ANNEXURE	TITLE
I	Depth To Water Levels (m bgl) In The Months Of May, 2020, August, 2020, November, 2020 and January, 2021 In Jharkhand State
II	Trend Of Ground Water Level (2011-2020)

FOREWORD

To understand the groundwater situations in diverse hydrogeological environments, changes in various facets of ground water, like variation in water level and water quality are to be monitored. A regular monitoring of ground water regime through a network of observation wells i.e. Ground water Monitoring Well (GWMW) is being carried out by Central Ground Water Board, MER Patna for the state of Jharkhand. Initially the task was taken up with the help of a few GWMW but gradually the numbers of stations were increased, which is now totals 474 GWMW (as on March 2021) which represents all 24 districts and almost all blocks of the state.

This is an attempt to make a presentation in the form of a report for Jharkhand State where the scenarios of water levels for the year 2020-2021 has been produced. The comparisons with decadal mean, seasonal & annual fluctuations, chemical quality of ground water, different maps along with data have been incorporated.

Periodic water level measurements were taken 4 times in a year in 2020-2021, (i.e. in the months of May, 2020, August, 2020, November, 2020 and January, 2021). Water samples from the GWMW were collected during the month of May-2020 to study the changes in hydrochemical regime.

The scientific officers and technical personnel of the state unit office Ranchi of Jharkhand, systematically collected field data from the GWMW as required for monitoring purposes and collected water samples during the pre-monsoon period which were analysed in the chemical lab of this region.

The compilation and analyzing data, its retrieval, evaluation, preparation of suitable maps and their reproduction in the form of present report has been carried out by **Dr. Anukaran kujur, Scientist-B, Mrs Sulekha Bhaya, Scientist-B & Dr Sudhanshu Shekhar, Scientist-D**, in supervision of Shri B.K.Oraon, Scientist-D & Officer-in-Charge, CGWB, SUO, Ranchi.

It is sincerely hoped that the appended write up, maps and basic information in this report would be very useful to the Planners and concerned beneficiaries in Jharkhand State

EXECUTIVE SUMMARY

In Jharkhand state ground water levels of 474 Ground Water Monitoring Wells (GWMW) were monitored four times in the year 2020 - 2021 as a part of regime monitoring of phreatic aquifer in different hydrogeological and agro-climatic zones. The water level monitoring was carried out in the months of May'20, August'20, November'20 and January'2021 and ground water samples were collected in pre-monsoon period (May, 2020) for chemical analysis. In the state the phreatic aquifer consists of weathered mantle and saprolite zone. Over 78% area of the state is underlain by rocks of Chotanagpur Granitic Gneissic Complex (CGGC) suit. Hence, most of the GWMW represented water level in weathered CGGC. A few GWMW represented water level of phreatic aquifer of Gondwana Super Group, Basalts, Limestones, Tertiary Formation and recent alluvium.

The observed water level data had been grouped into four categories viz. 0 -2m, 2-5m, 5-10m and >10m. Thematic maps depicting ground water levels measured in different periods have been prepared. The water levels have been further analysed to study its change with respect to measurement of pre-monsoon period of the same year, previous year water level data of corresponding period, and decadal mean water level data of the corresponding period. The fluctuations have been shown under rise and fall categories. In each category there are three groups viz. 0-2 m, 2-4 m and >4 m. Thematic maps have been prepared for each category.

The depth to water level data of all the Ground Water Monitoring Wells collected during the four measurements are also presented along with the general well information. The water samples were collected during May, 2020 chemical analysis report is under progress.

During pre-monsoon 2020-21, the water level measured in seven districts the ranges between 0.60 to 11.10 mbgl. The minimum and the maximum depth to water levels during pre-monsoon period have been recorded as 0.60 m bgl and 11.10 m bgl at Gumla and Ranchi. In general the water level throughout the State varies in the range of 5 – 10 m bgl. During Post-monsoon season minimum and the maximum depth to water levels have been recorded as 0.90 mbgl and 14.05 m bgl in Pakur and East singhbhum district respectively and in general the water level throughout the State varies in the range of 2 – 5 m bgl.

