems.

The plateaus extend throughout the western parts of Kalahandi, Nawapara, Koraput, Malkangiri , Rayagada and Nawarangpur districts with an average elevation varying from 300 to 600m above mean sea level (amsl).

Plate-2.1

3.0 DRAINAGE

There are eleven principal rivers traversing the entire state that can be grouped under eight major river basins within the state, whereas the Indravati, Kolab, Machkund sub-basins in the south forms part of Godavari river basin. Most of the major rivers flow in easterly and southeasterly direction with gentle gradient. Generally the rivers are effluent in nature. In general the drainage pattern is of both dendritic and radial types. The river basin map of Odisha is presented in **Plate 3.1**. The salient features of the major river basins are given in **Table 3.1**.

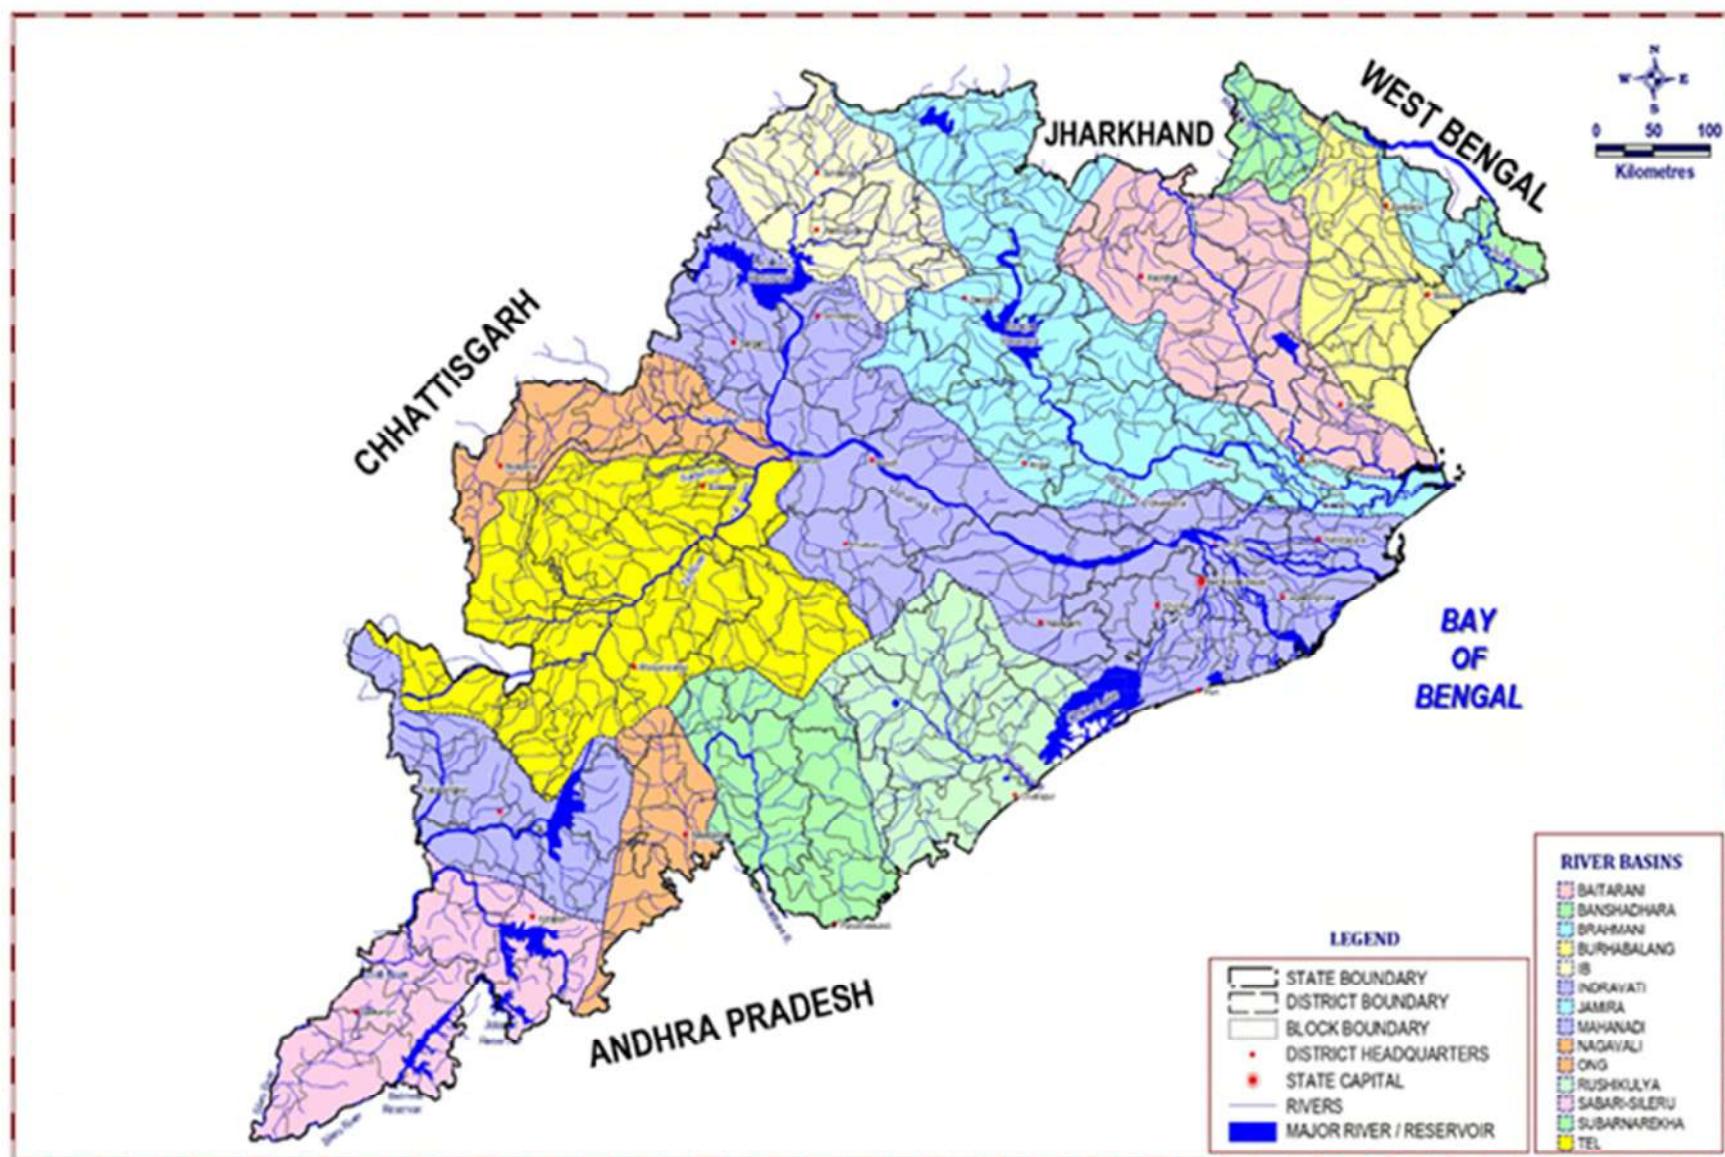

SALIENT FEATURES OF MAJOR RIVER BASINS

TABLE 3.1

River	Total Catchment Area (Sq Km)	Catchment Area In Odisha (Sq km)
Mahanadi	1,41,134	65,628
Brahmani	39,116	22,516
Baitarani	14,218	13482
Subarnarekha	19,277	2,983
Budhabalang	6,691	6354
Rusikulya	8,963	8963
Vamsadhara	11,377	8960
Nagavali	9,275	4500
Indravati	41,700	7,400
Kolab	20,427	10300
Bahuda	1118	890

RIVER BASIN MAP OF ODISHA

PLATE:3.1

4.0 CLIMATE AND RAINFALL

The state enjoys a sub-tropical climate with three distinct seasons i.e. summer, monsoon and winter. The southwest monsoon rain starts from mid of June and continues till mid of October. Summer season extends from March to early part of June and winter season spreads from November to February.

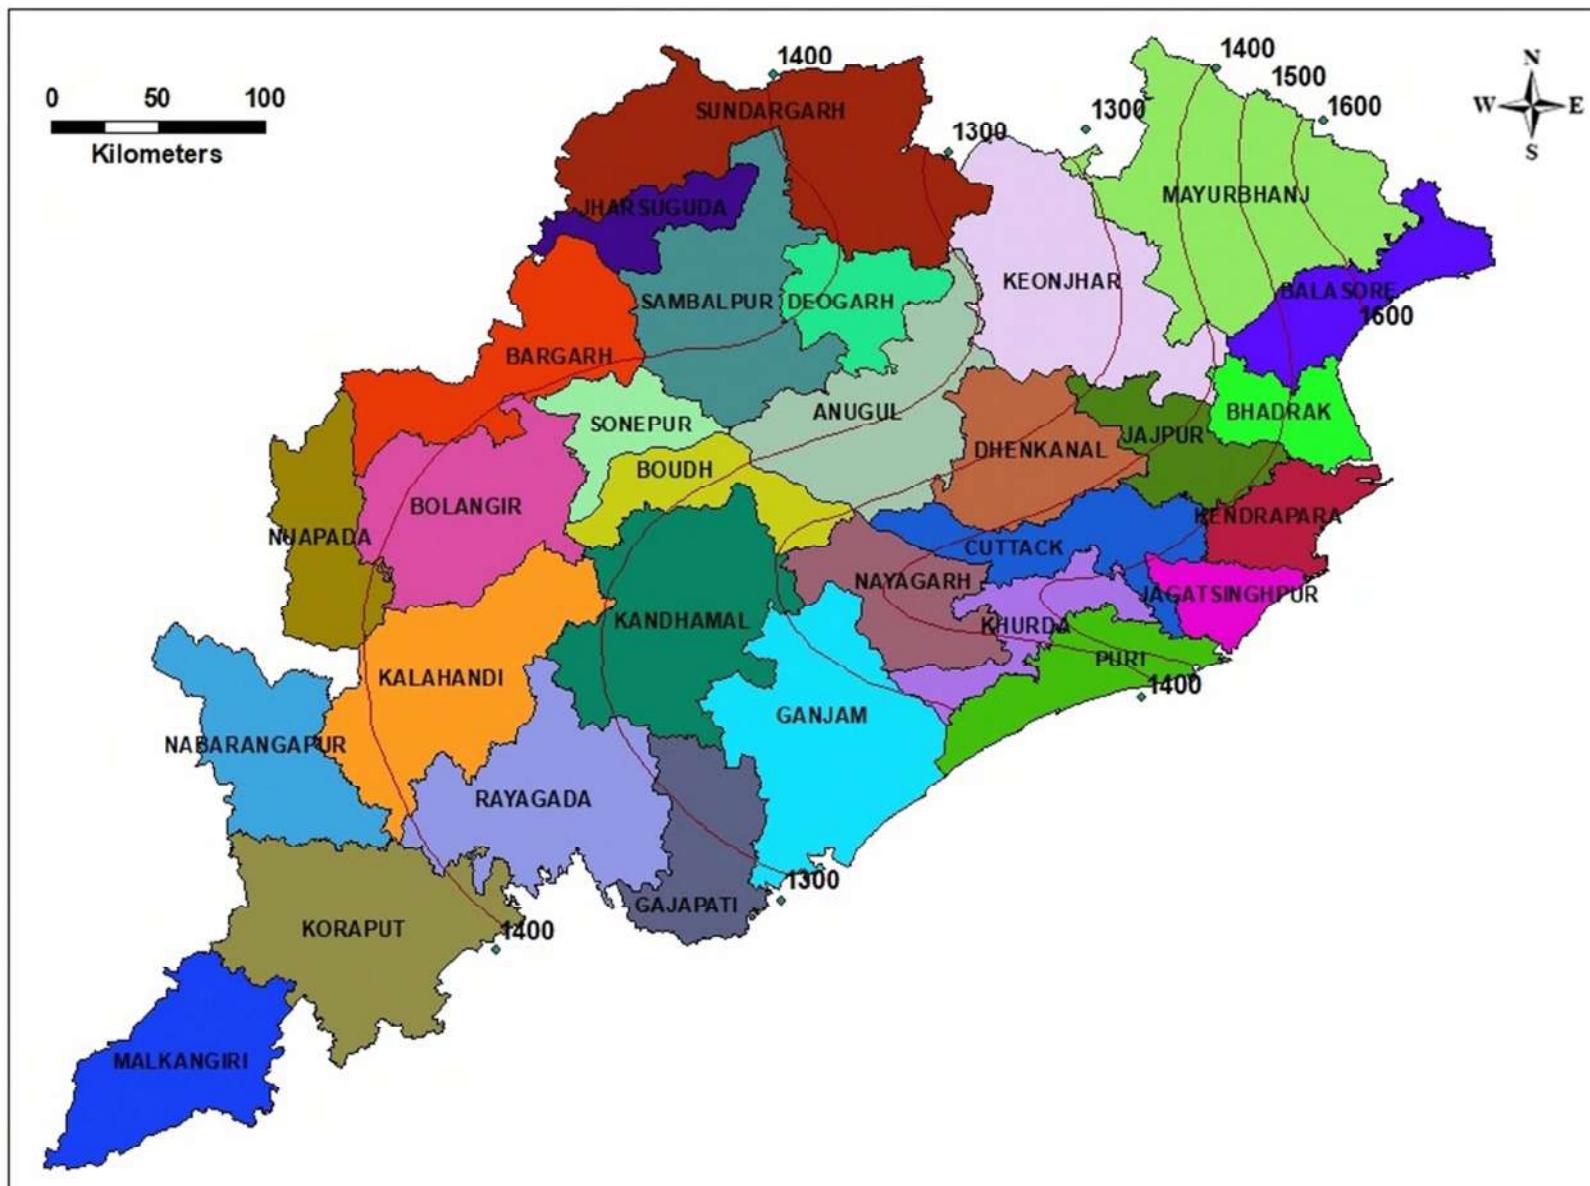

The normal average rainfall of the state is 1482.2mm . Nearly 86% of the annual rainfall is contributed by the southwest monsoon. The spatial distribution of the rainfall in the State is uneven and erratic. A perusal of the Isohyetal map of the normal rainfall for the period (**Plate –4.1**) shows that the rainfall is highest in the northern part of coastal tract, which ranges from 1520.32 to 1697.87 mm. The rainfall reduces westwards, from 1487.02 to 1211.08 mm in Kandhamal, Angul, Keonjhar districts and also southwards to 1221.14 mm around Gopalpur in Ganjam district.

The rainfall ranges from 1331.85 mm to 1491.89 mm in Koraput, Kalahandi, Bolangir, Sambalpur and Sundergarh districts. The IMD rainfall data for from **2010-2020** has been given in **Table 4.1**. From the rainfall departure data, it can be observed that the year 1990, 1995 and 2003 indicate excess rainfall in the major part of the state. **Table 4.2** presents the drought, flood and cyclone years in the state from **1980 to 2020**. A perusal of the table indicates that every alternate year, the state experiences a natural calamity in the way of drought or flood or cyclone. This has created a most unpredictable climate for any agricultural activity in the state.

The state experiences hot summer with temperatures shooting up to 45°C in the east to 50°C in the west. During winter season mornings and nights are cool. However the mean monthly winter temperature varies from 18°C to 22°C in different parts of the state. The mean monthly summer temperature is 37°C in western parts and 28°C in southern parts. Humidity ranges from 70% to about 100% in the state. During monsoon period the humidity is very high in the eastern parts and during summer it is dry in the western part of the state.

5.0 HYDROGEOLOGICAL CONDITION

Geological setting, climate and topography plays a vital role in occurrence and movement of groundwater. The state is underlain by diverse rock types, which range in age from Precambrian to Cenozoic. The Precambrians occupy nearly 80% of the total geographical area of the state. The Tertiary and the Quaternary formations are restricted mainly to the narrow coastal tracts. The Gondwana group of rocks belonging to Paleozoic and Mesozoic age occur in isolated patches in different parts of the state. These formations occur in Talcher area of Angul district and Ib river valley area of Sambalpur and Sundergarh districts. Hydrogeologically, the state can broadly be divided into 3 distinct geological units. The aquifer system of the state has been depicted in **Plate 5.1**.

Area with Precambrian Consolidated Formations –

Sundergarh, Keonjhar, Mayurbhanj, Subarnapur, Bolangir, Kandhamal, Boudh, Gajapati, Nuapara, Kalahandi and parts of Nayagarh, Khurda, Balasore, Cuttack, Ganjam, Koraput, Kalahandi, Angul, Dhenkanal, Sambalpur and Bargarh districts.

Area with Semi-consolidated Gondwana & Tertiary Formations –

Parts of Sundergarh, Mayurbhanj, Angul, Dhenkanal, Khurda, Sambalpur, Kandhamal and Bolangir districts.

Area with Unconsolidated Quaternary Formations –

Coastal tracts of Puri, Khurda, Cuttack, Jagatsinghpur, Jajpur, Kendrapara, Balasore, Bhadrak, Ganjam districts and inland river valleys.

5.1 CONSOLIDATED FORMATIONS

The consolidated formations include the hard crystalline and partly metamorphosed compact sedimentary formations belonging to Pre-Cambrian. The rock types are mainly granites, granite gneisses, schistose rocks, khondalites, charnockites, quartzites, calc-silicates, shale, phyllite, sandstone, limestone, marble etc. These rocks are devoid of primary porosity. The ground water occurs in secondary porosity resulting from weathering fracturing and jointing. The hard rock aquifers exhibit considerable variation laterally as also in depth. The weathered mantle is composed of loose regolith with intergranular porosity, which facilitates free circulation of ground water through deeper fractures and forms potential repository of ground water. In general the average thickness of weathered residuum varies from 15 to 20 m. Ground water occurs under phreatic condition. The water bearing fracture zones generally occur within 100m depth but deeper potential fractures have also been encountered in some of the bore holes drilled by the Central Ground Water Board.

5.2 SEMI CONSOLIDATED FORMATIONS

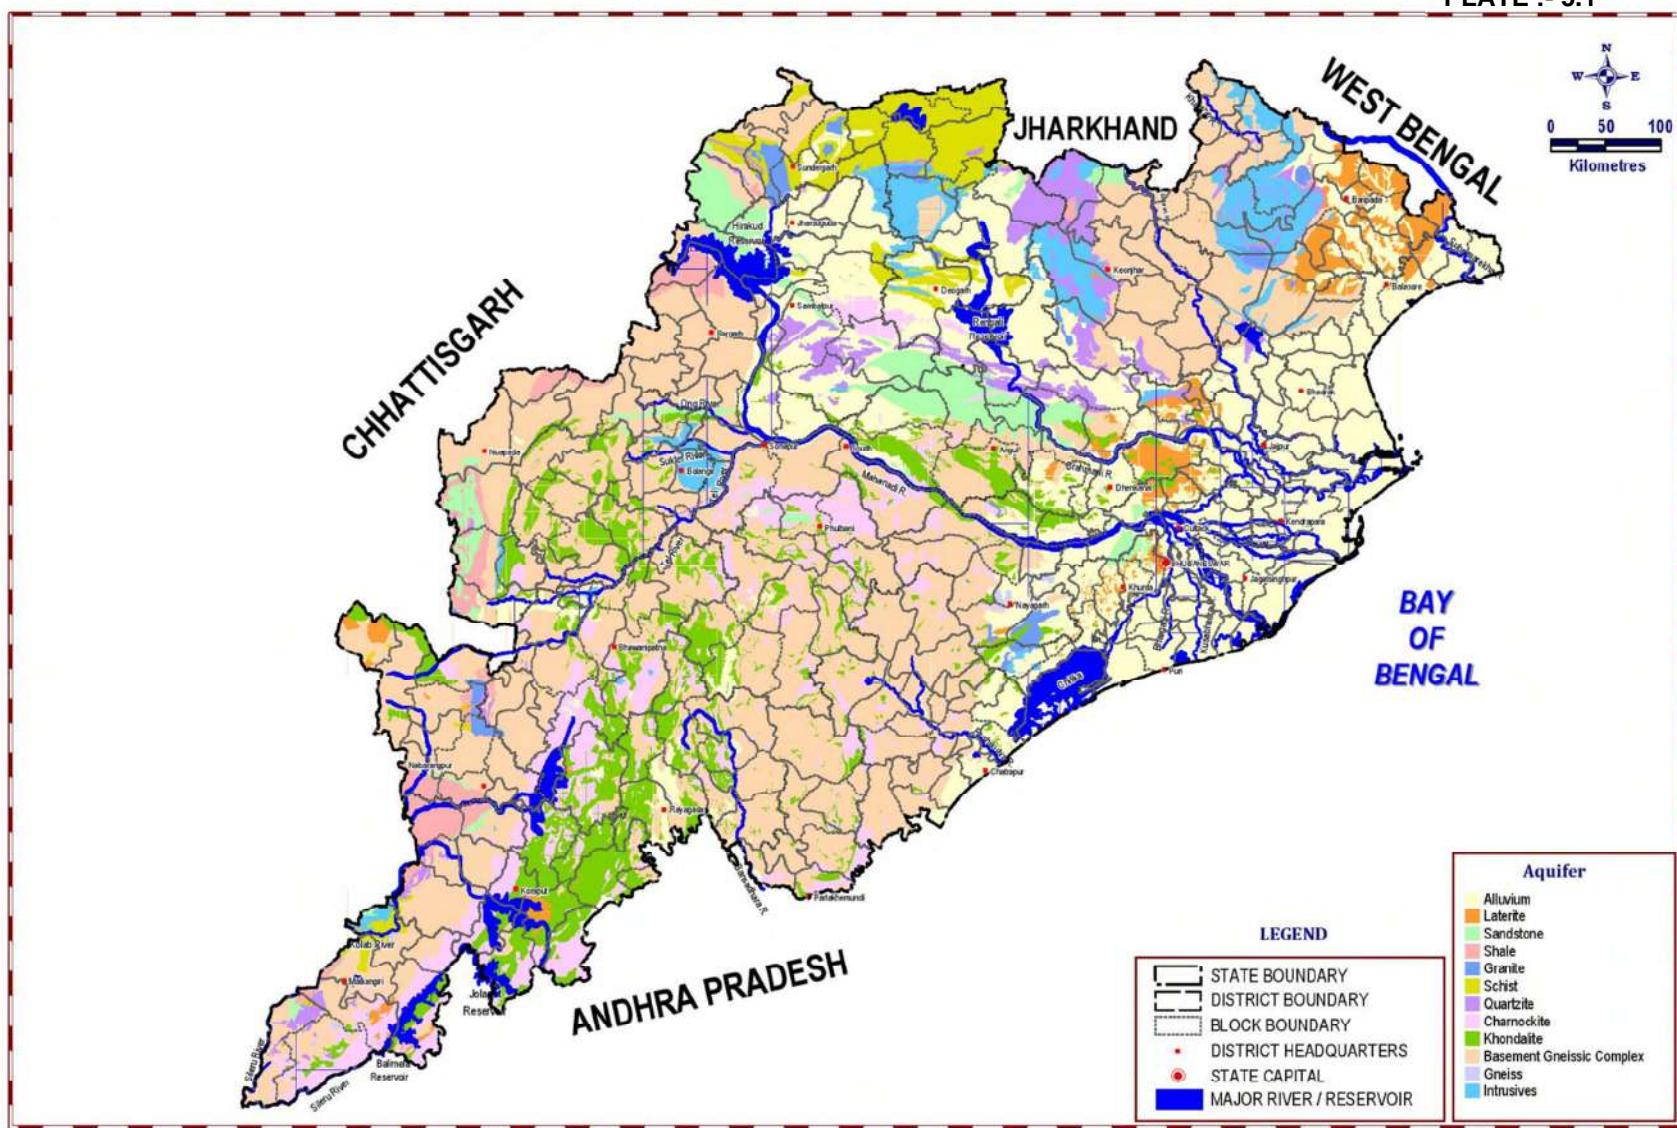

The semi-consolidated formations include Gondwana sedimentaries ranging in age from Upper Carboniferous to Cretaceous and the Baripada beds of Middle-Pliocene age. The Gondwanas include sandstones, shales, siltstones and conglomeratic beds, while the Baripada beds consist of fossiliferous limestones, stratified semi-consolidated sand beds with intercalated shales. The coarse to medium grained, weathered, fractured and friable Gondwana sandstones and the semi-consolidated sand beds of Baripada formation form the aquifers. The ground water occurs under water table condition in the shallow aquifers and under semi-confined to confined conditions in the deeper aquifers. The depth of weathering in Gondwanas generally extends to a depth of 15m.

5.3 UNCONSOLIDATED FORMATIONS

The unconsolidated sediments include Pleistocene and Recent alluvium. The older alluvium, which forms conspicuous and significant horizon, is generally overlain by laterites. The laterites are vesicular, essentially ferruginous and form the shallow aquifer. Maximum development of alluvial formations occurs along the coastal tract, with a maximum thickness of about 600m. Alluvium also occurs as discontinuous patches adjoining the river courses, where the thickness is limited to about 45m. The sand and gravel layers act as good repository of ground water. Groundwater occurs under unconfined condition in the shallow zone and under semi-confined to confined condition in the deeper zone. The coastal tract holds potential for large- scale ground water development as the sand zone forms prolific aquifers. But the coastal tract is beset with salinity problems both in shallow as well as deeper aquifers at different locales at different levels.

AQUIFER SYSTEM OF ODISHA

PLATE :- 5.1

6.0 GROUND WATER REGIME MONITORING

Ground water monitoring is carried out by CGWB through a network of observation wells (dug wells and piezometers) spread all over the state. These wells serve as permanent National Hydrograph Stations (NHS). The existing network provides an optimal spatial distribution of observation stations in the region, through which necessary information on ground water regime is available with a fair degree of accuracy. Through interpolation between data sets at different stations, it is possible to determine the characteristics of elements at any point in the region. Under normal circumstances, the water level of the observation wells are being measured four times in a year during fixed period of time as given below –

April – 20 th to 30 th of the month	Represents water level situation in Pre-monsoon period
August – 20 th to 30 th of the month	Represents peak water level of monsoon period.
November – 1 st to 10 th of the month	Represents situation of water level in Post-monsoon period.
January – 1 st to 10 th of the month	Represents water level during irrigation period.

