Foreword

Groundwater is the major source of freshwater that caters the demand of ever growing domestic, agricultural and industrial sectors of the country. This renewable resource has been indiscriminately exploited in some parts of the country by several users as it is easily available and reliable. Intensive and unregulated groundwater pumping in many areas has caused rapid and widespread groundwater decline. Out of 6607 groundwater assessment units (Blocks/mandals / taluks/ firkas etc.), 1071 units are over-exploited (groundwater withdrawal is more than recharge) and 914 units are critical (groundwater withdrawal is 90 % of recharge.

Central Ground Water Board (CGWB) has taken up the largest Aquifer mapping endeavor in the world, targeting total mapable area of country ~ 23.25 lakh sq. km with a vertical extent of 300 m in soft rock area and 200 m in hard rock area. The extent of aquifer, their potential, resource availability, chemical quality, its sustainable management options will be addressed by National Aquifer Mapping (NAQUIM). The NAQUIM program will also facilitate participatory management of groundwater to provide long term sustenance for the benefit of farmers. Currently, focus is on groundwater stressed areas of eight states comprising 5.25 lakh sq. km *viz.*, Tamil Nadu, Haryana, Punjab, Rajasthan, Gujarat, Andhra Pradesh, Telangana, Karnataka and Madhya Pradesh.

South Eastern Coastal Region, Central Ground Water Board, Chennai, under NAQUIM has been envisaged with the Mapping of an area of 70,102 sq. km during 2012-17 (erstwhile XII five year plan) in Tamil Nadu and UT of Puducherry. This report deals with the Aquifer mapping studies carried out in Varahanadi aquifer system covering an area of 4741 sq. km with 4716 sq. km as map able area. The basin comprises of parts of districts of Tiruvannamalai, Kancheepuram, Villupuram, Cuddalore and Union Territory of Puducherry region, with 41 firkas and Puducherry region. Twenty six firkas in Tamil Nadu and Puducherry region are over exploited and critical and are mainly dependent on groundwater (90%) for its drinking water needs. The major issues in the basin include declining groundwater levels, sustainability of wells, low yielding aquifers, threat of seawater intrusion, and backwater aqua culture. Aquifer units have been deciphered firka wise and regions of high yielding zone and low yielding have been demarcated for both soft and hard rock formations in the Varahanadi aquifer system. In hard rock regions two aguifer units viz., Aguifer Unit -I (weathered) and Aguifer Unit -II (fractured/jointed zone) are identified. In soft rock formations two aquifer units viz., Aquifer Unit-I (alluvium, sandstone with laterite and conglomerates) and Aquifer Unit-II (Tertiary and upper Cretaceous sand stones) are identified. In order to arrest the declining groundwater levels and increase the sustainability of wells, groundwater management plans in supply and demand sides have been formulated firka wise.

I hope this report will be useful for the district administrators, water managers, stakeholders including farmers in knowing the aquifer and managing the resources effectively in the Varahanadi aquifer system.

EXECUTIVE SUMMARY

Detailed hydrogeological studies were conducted in the study of Varahanadi Aquifer system region wherein huge existing data pertinent to geology, geophysics, hydrology and hydrochemistry were collected, integrated and analysed to bring out this report. This report mainly comprises the lateral and vertical extent of the aquifers with their geometry, aquifer properties of the study area which are considered to be measuring scales for groundwater availability and potentiality. Keeping these parameters in view a sustainable management plan has been suggested through which the groundwater needs can be fulfilled in a reasonable way.

Area experiences semi-arid climate with 1128 mm average rainfall covering 4741 km² area in parts of districts of Tiruvannamalai, Kancheepuram, Villupuram, Cuddalore and Union Territory of Puducherry region. About 61% of the geographical area is under agricultural activity of which 42% is groundwater irrigation. The main crops irrigated are paddy, sugarcane, groundnut, maize, cotton, ragi and other minor crops are turmeric, vegetables and flowers.

Two main aquifer systems exists in the basin and they constitute, namely 1. Crystalline rocks-the weathered zone at the top followed by a discrete anisotropic fractured/fissured zone at the bottom in the western, northern and central part of the basin. 2. Sedimentary rocks-alluvium in the eastern and southern parts are underlined by Neogene, Paleogene and upper Cretaceous sediments. Groundwater occurs under unconfined condition in the weathered zone & in the alluvial formation, under unconfined, confined to semi-confined conditions in the sandstones and fractured/fissured zone. The predominant water levels are in the range of 2 to 20 m bgl during pre-monsoon season and 0 to 10 mbgl during post-monsoon season of 2017. The net annual groundwater availability is 1135.09 MCM and the gross groundwater draft is 1211.11 MCM and the stage of groundwater development is of 105% (OE).

The major issues in the region are overexploitation and declining of groundwater level, massive crystalline formation and limestone/clays form poor aquifer, threat of seawater intrusion along the coast and backwater aqua culture.

In hard rock regions aquifer systems can be conceptualized as weathered zone down to ~18 m with average thickness of 9 m and fractured zones between 15 and 132 m bgl. The weathered zone is disintegrated from the bed rock (upper part–saprolite zone) and partially/semi weathered in the lower part (sap rock zone) with transmissivity varying between 2.2 and 24.34 m²/day and specific yield of 1-1.5%. The fractured zone is fractured gneiss or Charnockite, associated sometime with quartz veins. The yield varies from 1 to 3 lps and the transmissivity of this zone varies between 1 and 51.5 m²/day and storativity varies from 0.002 to 0.01. In alluvial regions the first aquifer unit comprising of sand, gravel has thickness ranging from 10 to 55 m with yields ranging from 1 to 5 lps and transmissivity values ranging from 245 to 770 m²/day. Neogene, Paleogene and upper Cretaceous formations underlie the alluvial formation and have yields ranging from 3 to 10 lps with transmissivity values ranging from 138 to 3162 m²/day.

Major part of groundwater is being used for irrigation purpose resulting in either shortage for irrigation needs or creates excessive draft to meet the demands in groundwater potential areas. The study formulates management strategies for supply side as well as demand side. The supply side measures include construction of artificial recharge structures of 39 Check dams,

292 nala bunds, 2177 recharge shafts in addition to the 693 ponds earmarked for rejuvenation with recharge shafts in all the 41 OE, 5 critical firkas and Puducherry region of the basin. The estimated cost for construction of these structures is to be Rs. 192 crores. The estimated recharge to groundwater system through these structures will be in the order of 65 MCM with an additional area of 4063 ha Paddy or 3250 ha Sugarcane or 6500 ha Banana or 10834 ha Irrigated dry crops. Demand side management is also recommended by change in irrigation pattern from flooding method to Ridge & furrow for paddy and flooding to Micro Irrigation for sugarcane and banana crops. This intervention would save 255.64 MCM of water annually. By carrying out both supply and demand side interventions the stage of groundwater development would be lowered from 105 to 82 %.

The existing regulatory measures may be modified suitably for optimal utilization of groundwater as well as for sustainable development of rural agricultural based economy. To achieve this goal, opinion pool has to be obtained from more user groups and valid suggestions may be incorporated in the regulatory acts.