Fluctuation in water level for November, 2020 compared with May, 2020 shows rise in water level (85%) and (15%) fall for the state of Jharkhand. which is a normal phenomenon due to recharge of ground water, as a result of onset of monsoon and rapid recharge due to moderate to steep slope in undulating tracts. A fall in water level is recorded in 11 wells out of 82 wells of the state which is mainly due to temporal withdrawal of ground water in those areas.

The fluctuation of water level of May, 2020 with respect to decadal mean water level of May 2019 indicate that the fall (5%) as well as rise (61%) in water level in the range of 0 – 2 m shows variation in almost the entire state. However the higher magnitude (2-4m) of fall also recorded in 2wells in one district which may be due to temporal higher withdrawal of ground water on that area.

The fluctuation of water level of November 2020 with respect to decadal mean water level of November 2019 indicate the fall (17%) as well as rise (58%) in water level in the range of 0 – 2 m. However, overall regional fluctuation of water level in the entire state is mainly restricted within 2 m only which is normal phenomenon and no abnormal rise or fall in water level is observed except in few localized well.

GROUND WATER YEAR BOOK OF JHARKHAND

2020 – 2021

JHARKHAND AT A GLANCE

Geographical Area (sq. km.)	79714
Population (Census 2011)	3,29,66,238
Population density(Persons/Sqkm)	413
Male Population(Million)	16.93
Female Population(Million)	16.03
Decadal Growth (2001-2011)	22.3%
Literacy Rate	67.63%
Sex ratio	947 females to 1000 males
No. of Districts	24
No. of Blocks	260
Normal Annual Rainfall (mm)	1251.2
Net sown area (in hectare)-2014-15	13,84515
Area under forest (in hectare) -2014-15	2339481
Barren and uncultivated area (in hectare)-2014-15	568009
Cultivable waste land (in hectare)-2014-15	352871
Cropping intensity(%) – 2011	114 %
Annual Replenishable Ground Water Resource in BCM (2020)	6.15
Net ground water availability in BCM (2020)	5.64
Annual Ground Water Draft For Domestic & Industrial use in BCM	0.78
Gross annual ground water draft in BCM (2020)	1.58
Stage of ground water development (in %) (2020)	27.73
Number of over-exploited blocks (As on 2020)	3
Number of critical blocks (As on 2020)	2
Number of semi critical blocks (As on 2020)	10
Number of Safe block (As on March-2020)	245
Ground Water Quality	In general chemical Constituents are within permissible limit except fluoride Contamination in parts of Palamu, Garhwa, Koderma, Pakur Districts and Arsenic contamination in parts of Sahebganj district

GROUND WATER YEAR BOOK OF JHARKHAND

2020 – 2021

1.0 INTRODUCTION:

Jharkhand state, was created on 15th November, 2000, consists of districts falling on Chotanagpur Plateau of erstwhile Bihar on the birthday of legendary tribal freedom fighter Birsa Munda. Presently it consists of 24 districts and 260 administrative blocks. The capital of the state is Ranchi. The state spreads over 79714 sq km, between Latitude 21° 55' 00" and 25° 15' 00" and Longitude 83° 15' 00" and 87° 55' 00". The state is bounded by Bihar in the north and by West Bengal in the east. The other two sides, west and south, are bounded by Chhattisgarh and Orissa states respectively (Plate-I).

The population of the state as per 2011 census is 03.30 crore. The population density is 414 person/km². The urban population is 7.912 million and the rural population is 25.05 million. The tribal population constitutes about 28% of total population. The state is moderately urbanized with Ranchi as its capital city. Nearly 24% of total population of the state lives in urban areas. Important urban centers are in the state are Jamshedpur, Dhanbad, Hazaribagh, Daltonganj, Dumka and Deoghar.

To acquire a detailed knowledge vis-a-vis scenario of ground water level with respect to behaviour, availability and quality, Ground Water monitoring is essential in time and space. Thus, the data so collected during monitoring gives an important input for ground water management. Periodical monitoring of ground water regime covering different geomorphic, hydrogeological units is an effort to get information on the behaviour of ground water levels and chemical quality of formation water through representative sampling. Monitoring of ground water regime includes:

- (a) Monitoring of ground water levels
- (b) Monitoring of ground water quality and
- (c) Temperature of ground water.