Water samples were collected from each of the network stations only during April (Pre-monsoon) every year, to assess the chemical quality of ground water.

6.1 DISTRIBUTION OF NATIONAL HYDROGRAPH STATIONS

A total number of 1600 Hydrograph Network Stations have so far been established and are being monitored in the state. Out of 1600 network hydrograph stations, open/dug wells are 1517 in numbers and 83 are Piezometers in hard rock and coastal tract (including piezometers under Hydrology Project) and are being monitored manually. The district wise NHS wells monitored in different season is furnished in **Table 6.1**. Locations of hydrograph network stations are shown in **Plate-6.1** and the general details of hydrograph network stations are given in Annexure-1.

6.2 ANALYSIS OF DATA

The water levels reflect the cumulative effect of natural recharge discharge conditions and ground water draft on the ground water regime. Where the draft exceeds the recharge, its manifestation is reflected by distinct decline in normal water level and where recharge is more than the draft rising trend is seen in water levels. The hydrographs given in **Plate 6.2** show the periods of recharge and discharge. Water level data collected four times a year is subjected to analysis for inferring the change in water levels i.e. rise/ fall and trend in water levels with reference to time and space. The locations where monitoring could not be carried out due to Covid pandemic, water level data for the same has been statistically rationalized.

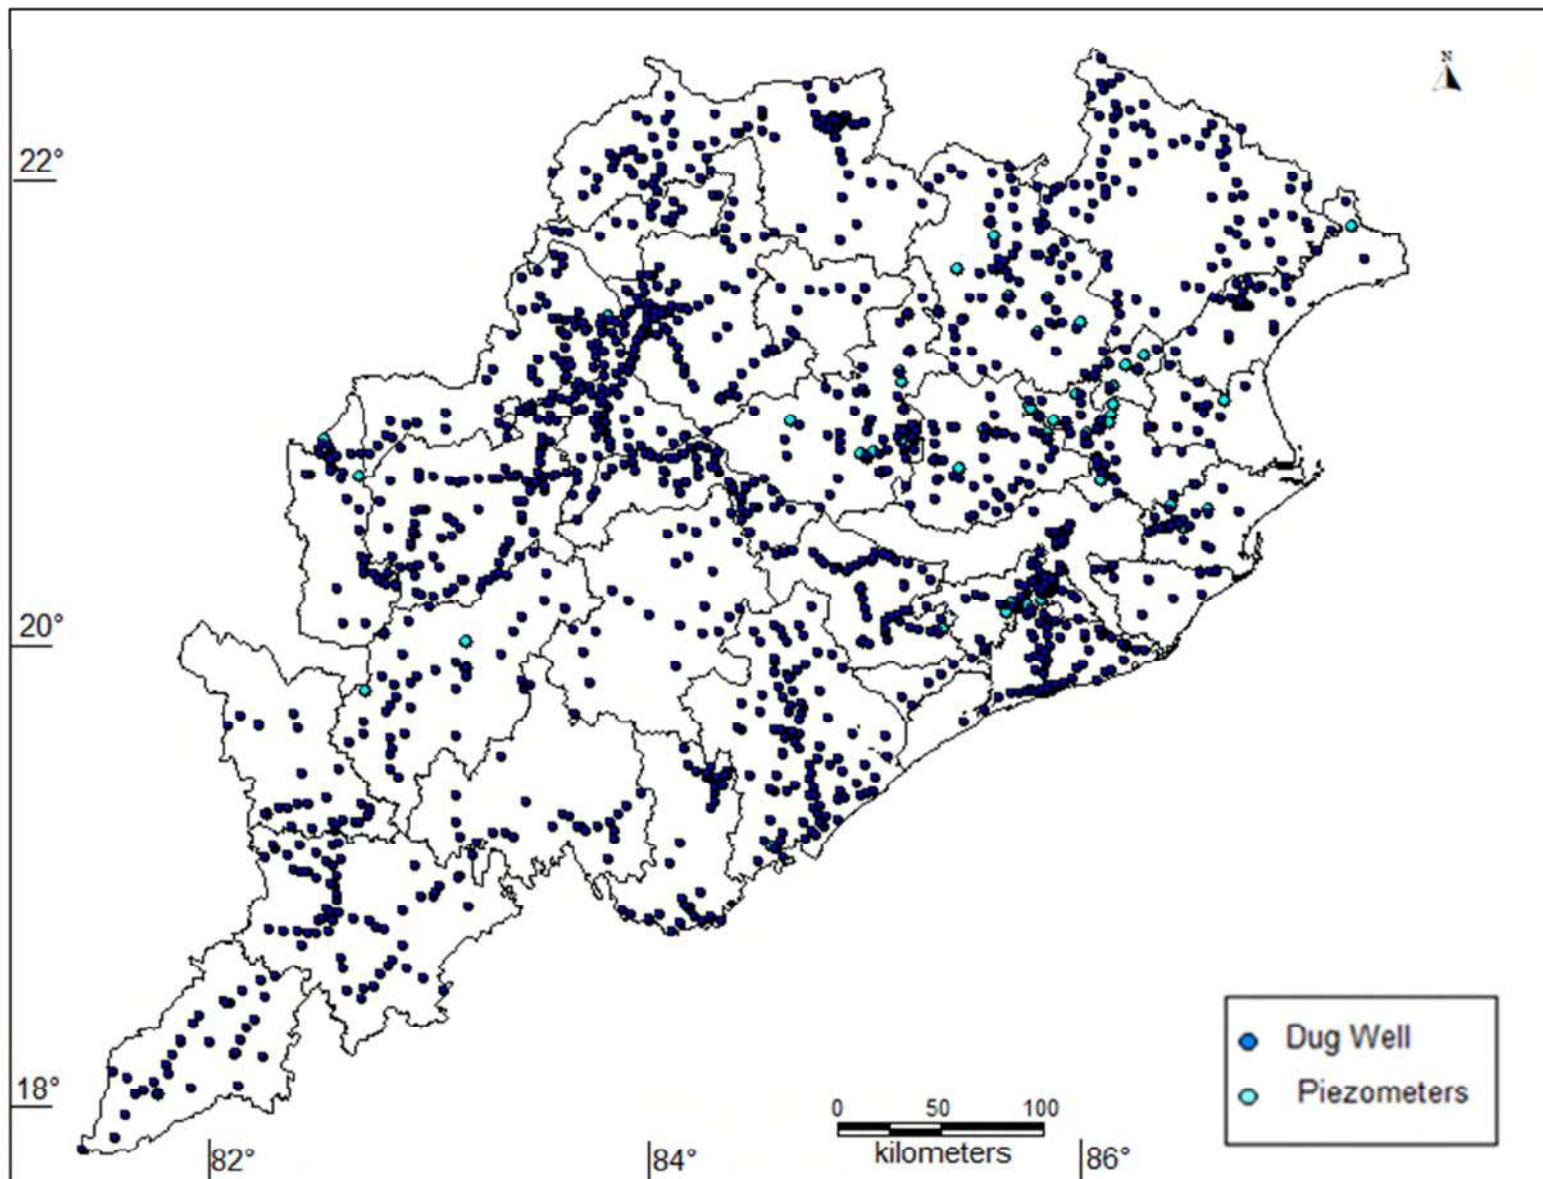

**NATIONAL HYDROGRAPH STATIONS MONITORED DURING
2020-2021**

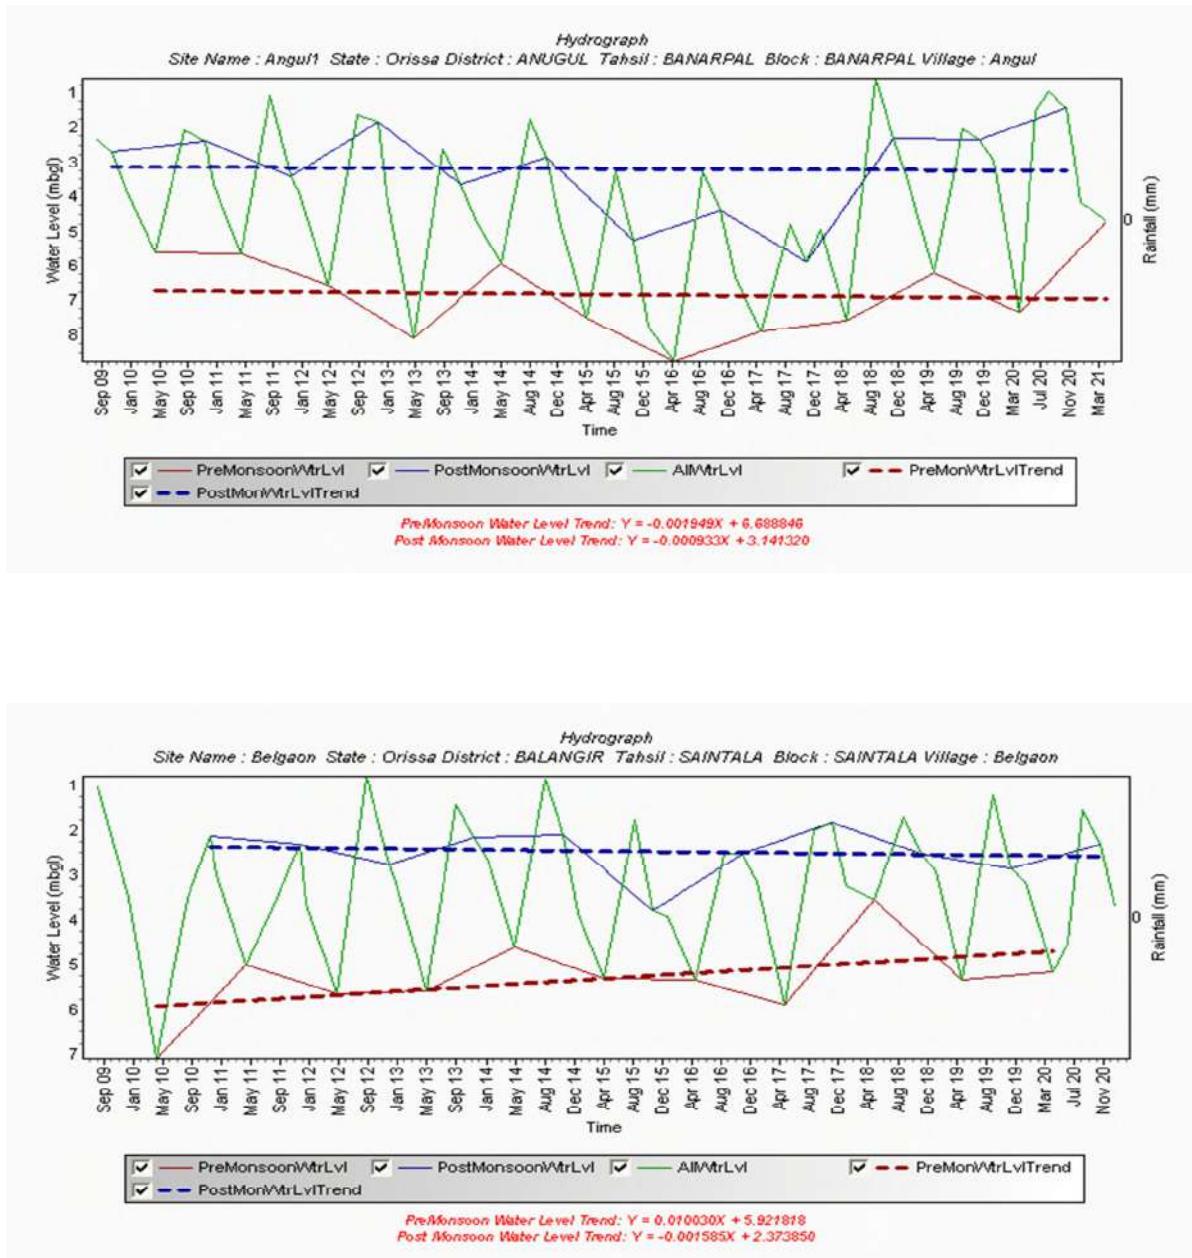

PLATE 6.1

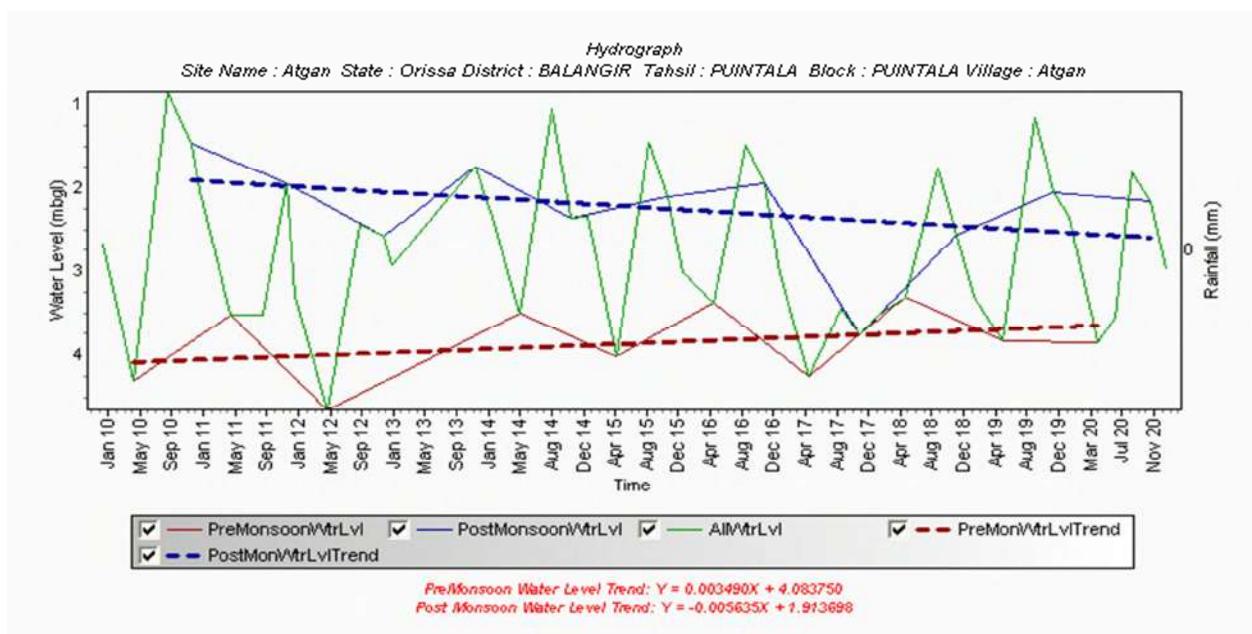

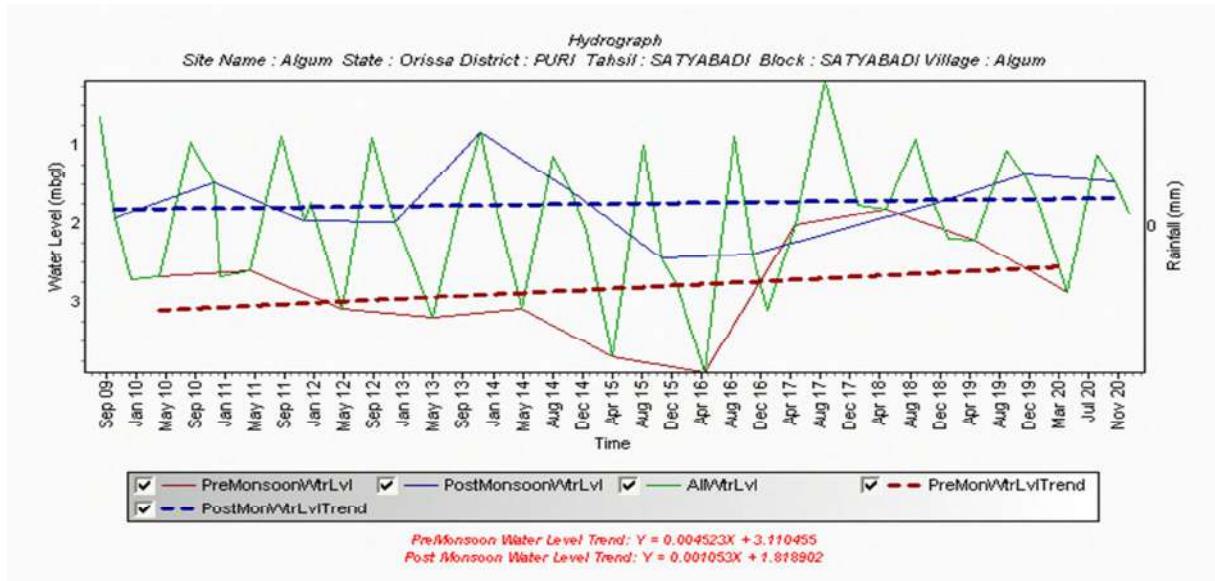

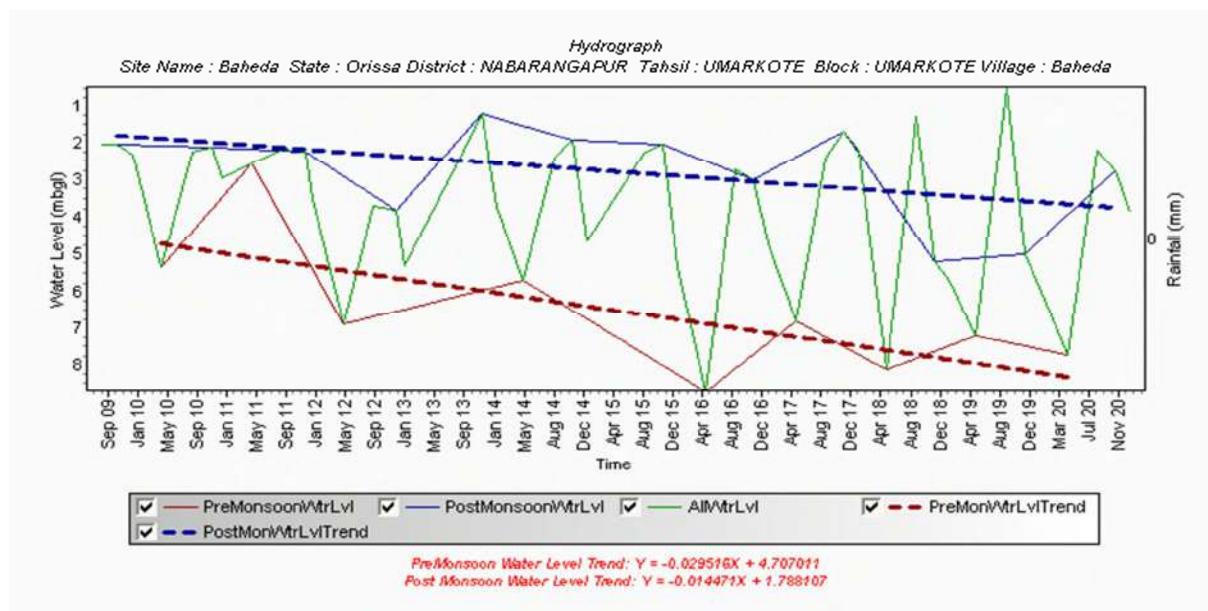

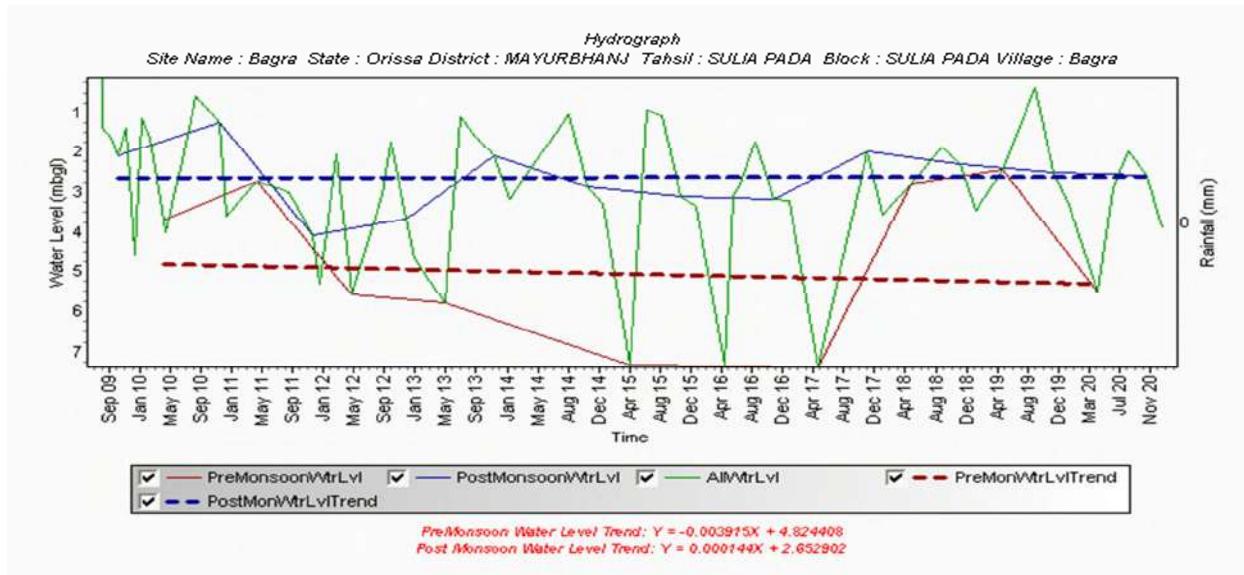

6.2 HYDROGRAPH ANALYSIS

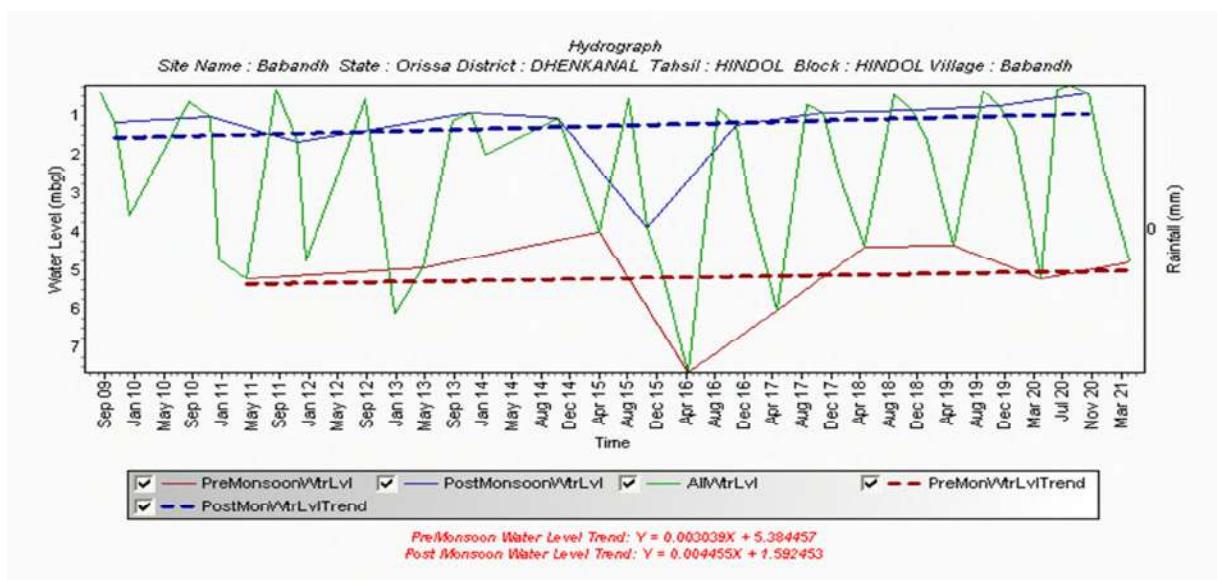

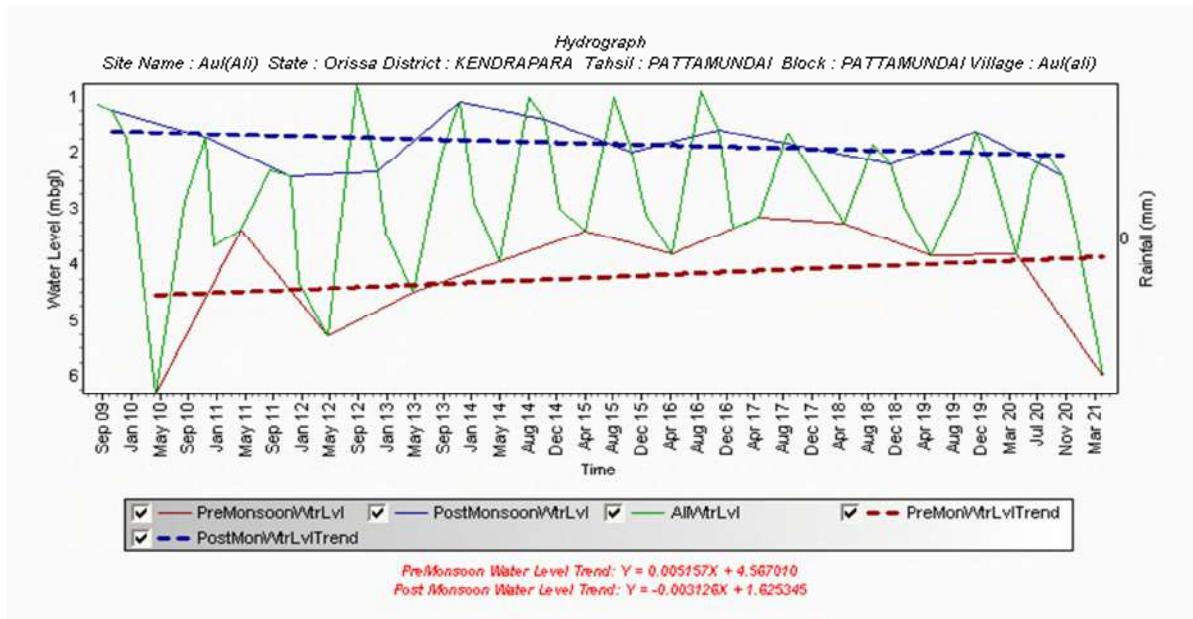

Long Term Water Level Trend Analysis

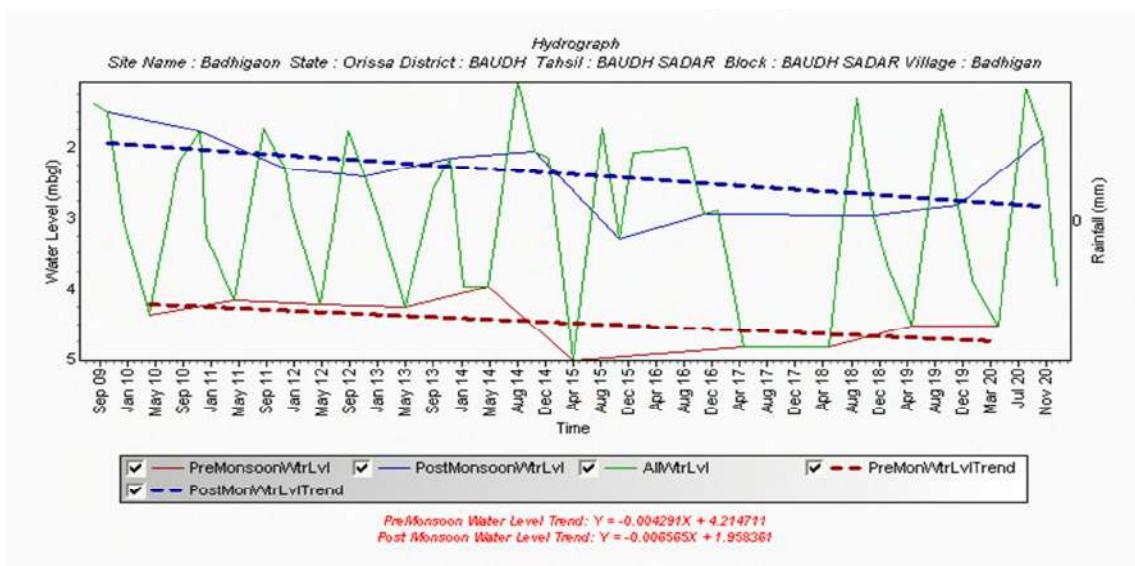

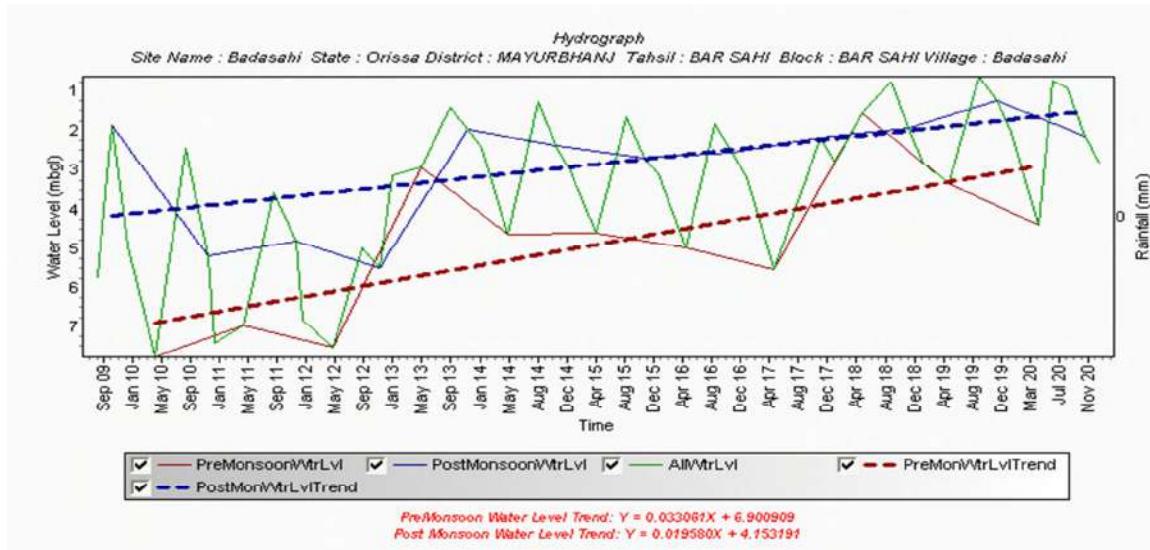

Hydrographs with Long term water level trend and comparison is given in **Plate 6.3**

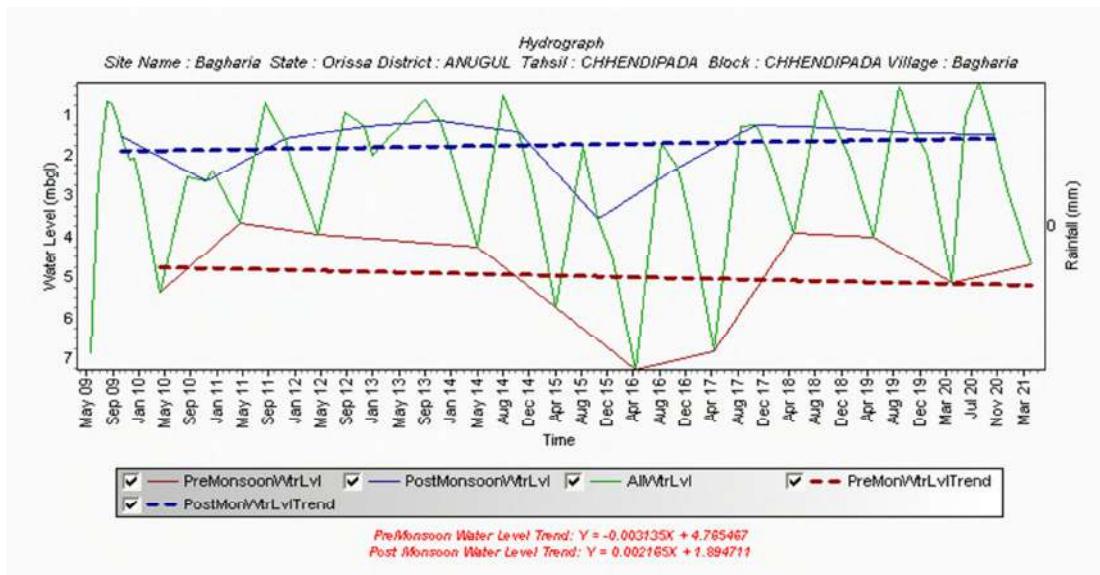

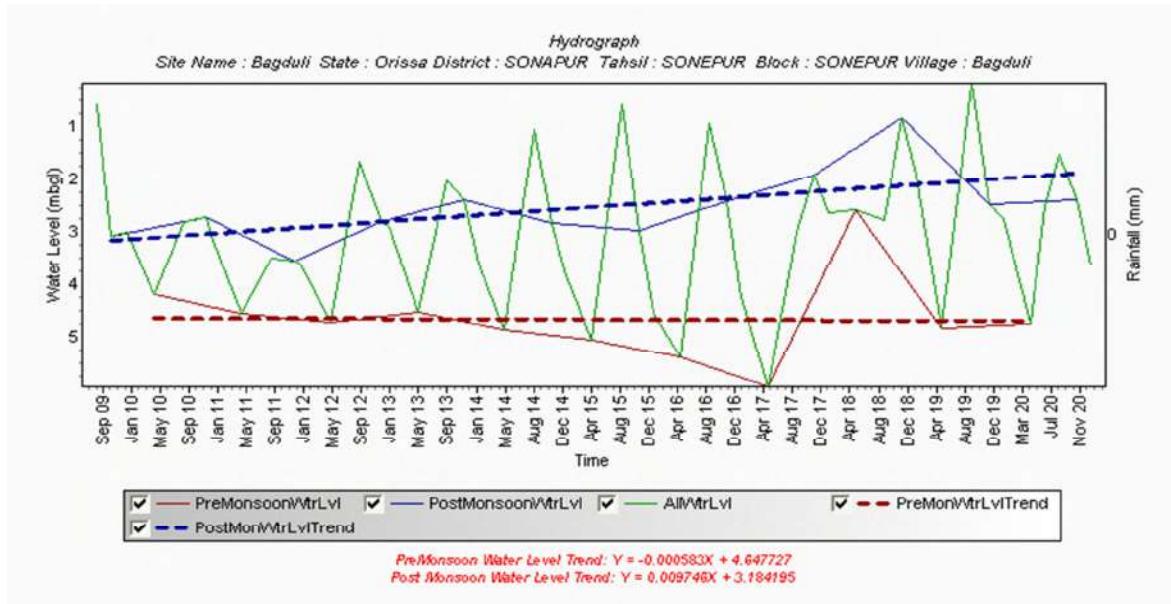

7.0 BEHAVIOUR OF WATER LEVEL DURING 2020 – 2021

During 2020 - 2021 the existing 1600 National Hydrograph stations were monitored four times and behaviour of the ground water regime during the year was inferred comparing the same with the decade mean, corresponding previous year data and pre-monsoon water level data. On the basis of water level data of NHS, for each measurement the following maps have been prepared.

1. Depth to water level for each measurement
2. Water level fluctuation in comparison to corresponding period of previous year.
3. Comparison of water levels to Pre-monsoon water levels.
4. Water level fluctuation in comparison to decade average.

7.1 DEPTH TO WATER LEVEL

7.1.1 DEPTH TO WATER LEVEL OF APRIL 2020

During April 2020, the water level (meter below ground level) in the state varies from minimum of 0.40 mbgl in Cuttack district to a maximum of 14.82 mbgl in Khordha district and water levels mostly range from 2 to 10 mbgl. The depth to water level map has been shown in **Plate-7.1** and district wise well frequency for different ranges of depth to water level are given in **Table- 7.1**.

Water level between 0-2 m

Only 6.68 % of the NHS wells recorded water level in this range during April 2020. This range generally appears as small and isolated patches. Also this range is seen in isolated patches in Canal command areas of Bargarh, Cuttack, Puri, Sambalpur and Sonapur districts with maximum 38.60% of wells in Bargarh district.

Water level between 2-5 m