AQUIFER MAPPING AND AQUIFER MANAGEMENT PLAN FOR THE VARAHANADI AQUIFER SYSTEM, TAMIL NADU & UNION TERRITORY OF PUDUCHERRY

1.0 INTRODUCTION

National Project on Aquifer Mapping (NAQUIM) initiated by Ministry of Water Resources, River Development and Ganga Rejuvenation, Government of India has a vision to identify and map the aquifers at the micro level with their characteristics, to quantify the available groundwater resources, propose plans appropriate to the scale of demand and institutional arrangements for participatory management in order to formulate a viable strategy for the sustainable development and management of the precious resource which is subjected to depletion and contamination due to indiscriminate development in the recent past.

Groundwater is being increasingly recognized as a dependable source of supply to meet the demands of domestic, irrigation and industrial sectors of the country. The development activities over the years have adversely affected the groundwater regime in many parts of the country. Hence, there is a need for scientific planning in development of ground water under different hydrogeological situations and to evolve effective management practices with involvement of community for better ground water governance.

Aquifer Mapping has been taken up in Varahanadi basin in a view to formulate strategies for sustainable management plan for the aquifer system in accordance with the nature of the aquifer, the stress on the groundwater resource and prevailing groundwater quality which will help in drinking water security and improved irrigation facility. It will also result in better management of vulnerable areas.

1.1. Objective

The objectives of the aquifer mapping in Varahanadi aquifer system can broadly be stated as

- To define the aquifer geometry, type of aquifers and their lateral and vertical extent
- To determine the groundwater regime scenario
- To determine the hydrogeochemical characteristics of the aquifer units
- 2D and 3-D disposition of the aquifer units.
- To estimate the availability of groundwater resources in the aquifer system
- To develop a sustainable groundwater management plan for the aquifer system.

1.2. Scope of the Study

The important aspect of the aquifer mapping programme is the synthesis of the large volume of data already generated during specific studies carried out by Central Ground Water Board and various Government organizations that broadly describe the aquifer system. The available generated data are assembled, analysed, examined, synthesized and interpreted from available sources. These sources are predominantly non-computerized data, which is to be converted into computer based GIS data sets.

Data gaps have been identified after proper synthesis and analysis of the available data collected from different state organisations like; TWAD Board, PWD, Agricultural Engineering Department. In order to bridge the data gap, data generation programme has been

formulated in an organised way in the basin. Exploration work has been carried out in different segments of the regions and aquifer parameters have been estimated. Groundwater monitoring regime has been strengthened by establishing additional monitoring wells.

1.3 Issues

- 1. Declining of groundwater level. (**Figure.1**)
- 2. Crystalline formation-Low yielding aquifer units.
- 3. Limestone/claystone- Low yielding aquifer units
- 4. Threat of Sea water Intrusion
- 5. Groundwater Contamination due to backwater aqua culture.

Figure.1. Issues pertaining to the Varahanadi Aquifer system

1.4. Approach & Methodology

Integrated multi-disciplinary approach involving geological, geophysical, hydrological, hydrogeological and hydrogeochemical components were taken up in 1:50000 scale to meet the objectives of study. Geological map of the basin has been generated based on the GSI maps, geophysical data has been generated through vertical electrical soundings and geoelectrical layers with different resistivities have been interpreted in corroboration with the litho stratigraphy of the observation wells and exploratory wells down to depths of 200 m bgl and 300 m bgl for hard rocks & soft rocks respectively. Hydrological and Hydrometerological data have been collected from state PWD and IMD departments. Drainage, soil and geomorphology of the basin were prepared based on the IRS –IC data, obtained from Institute of Remote Sensing, Anna University, Chennai.

Based on the data gap analysis data generation process has been scheduled through establishing key observation wells, pinpointing exploratory sites for drilling through in-house and outsourcing, collecting water samples in order to study groundwater regime, geometry of the aquifer and aquifer parameters, and quality of the groundwater respectively. Groundwater recharge and draft have been computed through different methods and resources of the basin estimated through groundwater balance method.

Based on the above studies management strategies both on the supply side through augmentation of groundwater through artificial recharge and water conservation and on demand side through change in irrigation pattern have been formulated for sustainable management of the groundwater resource.

1.5. Study area

The Varahanadi aquifer system covering an area of 4741 sq. km comprising of 25 sq. km of hilly area and 4716 sq. km of mappable area is situated between latitudes 11°45' N and 12°30' N and longitudes 79°10' E and 80°10' E of Tamil Nadu. It is bounded by parts of Kanchipuram and Tiruvannamalai districts in the north; part of Tiruvannamalai in the west and parts of Villupuram and Cuddalore districts in the south and the Bay of Bengal Sea on the east. The Varahanadi and Ongur are the two major rivers of this basin. This aquifer system covers partly or fully 41 firkas of Rettychavadi, Acchirupakkam, Cheyyur, Chithamur, Kadapakkam, Kayapakkam, Kodur, Onampakkam, Orathi, Sunampedu, Desur, Kilpennathur, Mangalam, Osur, Thellar, Anniyur, Avalurpettai, Brammadesam, Deevanur, Gingee, Kanai, Kanjanur, Kiliyanur, Mailam, Marakkanam, Melmalaiyanur, Melolakkur, Nemili, Olakkur, Rettanai, Sathiyamangalam, Sathampati, Siruvadi, Sithalampattu, Tindivanam, Vadasiruvalur, Valavanur, Vallam(V), Vanur, Vikkiravandi of Cuddalore, Kancheepuram, Tiruvannamalai and Villupuram districts. Part of Puducherry region of Union territory of Puducherry also falls in the aquifer system. Twenty one firkas are over exploited and five firkas are critical (Table.1). The major part of the basin area comes under Villupuram district of Tamil Nadu and Puducherry region of Union Teritorry of Puducherry, and parts of Kanjeepuram and Tiruvannamalai districts of Tamil Nadu. The administrative map of the Varahanadi aquifer system is presented as **Figure.2**

Table 1: Districts and Firkas of the Varahanadi aquifer system

Sl No.	District	Area Sq km	No. of firkas	No. of OE and Critical Firkas
1	Cuddalore	89	1	1
2	Kancheepuram	755	9	1
3	Tiruvannamalai	512	5	3
4	Villupuram	3092	26	21
5	Puducherry	293	1	1
	Total	4741	42	27

1.6. Data adequacy

Exploratory well data is available for 98 wells drilled by CGWB (87 nos) and State Departments (11 nos). Groundwater monitoring wells (143 nos) and Water Quality monitoring wells (112 nos) data was available for a long period i.e., more than ten years. 25 nos of Vertical electrical sounding data was available. Cropping pattern and Soil data has been collected from Agricultural and Statistics Department. After plotting the available historical data on 1:50,000 scale maps, data gaps have been identified and data generation process has taken up in those gap areas to complete the Aquifer map on the desired resolution of 1:50,000 toposheets.

1.7 Rainfall

The Varahanadi aquifer system has a monsoonal climate as it lies within the tropical monsoon zone. Based on the hydrometeorological feature of the basin, year is divided into 2 periods, Monsoon period spanning from June to December and Non-monsoon period spanning from January to May. The monsoon period is further sub-divided into 1) South West monsoon period spanning from June to September (4 months) and 2) Northeast monsoon period spanning from October to December (3 months). Similarly, the non-monsoon period is further sub-divided into (1) Winter period spanning January and February (2 months) and (2) Summer period spanning from March to May (3 months). As the monsoon period brings heavy rainfall it improves the recharging of groundwater and storage of surface water. Hence, the monsoon period is hydrologically significant for water resources analysis, but whereas the Nonmonsoon, it is insignificant. Normal annual rainfall for the Varahanadi aquifer system is 1128 mm (100 yrs).