Monitoring is being carried out by establishing suitable *Ground Water Monitoring Well* (GWMW) based on Geomorphology, Geology, Hydrogeology and status of ground water resource of the area with a view to observe the trend of water level and change of chemical quality with time and space. It is also very useful to estimate the dynamic ground water resources and to demarcate the water logged as well as drought prone areas.

2.0 BACKGROUND:

The Central Ground Water Board, State Unit office, Ranchi, is at present monitoring 474 GWMW (Ground water monitoring wells) to delineate the behaviour of ground water level with time and space covering 24 districts in the State of Jharkhand (Plate-I) four times a year, viz January (from 1st to 10th), May (from 20th to 30th), August (from 20th to 30th) and November (from 1st to 10th). The locations of GWMW are shown in Plate - II.

The district-wise status of GWMW in Jharkhand during the period from May, 2020 to January, 2021 is given in Table 1. The district-wise water level data of GWMW for the period May, 2020, August, 2020, November, 2020 and January, 2021 are given in Annexure- I. The Trend of ground water level data (2011 to 2020) is presented in Annexure-II. The results of chemical analysis of water samples collected during May, 2020 and analytical data is under progress.

3.0 GEOLOGY AND HYDROGEOLOGY:

The generalized geological succession of Jharkhand state is given Table 1 - Generalized geological succession of Jharkhand state.

Table 1. General Stratigraphic sequences of geological formations in Jharkhand State

Age	Formation	Broad Lithology
Quaternary	Alluvial deposits	Sand, clay, silt and occasional gravel
Tertiary	Dhalbhumgarh Gravel beds	Sandstone, conglomerate, claystone, gravel
Upper Jurassic to Lower Cretaceous	Rajmahal Volcanics	Basalt flows with inter-trappean sedimentary beds
Upper Jurassic to Carboniferous	Gondwana Supergroup	Sandstone, shale, clay, conglomerate with coal beds
Lower Cambrian to Proterozoic	Vindhyan Supergroup	Sandstone, dolomite, chart, shale <i>etc.</i>
Proterozoic	Rocks of Singhbhum-Greenstone-Granite domain, basic volcanics and Chhotanagpur Gneiss Granulite Complex including BMB	Granites, granite-gneiss, schists, phyllites, dolomites, basic and ultrabasic lavas, amphibolites
Archaean	Older Metamorphic Gneiss, Older Metamorphic Tonalite Gneiss	Gneiss, schists, arenites, amphibolites

GRANITE - GNEISS, SCHIST, PHYLLITE, AND OTHER ROCKS BELONGING TO CGGC

It covers nearly 85 % of the geographical area of the state. The phreatic aquifer in this formation consists of weathered mantle and underlying secondary porosities like fractures, joints and fissures. In general, the thickness of weathered zone varies between 10 and 25 m, however in localized patches it is > 35 m. The weathered zone is the main repository of ground water. Exploratory wells of CGWB reveal that the fractures underlying the weathered zones form the potential aquifer. The fracture zones (generally beyond 100 m depth) are exploited particularly in urban areas. In general 2-5 sets of fractures have been encountered within 150 m bgl. In a few wells, fractures have been encountered beyond 150 m depth. The ground water occurs under semi-confined to confined condition in the fractures situated at a deeper level. In this formation discharge from negligible to 30 lps has been recorded from the bore wells.

VINDHYAN SUPERGROUP

The rocks of this group are exposed in Palamu and Garhwa districts over a limited aerial extent, in the south of the river Son. The sandstones are hard and compact. The ground water occurs within the secondary porosities like fractures and joints. The fractured sandstone has good ground water potential in comparison to the shale. The ground water occurs under unconfined condition in weathered zone. The yield potential of sandstone is poorer than granite gneiss.

VOLCANIC ROCKS

The volcanic rocks occur mainly in the northeastern part of the state in Sahebganj, Pakur, Dumka and Godda districts as Rajmahal Traps and in southeastern part of the state in East & West Singhbhum, and Saraikela districts as other volcanics. The Rajmahal trap is a series of basaltic flows horizontally disposed. In an individual flow, the lower part is massive and the upper part is vesicular. In some cases, vesicles are filled with secondary material. Partially filled interconnected vesicles form the potential aquifers. Thin inter-trappean beds are also observed between the flows. The ground water occurs under unconfined conditions in upper vesicular flows, which are exposed generally at the ground level. In the vesicular layers disposed at deeper levels the ground water occurs under semi-confined to confined condition.