44.27% of the NHS wells have shown water level in this range of 2–5 mbgl. All the districts have recorded water level in this range except Kandhamal. The districts which has the maximum number of wells showing this range of water level i.e., Jagatsinghpur (100.00%), Kendrapara (94.44%), Puri (72.46%), Bhadrak (71.43%), Malkangiri (68.42%), Rayagada (63.64%), Cuttack (62.50%) and Ganjam (60.87%). The major command areas of the state like Hirakud, Mahanadi, delta stage I & II, Baitarani, Salandi and Anandpur have shown water level in this range.

Water level between 5-10 m

48.80 % of the total NHS wells recorded water level in this range during April 2020. The hard rock and hilly terrains of the state has recorded water level in this range in majority of wells. The maximum percentage of wells in this range is recorded in Dhenkanal (82.93%), Kandhamal (80.00%), Baudh (75.56%), Nabarangpur (72.00%) and minimum in Kendrapara (5.56%) district. Partially all the districts of Odisha show this category except Jagatsinghapur.

Water level between 10-20 m

2.22% of the wells of the state fall in this category. It is mostly in the hilly districts like Kandhamal (20.00%), Sundargarh (10.00%), Anugul (8.47%), Koraput (5.26%).

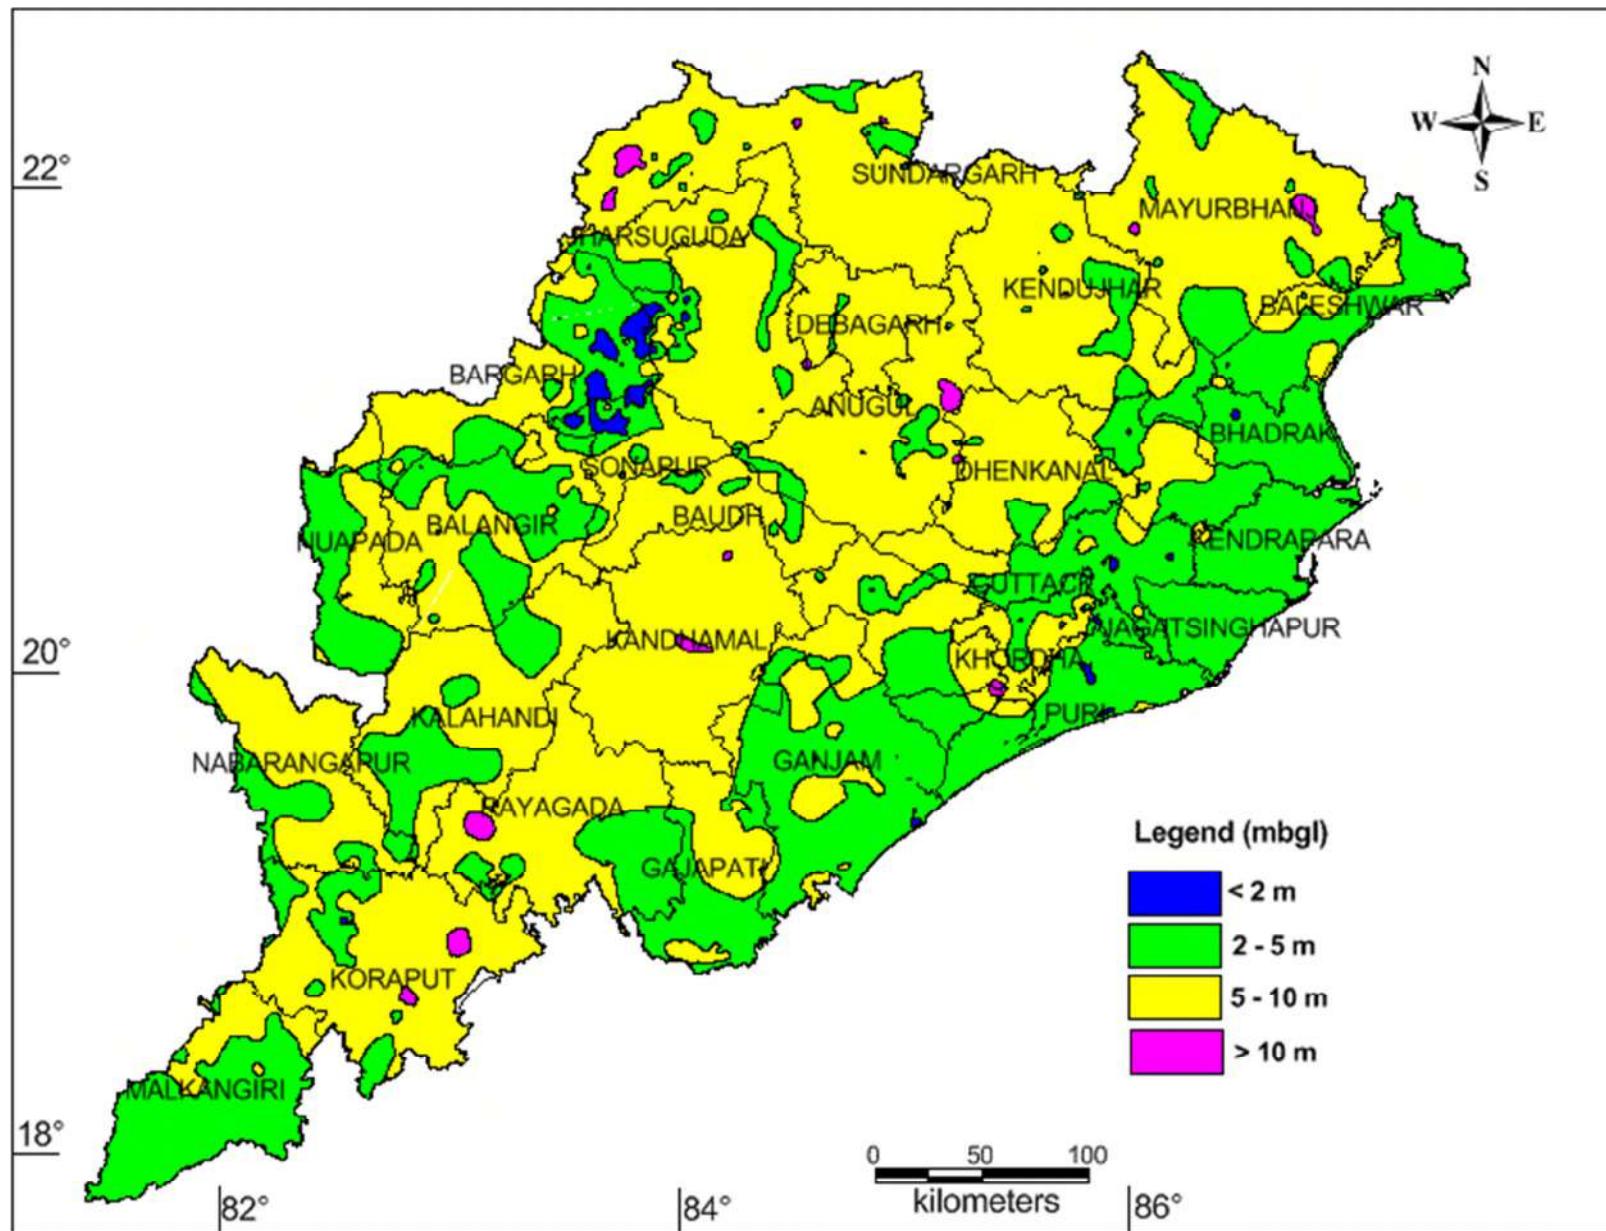

Water level more than 20m

No well have shown more than 20m of water level during April 2020.

In general, it can be said that during the month of April 2020, the state recorded water level in 2-10 m range in almost all the districts. Some wells in the hilly districts recorded water level in 10-20 m range.

7.1.2 DEPTH TO WATER LEVEL OF AUGUST 2020

A perusal of data and maps pertaining to August 2020 shows that the depth to water level ranges from 0.03 to 13.41 mbgl and in majority (62.44%) of NHS wells level was in the range of 0-2 m below ground level and 33.52% of wells in 2-5 m below ground level. The district-wise depth to water level of August 2020 is shown in **Table 7.2** and the depth to water level map has been shown in **Plate-7.2**.

Water level between 0-2 m

62.44% of the wells monitored in the state has water level in this range. The districts like Malkangiri (100%), Jagatsinghpur (92.31%), Baudh(91.30%), Bargarh (88.68%), Debagarh (87.50%), Jharsuguda (80.00%) have majority of wells with water level in this range. In most of the command areas of the state like the Hirakud, Rusikulya, Mahanadi stage I & II, Upper Kolab and Potteru the water level is in this range.

Water level between 2-5 m

33.52 % of the monitored wells showed water level in this range. The districts like Nuapada (76.92%), Kendujhar (75.34%), Kandhamal (71.43%), Balangir (59.57%), Mayurbhanj (54.46%) have majority of wells with water level in this range. All the districts of the state have recorded in this range except Malkangiri, where all the wells fall in the range of 0-2 m.

Water level between 5-10 m

Water level in this range was recorded in 3.85% of the wells in the state. Districts Like Rayagada (20.00%), Kandhamal (14.29%), Koraput (9.80%), Puri (9.46%), Khordha (8.96%), Anugul (7.02%) and Sundargarh (5.71%) showed water level in more than 5% of the wells in this range. They occur as isolated patches in areas where the water level is generally in 2-5 m range.

Water level between 10-20 m

Only 2 wells (0.16%) fall in this category and ie from 1 well in Khordha and 1 in Koraput district.

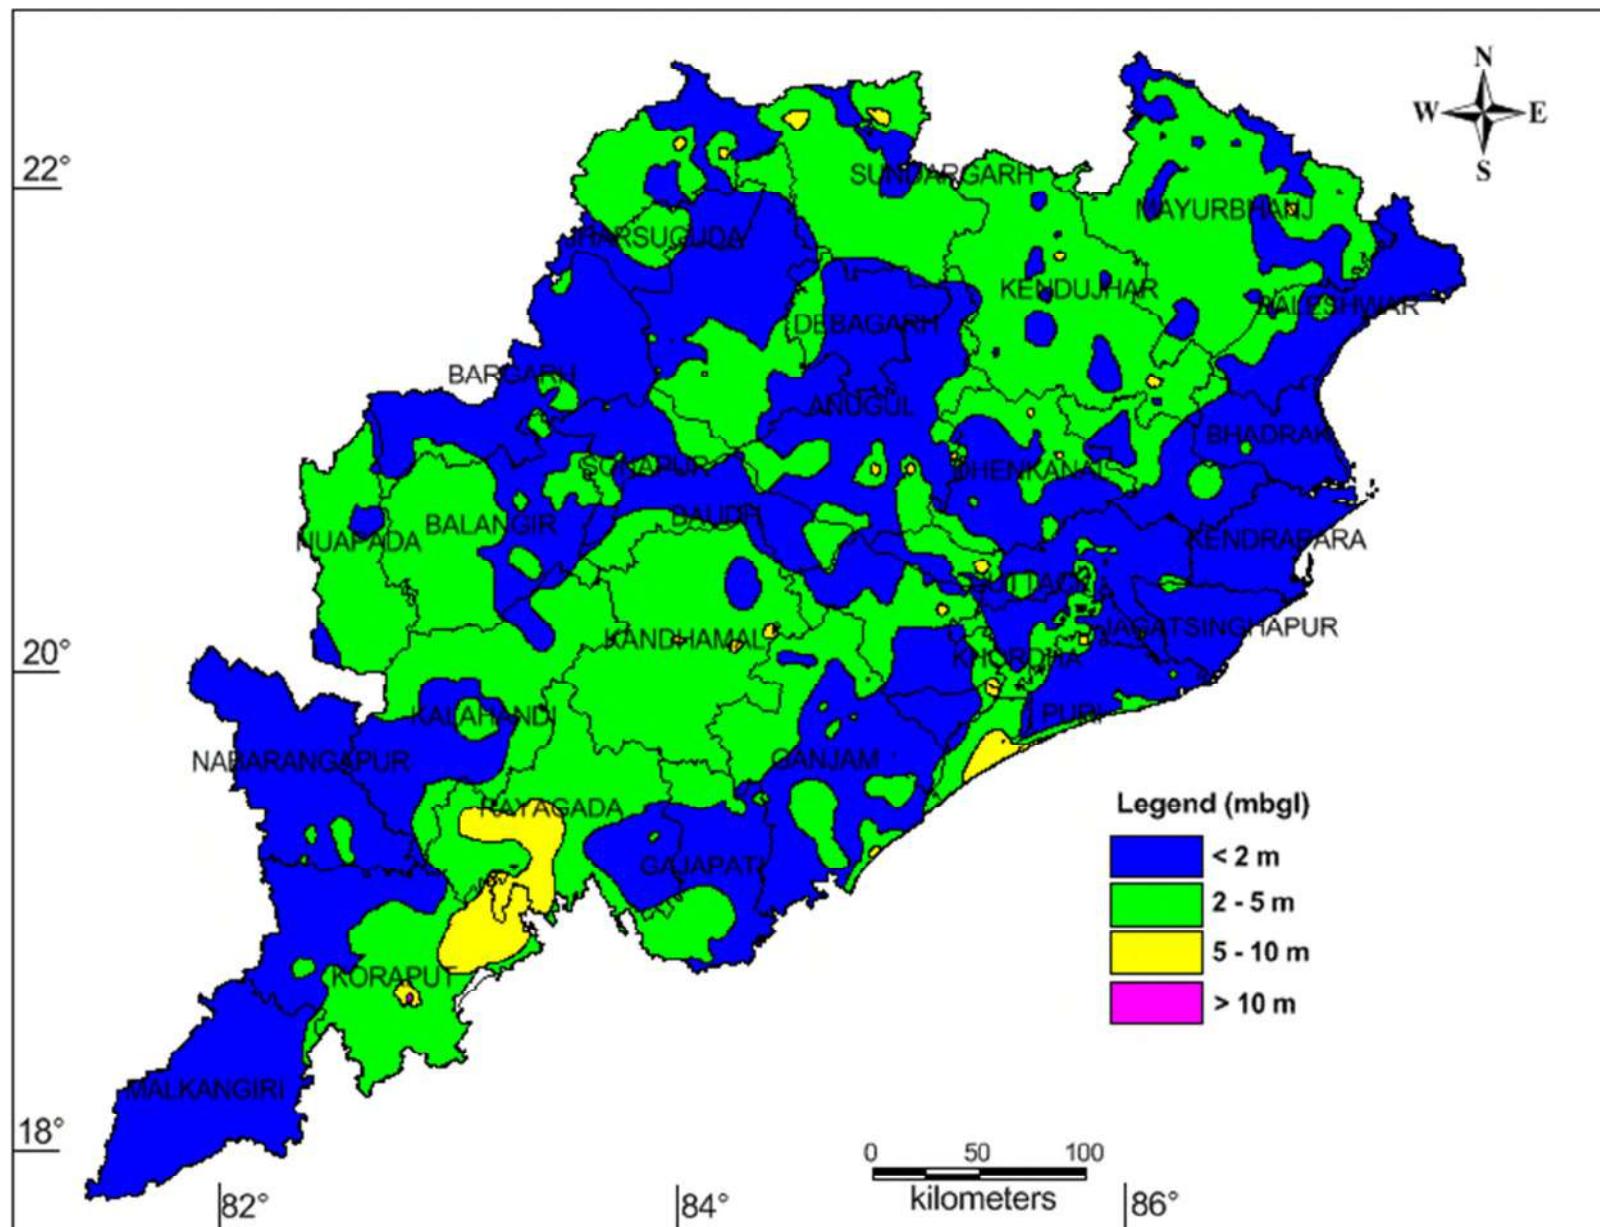

Water level more than 20 m

None of the wells monitored during August 2020 showed water level in this range.

In general the water level in the state during August 2020 monitoring is found in the range of 0-2 m bgl.

7.1.3 DEPTH TO WATER LEVEL OF NOVEMBER 2020

A perusal of data and maps pertaining to November 2020 shows that the depth to water level ranges from 0.01 to 12.76 mbgl and in majority (44.06%) of NHS wells level was in the range of 0-2 m below ground level and 47.64% of wells in 2-5 m below ground level. The district-wise depth to water level of November 2020 is shown in **Table 7.3** and the depth to water level map has been shown in **Plate-7.3**.