Figure 2: Administrative setup of the Varahanadi aquifer system

1.9. Physiography and Drainage

Physiographically the Varahanadi aquifer system region comprises of two major rivers Varahanadi and Ongur and their watersheds (**Figure.3**) Both the rivers are ephemeral and drain in to Bay of Bengal sea. The Varahanadi flows from northwest to southeast and to east into sea, south of Ariyankuppam in Puducherry. The Varahanadi river is also known as Gingee, Sankaraparani and Chunnambar. The Varahanadi is about 79 km in length and it originates on the western slope of Gingee Hill in Villuppuram district of the state of Tamil Nadu. It has two sources, one in the Pakkammalai hills and another one in the hills of Melmalayanur and they join near Thenpalai village to form the main river. Thondiar, Pambai, and Guduvaiyar rivers are the tributaries of Varahanadi. Ongur river is about 42 km in length and it originates as a surplus of Saram tank in Tindivanam. Nedunkal odai is the tributary of Ongur river.

A back water lagoon at Kaluveli is extending from north of Puducherry to Marakkanam. Edaiyanthittu swamp is north of the Kaluveli tank and connected to it. Ongur river drains in to the Edaiyanthittu. Othiyur backwater lake is in the northeast corner of the area. Major tanks in the area are Melmalayanur and Usteri near Puducherry. There are more number of systems and non-system rain fed tanks lying in the study area. These water bodies are very specifically useful in meeting the irrigation need.

The Maximum elevation is 491 m above m.s.l. and minimum elevation is mean sea level. Vidur reservoir built across Varahanadi is situated in the central part of basin. The nominal topography is generally sloping towards the East and Southeast. The general trend of dipping ranges from West to East. The Hydraulic gradient and the flow lines of ground and surface water are towards east, the sea.

1.10. Geomorphology

The geomorphology of an area is the external appearance of landforms, which gives a reliable picture of the underground strata and its physio-chemical condition. The different formations and the layer confirms and cogent to its geomorphology. Geomorphologically, the area has been delineated into 1. Residual hills 2. Pediments and pediplain 3. Flood plains and Coastal plains. The regional slope is towards east. The residual hills in the western and north-western parts of the area comprises Charnockite group of rocks, The pediments and pediplain in the western part and central part overlie the Migmatic and Charnokitic domain. The rocks of Miopliocene age *ie.*, Cuddalore sandstone and laterite form low plateaus in the area. The southern part is marked by depositional regime of Varahanadi river, manifested in the form of flood plains occurring at the lowest elevation in the area. The eastern part adjoining to beach and shores covers coastal geomorphic units representing Cretaceous-Eocene formations.

The marine regime is represented by the beach, beach terraces, tidal flats, estuary, beach ridges and barrier dunes. The beaches are broad in north and south of Puducherry, whereas in Puducherry the beach is narrow and under active erosion. The beaches are landforms covered by sand and sandy materials having high porosity and unconsolidated loose formation with voids and spaces.

The step like projection bordering the sandy terrain and the shoreline are called as beach terraces. These terraces are undulated and according to the forces of the tide and their deposition. Beach ridges are elevated sandy tops adjoining the beaches and are good horizons

for groundwater presence.

Figure 3: Drainage map of the Varahanadi aquifer system

Figure 4: Geomorphology map of the Varahanadi aquifer system

Nearly 74% of the region is covered by pediment including pedimont zone and is represented in **Figure.4**. These are evidenced from the dendritic pattern of drainage. Sedimentary high ground and Alluvial plain are seen in the eastern and southern part of the area respectively

Flood plains consisting of sand and clay are found along the boundaries of Varahanadi, Pambaiar and Guduvair rivers. The thickness of the alluvial sand varies from 1 to 20 m and the flood plain itself is found spread over width varying from 0.25 to 1 km from the riverbanks. The piedmonts regions constitute of boulders, cobbles, pebbles, gravels, sand, silt and clay of varying lithology. **Figure 5** illustrates the level I classification of geomorphological features of the Varahanadi aquifer system.

Figure 5: Level I classification of geomorphology of the Varahanadi aquifer system.

1.11 Landuse and Land cover

Agricultural land occupies nearly 3348 sq. km i.e., 71% of the Varahanadi aquifer system area and spread throughout the study area. Forests occupy about 141sq. km (03 %) of the area taking the green area to 74% (**Figure 6 & 6a**). Water bodies, waste land and built up/urban area occupies 11, 10 and 5 % respectively.

Figure 6: Level 3 Landuse /Land cover map of the Varahanadi aquifer system

Figure 6a: Level 1 Landuse/ Land analysis diagram of the Varahanadi aquifer system

1.12. Soils

Soils play a major role in hydrologic control of the infiltrating water. Soils are generally classified by taking their color, texture, fertilities and chemical combinations includes salts, minerals and the solution effect over them. The major soil types in the study area are Red soil, Black cotton soil, Sandy loam and Forest loam (**Figure 7**)

1.13 Slope

The slope of any terrain plays a vital role in allowing the infiltration of water into the subsurface system. In regions of gentle slope the runoff will be slow and will have more time for percolation of rainwater, whereas steep slope facilities high runoff allowing less residence time for rainwater to percolate. The Digital Elevation Model (DEM) map of study area was prepared from the Cartosat DEM of 30 m spatial resolution (**Figure**). The elevation of the Varahanadi Aquifer system ranges from 491 m a msl in the west to sea level in the east.

1.14. Agriculture

Agriculture is the main stay of the rural population in the entire study area. The total irrigated area of the Varahanadi aquifer system area is 3089 sq. km with main water intensive crops irrigated are paddy, sugarcane and banana covering about 1488 sq. km (**Figure 9**). The less water intensive crops irrigated are maize, tomato, groundnut and chilly. The other crops include cotton, ragi etc., and other minor crops are turmeric, flowers and vegetables. The total cultivated area is about 5611 Sq. Km

Figure 7: Soil map of Varahanadi aquifer system

Figure 8: DEM of the Varahanadi Aquifer system

1.15. Irrigation:

The total area irrigated under different crops is 3089 sq. km out of the total geographical area of 4716 sq.km, which accounts for 65.5 %. Paddy is the main water intensive crop in the study area. About 98% of the groundwater is used for irrigation. Water from the Vidur reservoir is used for irrigation purpose.

Figure 9: Crop wise distribution in the Varahanadi aquifer system

1.16. Geology

Geologically, the Varahanadi aquifer system comprises of upper Cretaceous, Palaeogene and Neogene sediments of marine, estuarine and fluvial alluvium underlained by Precambrian rocks of Granitic gneiss, Hornblende Biotite Gniess and Charnockites,. The Charnockites occur in the northern and central parts, and Hornblende Biotite Gniess occurs in the eastern part of the area.