GONDWANA SUPERGROUP

The Gondwana Super Group ranging in age from Upper Carboniferous to Cretaceous is considered as semi-consolidated formation. Ground water occurs within inter-granular space as well as within the secondary porosities like fractures and joints. Rocks of this unit are exposed as patches in the districts of Hazaribagh, Dhanbad, Giridih, Bokaro, Ranchi, Dumka, Jamtara, Latehar, Godda and Garhwa districts. The sandstones form repository of ground water. The exploratory drilling of CGWB and other agencies indicate that ground water occur in semi-confined to confined condition

in aquifers situated at deeper level, and under unconfined condition at shallow level. At few places, the piezometric head rises above the ground level to give rise to auto flow condition.

LATERITES AND TERTIARY SEDIMENTS

The Dhalbhumgarh Formation of Tertiary age occur in Chakulia- Bahragora-Dhalbhumgarh tract of East Singhbhum district. Exploration to a depth of 120 m indicates presence of 2 to 4 sedimentary layers. Laterite formations also occur as cappings in some parts of the state. These sedimentary layers are repository of ground water, which occurs under unconfined condition in aquifers disposed at shallow level and under confined to semi-confined condition in aquifers situated at deeper levels.

YOUNGER ALLUVIUM

The Younger Alluvium deposits are confined mainly to the bordering area of the state and occur in patches in the districts of Godda, Sahebganj and Pakur in the northeast and in Latehar, Palamu, Deoghar and Garhwa districts. In the bordering areas alluvial patches is extension of the Gangetic Plain. There is a patch of alluvial deposit in Ranchi district also. The ground water occurs under unconfined condition in aquifer disposed at shallow level. The depth of dug wells ranges between 10 –15 m in general while the depth of shallow tube well ranges between 20 - 30 m. The hydrogeological map & Geological map of Jharkhand is given in Plate III & IV.

4.0 GROUND WATER SCENARIO

4.1 DEPTH TO WATER LEVELS IN JHARKHAND DURING 2020 - 2021

May 2020

Water levels during May, 2020 were monitored from 91 wells (out of 474 existing wells). The district-wise status of distribution of Ground Water Monitoring Wells with different ranges of depth to water level is presented in *Table-2*

The minimum and the maximum depth to water levels have been recorded as 0.60 m bgl in Gumla district and 11.10 m bgl in Ranchi district. In general the water level throughout the State varies in the range of 5 – 10 m bgl and has been observed in the 47 wells (51%) out of 91 analysed wells. Secondly, water level >10 m bgl has been observed in the 8 wells (9%). The water level in the range of 2– 5 m bgl has been observed in the 29 wells (32%). The water level below 2 m has been observed only in 7 wells, out of which 3 wells located in Ranchi 2 well in Gumla 1 well in Bokaro and 1 well in Hazaribagh districts.

August 2020

Water levels during August, 2020 were monitored from 109 Dug wells. The district-wise status of distribution of Ground Water Monitoring Wells with different ranges of depth to water level is presented in Table 3.

The minimum and the maximum depth to water levels have been recorded as 0.20 m bgl in Hazaribagh district and 08.50m bgl in Gumla and Hazaribagh District. About 48% of wells have water level ranging between 0-2 mbgl. In general the water level in six districts in the State varies in the range of 0-2 (48%) m bgl from 109 analysed wells. Secondly, the water level in the range of 5 – 10 m bgl has been observed in the 11 % of the wells. Water level >10m bgl has not been observed in districts.

November 2020

A total of 279 GWMW has been monitored during post-monsoon period in November 2020, five groupings were made based on the range of water level data viz. 0-2, 2-5, 5-10, 10-20 and 20-40 m bgl. The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is presented in *Table 4*.