Water level between 0-2 m

44.06% of the wells monitored in the state has water level in this range. The coastal districts like Bhadrak (93.33%), Jagatsinghapur (90.91%) and Kendrapara (75.00%) have majority of wells with water level in this range. In most of the command areas of the state like the Hirakud, Rusikulya, Mahanadi stage I & II, Upper Kolab and Potteru the water level is in this range.

Water level between 2-5 m

47.64% of the wells monitored showed water level in this range. Among the coastal district Balasore (62.96 %), Cuttack (50%) Gajapati (44.12 %) and Puri(21.95 %) have 2 to 5 mbgl of water level. In the central and western Odisha, Boudh (50%), Nuapada (76.47%), Mayurbhanj (69.39%), Balangir (70.83%), Anugul (40.06%), and Kandhamal (34.78%) showed major of the wells in this range. All the districts of the state have recorded in this range.

Water level between 5-10 m

Water level in this range was recorded in 8.06% of the wells in the state. About 11.32% of wells in Anugul, Kandhamal (52.17%), Khordha (18.18%) Dhenkanal (10.26%), Jajpur (12.82%), Koraput (27.12%), Mayurbhanj (12.24%), Puri (10.98%), Rayagada (23.81%) and Sundargarh (10.81%) district have showed water level of the wells in this range. They occur as isolated patches in almost all the districts except Balangir, Baudh, Bhadrak, Cuttack, Debagarh, Jagatsinghapur, Jharsuguda, Kendrapara, Nayagarh and Nuapada.

Water level between 10-20 m

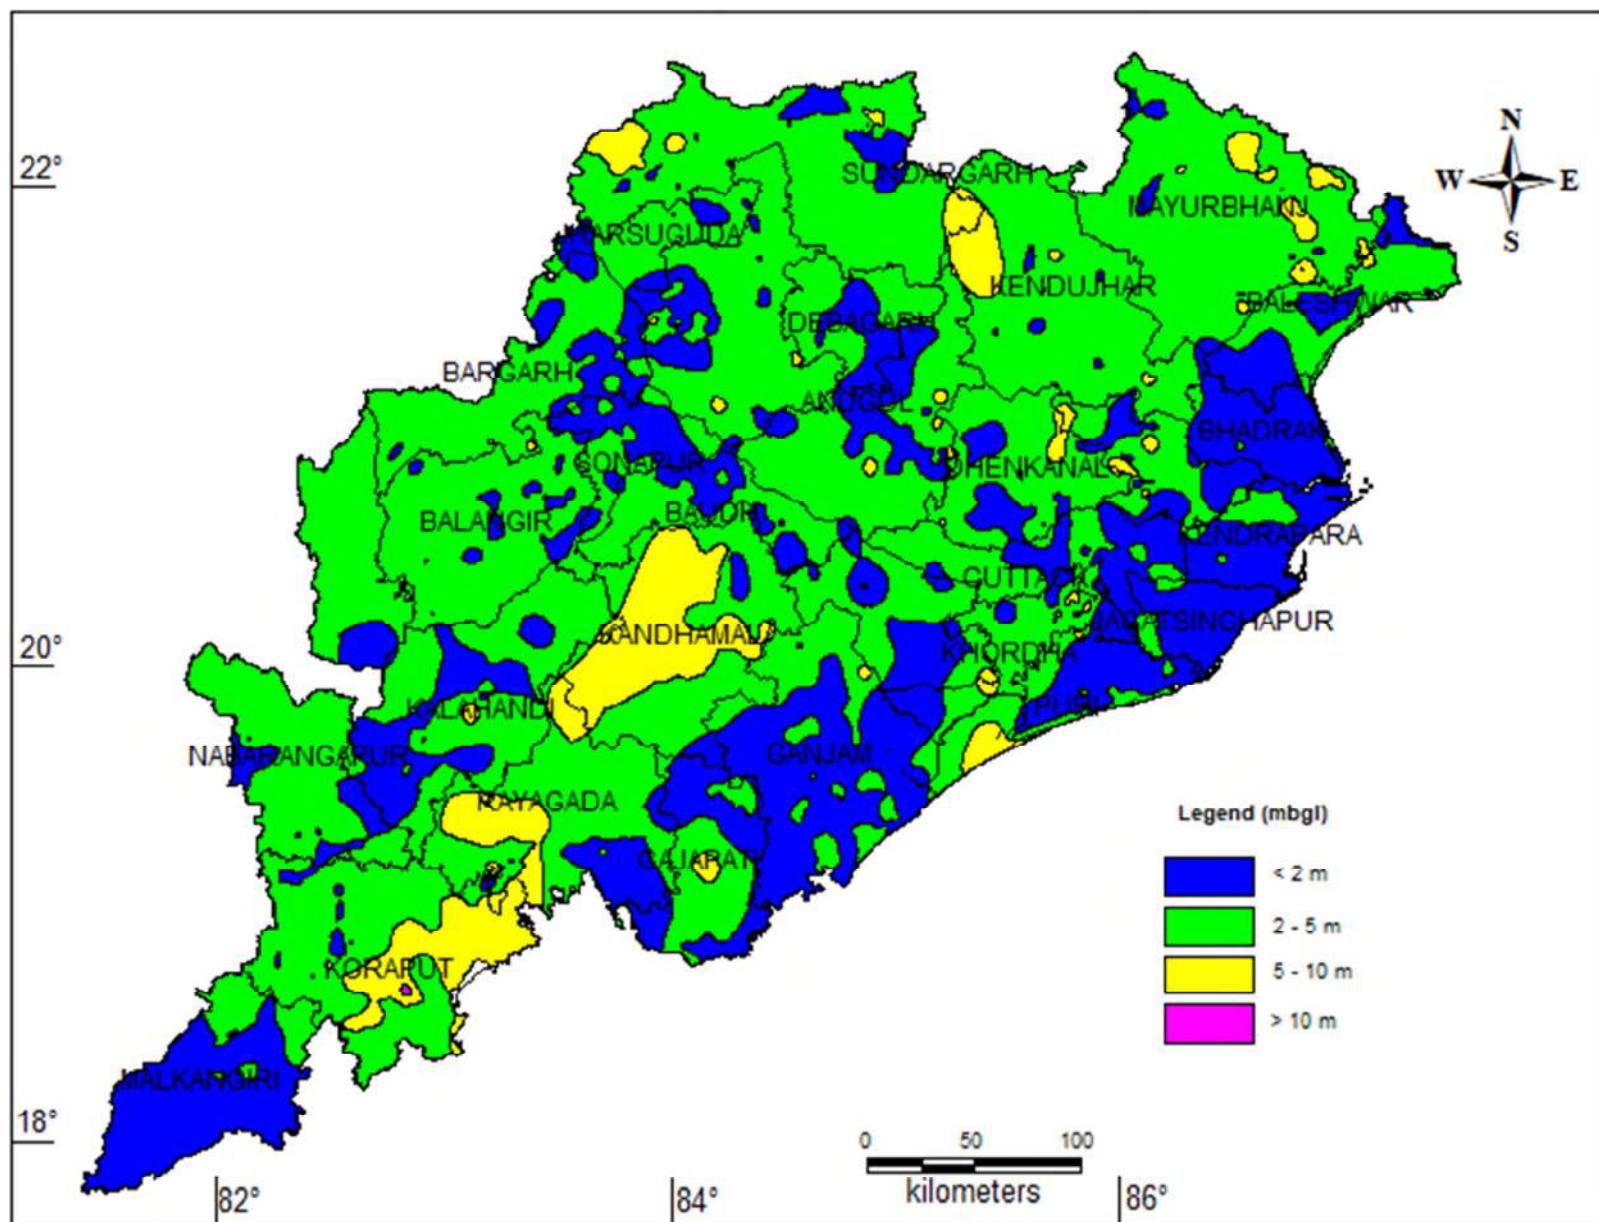

Only 3 wells (0.33%) fall in this category. 1 in Jajapur, 1 in Koraput and 1 in Mayurbhanj.

Water level more than 20m

None of the wells monitored during November 2020 showed water level in this range. In general the water level in the state during November 2020 monitoring is found in the range of 0-2 m bgl especially in the coastal stretch and in parts of the hilly terrain, whereas 2-5 m bgl water level is found in the coastal and hard rock terrain.

7.1.4. DEPTH TO WATER LEVEL OF JANUARY 2021

A perusal of data and maps pertaining to January 2021 shows that the depth to water level ranges from 0.03 to 17.30 mbgl and in majority (60.21%) of NHS wells level was in the range of 2-5 m below ground level and 20.43% of wells in 0-2 m below ground level. The district-wise depth to water level of January 2020 is shown in **Table 7.4** and the depth to water level map has been shown in **Plate-7.4**.

Water level between 0-2 m

20.43% of the wells monitored in the state has water level in this range. The coastal districts like Jagatsinghapur (69.23%), Kendrapara (53.33%), and Bhadrak (75.00%) have majority of wells with water level in this range. In most of the command areas of the state like the Hirakud, Rusikulya, Mahanadi stage I & II, Upper Kolab and Potteru the water level is in this range.

Water level between 2-5 m

60.21% of the monitored wells showed water level in this range. Among the coastal district Balasore (66.67%), Cuttack (56.72%) Gajapati (75.76%) and Puri(46.84%) have 2 to 5 mbgl of water level. In the central and western Odisha, Boudh (91.49%), Nuapada (70.00%), Mayurbhanj (68.00%), Balangir (75.68%), Anugul (52.54%), and Kalahandi (72.73%) showed more than 50% of the wells in this range. All the districts of the state have recorded in this range.

Water level between 5-10 m

Water level in this range was recorded in 18.27% of the wells in the state. About 37.29% of wells in Anugul, Kandhamal (58.33%), Khordha (43.75%) Dhenkanal (34.15%), Debagarh (20.00%), Koraput (36.36%) and Nabarangapur (20.83%) district have showed water level of the wells in this range. They occur as isolated patches in almost all the districts except Kendrapara.

Water level between 10-20 m

Only 15 wells (1.07%) fall in this category. 2 in Anugul, 3 in Jajapur, 2 in Kandhamal, 1 in Khordha, 1 in Koraput, 2 in Mayurbhanj, 1 in Nuapada, 1 in Rayagada, 1 in Sambalpur and 1 in Sundargarh.

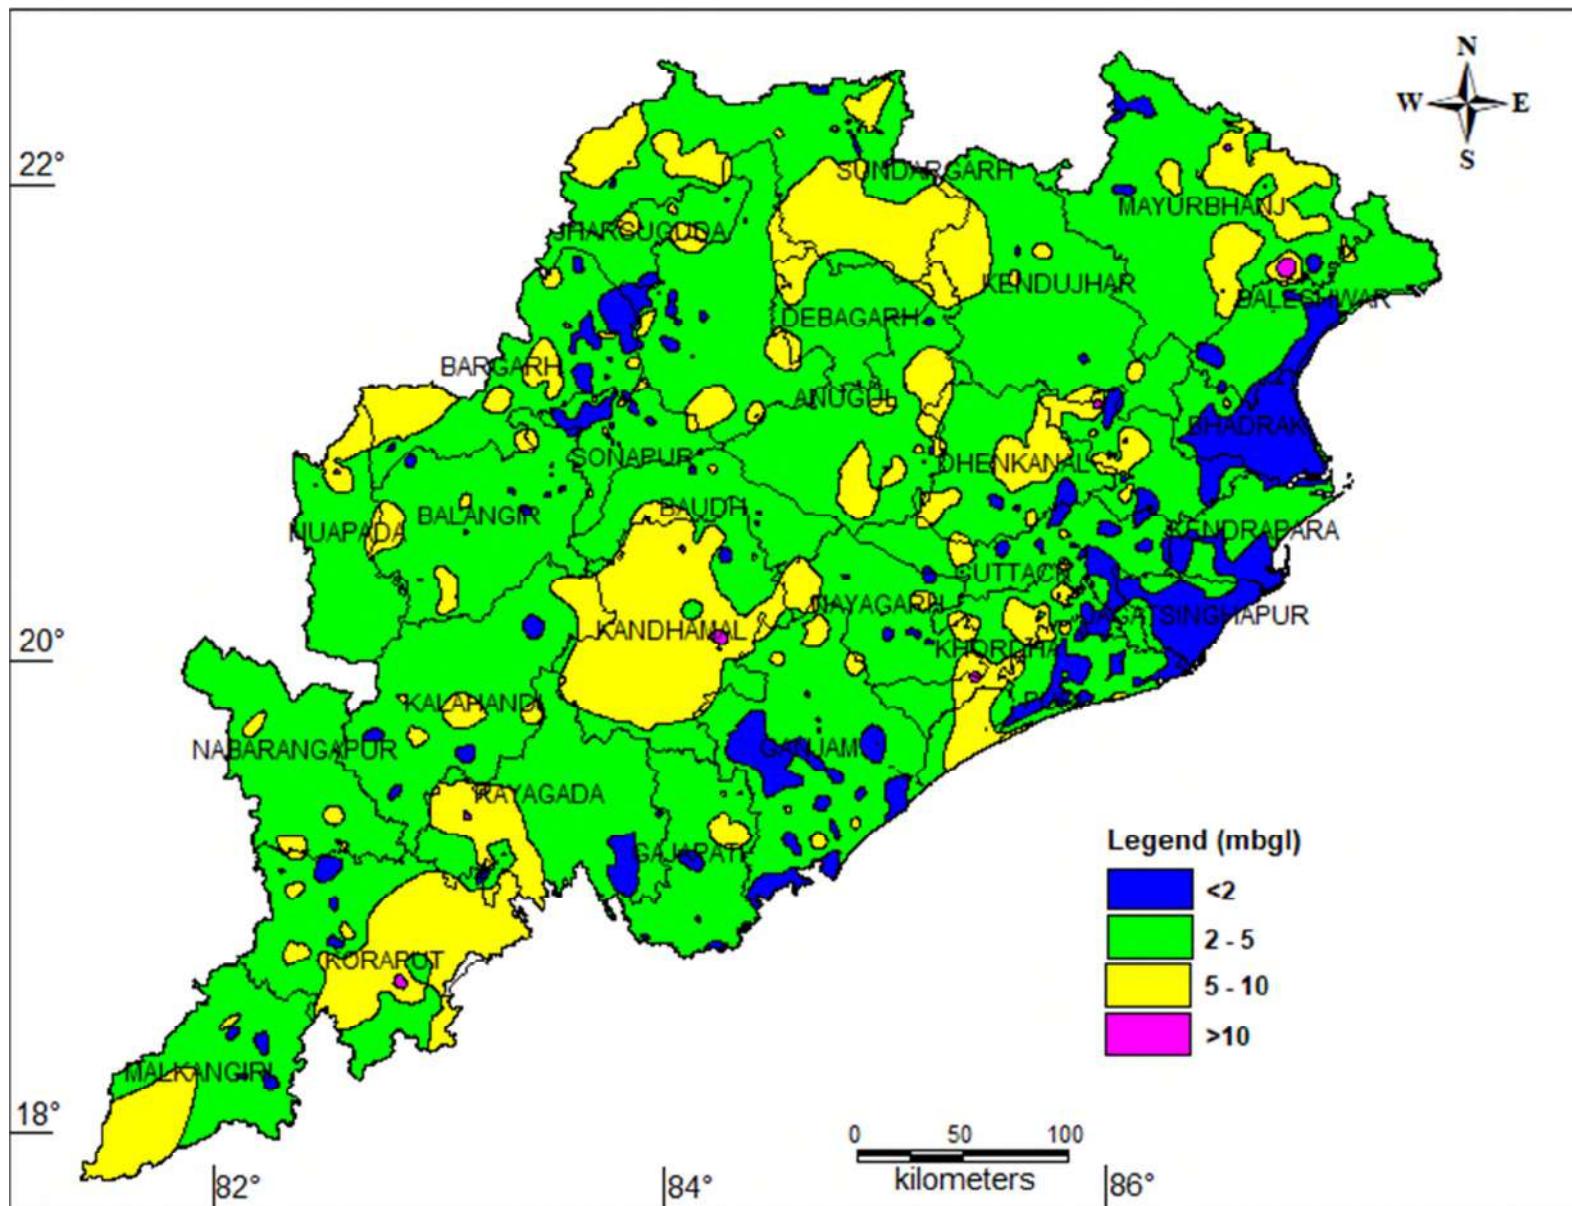

Water level more than 20m

None of the wells monitored during January 2021 showed water level in this range.

In general the water level in the state during January 2021 monitoring is found in the range of 0-2 m bgl especially in the coastal stretch and in parts of the hilly terrain, whereas 2-5 m bgl water level is found in the coastal and hard rock terrain.

7.2 FLUCTUATION IN COMPARISON TO CORRESPONDING PERIOD OF PREVIOUS YEAR

7.2.1 APRIL 2019 - APRIL 2020

The district-wise categorization of change in water level during April-2019 with respect to that of April-2020 has been given in **Table 7.5** and has been presented in **Plate 7.5**.

Rise of water level

A perusal of data and map showing the variation in water level of April 2019 with respect to April 2020 shows that 33.83% of the wells recorded a rise in water level. Maximum number of wells have shown rise in 0-2m range, i.e., 31.64% of the total wells analysed. All the districts show this range of rise including the command areas of the state. Rise in 2-4m range is noticed only in 2.02% of the wells, mainly in Baleshwar, Kalahandi, Koraput, Malkangiri and Rayagada districts. Rise of more than 4m is observed only in 0.16 % of the wells in Koraput and Sundargarh districts.

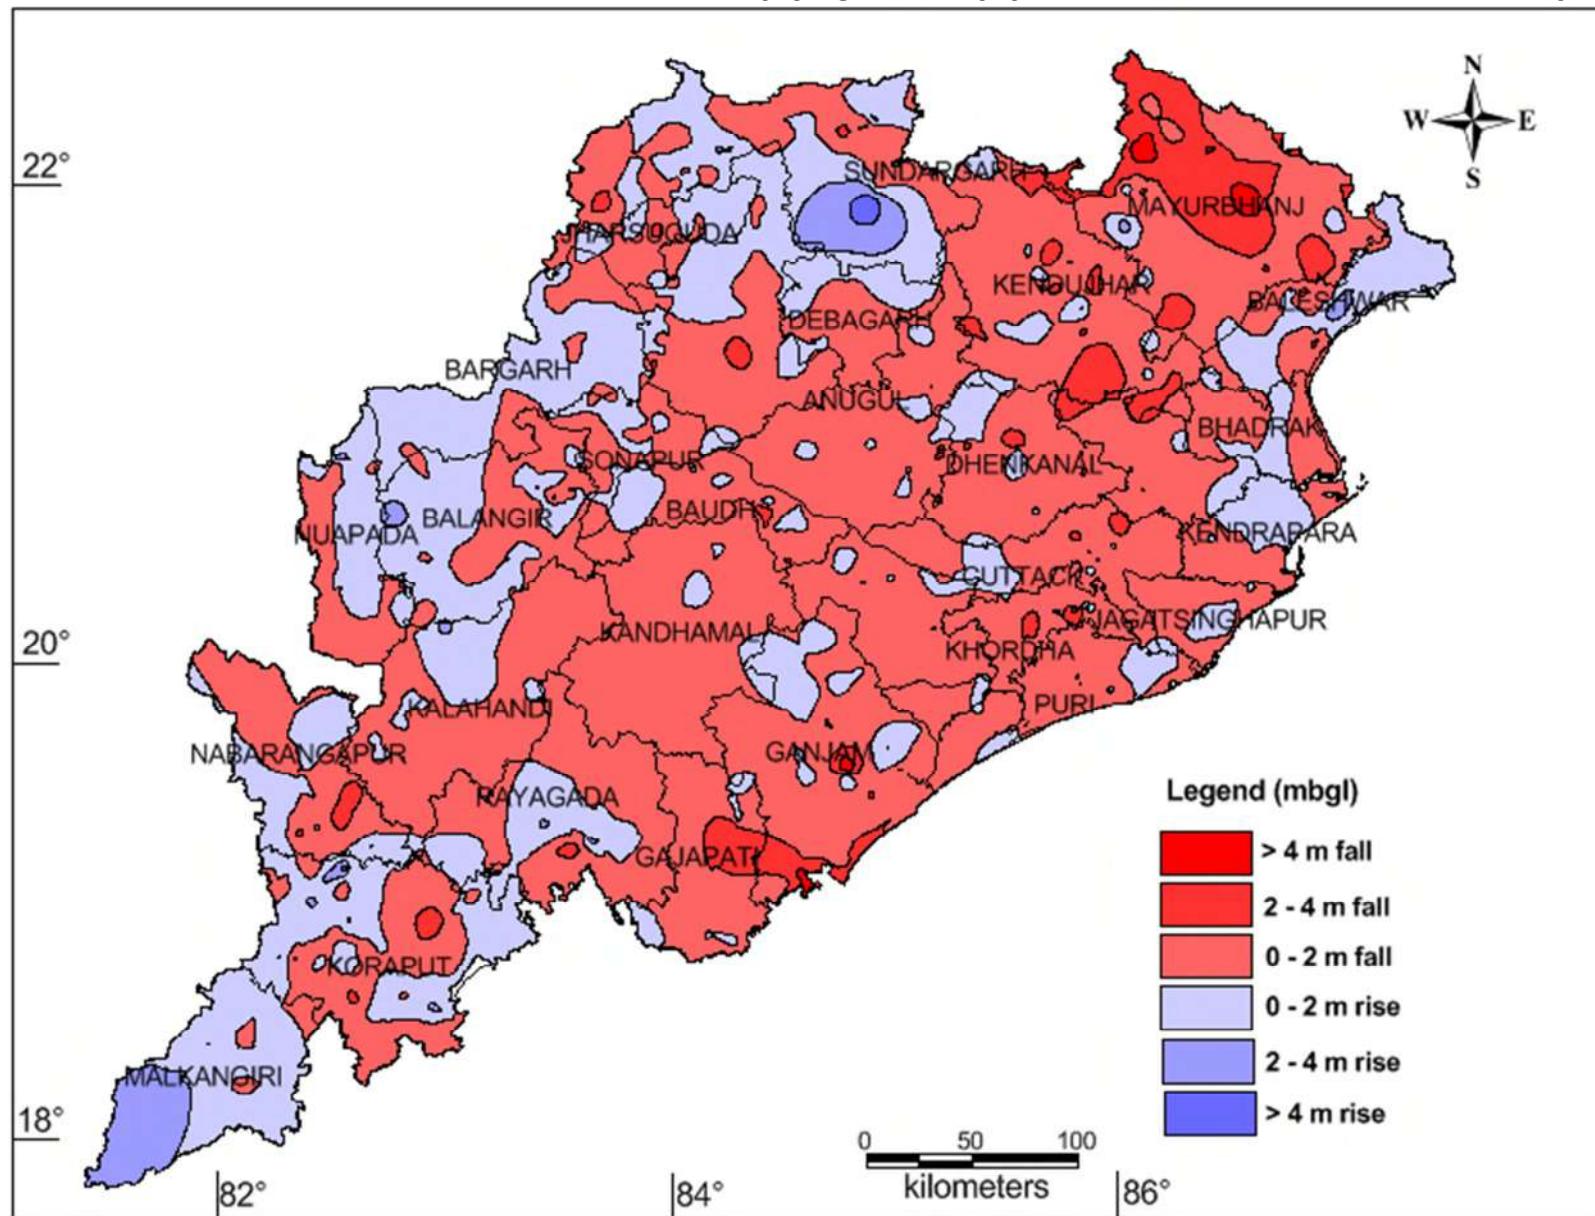

Fall of water level

A perusal of data and map pertaining to the fluctuation of April 2019 with respect to April 2020 shows that in 64.39% of wells there has been fall in water level. The fall in water level in the range of 0-2m have been observed in 56.22 % of the wells in the state. It varies from minimum of 21.43 % in Bargarh district to maximum of 84.62% in Jajapur district. Fall in 2-4m range is observed only in 7.32% of wells. More than 4 m fall in water level has been observed in a minor 0.84% wells of the state.

In general a rise and fall in water level has been observed in April 2019 with respect to April 2020.

7.2.2 AUGUST 2019 - AUGUST 2020

The district-wise categorization of change in water level during August-2019 with respect to that of August-2020 has been given in **Table 7.6** and rise/ fall map has been presented in **Plate 7.6**.