Figure 10: Geological map of the Varahanadi Aquifer system

Alluvium underlain by clays, sandstone, limestone and claystone are found in the eastern and southern part of area (**Figure 10**). Geologic succession of the Varahanadi aquifer System is presented in **Table 2**

Precambrian Rocks

The Precambrian rocks belonging to Archaean age comprising Charnockite group, the Migmatic complex, Hornblende biotite gneiss, Granitoid gneiss, Granite with basic and ultrabasic intrusive are found in western, northern and central part of the area. Charnockite forms the basement for the Cretaceous, Palaeogene, Neogene and Quaternary sediments.

Charnockite occurs in the northern and central part, and the rocks are scarcely weathered and poorly jointed, generally massive and unfoliated. Granitoid gneiss forms the linear band within Charnockite and the contact between them is highly sheared. The migmatite complex made up of Hornblende biotite gneiss, pink Augen gneiss and pink Migmatite, occurring in the eastern part and are micaceous with bands of granite and pegmatite, with quartz veins. The younger intrusions of Tindivanam and Gingee granite and basic dykes occur in the magmatic complex. Epidote-hornblende gneiss occurs as small isolated outcrops around Gingee. Dolerite dykes form the youngest basic intrusive traversing both Charnockite as well as the Migmatite complex.

Paleozoic sediments

Paleozoic sediments of lower Permian and lower Gondwana group, the Talchir Formation (CP-Carboniferous to Permian) comprising boulder bed, conglomerates, olive green to khaki coloured splintery shale with minor pink sandstone occurs as NS linear formations in the northern part of the area. The palyno-fossil assemblage consists of Virkki pollenites, Plicatipollenites, Potoniei sporites, Lumati sporities, which are indicative of early Permian Age.

Mesozoic & Tertiary (Neogene and Paleogene) sediments

Marine upper Cretaceous and Palaeogene rocks, and Cuddalore formation of Mio-Pliocene age occur in the south eastern part known as Puducherry sub-basin. The upper Cretaceous and Palaeocene formations are equivalent to the Ariyalur group of the Trichinopoly Cretaceous-Tertiary sub-basin. The rocks are overlapped by Cuddalore formation towards south east.

Argillaceous sandstone with bands of limestone/calcareous sandstone, clays, shales/siltstone, fossiliferous limestone and marlstone are the main rocks of different formations *viz.*, Vanur formation (Valudavur beds), Nesal formation, Karasur formation and Manaveli formation, in an ascending order. The Vanur formation comprises argillaceous sandstone with thin bands of sandy limestone/calcareous sandstone. The rocks of the formation have been referred to as Valudavur beds. The Nesal formation is essentially made up of clays, shales, sandy shale/siltstone with lenticular bands and lenses of shell limestone with fossils comprising Trigonoarca, Exogyra, Turitella, baculites and Echinoids. Both Vanur and Nesal formations are of upper Cretaceous age.

The Karasur formation consists of bands and lenses of fossiliferous limestone alternating with argillaceous sandstone. This formation is known as 'Nerinea beds' and considered equivalent to Niniyur formation of Ariyalur group of Trichinopoly sub-basin. Manaveli formation, which lies above the Karasur formation comprises shale, silt and fine grained unconsolidated sandstone.

The age of the formation is Paleocene, but the upper beds are suspected to transgress into Eocene.

The Cuddalore formation overlies the marine upper Cretaceous and Paleogene formations. The area occupied by Cuddalore formations forms higher ground and is characterised by red/lateritic soil. The formation comprises argillaceous sandstone, pebbly sandstone and lenses of clays, besides lignite seams. This formation contains large quantities of fossil wood around Tiruvakkarai, which have been declared and maintained as National fossil wood park by Geological Survey of India (G.S.I).

Quaternary

Quaternary sediments are found in the southern and eastern part of Varhanadi aquifer system all along the coast, river courses and in the southern part, the alluvium of Varahanadi/Gingee, youngest formations over lie Neogene, Paleogene and upper Cretaceous formations. The Quaternary sediments are of two types, deposited under fluvial environment (river deposits) and marine environment. The fluvial sediments include clays and sands, mud, silt and medium to coarse grained sand (beach deposits). The thickness of the alluvial deposits is about 50 m. The marine deposits extend all along the coast of Puducherry. They comprise tidalflat, mudflat deposits (black clays and muds), barrier dune sand deposits (grey brown medium sands). The dune mound deposits are widely displayed in the stretch between Kirumambakkam and Nakemedu areas.

Table 2: Geological succession of the Varahanadi Aquifer system

S. No	Eon	Era	Series/Epoch Age Group/Formation		Lithology	Groundwater relevance
1.			Quaternary	Holocene-Pleistocene/ Fluvial sediments, Marine sediments	Soils, black clays, coastal /river alluvium (sand & silt), beach sand and laterite	Moderate to very good porous aquifer system
	zoic	oic		Neogene/ Mio Pliocene Cuddalore	Pebbly, argillaceous and mottled sandstone	Very good porous aquifer
	Phanerozoic	Cenozoic	iary	Paleogene / Eocene, Paleocene	Fossilliferous clays /	Very low porous Aquifer
2.			Tertiary	Manaveli,	siltstone and Argillaceous sand stone	Very low porous Aquifer
				Karasur (Nerinea beds)	Fossiliferous limestone/ sandy limestone	Very low Porous aquifer

		zoic	Upper Cretaceous/ Maastrichtian Nesal	Fossiliferous shale, Argillaceous sandstone with shell limestone,	Very low Porous aquifer				
3.		Mesozoic	Vanur (Valudavur beds)	Argillaceous and micaceous sandstone.,	Moderate to good porous aquifer				
			Unco	nformity					
4		Lower Permian Paleozoic Lower Gondwana Talchir formation		Bouldery beds, Shale, Conglomerates	Moderate porous aquifer				
			Unconformity						
5.	Precambrian	Archaean	Late Archaean to Proterozoic Younger granites Basic intrusives Migmatic complex	Dolerite dykes, Epidote Hornblende gneiss Gingee/Tindivanam granite / Hornblende biotite Gneiss, Pink augen gneiss, Pink migmatite	Weathered and Fractured aquifer units				
			Charnockite group	Charnockites, Pyroxene- granulite, Garnetiferous gabbro					

2.0 DATA COLLECTION AND GENERATION

Periodical data pertaining to groundwater levels, quality, pumping tests and slug tests were collected during aquifer mapping studies apart from water sample collection to assess the groundwater quality. In addition Geophysical data has been generated through conducting Geo electrical soundings after evaluation of data gap analysis.

2.1. Hydrogeological data

The periodical monitoring of groundwater level reflects the groundwater recharge and discharge (natural and manmade) occurring in the aquifer systems. It also reveals the interaction between surface and sub-surface water systems. In Varahanadi Aquifer system area, 143 groundwater monitoring wells which included 11 CGWB monitoring wells, 56 Tamil Nadu state department wells, 57 and 19 piezometers of Union Territory of Puducherry (UTP) and CGWB respectively, were monitored periodically. The monitoring was useful to record the temporal and spatial changes in the aquifer system. The locations of monitoring wells are presented in **Figure 11.** Pumping test data of 15 bore wells was collected and analysed for the aquifer parameters.