Minimum and the maximum depth to water levels have been recorded as 0.32 m bgl and 14.05 m bgl in Ranchi and Purbi_Singhbhum district respectively. Out of 279 wells 171 (61%) of GWMW, water level ranges 2 - 5 m bgl which covers almost entire Jharkhand State. The water level in the range of 5-10 m bgl has been observed in the 44 wells (15%). Ground water level of 0 – 2 m bgl depth range has been observed only in 61 wells (22%) at different locations. Only 3 wells (1%) have shown water level more than 10 m bgl. (Plate V).

January 2021

To study the water levels of recession period data were collected during January, 2021 from 236 wells. The district-wise status of distribution of network hydrograph stations with different ranges of depth to water level is presented in *Table 5*.

The minimum and the maximum depth to water levels in the State have been recorded 1.20 m bgl in Gumla district and 14.05 m bgl in Purbi-Singhbhum district. The water level in the range of 2 - 5 m bgl has been observed in the 96 wells (41%) covered almost entire State. And 5-10 m ranges in 112 wells about 47% . Water level range from 10 to 20 m bgl has been observed. 8 wells about 3% . The water level below 2 m has been observed in 20 wells Plate VI.

4.2 SCENARIO OF ANNUAL FLUCTUATIONS IN JHARKHAND DURING 2019-20 TO 2020-21

The annual fluctuation in water levels for the periods of (1) May 2019 and May 2020, (2) August 2019 and August 2020, (3) November 2019 and November 2020 and (4) January 2020 and January 2021 have been analysed to study the net status of ground water conditions during the previous and current year.

May 2019 & May 2020

The annual fluctuation in water level between May, 2019 and May, 2020 indicates the net status of ground water condition during the previous year and current pre-monsoon measurement. The district wise statement of frequency of distribution of ground water monitoring wells falling in different ranges of water level fluctuation is presented in *Table-6*.

Only Seven District in the State water level have been analysed. The major part of the analysed districts show rise in water level (90%) and fall in water level (8%) and (2%) no change. Total 41wells (48%) out of 84 analysed wells, comes under 0-2 m rise zone category, on the other hand 5 wells (6%) show fall within 2 m, which may indicate that the regional fluctuation of the state (54%) is mainly restricted within 2 m. The next higher magnitude of fluctuation is of 2 -4 mbgl rises in water level in the state 27% is observed and 2% fall in some part of the state. The highest magnitude of >4 mbgl rise has been observed in only 13% of wells.

Overall the seven districts in the State is covered under rising and falling zone category (75 and 7 wells out of 84 analysed well), which may indicate the slightly moderate rainfall (2020).

August 2019 and August 2020

The annual fluctuation in water level between Aug, 2019 and Aug, 2020 indicates the status of ground water condition during the previous year and current monsoon measurement The district wise statement of frequency of distribution of network hydrograph stations falling in different ranges of water level fluctuation is presented in Table 7.

A general fall in water level (20%) has been found in major part of the seven district whereas rise in (80%). Water level rise is recorded in 42% of wells and fall in 15% within 2 m, 24% rise and 3% fall within 2-4m and 12% rise and 2% fall has been observed in >4 mbgl.

Overall the seven districts in the State is covered under the category of 80% rise and 20 % fall which may be due to moderate to high rain fall during previous year.

November 2019 And November 2020

The Annual fluctuation in water level between November 2019 and November 2020 indicates the net status of ground water conditions during the previous and current post-monsoon year and the same is presented in Plate VII. The district-wise statement of distribution of network hydrograph stations in different ranges of water level fluctuation is presented in *Table 8*.

The comparison of fluctuation in water level between November 2019 and November 2020 shows fall in 54% GWMW as well as rise in 46% GWMW of the total 248 analysed wells during the period. The major part of the state shows a general fall in water level within 2.00 m. Out of 248 wells fall of water levels are observed, 111 wells (44%) water level ranges 0 - 2m, 2 wells (6%) 2 – 4 m

and 6 wells (2%) > 4 m. 113 wells (46%) wells are observed rise in water level. In which 86 wells (35%) ranges 0-2m, 16 wells (6%) 2-4 m and 6 wells (2%) > 4m during the period.