Rise in water level

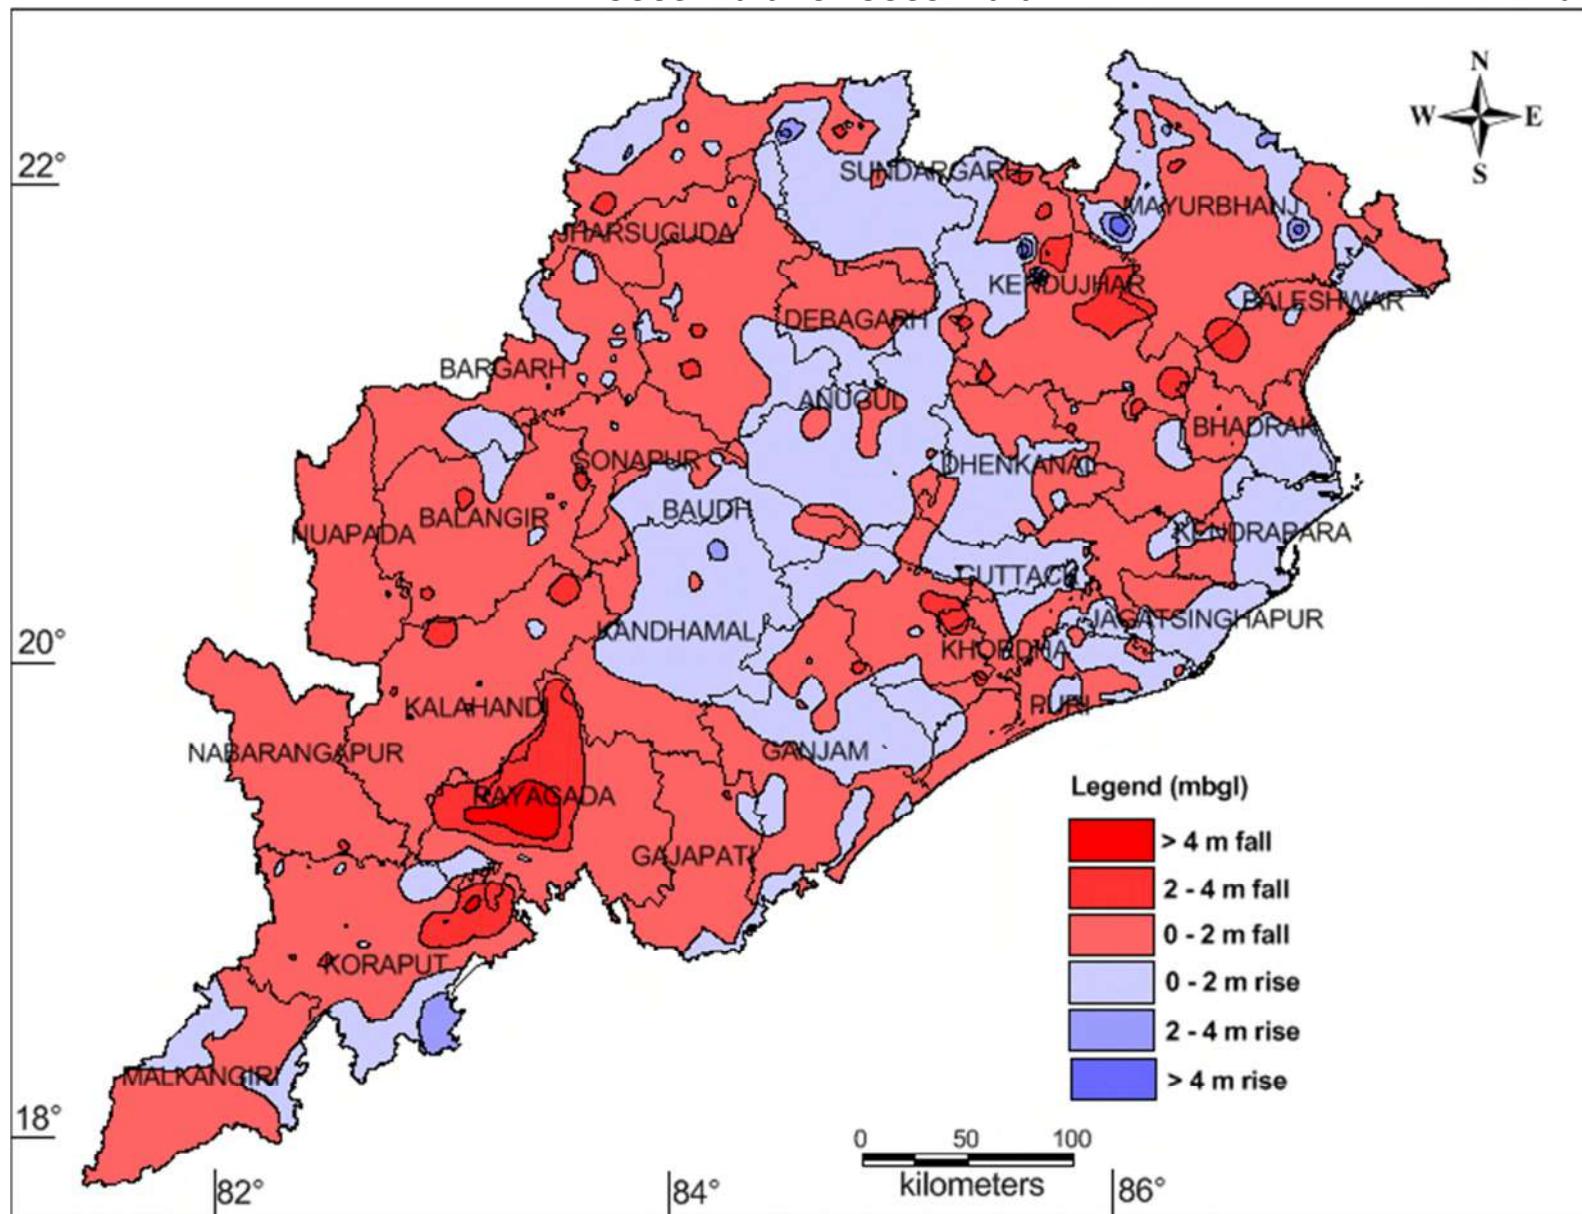

A perusal of data and maps pertaining to fluctuation of August 2019 water level with that of August 2020 showed that 35.13% of the total stations showed a rise in water level. The rise is more in 0-2 m range ie about 33.27%; 1.30% in 2-4 m range and 0.55% in greater than 4 m range. All the districts have recorded water level in 0-2m range except Nabarangpur and Nuapada. 2-4m range occurs in isolated patches throughout the state. Only 6 wells (0.55%) of the total wells monitored showed greater than 4 m rise.

Fall in water level

A total of 63.38% NHS showed a fall in water level in August 2019 as compared to August 2020. Out of which 57.71% wells showed fall in 0-2m range, 5.20% in 2-4m range and a minor 0.46% in greater than 4 m range. Jharsuguda district shows a maximum fall of 90.00% and Kandhamal district shows a minimum fall of 8.33% in the range of 0-2m. Fall in 2-4m range is found in isolated patches in the state with districts mainly Baleshwar, Balangir, Gajapati, Kalahandi, Kendujhar, Koraput, Nabarangapur and Rayagada districts. Greater than 4m fall in water level is found in Kendujhar, Koraput and Rayagada. They occur as minor patches within areas showing fall in 2-4range.

7.2.3 NOVEMBER 2019 - NOVEMBER 2020

The district-wise categorisation of change in water level during November-2019 with respect to November-2020 has been given in **table 7.7** and rise/ fall map has been presented in **Plate 7.7**.

Rise in water level

A perusal of data and maps pertaining to fluctuation of November 2020 water level with that of November 2019 showed that 53.84% of the total stations showed a rise in water level. The rise is more in 0-2 m range i.e. 50.43%; 2.97% in 2-4 m range and 0.47% in more than 4 m range. All the districts have recorded rise in 0-2m range. Most of the districts show water level rise in 2-4 m range except Balangir, Baleswar, Bhadrak, Cuttack, Debagarh, Jagatsinghapur, Jajpur, Jharsuguda, Kalahandi, Kendrapara, Khordha, Malkangiri, Nuapada, Puri and Rayagada. Only 5 wells (0.47%) of the total wells monitored showed greater than 4 m rise. They occur as minor patches within the state.

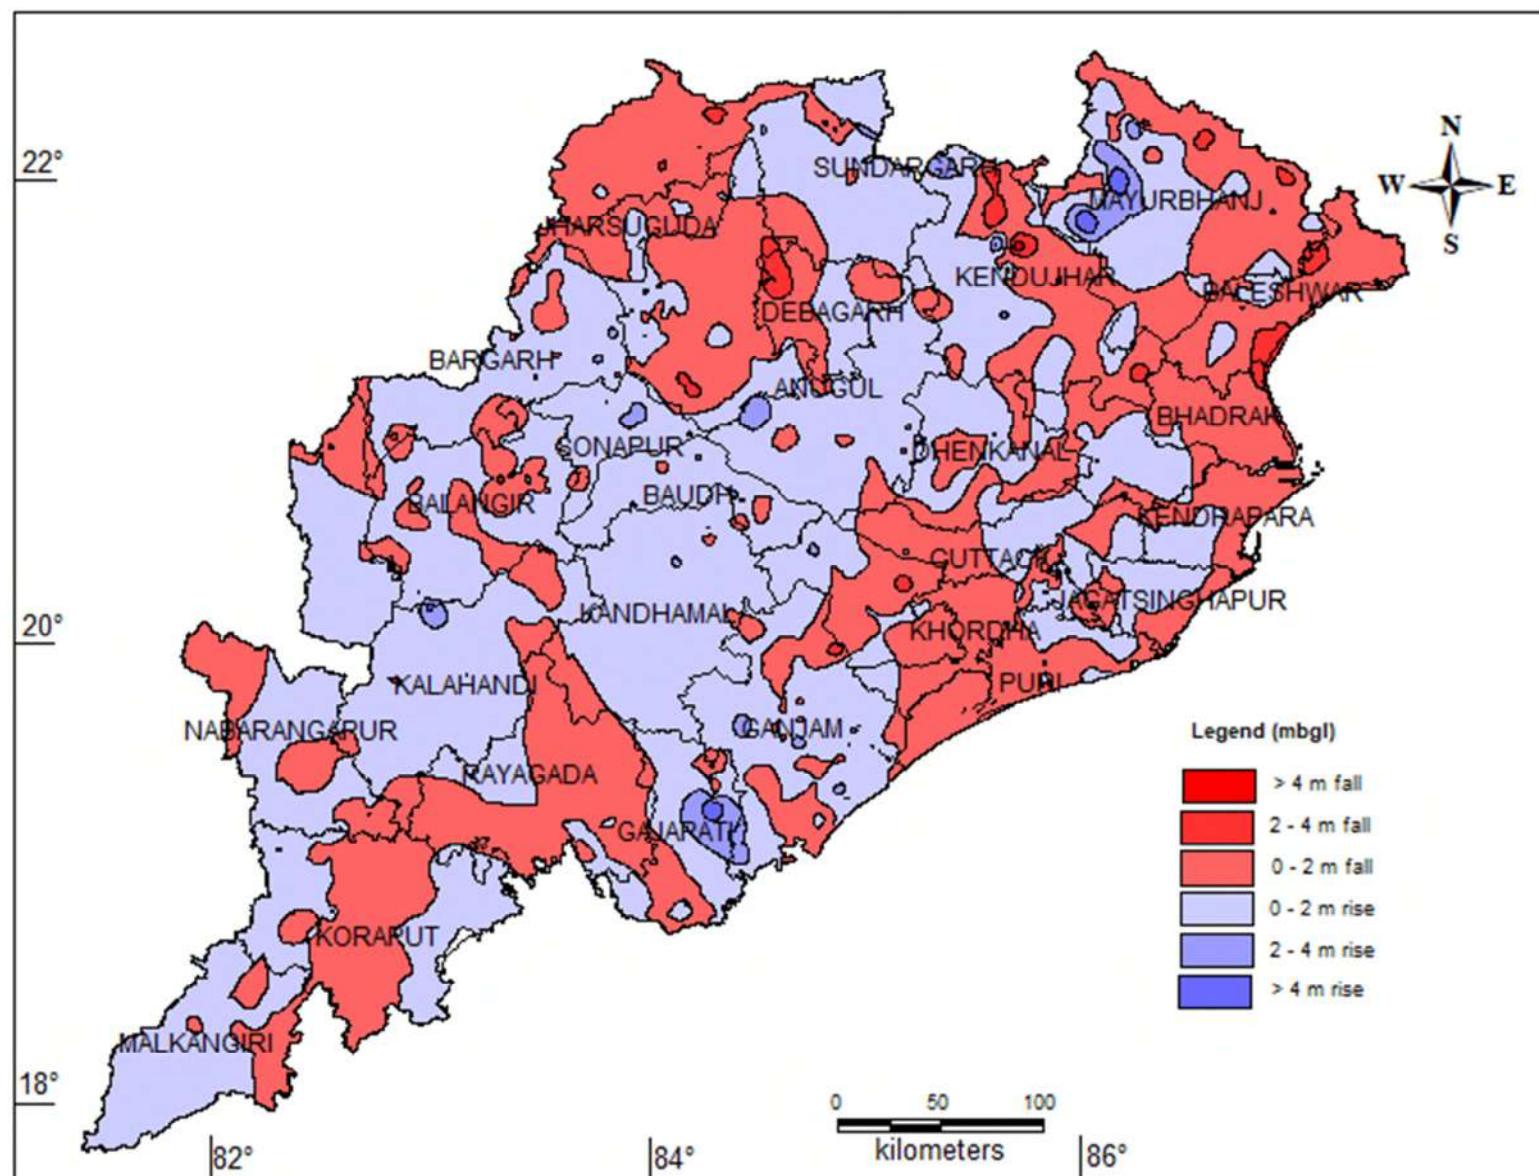

Fall in water level

A total of 43.35% NHS showed a fall in water level in November 2020. About 41.34% wells showed fall in 0-2m range, 1.92% in 2-4m range and a minor 0.08% in greater than 4 m range. All the districts have recorded fall in the range of 0-2m. Fall in 2-4m range is found in Balangir, Baleswar, Bargarh, Debagarh, Gajapati, Ganjam, Kendujhar, Khordha, Mayurbhanj, Nayagarh, Sambalpur and Sundargarh. Greater than 4m fall in water level is found in Kendujhar district.

In general a rise in water level is observed throughout the state during November 2019 with respect to November 2020 and majority of wells recorded 0-2 m rise due to variation of monsoon rainfall and development.

7.2.4 JANUARY 2020 – JANUARY 2021

The district-wise categorisation of change in water level during January-2020 with respect to that of January-2021 has been given in **Table 7.8** and has been presented in **Plate 7.8**.

Rise in water level

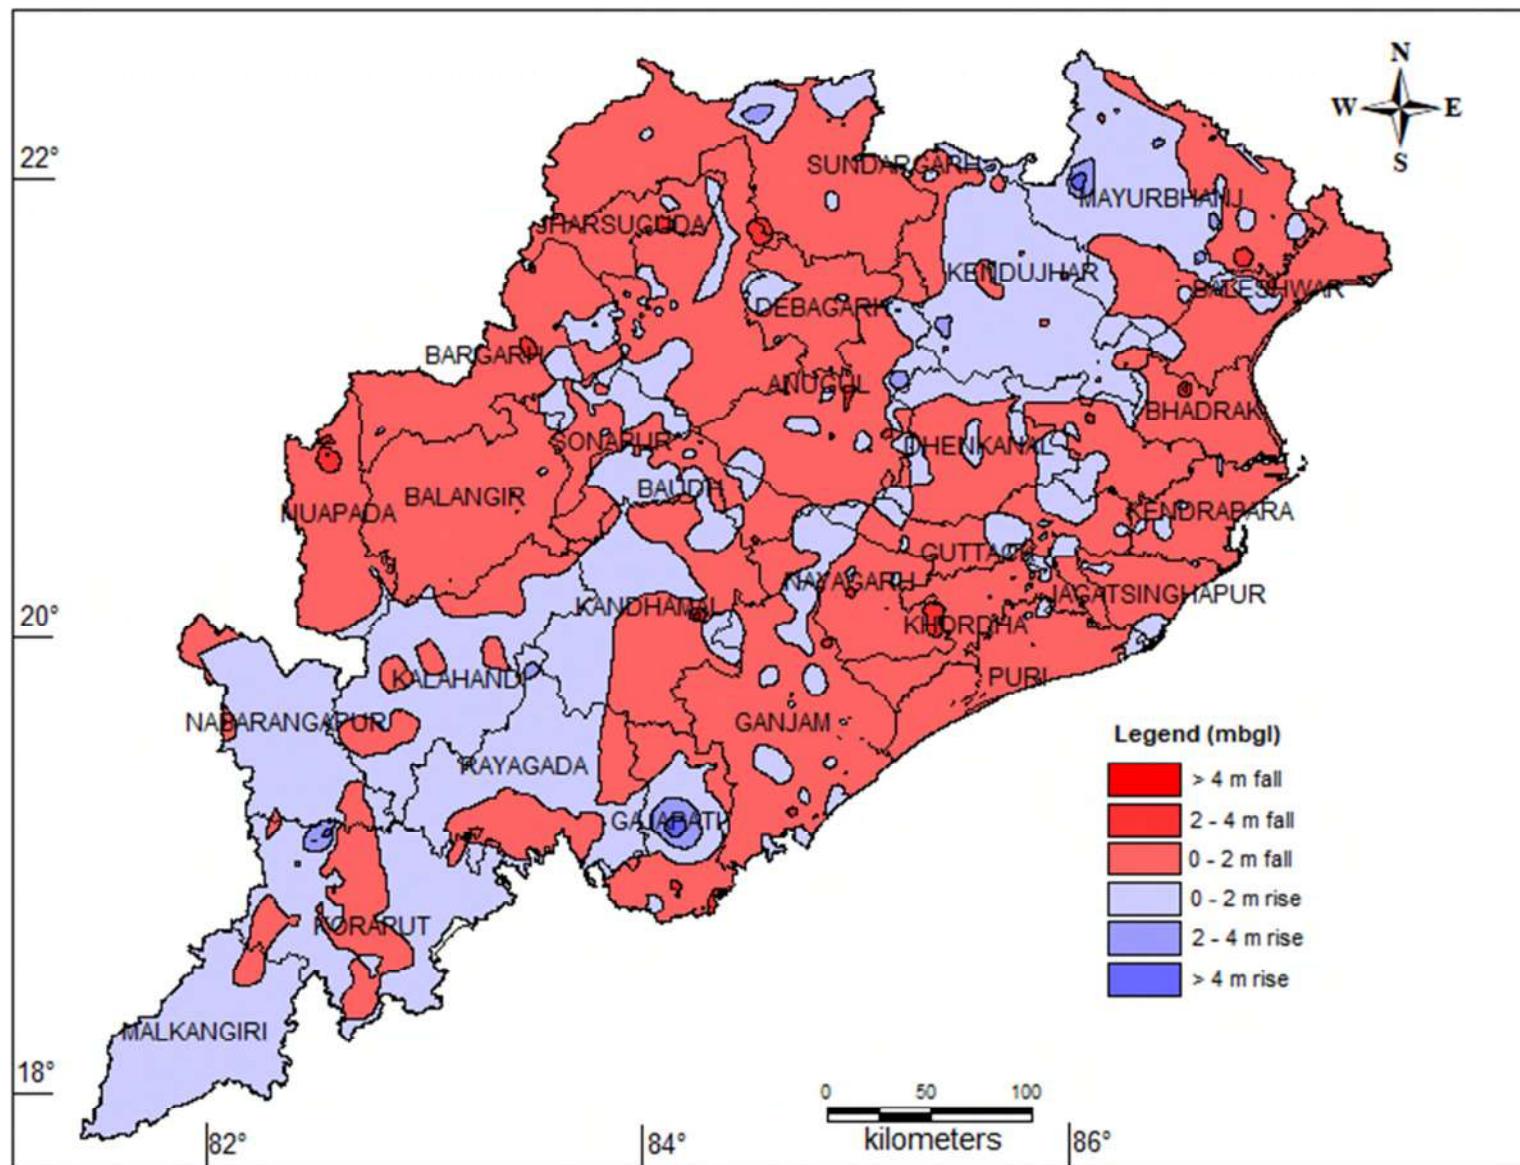

A perusal of data and maps pertaining to fluctuation of January 2021 water level with that of January 2020 showed that 33.64% of the total stations showed a rise in water level. The rise is more in 0-2 m range ie about 31.83%, 1.41% in 2-4 m range and 0.39% in greater than 4 m range. All the districts have recorded water level in 0-2m range. 2-4m range occurs in isolated patches throughout the state. Only 5 wells (0.39%) of the total wells monitored showed greater than 4 m rise.

Fall in water level

A total of 64.38% NHS showed a fall in water level in January 2021 as compared to January 2020. Out of which 61.22% wells showed fall in 0-2m range, 2.91% in 2-4m range and a minor 0.236% in greater than 4 m range. Balangir district shows a maximum fall of 87.32% in the range of 0-2m. Fall in 2-4m range is found in isolated patches in the state with districts mainly Anugul, Bargarh, Jajapur, Ganjam, Gajapati, Mayurbhanj, Nayagarh and Sambalpur districts. Greater than 4m fall in water level is found in Bhadrak, Kandhamal and Nuapada. They occur as minor patches.

7.3 FLUCTUATION WITH RESPECT TO PRE-MONSOON WATER LEVEL

7.3.1 APRIL 2020 - AUGUST 2020

The district-wise categorization of change in water level during August-2020 with respect to that of April-2020 has been given in **Table 7.9** and rise / fall map has been presented in **Plate 7.9**.

Rise in water level

99.6 % of the wells monitored in August 2020 showed a rise in water level when compared with that of April 2020 (Pre-monsoon). 25.76% of wells showed rise in 0-2 m range, 44.05% in 2-4 m range and 29.79% rise in the range of more than 4m. A maximum of 66.67% of wells in Kendrapara district and a minimum of 2.33% in Baudh district recorded a rise in the range of 0-2m. A maximum of 75.00% of wells in Balangir district and a minimum of 25.00% in Kandhamal district recorded rise in the range of 2 – 4m. A maximum of 75.00% of wells in Kandhamal district and a minimum of 1.64% in Puri district recorded rise in the range of >4m.

Fall in water level

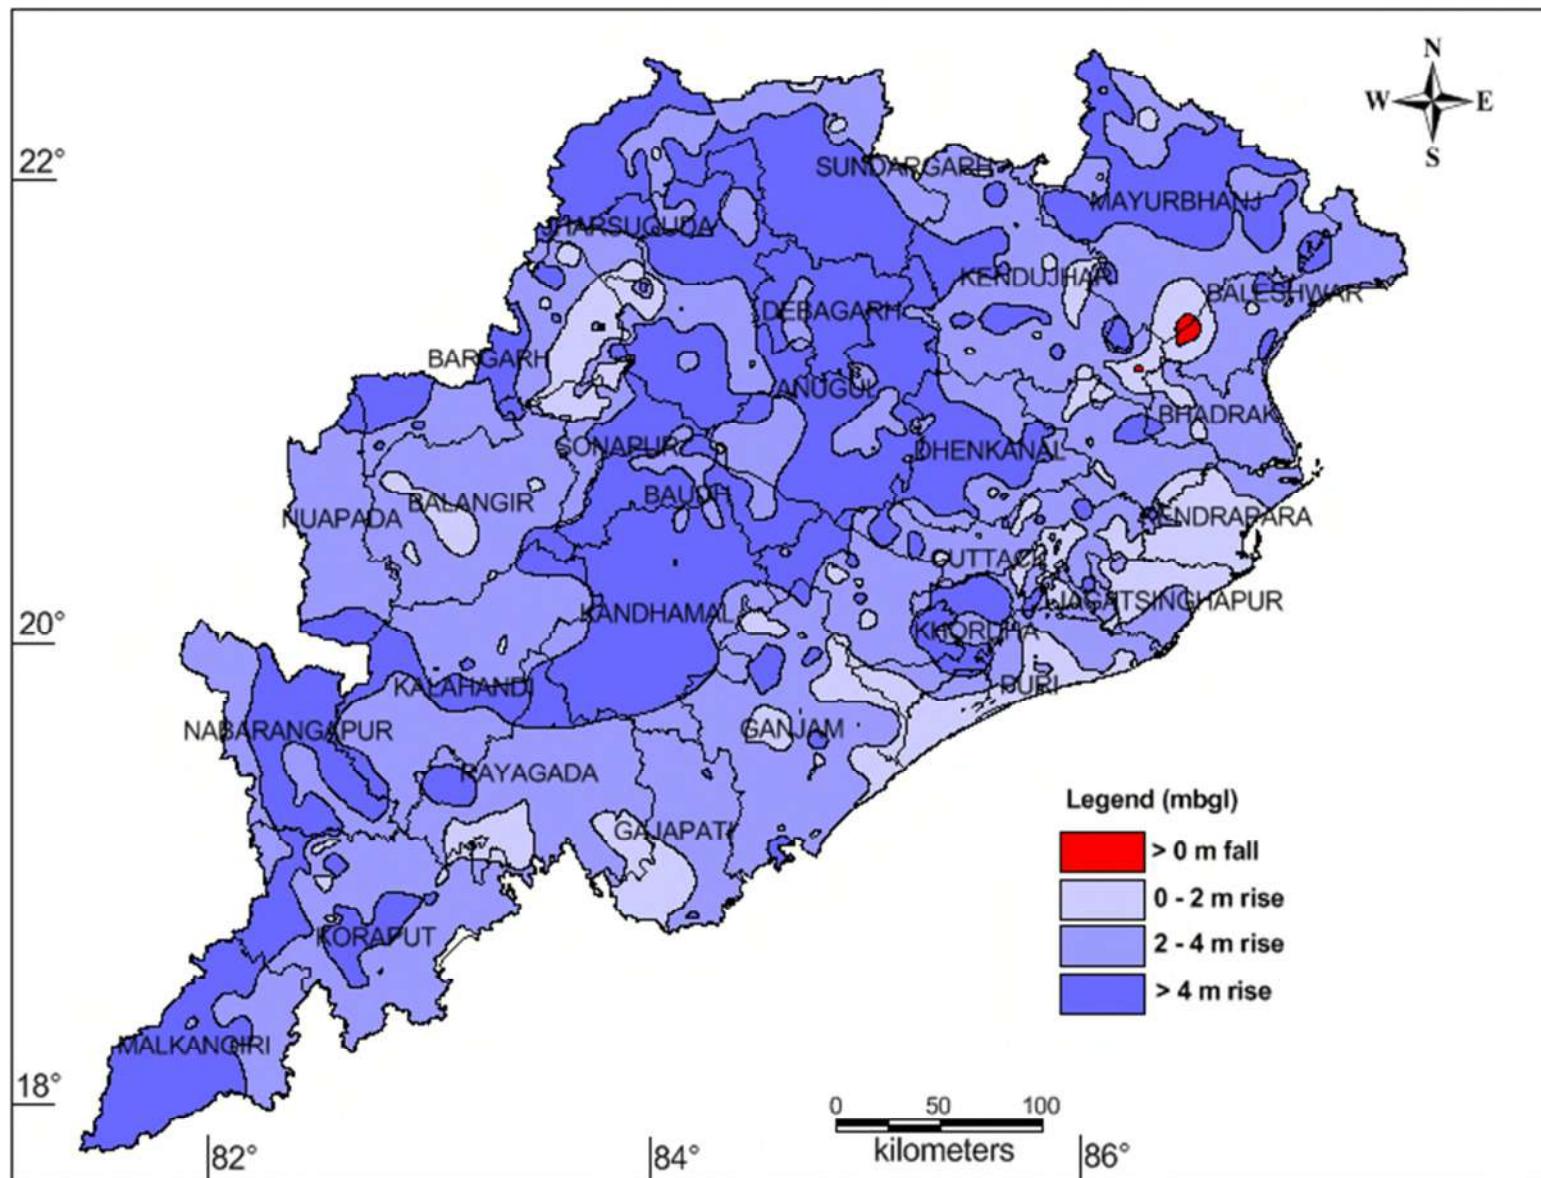

Only 0.39% of the wells monitored showed a fall in water level. 0.39% of wells showed fall in 0-2 m range. The fall in 0-2m range is seen in Baleshwar, Kendujhar, Khordha, Nayagarh districts.