- CGWB DUG WELLS (PRE NAQUIM) (11)
- PWD DUG WELLS (PRE NAQUIM) (44)
- TWAD DUG WELLS (PRE NAQUIM) (12)
- CGWB PIEZOMETRIC WELLS (PRE NAQUIM) (19)
- PONDIY PWD PIEZOMETRIC WELLS (PRE NAQUIM) (57)

Figure 11: Location of Groundwater Monitoring Wells

2.2. Hydro chemical data

The groundwater quality of the Varahanadi aquifer system was studied by collecting water samples from dug wells and bore wells. Groundwater samples were collected for 112 locations. The sample locations in the Varahanadi aquifer system are presented in **Figure.12**.

Figure 12: Location of Groundwater quality Monitoring Wells

Ground water quality data has been collected from TWAD, SG&SWRDC, PWD- Govt. of Tamil Nadu (44), PWD, UTP (57) and CGWB (11)

2.3. Geophysical data

The geophysical survey was conducted in the study area consisting of Vertical Electrical Soundings (VES) by employing Schlumberger configuration with maximum half current electrode separation of 300m. The objective of the study area is to decipher the sub surface conditions such as weathered and fractured layer resistivity and thicknesses and massive formations up to the depth of 200 m. A total number of 25 VES were carried out and geo electric layers inferred through interpretation of the results obtained. The locations of the VES are presented in the following **Figure 13**.

Figure 13: Location of Vertical Electrical Sounding Sites

2.4 Groundwater Exploration data

Data of Ninety eight exploratory wells drilled in the Varahanadi aquifer system (87 nos CGWB and 11 nos State department wells) prior to National Aquifer Mapping project were compiled and analysed (**Figure.14**). These wells were plotted on the 1:50,000 scale topographical map and as per the NAQUIM guidelines for the hard rock & soft rocks, data requirements were identified on the plotted topographical map.

Figure 14: Location of all Exploratory Wells

Based on the data requirements, 11 exploratory wells have been recommended for drilling through outsourcing activity as part of the data generation. The data such as lithology, fracture depth, yield, water level, aquifer properties were generated and utilised to depict the prevailing aquifer systems of the basin (**Annexure-I**). Similarly wells drilled by state department and CGWB totalling 90 wells drilled upto the depth of 60 m bgl were used for deciphering the first aquifer. (**Annexure-II**).

3.0 DATA INTERPRETATION, INTEGRATION AND AQUIFER MAPPING

3.1 Hydrogeological Data Interpretation

Aquifer Maps- 2D models showing Aquifer Dispossition:

Based on the lithologs of the exploratory wells and the well sections observed during field studies as part of Aquifer Mapping studies, 2D models of the aquifer system of the basin has been deciphered by using ROCKWORKS software. The data input for ROCKWORKS was prepared to generate 2D models of the basin along different selected sections.

Hard rock region

Hard rock region comprising of gneissic and charnockite rocks are found in the western, northern and in the central part of the Varahanadi aquifer system (**Figure 15**). Hard rock regions cover an area of 3449 Sq, Km. The gniessic rocks cover an area of 1392 Sq. Km. The Charnockite rocks cover an area of 2057 Sq. Km and both gneissic and Charnockite rocks are found in 40 firkas (**Table 3**) including partial firkas. The gniessic and Charnockite rocks form two aquifer units namely the weathered and fracture/jointed aquifer unit.

Aquifer Unit I – Weathered: The weathered aquifer unit occurs from the ground level and has a minimum thickness of 6 m and maximum thickness of 18 m with average thickness of 9 m. 2D disposition along north northeast to south west, (Figure 16 and Figure 17) clearly shows the vertical and lateral distribution of the gneissic and Charnockitic formations. Yield of this weathered aquifer unit ranges from 1.6 to 20.3 m³/hr. During monsoon period the wells tapping this aquifer unit sustains pumping for 2 to 4 hrs/day while during non-monsoon period (April to June) sustains pumping for less than 1 hour/day. Groundwater occurs in unconfined condition.

Figure 15: Spatial distribution of the aquifers of the Varahanadi aquifer system

Figure 16: Layout of cross sections along A-A', B-B' and C-C' of Varahanadi aquifer system

Table 3: Name of firkas in hard rock regions

Hard rock rocks	Name of the firkas		
	Acchirupakkam, Cheyyur, Chithamur, Kadapakkam, Kayapakkam, Kodur,		
	Oonampakkam, Orathi, Sunampedu, Desur, Kilpennathur, Mangalam, Osur,		
Gneiss and Charnockite	Thellar, Anniyur, Avalurpettai, Brammadesam, Deevanur, Gingee, Kanai,		
region:	Kanjanur, Kiliyanur, Mailam, Marakanam, Melmalayanur, Melolakkur, Nemili,

	Tindivanam, Uppuvelur, Vadasiruvalur, Valavanur, Vallam(V), Vanur,		
	Vikkiravandi		

The aquifer parameter such as transmissivity in this aquifer unit ranges from 2.2 to 24.34 m²/day. The Specific yield of this aquifer unit ranges from 1 to 1.5% with potable groundwater quality. The general EC of this aquifer unit ranges from 750 to 3000 μ S/cm and is suitable for drinking except in a small north portion. (**Table 5**).

Figure 17. 2D aquifer disposition of the Varahanadi aquifer system

A-A' (south west to north northeast)

Aquifer Unit II (Fractured/Jointed) – This aquifer unit comprises of fractured and jointed gneissic and Charnockites formed due to tectonic activity. Top of this aquifer unit occurs from 6 to 18 m bgl. At some places it is nil. Based on the analysis of the 78 wells it is observed that there is a possibility of occurrence of 1 to 3 fractures/joints existing up to 132 m bgl in the gneissic region. (Table 4). In Charnockite region 1 to 3 fractures are likely to be encountered and they exist upto 120 m bgl. The distribution of the fractures with depth is given in Table 5. The yield of this aquifer unit II ranges from 4 to 10.8 m³/hr. During monsoon period the wells tapping this aquifer unit sustains pumping for 4 to 6 hrs /day while during non-monsoon period (April to June) sustains pumping for 1 to 3 hour/day. Transmissivity of this aquifer unit ranges from 1.0 to 51.5 m²/day The general EC of Aquifer I and II aquifer unit ranges from 750 to 3000 and 340 to 2100 μs/cm respectively and are potable.

Table 4: Salient features of the aquifer units in HR region of Varahanadi Aquifer System

Type of Aquifer	Formation	Top of the aquifers (mbgl)	Thickness/ occurrence of fractures (m)	Range of Yield (m³/h)	Sustainability (hrs/day)	Aquifer parameter (Transmissivity -m²/day)	Groundwater quality EC values (µs/cm)	Suitable for Drinking
Aquifer unit-I	Weathered gneiss & Chamockites	GL	6–18 (Avg. 9)	1.6-203 (Avg- 7. 2)	Monsoon: 2-4 & non monsoon (May "Jun & July) <1 to 2	22-24.34	750-3000	Yes – except small northern portion
Aquifer Unit-II	Jointed & Fractured Gneiss/ Chamockite	Nil at some places 6-18	Nil at some places 15-132 (3 to 4 fractures exist)	4 to 10.8 (Avg- 7.2)	Monsoon: 4-6 and non- monsoon < 1 to 3	1.0-51.5	340-2100	Yes

Alluvium/ Sedimentary rocks

Alluvium and sedimentary rocks cover an area of 1267 Sq. Km (**Figure.15**) and encompasses 13 firkas (**Table.7** Firka details) and Puducherry region in the Varahanadi Aquifer system. The sedimentary region forms two aquifer units namely aquifer unit-I comprising alluvium, sandstone with laterite capping and conglomerates, and aquifer unit-II comprising of pebbly, argillaceous, micaceous and mottled sandstone. These are generally very good to moderate yielding aquifer units.