January 2020 And January 2021

The annual fluctuation in water level between January, 2020 and January, 2021 indicates the status of ground water condition during the previous year and current measurement and the same is presented in Plate VIII. The district wise statement of frequency of distribution of network hydrograph stations falling in different ranges of water level fluctuation is presented in *Table 9*.

The major part of the state shows general fall (61%) and rise (38%) and no change in 1%. in water level. Out of 209 well 60 wells (28%) are observed water level rise 0 - 2 m, 13 wells (6%) 2-4m and 6 wells more than 4m. Fall of water level range is observed in 109 wells (52%) 0-2m, 14 2-4m and 4 wells more than 4m.

4.3 SCENARIO OF SEASONAL FLUCTUATIONS IN JHARKHAND DURING THE GROUND WATER YEAR 2020 – 2021:

An attempt has been made to compare the pre-monsoon water levels of May, 2020 with water levels of August 2020, November 2020 and January 2021 to delineate the impact of rainfall as well as ground water development on ground water regime in the state during the above period.

May 2020 and August 2020

The fluctuation in water level between May 2020 and August 2020 indicates the change in water level from pre-monsoon measurement to monsoon measurement. The district wise statement of frequency distribution of network hydrograph stations falling in different ranges of water level fluctuation is presented in *Table 10*.

During this period only seven district in the state of Jharkhand has been analysed and show a general rise in water level, which is mainly due to recharging of ground water on onset of monsoon from June 2020. However 3 wells show fall in water level which may be mainly due to temporal withdrawal of ground water and less rainfall in those areas.

May 2020 and November 2020

The seasonal fluctuation in water level between May 2020 and November 2020 indicates the change in water level from pre-monsoon measurement to post-monsoon measurement. The district-wise statement of distribution of network hydrograph stations in different ranges of water level fluctuation is presented in *Table 11*.

Fluctuation in water level for November 2020 compared with May 2020 shows rise in water level (85%) for the seven districts in state of Jharkhand. Out of 82 wells analysed, in the tune of 0.00 - 2.00 m (34%), 2.00 - 4.00 m (32%) and above 4 m (30%) during the period, which is a normal

phenomenon due to recharge of ground water, as a result of onset of monsoon and rapid recharge due to moderate to steep slope in undulating tracts. A fall in water level is recorded in 11 wells out of 82 wells of the state which is mainly due to temporal withdrawal of ground water in those areas.

May 2020 and January 2021

The fluctuation in water level between May 2020 and January 2021 indicates the change in water level from pre-monsoon measurement to January measurement. Fluctuation in water level maps for May 2020 and January 2021 have been retrieved from 50 analyzed wells. The district wise statement of frequency distribution of network hydrograph stations falling in different ranges of water level fluctuation is presented in *Table 12*.

During the period the entire state of Jharkhand shows a general rise (38 wells) in water level, in the range of 0.00 to 2.00 m (52%), 2.00 to 4.00 m (18%) and > 4 mbgl (6%) which is mainly due to recharge on ground water for onset monsoon from June 2020 and rainfall during July - October 2020. However, 12 wells of the state shows fall in water level which may be due to temporal withdrawal of ground water at that area.

4.4 SCENARIO OF DECADEAL WATER LEVEL FLUCTUATIONS WITH THE GROUND WATER YEAR 2020 – 2021

Decadal Mean and May 2020

Water level fluctuation has been compared the water level data of 89 wells for May Mean (2010-2019) with the depth to water level data May 2020. The district wise statement of frequency distribution of ground water monitoring wells falling in different ranges of water level fluctuation is presented in *Table 13*.

The fall (7%) as well as rise (92%) in water level in the range of 0 – 2 m shows variation in almost the districts in the state. However, the higher magnitude (>4m) of fall not recorded.

Decadal Mean and August 2020

Water level fluctuation has been compared the water level data of 109 wells for May Mean (2010-2019) with the depth to water level data August 2020. with the depth to water level data August 2020. The district wise statement of frequency distribution of network hydrograph stations falling in different ranges of water level fluctuation is presented in *Table 14*.

The rise (84%) as well and fall (16%) in water level in the range of 0 – 2 m shows variation almost in the seven district in the state. Rise in water level in the range of 2 – 4 m bgl is recorded in 24% wells. Fall in water level in the range of 2 – 4 m bgl is recorded in 4% wells.