In general as it should be, a rise in water level is observed throughout the state during August 2020 with respect to April 2020 and majority of wells recorded 0-4 m rise because of recharge of aquifer due to monsoon rainfall.

7.3.2 APRIL 2020 - NOVEMBER 2020

The district-wise categorization of water level fluctuation of April 2020 with respect to November-2020 has given in **Table 7.10** has been shown in **Plate :- 7.10**.

Rise in water level

97.50 % of the wells monitored in November 2020 showed a rise in water level when compared with that of April 2020. About 36.53% of wells showed rise in 0-2 m range, 42.25% in 2-4 m range and 18.72% rise in the range of more than 4m. A maximum of 83.33% of wells in Puri district and a minimum of 7.69% in Kandhamal district recorded a rise in the range of 0-2m. A maximum of 80.00% of wells in Kalahandi and a minimum of 12.50% in Jagatsinghpur district recorded rise in the range of 2 – 4m with majority of the districts in the state have more than 25% of the wells showing rise in this range. A maximum of 42.86% of wells in Debagarh and a minimum of 1.52% in Puri district recorded rise in the range of more than 4m.

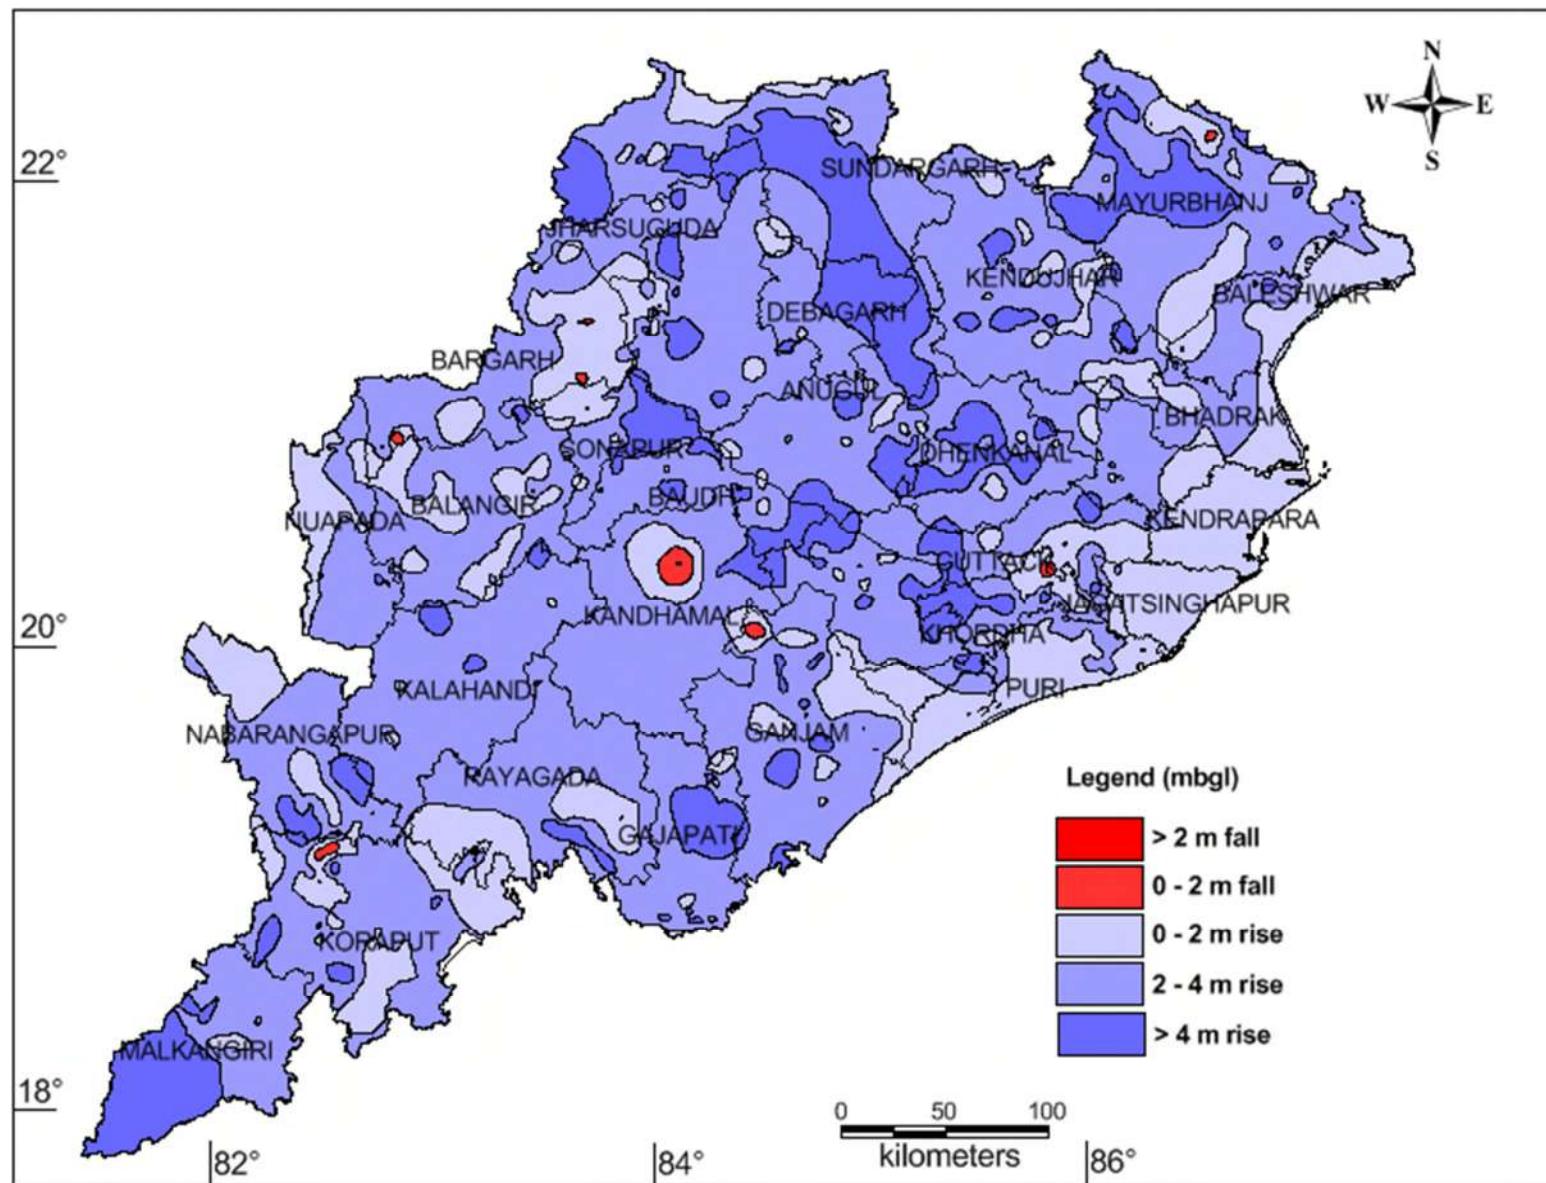

Fall in water level

Only 2.39% of the wells monitored showed a fall in water level which almost fall in 0-2 m range. The fall in 0-2m (2.30%) range is seen in Balangir, Baleswar, Bargarh, Ganjam, Khordha, Koraput, Mayurbhanj, Nabarangpur, Puri, Sambalpur, Sonapr and Sundargarh districts. Only 1 well in Kandhamal district shows water level fall in 2-4 m range (0.09%).

In general as it should be, a rise in water level is observed throughout the state during November 2020 with respect to April 2020.

7.3.3 APRIL 2020 – JANUARY 2021

The district-wise categorization of water level fluctuation of January 2021 with respect to April 2020 has been given in **Table 7.11** and has been presented in **Plate 7.11**.

Rise in water level

A perusal of the data and map pertaining to January 2021 with reference to April 2020 shows that 90.31% of total wells show rise in water level. Rise in water level between 0-2m has been observed in 56.54 % of the wells with maximum of 88.89% of wells in Jagatsinghpur district and a minimum of 21.43% in Bhadrak district. Wells showing rise in 2-4 m range is 27.83 % and 5.93 % of wells show rise more than 4m.

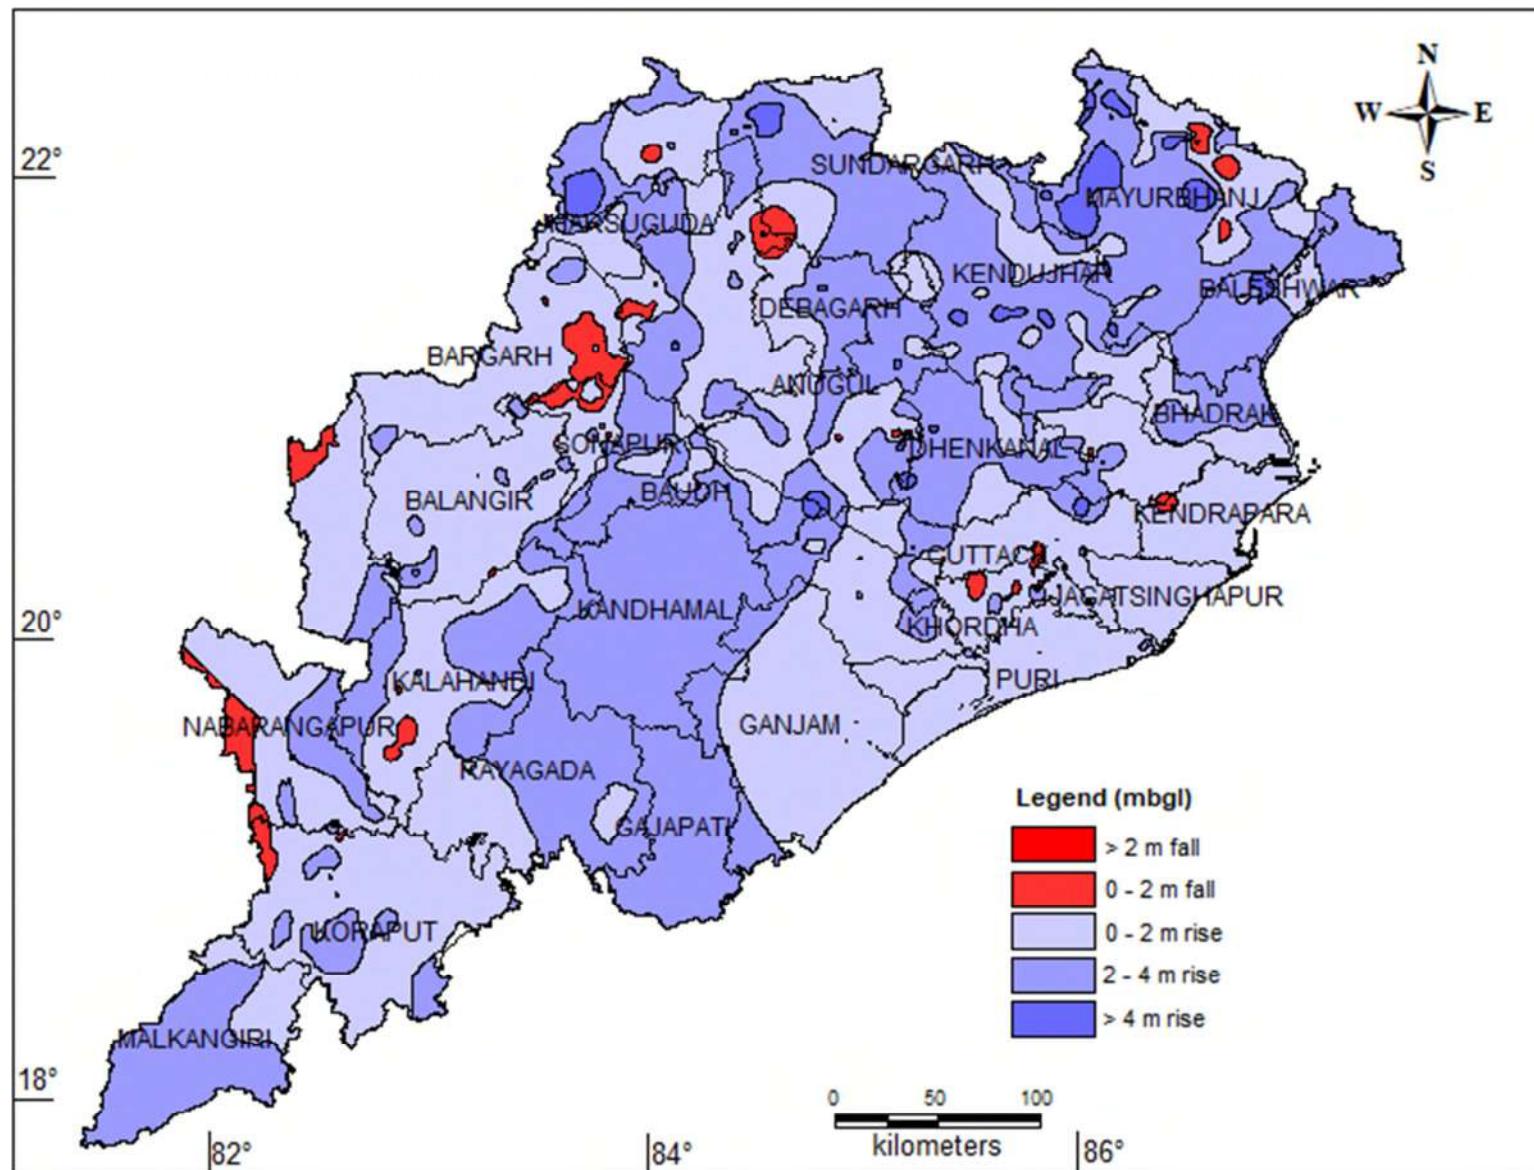

Fall in water level

9.51% of the wells monitored showed a fall in water level which almost fall in 0-2 m range. The fall in 0-2m (9.16%) range is seen in adequate number of wells in Bargarh, Khordha, Sonapur, Puri, Koraput, Mayurbhanj districts. The fall in 2-4 m (0.34%) range is seen in Bargarh, Mayurbhanj, Sambalpur and Sundargarh districts.

In general as it should be, a rise in water level is observed throughout the state during January 2021 with respect to April 2020 and majority of wells recorded 0-4 m rise because of recharge of aquifer due to monsoon rainfall.

7.4 WATER LEVEL FLUCTUATION WITH RESPECT TO DECADAL MEAN

7.4.1 APRIL 2020 – DECADAL MEAN (APR 2010 – APR 2019)

The district-wise categorisation of change in water level in April-2020 with respect to the decadal mean (April 2010 to April 2019) has been given in **Table-7.12** and rise and fall map has been presented in **Plate-7.12**.

Fall in water level

A perusal of the data and map pertaining to April 2020 with reference to decadal mean (2010-2019) shows fall in water level is observed in 45.48% of the total wells in the state. 45.40% of the wells have shown fall in the 0-2m range. It varies from minimum of 26.67% of wells in Jharsuguda district to a maximum of 70.00% of wells in Baleswar district. Almost all the districts have shown water level in this range. The range of 2-4m fall in water level has been observed in 0.08% of the state only in Ganjam district. No district is showing a fall of more than 4m.

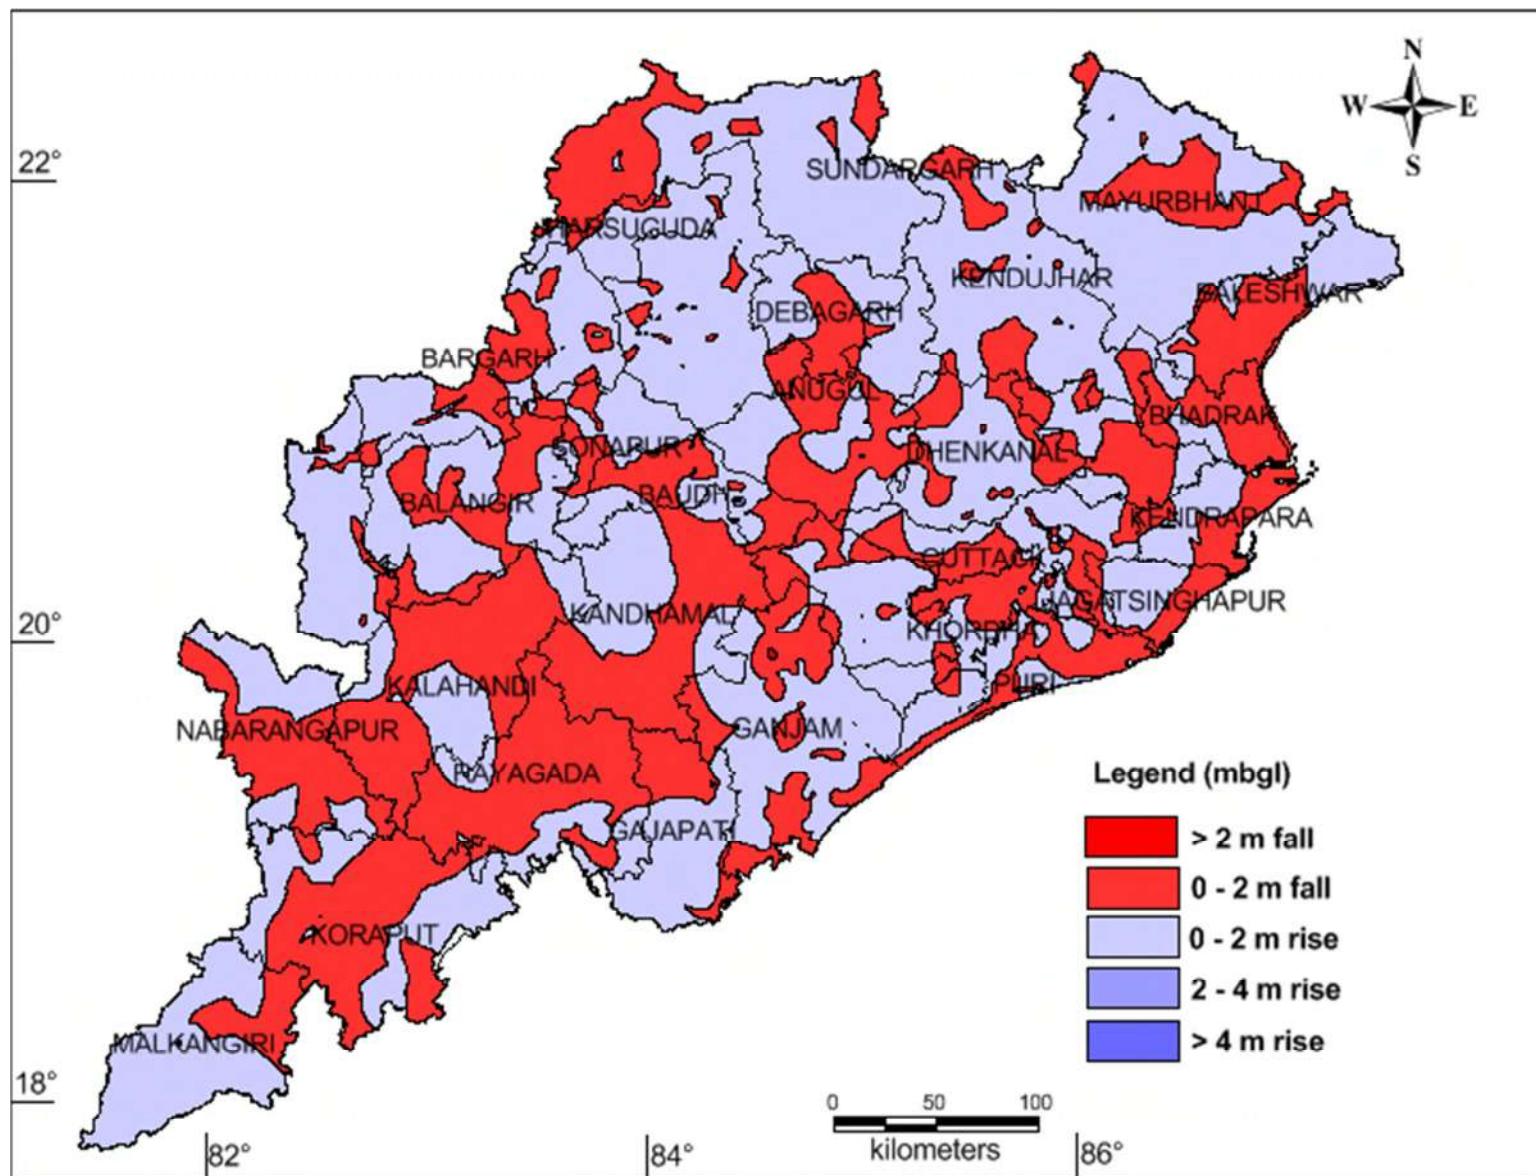

Rise in water level

A perusal of the data and map pertaining to April 2020 with reference to Decadal mean (2010-2019) shows that 44.31% of total NHS wells in the state shows rise in water level. Rise in water level between 0-2m has been observed in 44.23% of the network stations in the state. It varies from minimum of 20.00% Baleswar to a maximum of 66.67% in Jharsuguda district. All the districts have recorded rise of water level in this range. No district is showing a rise in 2-4 m range. Only Baudh district is showing rise in more than 4 m range (0.08%).

In general a minor fall has been recorded in water level of April 2020 when compared with the decadal mean (April 2010-2019).

7.2.2 AUGUST 2020 - DECADAL MEAN (AUGUST 2010 – AUGUST 2019)

The district-wise categorisation of change in water level during August -2020 with respect to the decadal mean (August-2010- August-2019) has been given in **Table 7.13** and presented in **Plate 7.13**.

Rise in water level

A perusal of the data and map pertaining to August 2020 with reference to decadal mean (2010-19) shows that rise in water level between 0-2 m has been observed in 54.81% of the network stations in the state. All the districts have recorded rise of water level in this range. Rise in water level between the range of 2-4m has been noticed in 2.25% wells in isolated locations and more than 4m have been observed in 0.18% of wells.

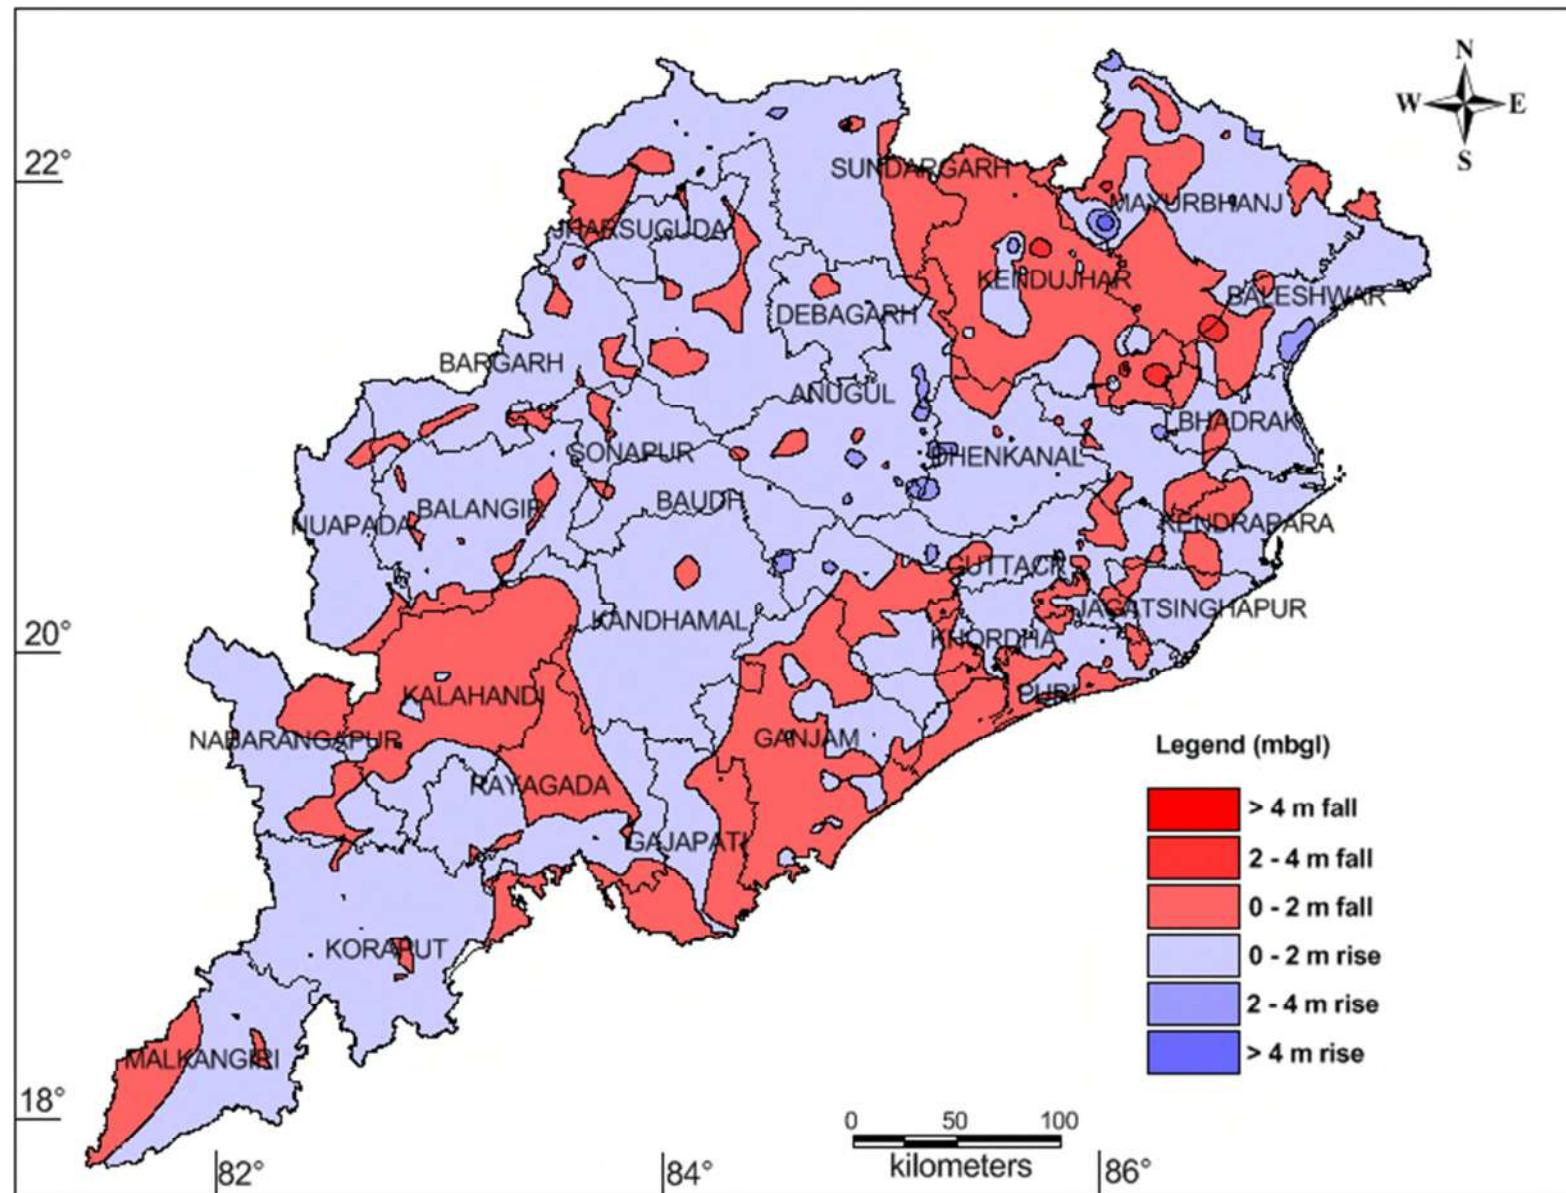

Fall in water level

Fall in water level is seen in patches mostly in the hard rock and hilly terrain of the state. Fall in water level between 0-2 m has been observed in 39.24% of the network monitoring wells in the state. Fall in water level between the range of 2-4m has been observed in 1.26% of network wells in the state. Fall in water level of more 4m, is 0.09% of the total wells in the state.