Table 6: Name of firkas in alluvium/sedimentary regions

Formation and number of firkas	Name of the firkas
Alluvium/sedimentary region (13 firkas)	Kadapakkam, Kodur, Kiliyanur, Marakanam,
	Nemili, Retty Chavadi, Siruvadi, Sithalampattu,
	Sunampedu, Uppuvelur, Valavanur, Vanur,
	Vikkiravandi

Aquifer Unit I: This aquifer unit comprises of alluvium, sandstone with laterite capping and conglomerates. The top of this aquifer unit occurs from ground level. The thickness of this aquifer unit ranges from 10 to 55 m. The maximum thickness of the laterite deposit is 8 m and is observed in the southern portion of the Varahanadi aquifer system (2D aquifer disposition along southwest to south-southeast and northwest to southeast is represented in Figure 17, 18 and Figure 19 respectively). Yield of this aquifer unit ranges from 11 to 25 m³/hr. Alluvium and sandstones have high yield. Conglomerates are good aquifers and wells tapping the shales and limestones form poor aquifers. Alluvium and sandstone aquifers sustain pumping for 4 to 6 hrs/day during monsoon and 2 to 3 hrs/day during non-monsoon i.e., May, June and July. Transmissivity value ranges from 245 to 770 m²/d. Transmissivity have high values in alluvium and sandstone regions. Groundwater occurs in unconfined condition. EC in this aquifer unit ranges from 646 to 2250 μS/cm.

Aquifer Unit II: This aquifer unit comprises of Tertiary and upper Cretaceous sandstones. They are very good reservoir rocks. This aquifer unit- II occurs below the alluvium and exposed in south eastern part of the area. The top of this aquifer unit extends from 10 to 55 m bgl and has thickness ranging from 190 to beyond 300 m. 2D aquifer disposition along southwest to northnortheast, southwest to southsoutheast and northwest to southeast is represented in **Figure 17**, **18 and Figure 19** respectively. Yield of this aquifer unit ranges from 18 to 72 m3/Hr and can sustain pumping for 8 to 10 hours /day during monsoon and nonmonsoon periods. Salient features of this aquifer are presented in table 8. EC values in this aquifer unit ranges from 400 to 2250 μ S/cm. groundwater is generally potable except in brackish areas. Details provided in **Table 7**.

2D aquifer disposition with Aquifer properties is represented in **Figure 20**

Figure 18: 2D aquifer disposition of Varahanadi aquifer system B-B' (southwest –south southeast direction)

Figure 19: 2D aquifer disposityion of Varahanadi aquifer system C-C' (northwest-southeast direction

3.2 Groundwater Level

During Aquifer Mapping studies in Varahanadi aquifer system, 143 Groundwater monitoring wells were monitored regularly and 27 of them were used for water level analysis in different formations in order to know the behavior of the groundwater regime. Out of total 143 wells 60 wells were established in Charnockite and gneissic region, and 83 wells were established in alluvium/sedimentary region. The water levels were monitored from May 2015 to May 2017 (four times in a year).

3.2.1 Depth to Water level for aquifer I (May2016)

Based on the data of key wells inventoried and NGWM wells, the depth to water level during May 2016 varied from 2.20 m bgl to 9.38 m bgl. Major part of the basin shows water level in the range of 2 to 10 m bgl. Distribution of decadal groundwater level is shown in **Figure. 24**

Figure 24: Decadal groundwater level (May 2008-May 2017) of Varahanadi aquifer system

3.2.2. Depth to Water level For aquifer I (Jan-2017)

The depth to water level during Jan 2017 varied from 4.65 m bgl to 10.10 m bgl. It is observed that the water levels in all the monitoring wells are less than 11 mbgl. Distribution of decadal groundwater level is shown in **Figure**. 25

Figure 25. Decadal groundwater level (Jan 2008-Jan 2017) of Varahanadi aquifer system

3.2.3 Water Level Fluctuation:

Water level fluctuation in the observation wells in an area between two periods is indicative of the net changes in the groundwater storage during the period in response to the recharge and discharge components and is an important parameter for planning for sustainable groundwater development. The seasonal water level fluctuation in the area has been analysed using the water level data of May 2016 and January 2017. As both southwest and northeast monsoons are active in the area the fluctuation recorded in groundwater levels of January 2017 in comparison to the water levels of May 2016 indicate the extent of replenishment of the shallow aquifer due to the monsoon rainfall.

Figure 26. Water table elevation map and Hydrogeological map of Varahanadi aquifer system

3.2.4. Water Table Elevation

Water table elevation map of phreatic aquifer of the basin during May 2016, along with flow lines showing the direction of groundwater movement is shown in **Figure 26.** The water table elevation ranges from 155 to 0.5 m amsl in the basin. The groundwater movement is from the west to east part of the basin.

3.2.5 Pumping Tests

The yields of the wells in the study area are widely varied. Many of dug wells in the hard rock area have less than one meter water column during most of the year and about 80 to 95 % of wells get dry during summers. The wells located in favourable hydrogeological settings like shear zones, topographic lows, river alluvium etc., are able to sustain at a rate of 100 lpm for 2 to 3 hrs of pumping. The yield of large diameter wells tapping the weathered mantle of crystalline rocks ranges from 20 to 50 m³/day for a drawdown of 2 to 3 m and are able to sustain 1-3 hours of pumping. The specific capacity of the porous weathered formation ranges from 1.52 to 50.4 lpm/m/dd. The Transmissivity values of the weathered formation computed from pumping tests ranges from 2.2 to 24.34 m² /day and storativity ranges from 2.84x10⁻⁵ to 8.9x10⁻³.

3.3 Groundwater quality

3.3.1 Electric Conductivity

Electrical conductivity is the indicator of the total mineral content of water and hence it indicates the total dissolved solids (TDS) present in water. TDS of water determines its usefulness to various purposes. Generally water having TDS <500 mg/L is good for drinking and other domestic uses. However, in the absence of alternative sources TDS up to 2000 mg/L may be used for drinking purposes. The distribution of EC in different aquifers are shown in **Figure. 27**.

The phreatic aquifer groundwater quality is fresh in about 10% of the samples , as indicated by the EC value less than 750 $\mu s/cm$ at $25^{\rm o}C.$ In about 86 % of the samples, Groundwater indicating the moderately fresh showing the EC values between > 750 and 2250 $\mu s/cm$ at 25° C, 4 % of Groundwater samples showing EC ranges between > 2250-3000 $\mu s/cm$ at 25° C indicating that the groundwater is slightly mineralized (**Table 8**)

3.3.2 Chloride

In four samples, the concentration of chloride in phreatic aquifer are more than the desirable limit (>250 mg/l). In rest of the samples of phreatic aquifer, the concentration of chloride is within the desirable limit.