However, overall regional fluctuation of water level in the entire state is mainly restricted within 2 m only which is normal phenomenon and no abnormal rise or fall in water level is observed except in few localized well. Fall > 2 mbgl may be due to irregularities of rainfall during last 3 to 4 years.

Decadal Mean and November 2020

The fluctuation map of water level between November Mean and November 2020 (Plate IX) has been prepared on the basis of available Mean water level data (276 wells) of November for last 10 years (2010-2019) with the present water level data for Jharkhand. The district-wise statement of distribution of network hydrograph stations in different ranges of water level fluctuation is presented in *Table 15*.

The fluctuation of water level of November 2020 with respect to decadal mean water level of November, 2019 indicate the fall (20%) as well as rise (80%) in water level in the range of 0 – 2 m. Fluctuation in water level 2-4 m has been recorded fall in 2 % of the wells and rise in 15 % of the wells. Fluctuation more than 4m fall 1% wells and 6% rise in water level of wells are recorded.

However, overall regional fluctuation of water level in the entire state is mainly restricted within 2 m only which is normal phenomenon and no abnormal rise or fall in water level is observed except in few localized well.

Decadal Mean and January 2021

Water level fluctuation map (Plate X) has been prepared by comparing the water level data (234 wells) for January Mean (2011-2020) with the depth to water level data January, 2021. The district wise statement of frequency distribution of network hydrograph stations falling in different ranges of water level fluctuation is presented in *Table 16*.

The fluctuation of water level of January, 2021 with respect to decadal mean water level of January, 2020 indicates 38 % fall and 62% rise in the range of 0 – 2 m has been observed in almost entire state. Out of 234 wells analysed 3 % wells have shown fall and 10% wells rise in water level in the range of 2-4m and 5 wells fall and 10 wells rise have been shown > 4 mbgl.

However, overall (76%) regional fluctuation of water level in the entire state is mainly restricted within 2 m only which is normal phenomenon and no abnormal rise or fall in water level is observed except in few localized well.

4.5 TREND OF GROUND WATER LEVEL

The Trend of ground water level data is presented in **Annexure-II**.

The observation shows the rising trend of ground water level in 119 wells and falling trend in 80 wells. The trend of ground water level of the entire state is mainly restricted within 0.5 m only which is normal phenomenon and no abnormal rise or fall in water level is observed in the well of the state.

5.0 HYDROCHEMISTRY:

The chemical quality of groundwater is dependent on the source of water and on the course over which it flows. Ground water carries a higher mineral content than surface water due to the slow circulation and longer period of contact with the rocks formation. In order to assess the chemical quality of ground water of phreatic aquifers of Jharkhand state ground water samples have been analysed for major 15 parameters viz. EC, pH, HCO₃, CO₃, Cl, TH, Ca, Mg, K, Na, F, SiO₂, PO₄ and NO₃. The chemical analysis data of ground water samples collected (390) during the period May 2018.

Ground water samples throughout the state found to be slightly alkaline in nature as the pH mostly varies between 6.20-8.60. The quality of ground water in most of part of the state is potable with low mineral contents having electrical conductance varying from 84.20 (recorded at Kudri, Khunti) to 2450 (at Chandankiyari, Bokaro) $\mu\text{S}/\text{cm}$ at 25^oc. The samples found to be suitable for drinking and irrigation purposes. Only 3 samples are having electrical conductivity greater than 2000 $\mu\text{S}/\text{cm}$, which can be treated as brackish water. Spatially in major part of the state EC rested in the range of 400-1000 $\mu\text{S}/\text{cm}$. In most of the samples the concentration of chloride is within the desirable limit of drinking water (250 mg/l). Concentration of chloride in ground water >250 mg/l is recorded in 14 number of samples in Dumka, Giridih, Sahibganj, Jamtara, Khunti, Saraikela, Dhanbad, palamau, Hazaribagh, Pakur West singhbhum districts.

Thus it is observed that the quality of ground water in shallow aquifers in the entire state is suitable for drinking, irrigation and industrial purposes except in arsenic & fluoride infested areas.