In general a rise has been recorded in water level of August 2020 when compared with the decadal mean (August 2010-2019). It can be safely concluded that variation in water level is not due to over development; rather the water levels reflect the variation of rainfall in space and time.

7.2.3 NOVEMBER 2020 - DECADAL MEAN (NOVEMBER 2010 – NOVEMBER 2019)

The district-wise categorizations of change in water level during November-2020 with respect to the decadal mean (November 2010 – November 2019) has been given in **Table 7.14** and presented in **Plate 7.14**.

Rise in water level

A perusal of the data and map pertaining to November 2020 with reference to decadal mean (2010 -19) shows that rise in water can be observed in 67.82% wells. Rise in water level between 0-2m has been observed in 63.46% of the network stations in the state. All the districts have recorded rise of water level in this range. Rise in water level between the ranges of 2-4m has been noticed in 3.87% wells in isolated locations and more than 4m have been observed in 0.48% of wells.

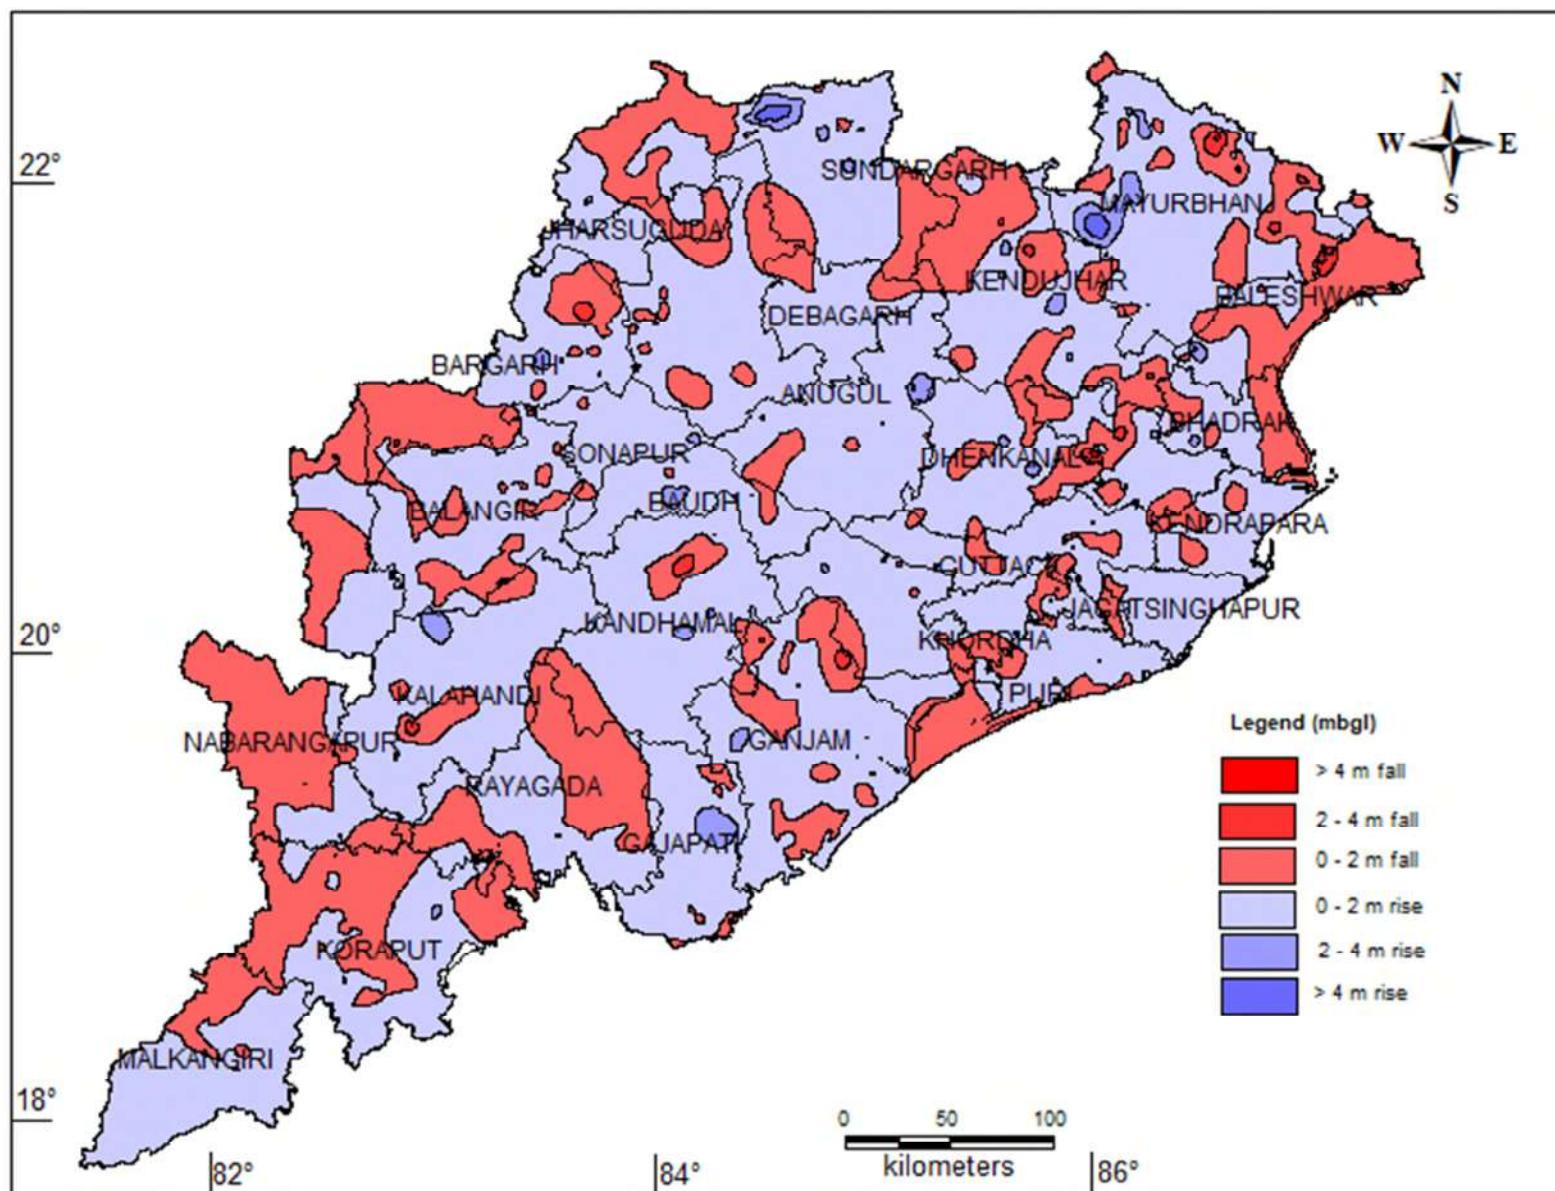

Fall in water level

Fall in water level is seen in all districts and can be observed in 32.09% of wells of the state. Fall in water level between 0-2 m has been observed in 30.24% of the network monitoring wells in the state. Fall in water level between the ranges of 2-4m has been observed in 1.61% of network wells in the state which occur in patches. Fall in water level of more than 4m is present only in 1 well with 0.24% of the total wells in the state.

In general a rise in water level of November 2020 when compared with the decadal mean (November 2010-2019). It can be concluded that variation in water level is due to development as well as variation of rainfall in space and time.

7.2.4 JANUARY 2021 - DECADAL MEAN (JANUARY 2011 – JANUARY 2020)

The district-wise categorisation of change in water level during January -2021 with respect to the decadal mean (2011 - 2020) has been given in **Table 7.15** and presented in **Plate 7.15**.

Rise in water level

A perusal of the data and map pertaining to January 2021 with reference to decadal mean (2011-20) shows that rise in water level between 0-2m has been observed in 54.64% of the network stations in the state. All the districts have recorded rise of water level in this range. Rise in water level between the ranges of 2-4m has been noticed in 4.49% wells in isolated locations and more than 4m have been observed in 0.67% of wells.

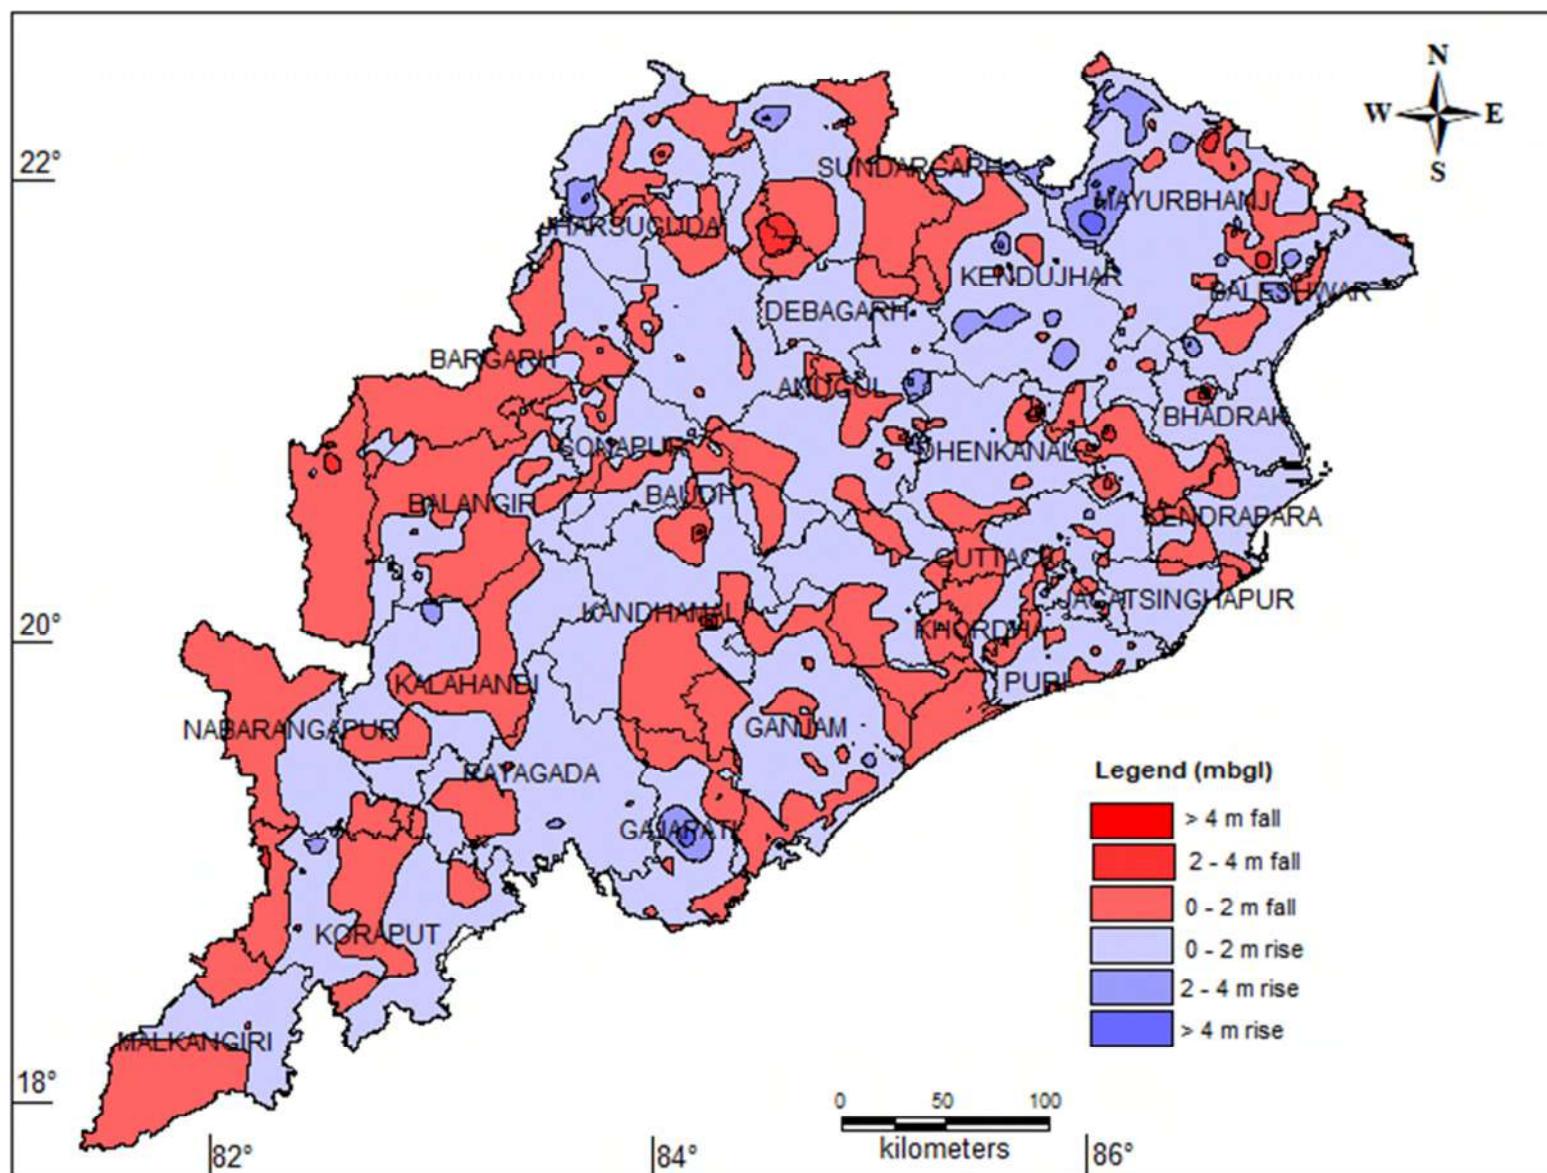

Fall in water level

Fall in water level is seen in patches mostly in the hard rock and hilly terrain of the state. Fall in water level between 0-2 m has been observed in 37.93% of the network monitoring wells in the state. Fall in water level between the ranges of 2-4m has been observed in 1.72% of network wells in the state. Fall in water level of more 4m, is 0.37% of the total wells in the state.

In general a rise has been recorded in water level of January 2021 when compared with the decadal mean (2011-2020).

8.0 GROUNDWATER QUALITY OF ODISHA

Groundwater monitoring is being carried out 4 times in a year (January, April, August and November) as a part of national ground water monitoring programme in the state of Odisha. Out of these, the collection of groundwater samples is carried out in the month of April for assessing the groundwater quality. Groundwater quality is assessed by analysing 1243 samples, (Table 8.1) collected from National Hydrograph Stations located in the state of Odisha during 2019 (April). The samples were analysed for 14 parameters namely pH, Electrical Conductivity, Total Dissolved Solids (TDS), Total Hardness (TH), Alkalinity, Calcium (Ca), Magnesium (Mg), Sodium (Na), Potassium (K), Carbonate (CO_3), Bicarbonate (HCO_3), Chloride (Cl), Sulphate (SO_4), and Fluoride (F) as per standard procedures laid down in APHA (23rd Edition). The suitability of groundwater is assessed for drinking purposes as per BIS (IS 10500:2012). The parameters like SAR, RSC and % Na calculated and are taken into consideration for assessing the samples for suitability in irrigation practices.

Total					1243

Groundwater quality of the state is found to vary widely, depending upon the physiography, soil texture and underlain soil formations. The shallow aquifer of inland zone is mostly fresh and dominated by Ca-Mg- HCO_3 and mixed types of water. In the coastal plain where most of the wells are located in alluvium, the quality is relatively saline and also western parts of Odisha, the districts like, Kalahandi, and Bargarh, Sundargarh are saline. Groundwater from the state is slightly acidic to alkaline in nature with pH in the range of 6.02 and 9.15 with an average value 7.98. Basic statistics of Physico-Chemical parameters of Groundwater of Odisha 2019 is shown in the Table 8.2.

8.1.1 DITRIBUTION OF ELECTRICAL CONDUCTIVITY

The distribution of electrical conductivity (EC) in the state varies from 40 to $5300 \mu\text{S}/\text{cm}$ at 25°C . mg/l with an average $719 \mu\text{S}/\text{cm}$ at 25°C . The maximum value of EC has been found in the well of Huma in Ganjam district. The distribution of EC in shallow aquifer of Odisha is given in **Plate 8.2**. The distribution map of Electrical conductivity shows that most part of that state is having EC less than $1000 \mu\text{S}/\text{cm}$ with few exceptions in the western and coastal part. The locations having higher conductivity more than $2000 \mu\text{S}/\text{cm}$ are listed below.

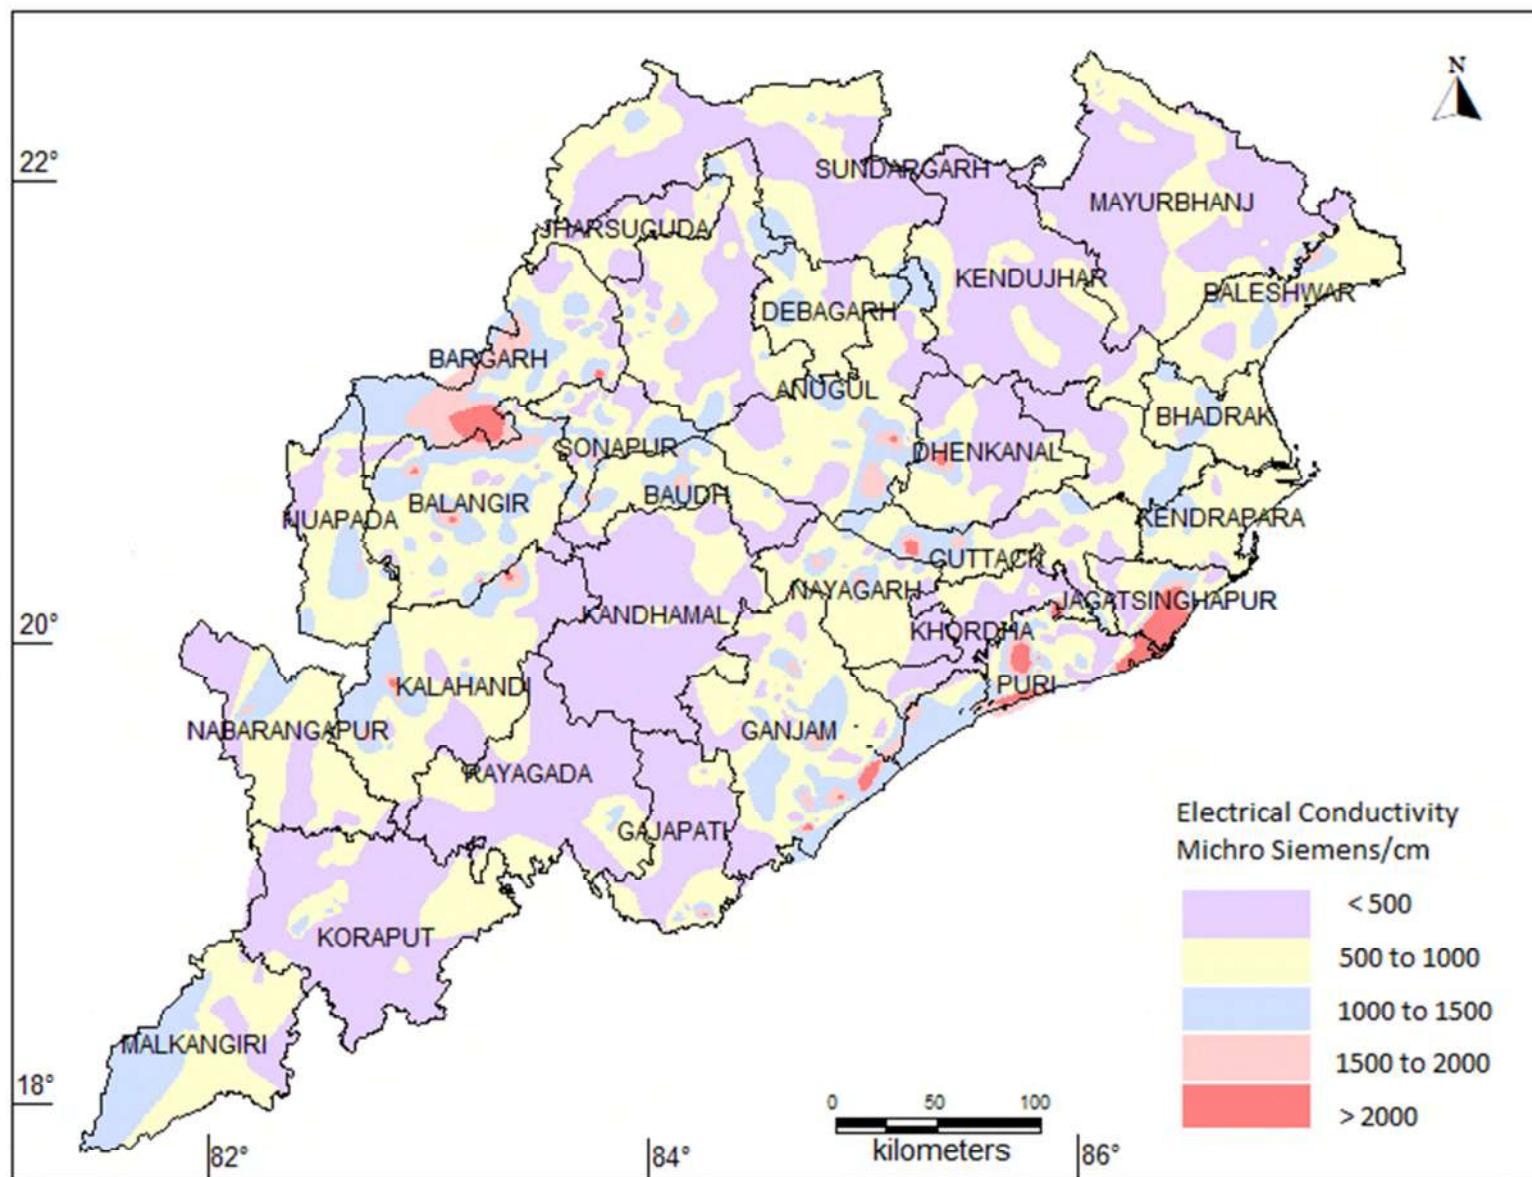

**TABLE: 8.3: LOCATION OF WELLS HAVING HIGH ELECTRICAL CONDUCTIVITY

8.2 ASSESSMENT OF GROUNDWATER QUALITY FOR DRINKING PURPOSE

The test results of groundwater samples (NHS, 2019) are used to assess the suitability for drinking purposes by compared with that of the drinking water specification of Bureau of Indian Standards (IS 10500:2012). The suitability of the ground water samples collected from shallow aquifers for drinking purposes with reference to chemical parameters is presented in Table 8.4.

TABLE: 8.5: STATUS OF GROUNDWATER OF ODISHA FOR DRINKING PURPOSE (IS-10500: 2012)

Parameters	Drinking water Specification (IS 10500:2012)		Samples (%)		
	Acceptable Limit	Permissible Limit in the Absence of Alternate Source	Suitable	Acceptable	Unsuitable
pH	6.5-8.5	No relaxation	92.7	0	7.3
TDS, mg/l	500	2000	75.7	24	0.3
TH mg/l as CaCO ₃	200	600	51	46.7	2.3
TA mg/l as CaCO ₃	200	600	61.5	37.9	0.6
Ca ⁺⁺ mg/l	75	200	87.6	12.3	0.1
Mg ⁺⁺ mg/l	30	100	68.8	29.8	1.4
Cl ⁻ mg/l	250	1000	93.8	6	0.2
SO ₄ ⁼ mg/l	200	400	99.2	0.6	0.2
F ⁻ mg/l	1.0	1.5	92.7	4.4	2.9
OVERALL			43.3	44.3	12.4

Out of 1243 samples, 92.7% of samples the pH are between 6.5 and 8.5 and are suitable for drinking when compared with the drinking water specification of Bureau of Indian Standards (IS 10500:2012).The highest pH 9.15 of groundwater sample was found in Kasarda, of Cuttack district was found and unfit for drinking purposes. There are such 91 samples unfit for drinking purposes in the state due to high pH values.