Figure 27. Distribution of Electrical conductivity of Varahanadi aquifer system

3.3.3 Nitrate

In six samples, the concentration of Nitrate in phreatic aquifer are more than the desirable limit (>45 mg/l). In rest of the samples of phreatic aquifer, the concentration of Nitrate is within the desirable limit

Table 8: Concentration of EC

4.0. GROUND WATER RESOURCES

The dynamic groundwater resources are estimated as on 2013, based on the methodology suggested by Ground Water Estimation Committee (GEC) 1997 and categorisation of firkas falling in Varahanadi aquifer system is represented in **Figure 28**.

The groundwater recharge is calculated both by groundwater fluctuation-specific yield method and by rainfall infiltration method. The annual replenishable groundwater recharge is the summation of four components viz.,

- i) Monsoon recharge due to rainfall
- ii) Monsoon recharge from other sources
- iii) Non-monsoon recharge due to rainfall
- iv) Non-monsoon recharge due to other sources

Firka-wise dynamic groundwater resources have been taken from the approved resources estimation done as on March 2013, jointly by State PWD of Tamil Nadu and CGWB, to arrive at the total resources available in the study basin. Out of the 109 Firkas of the study basin 86 firkas are falling totally in the basin and the rest 23 are falling partly. The resources have been apportioned to as per the ratio of the firka area within the basin and total firka area for the 23 firkas which are falling partly in the basin.

4.1. Net Groundwater Availability

The net groundwater availability refers to the available annual recharge after allowing for natural discharge in the monsoon season in terms of base flow and subsurface inflow/outflow. This annual groundwater potential includes the existing groundwater withdrawal, natural discharge due to base flow and subsurface inflow/ outflow in the monsoon season and availability for future development. As the groundwater development progresses the natural discharge gets suitably modified and comes down to negligible quantities due to interception by different groundwater structures. Hence, natural discharges in the monsoon season may not be considered and the total annual ground water recharge may be taken as net groundwater availability.

The net groundwater availability of the Varahanadi basin for the year 2013 is arrived at 113509 Ham, out of which the availability for 1 firka of Cuddalore is 5505 ham, 9 firkas in Kancheepuram district is 19281 ham, 5 firkas of Tiruvannamalai district is 12364 ham, 26 firkas of Villupuram district is 65864 ham and 1 region of U T of Puducherry is 10946 ham (**Table 9**)

4.2. Ground water Draft

The gross groundwater draft has been assessed by using Unit draft method for irrigation draft component and by adopting formula suggested by GEC 1997 for domestic and industrial draft components.

The existing groundwater draft for irrigation is maximum in Puducherry region (11875 ham) followed by Sithalampattu (5905 ham), Sathyamangalam (5238 ham) etc. The gross ground water draft for domestic and industrial uses is maximum in Reddichavadi of Cuddalore district (4587), followed by Puducherry region of U T of Puducherry (2393 ham) and Olakkur in Villupuram district (231 ham). The existing gross groundwater draft in Cuddalore, Kancheepuram, Tiruvannamalai and Villupuram districts and UT of Puducherry are 8206 ham, 12572 ham, 11611 ham, 74454 ham and 14268 respectively. And the total gross ground water draft of the basin is 121111 ham against the availability of 113509 ham.

Groundwater abstraction structures district wise is given in **Table 10**. The groundwater draft for the Varahanadi aquifer system is about 898.74 mcm/yr. Groundwater withdrawal from aquifer I and aquifer II is 745 and 154 mcm/yr respectively.

Table 9: Groundwater availability in Varahanadi aquifer system

	Resources (ham)						
District	201	11	2013

Total	116508		11706	75915	204129	898.74

Total number of abstraction structures in the Varahanadi aquifer system is given below

Total Annual Groundwater Draft

Aquifer – I : : 1,211 MCM Aquifer – II : : 274 MCM

Total : 1,485MCM

4.3. Stage of Development and Categorization:

The stage of development is defined by stage of groundwater development (%)

= (Existing ground water draft/ Net Groundwater availability) x 100

The stage of groundwater development is calculated for all the 109 firkas of the basin. The Categorization has been done by considering the two factors as suggested by GEC 97, viz.,

- i) Stage of Development
- ii) Long term trend of pre and post monsoon water levels.

The following FOUR categories have been suggested by GEC-97 based on the above two factors.

a) Safe b) Semi-critical c) Critical d) Over-exploited

Based on the above categorization 27 out of the 41 firkas in Tamil Nadu and 1 region of U T of Puducherry of the Varahanadi aquifer system, fall under over exploited and critical categories. In Cuddalore district 1 firka is over exploited, in Tiruvannamalai district 3 out of 5 firkas fall under Over-exploited/Critical Category, in Villupuram district 21 out 26 firkas and 1 region of

Figure 28: Categorisation of firkas in Varahanadi aquifer system

U T of Puducherry falls under Over exploited. The total stage of development of Varahanadi aquifer system is 106.7% and Over exploited.

4.4. Static Ground Water Resource

(3 to 4 fractures-Likely to encountered in hard rocks)

The groundwater available below the zone of water level fluctuation is called Instorage Ground Water Resource. A total quantity of 331 MCM in Aquifer unit I and 762 mcm in aquifer unit-II is available as instorage resource. The instorage in alluvium formation contributes to major portion for the aquifer unit I. The **Table 11** below describes the unit wise instorage available in the Varahanadi aquifer system.

Harnessable runoff

: 460 MCM

Table 11: Instorage Groundwater Resources of Varahanadi aquifer system

Alluvium	127 MCM	NA
Tertiary	204 MCM	661 MCM
Gneiss and Charnockite	0 MCM	101 MCM
Total	331 MCM	762 MCM

5.0. GROUNDWATER RELATED ISSUES

Ground water is extensively utilized for irrigation in the entire basin area for the past two decades, especially in the 21 over-exploited firkas and 1 region out of the 41 firkas in Tamil Nadu and 1 region of U T of Puducherry in the basin.

Following steps to be undertaken for the groundwater depleted area

- Maintenance of Existing Water bodies/Recharge sources (Tanks and Ponds).
- Construction of additional Artificial Recharge & Water Conservation structures.
- Nala bunds and Check Dams, Percolation ponds
- Desilting of the tanks along with construction of recharge shaft or recharge bore wells.
- Construction of Recharge Ponds.
- Rainwater harvesting through dug wells.
- Less water intensive crops like vegetables, flowers, etc may be encouraged.

Following measures can be taken up in the coastal region to prevent the seawater intrusion

- Stopping of heavy pumping of GW near coastal area.
- Construction of percolation tanks in the affected area to make fresh water ridge.
- Coconut and saline resistance crops are grown in areas having TDS 1500 2500 mg/l)

6.0 MANAGEMENT STRATEGIES

The groundwater management strategies are inevitable either when there is much demand to the resource than the available quantity or when the quality of resource deteriorates due to contamination in a given geographical unit. In recent years water resources are used extensively both for irrigation and industrial needs. In addition, to meet the domestic requirements of the fast growing urban agglomerations the administrators are compelled to allocate a considerable quantum of resource, which otherwise is being used for irrigation purpose. So, the urbanization has a negative impact on the food production as well as grabbing the employment of the agricultural labourers. Hence, it is the need of the hour to formulate sustainable management of the groundwater resource in a more rational and scientific way.