8.2.1 DISTRIBUTION OF TDS

The Total Dissolved Solids (TDS) when comapred with the drinking water specification of Bureau of Indian Standards (IS 10500:2012), it is found that 75.7% of total samples are suitable for drinking purposes whereas only 4 nos of samples are unfit for drinking. The TDS varies from 24 to 2911 mg/l with an average 383 mg/l.. The maximum value of TDS has been found in the well located at Huma in Ganjam district. The TDS is within the

range of 500 mg/l northern and southern part of the state whereas the remaining part of Odisha, the TDS are within the range of 500 – 2000 mg/l except 4 stations. The locations with the TDS more than 2000 mg/l are given below:

TABLE: 8.6: LOCATIONS WITH TDS > 2000 mg/L

SL NO	DIST	VILLAGE	TDS in mg/L
1	GANJAM	Huma	2911
2	PURI	Astarang	2371
3	PURI	Sakhigopal	2355
4	PURI	P-19 Kashi Jagannathpur	2206

8.2.2 DISTRIBUTION OF TOTAL ALKALINITY

The total alkalinity of groundwater samples ranges from 5 to 779 mg/l as CaCO₃. 61.5 % of samples are within the acceptable limit of drinking water specification of Bureau of Indian Standards (IS 10500:2012) where as 0.6% of samples (7 nos) in the state exceeds the maximum permissible limit and are not suitable for drinking purposes.

8.2.3 DISTRIBUTION OF CHLORIDE

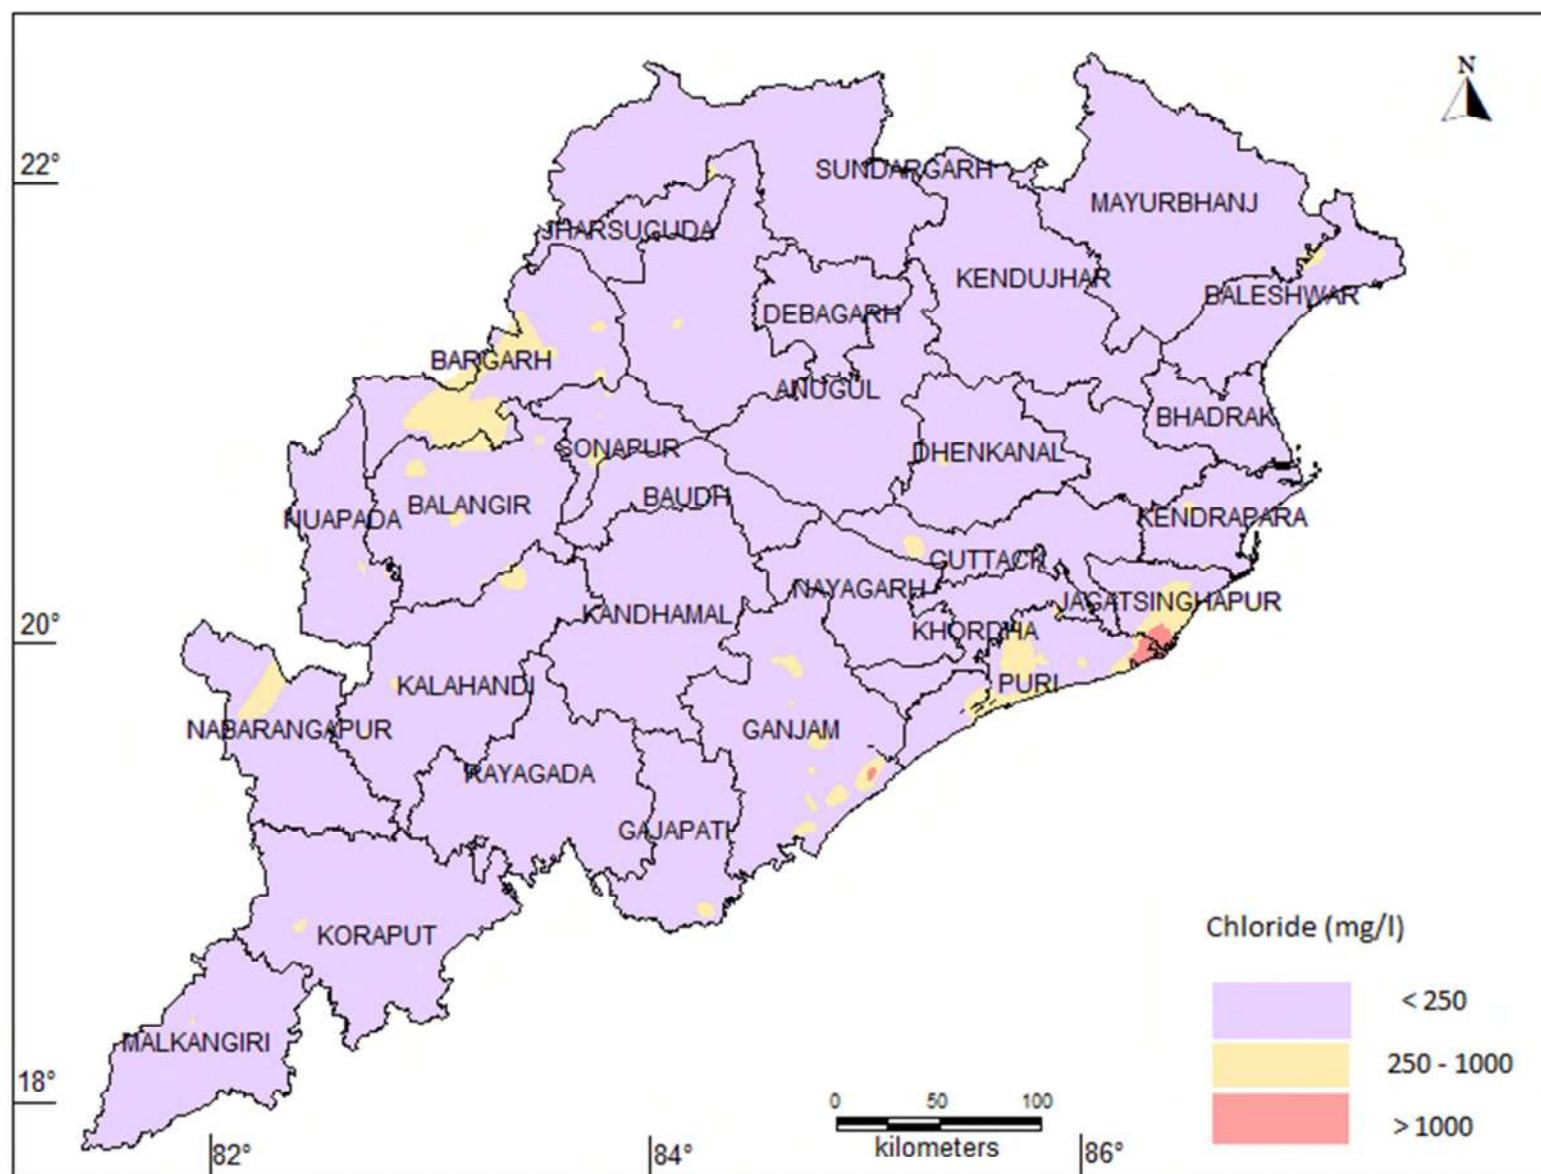

Chloride content in 1166 (93.0%) number of samples in the state are within the acceptable limit of drinking water specification of Bureau of Indian Standards (IS 10500:2012) and may be used for drinking purposes. 4 number of samples in the state exceeds the BIS maximum permissible limit and are not suitable for drinking purposes. The locations having higher chloride content in the state are given below: The distribution of chloride in the state shows that the chloride value is within 1000 mg/l except at two locations. The following locations are having the chloride content more than 1000 mg/l.

TABLE: 8.7: LOCATIONS WITH CHLORIDE > 1000 mg/L

PLATE 8.3

8.2.4 DISTRIBUTION OF FLUORIDE

Fluoride content in the state varies between 0.01 and 5.68 mg/l and maximum concentration is detected at Badabasul of Kalahandi district . There are 36 stations listed below where the fluoride content in groundwater is more than the maximum permissible limit of drinking water specifications (IS 10500:2012).

Out of 30 districts, 14 districts are affected with high fluoride content in groundwater in the state of Odisha. The locations having fluoride content is more than the maximum permissible limit of drinking water specifications (IS 10500:2012) is given below.

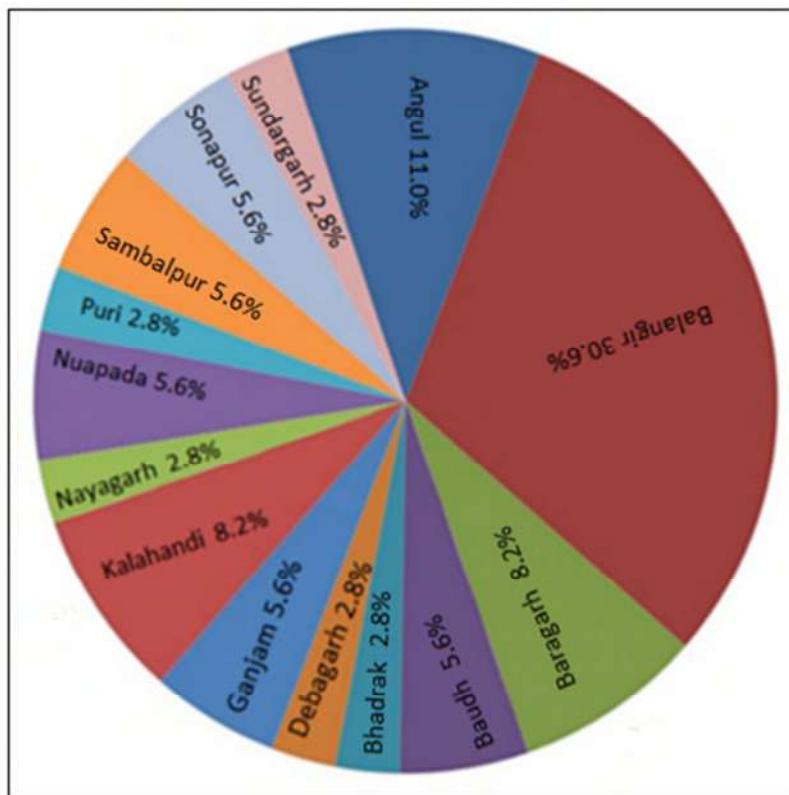

TABLE: 8.8: LOCATIONS WITH FLUORIDE > 1.50 mg/L

Out of 1243 samples, 36 samples were unfit for drinking purposes and the districts include Balangir, Anugul, Baragarh, Kalahandi, Nuapda, Sonapur, Sambalpur, Baudh, Sundargarh etc.

**PIE CHART ON DISTRIBUTION OF HIGH FLUORIDE (>1.5 mg/L) IN THE GROUNDWATER OF ODISHA
(NHS-2019)**

DISTRIBUTION OF FLUORIDE IN SHALLOW AQUIFER OF ODISHA

PLATE 8.4

During 2019, 1243 nos of groundwater samples were assessed for drinking and irrigation purposes in the state of Odisha. Out of these samples 43.3% (538) samples are suitable for drinking purposes , 44.3% samples are accepted while remaining 12.4% are not suitable for drinking purposes when compared with the drinking water specification of Bureau of Indian Standards (IS 10500:2012). The samples not fit for drinking purpose may be due to high values of fluoride, pH, total hardness , chloride and total dissolved solids.

8.3 ASSESSMENT OF GROUNDWATER FOR IRRIGATION PURPOSES

The most extensive use of ground water in the world is for the irrigation consumption. The chemical quality of ground water is an important factor to be considered in evaluating its usefulness for irrigation as poor-quality ground water may cause salinity, specific ion toxicity or infiltration problem in soils. Such effect may adversely affect crop production. Water quality constraints in irrigation can be examined using a number of empirical indices that have been established on the basis of field experience and experiments. The parameters like SAR, RSC and % Na are calculated and are taken into consideration for assessing the samples for suitability in irrigation practices.

SODIUM ADSORPTION RATIO (SAR) is a very important property of water from its irrigation application point of view. The sodium (Na^+), Calcium (Ca^{++}) and Magnesium (Mg^{++}) ions are important for determining SAR value of water . SAR of water is calculated by the following equation given by Richard (1954) as:

$$\text{SAR} = \frac{\text{Na}^+}{\sqrt{\frac{\text{Ca}^{++} + \text{Mg}^{++}}{2}}}$$

Where all the ions are expressed in meq/l.

There is a significant relationship between SAR values of irrigation water and the extent to which sodium is absorbed by the soil. Sodium replacing adsorbed calcium and magnesium is a hazard that damage soil structure as indicated by the high SAR. The U.S. Salinity Laboratory (USSL) diagram was used to classify the waters for irrigation (Richard,1954). In the USSL diagram, Electrical Conductivity (EC) is taken as the salinity hazard and SAR as the alkalinity hazard . These two parameters are important to assess the quality of water for irrigation in USSL diagram.

RANGE OF IRRIGATION WATER QUALITY INDICES OF ODISHA (NHS, 2019)

Indices	Min	Max	Mean
SAR	0.051	20.92	1.53
RSC	-20.81	9.96	-0.78
%Na	0	88.93	28.59

TABLE:8.9: SALINITY HAZARD OF GROUNDWATER ACCORDING TO ELECTRICAL CONDUCTIVITY

Water Class-	Range of EC in $\mu\text{S}/\text{cm}$	Salinity significance		Percentage of samples
C1	<250	Low salinity water	Most crops on most soils	14%
C2	250-750	Medium salinity water	Plants with moderate salt tolerance	51%
C3	750-2250	High salinity water	Plants with good salt tolerance, special management for salinity control	33%
C4	>2250	Very high salinity water	Not suitable for irrigation	2%

RESIDUAL SODIUM CARBONATE (RSC)

The RSC is defined as the excess of carbonate and bicarbonate amount over the alkaline earths (Ca^{++} and Mg^{++}). Use of RSC beyond permissible limit (>2.5) adversely affects irrigation. The tendency of Ca^{++} and Mg^{++} to precipitate, as the water in the soil becomes more concentrated, as a result of evaporation and plant

transpiration, and gets fixed in the soil by the process of base exchange, thereby decreasing the soil permeability.

$$RSC = (CO_3^{2-} + HCO_3^-) - (Ca^{++} + Mg^{++})$$

Where concentrations are in meq/l.

Distribution of ground water in the state as per RSC given in Table reveals, majority of samples (94.5%) fall in Safe category ($RSC < 1.25$), 2.8 % samples in the doubtful category and remaining 2.7% samples in the Unsuitable category and are not suitable for irrigation purposes.

CLASSIFICATION OF GROUNDWATER OF ODISHA ON THE BASIS OF RSC

Parameter	Range	Water classification	No of samples
RSC	<1.25	Good	94.5%
	1.25-2.5	Doubtful	2.8%
	>2.5	Unsuitable	2.7%

PERCENT SODIUM (%Na)

Sodium percent is a parameter used to evaluate fitness of water for irrigation purposes and therefore is a vital component in classifying irrigation water. Irrigation water containing large amounts of Na^+ is of special concern due to sodium's effects on the soil, leading to salinity hazard. Excess Na^+ in water produces the undesirable effects of changing soil properties and reducing soil permeability. The following formula is used for calculating the percent sodium (%Na):

$$\% Na = \frac{Na^+}{Ca^{2+} + Mg^{2+} + Na^+ + K^+}$$

The % Na was found up to 87.08% with an average 28.08% in the state. Out of 1243 tested samples, 29.3% are found to be excellent while 53.4% samples of good to permissible types for irrigation. 13.8% samples fall under permissible to doubtful. The remaining groundwater samples fall in the doubtful/unsuitable categories.

Parameter	Range	Water classification	No of samples
%Na	<20%	Excellent to good	29.3%
	20-40	Good to permissible	53.4 %
	40-60	Permissible to doubtful	13.8%
	60-80	Doubtful to unsuitable	2.9%
	>80%	Unsuitable	0. 6%

DISTRIBUTION OF TRACE AND TOXIC ELEMENTS IN THE STATE OF ODISHA

A total of 1114 samples were collected to know the status of the trace and toxic elements content in groundwater in the state of Odisha during Nov-2019. The samples were collected in 125 ml polyethylene bottles which were pre-cleaned with concentrated nitric acid. After collection the samples were acidified with ultrapure concentrated nitric acid (65%).

DISTRIBUTION OF IRON

According to drinking water specification of BIS (IS 10500:2012), the maximum permissible limit of Fe is 1.0 mg/l.

The Fe concentration in the groundwater of the state ranges between 0.25 mg/l and 27.37 mg/l , with a mean value of 1.93 mg/l.

68	Kendrapara	Rajnagar	Rajnagar	1.226
69	Sambalpur	Jujomura	Gargarbahal	1.219
70	Balasore	Nilagiri	Darkholi	1.127

DISTRIBUTION OF MANGANESE (MN)

According to BIS (2012), the maximum permissible limit and acceptable limit of Mn in drinking water is 0.1 and 0.3 mg/l respectively. The Mn concentration in the groundwater of the state ranges between 0.25 mg/l and 5.94 mg/l , with a mean value of 0.98 mg/l.

DISTRIBUTION OF URANIUM (U)

According to drinking water specification of BIS (IS 10500:2012), the maximum permissible limit of Uranium is 0.03 mg/l. The Uranium (U) concentration in the groundwater of the state is found upto 0.059 mg/l at Gosala of Sambalpur district. The locations having higher U content are listed below.

TABLE:8.16: LOCATIONS HAVING URANIUM > 0.03 mg/L

SL No	District	Block	Village	U mg/L
1	Sambalpur	Maneswar	Gosala	0.059
2	Dhenkanal	Parajang	Kandarsingha	0.038
3	Sundargarh	Subdega	Alikera	0.038
4	Anugul	Banarpal	Kukurang	0.036

DISTRIBUTION OF ARSENIC (As)

Arsenic (As) occurs in earth's crust in small amount and is highly toxic with maximum permissible limit of 0.01 mg/l. The locations having higher As content are listed below

TABLE:8.17: LOCATIONS HAVING ARSENIC > 0.01 mg/L

SL No	District	Block	Village	As mg/L
1	Ganjam	Rangilunda	Berhampur1	0.147
2	Kendrapara	Kendrapara	Jajanga	0.015
3	Bhadrak	Bant	Kenduapada	0.011
4	Jagatsinghpur	Ersama	Nuagaon	0.011

DISTRIBUTION OF LEAD (Pb)

According to BIS (2012), the maximum permissible limit of Lead (Pb) in drinking water is 0.01 mg/l. The Mn concentration in the groundwater in the state ranges between 0.25 mg/l and 5.94 mg/l , with a mean value of 0.98 mg/l. The locations having higher Pb content are listed below.

TABLE:8.18: LOCATIONS HAVING LEAD > 0.01 mg/L

SL No	District	Block	Village	Pb mg/L
1	Sonepur	Ulunda	Sindol	0.114
2	Sundargarh	Lahunipara	Darjin	0.025
3	Sambalpur	Kochinda	Kuchinda	0.016
4	Boudh	Harbhanga	Purnakatak1	0.015

DISTRIBUTION OF ZINC (Zn)

The maximum permissible limit and acceptable concentration of Zn in drinking water is 15 mg/l and 5 mg/l respectively. The locations having higher Zn content are listed below:

TABLE:8.19: LOCATIONS HAVING ZINC > 15.0 mg/L

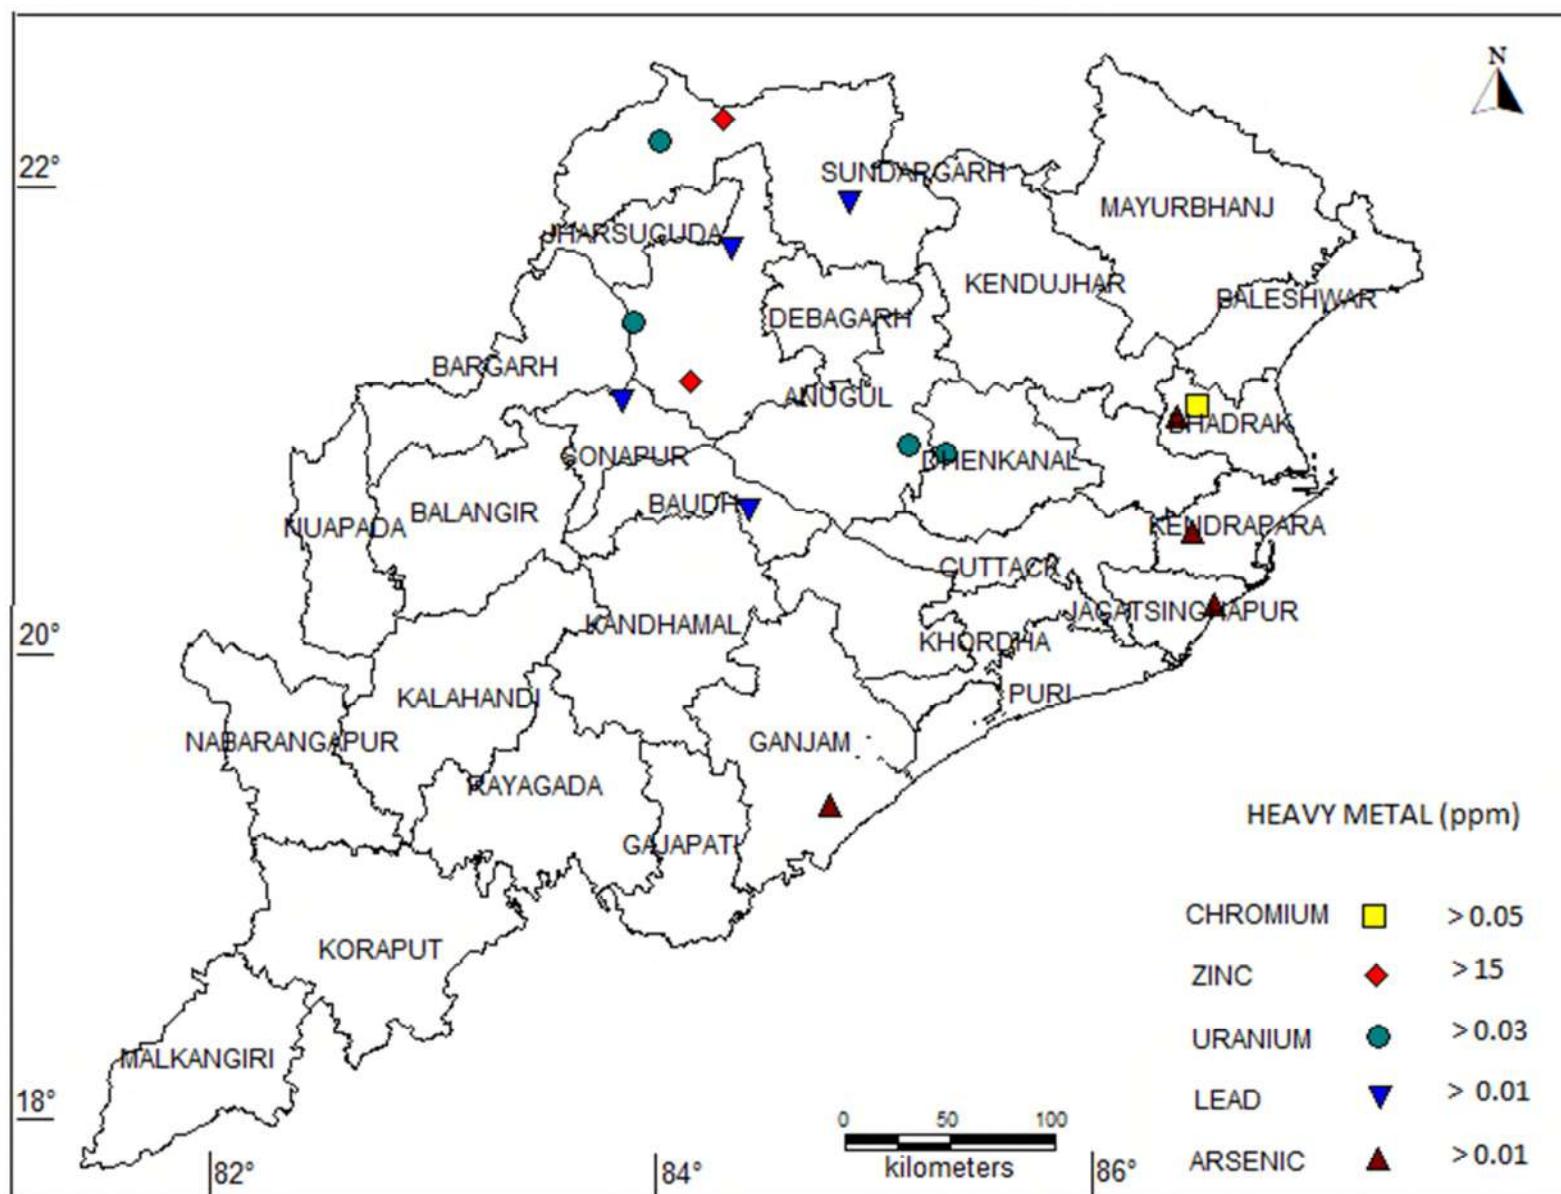

SL No	District	Block	Village	Zn mg/l
1	Sambalpur	Rairakhol	Mochibahal	24.682
2	Sundargarh	Baragaon	Ekma	19.854

DISTRIBUTION OF CHROMIUM (Cr)

Chromium (Cr) occurs in earth's crust in small amounts. Pure metallic form of Cr does not occur naturally. The maximum permissible limit of Cr in drinking water according to BIS (2012) is 0.05 mg/l. The maximum concentration of Cr (0.55 mg/l) is observed at village Randia of Bhadrak district during 2019.

DISTRIBUTION OF TOXIC ELEMENTS IN SHALLOW AQUIFER OF ODISHA

PLATE 8.5

ANNEXURE - I