In the present study area of Varahanadi aquifer system, the sustainable management plan for groundwater is being proposed after a thorough understanding of the aquifer disposition down to a depth of 200 m bgl. The study area is characterized by weathered and fractured system, and alluvium with very heavy abstraction of groundwater for irrigation practices.

6.1 Sustainable Management Plan

The groundwater resource is over-exploited in 21 firkas of Tamil Nadu and 1 region and U T of Puducherry in the basin. Irrigation draft of 1108 MCM is estimated as per the GEC 2013 against the Net availability of the resource of 1135 MCM. A total of 27 MCM in excess was drawn from the groundwater system basin. Therefore, the usage of groundwater has to be reduced by 45 percent of the existing draft for the sustainability of the resource. Or else the availability has to be augmented through artificial recharge methods to bridge the gap between draft and availability. The draft can be reduced through application of water efficiency methods in irrigation sector and through changing the irrigation practices from wet to dry cash crops.

6.2 Augmentation Plan

Augmentation of groundwater can be achieved through construction of percolation ponds and recharge shafts where the top soil zone is clayey which does not allow infiltration. Normally it can be achieved through capturing surface runoff. Surface water transfer also can be planned in the absence of surface runoff during droughts. It needs uncommitted runoff from the adjoining localities to transport to the needy areas through diversion channels.

In the study area with exception of central and northeastern parts, other areas are subjected to over-exploitation. Normally due to over exploitation of groundwater the water levels are depleting in this zone. The natural rainfall recharge is insufficient to recoup the extracted groundwater. Artificial Recharge and Water Conservation Plans are proposed in the OE & Critical firkas of the basin through utilizing the uncommitted surface runoff of 511 MCM.

Artificial Recharge Plan

Based on the water level monitoring in different seasons across the basin, as well as after having better understanding of the disposition and extent of the aquifer system through exploratory drilling, pumping tests, etc., the potential volume of void space available within the weathered zone (3 mbgl) of first aquifer of the basin has been estimated as 474 MCM and tabulated below. The annual uncommitted runoff is only 511 MCM and harnessable runoff is 414 MCM. Artificial recharge and Water conservation plan is prepared for the over exploited

firkas of the basin area through harnessing the uncommitted runoff is 72 MCM, with a total out lay of ₹. 192 crores.

The suggested artificial recharge structures are mainly Nala bunds, Check Dams and Recharge Shafts and Recharge ponds in addition to removal of silt in the surface tanks. Selection of the site locations of these structures are based on the critical analysis of the hydrogeological, geophysical and exploration data of the basin. Particularly geomorphological and drainage aspects are being given more weightage in selection of the Artificial Recharge structures.

A total number of 39 check dams, 292 nala bunds and 2177 recharge shafts are proposed in the OE and critical firkas of the basin (**Figure 24** and **Annexure-III**). A total number of 794 Recharge Rejuvenation ponds are selected for desilting followed by construction of recharge shafts within the tanks. The expected recharge through these artificial recharge structures is in the order of 72 MCM.

The expected benefit by the recharge structures in the 27 OE and critical firkas in Tamil Nadu, and 1 region of U T of Puducherry area will be creation of additional crop area of Paddy or Sugarcane (or) Banana (or) Irrigated dry crops.

Water Conservation Plan

Low pressure water distribution system is being proposed in 290.9 Sq. km of cropped area which otherwise is under irrigation through earth channels. The expected savings of water through this method is expected to be 70.94 MCM./ yr. A total number of 6720 Farm ponds are proposed which will act as storage tanks in farm as well as augment groundwater recharge.

6.3 Demand side Management Plan

Demand side management can be accomplished through change in irrigation pattern. It is recommended to change the irrigation pattern for paddy, Sugarcane and Banana crops. The general practice for paddy irrigation is by flooding method. It is recommended for System of Rice Intensification (SRI) instead of flooding method in 887.92 sq. km and this would save 184.69 MCM of water annually if 100 % area is covered. Similarly for sugarcane and banana crops shift from flooding to Micro irrigation for 100 % area of 285.54 Sq. Km and 5.36 Sq. Km would save 68.53 and 2.41 MCM respectively. The total water saved would be ₹413 crores.

Figure 29: Proposed Artificial recharge structures in Varahanadi aquifer system

If Scenario 1 - 30% Area is changed then water saved would be 76.67 MCM. The cost would be ₹ 161 crore and the Stage of Development would be lowered from 105 to 102 %. In case of Scenario II wherein 50% Area is changed then water saved would be 127.7 MCM and the Cost would be ₹ 210 crore. The stage of Development would be lowered from 105 to 100 %.

Future Demand Stress Aspects

In views of rapid urbanization the domestic water needs are increasing multifold. In this urbanization process the water wastage component is increasing mainly because of leakages through distributor system. Whereas in the agricultural irrigation sector the water demand mainly due to the enthusiasm of the farmers to increase the crop irrigation area.

Hence, the policy makers at higher administrative level and rural development authorities at block level should educate the farmers in their jurisdiction in such a way that they should not venture to increase the farm irrigation area. Rather these authorities have to suggest high yielding crop varieties and high-value crops to grow with minimum water requirement with the technical guidance of local agricultural/agronomic experts.

6.4 Strategies to overcome the future stresses

Future stresses are only hypothetical. If the sustainable management is taken up in a true spirit in consultation with local village level bodies the groundwater depletion will not occur in future. However, it is very difficult to overcome gluttonous user attitude thrives for fullest use of the resource to get maximum output. In this process the vital resource is lost. Therefore, a thorough understanding of the consequences of indiscriminate usage of the water should be propagated among users mainly among farmers as they are bulk users of the resource in the study area.

The demand side strategies to overcome future stresses are mainly

- Promoting irrigation pattern change
- Agronomic Water Conservation
- Reducing Water use reduction in Urban areas

7.0 PUDUCHERRY REGION IN VARAHANADI AQUIFER SYSTEM

Aquifer mapping of the Puducherry region falling in the Varahanadi aquifer system is to formulate strategies for sustainable management plan for the aquifer system in accordance with the nature of the aquifer, the stress on the groundwater resource and prevailing groundwater quality which will help in drinking water security and improved irrigation facility. It will also result in better management of vulnerable areas.

Objective

The objectives of the aquifer mapping in Puducherry region can broadly be stated as

- To define the aquifer geometry, type of aquifers and their lateral and vertical extent
- To determine the groundwater regime scenario
- To determine the hydrogeochemical characteristics of the aquifer units
- 2D and 3-D disposition of the aquifer units.
- To estimate the availability of groundwater resources in the aquifer system
- To develop a sustainable groundwater management plan for the aquifer system

Issues

Major groundwater issues in the Puducherry region are

- 1. Limestone/claystone- Low yielding aquifer units and
- 2. Threat of Sea water Intrusion

Study area

The study area covers an area of 293.78 sq.km and situated in east coast between 11° 46′ and 12° 30′ N latitudes and 79° 36′ and 79° 53′E longitudes. It is bounded by parts of Villupuram and Cuddalore districts in the north west and south, and the Bay of Bengal sea on the east. The administrative map of the Puducherry region is presented as **Figure 30**.

Rainfall and climate

The region receives the rain under the influence of both southwest and northeast monsoons. Most of the precipitation occurs in the form of cyclonic storms caused due to the depressions in Bay of Bengal chiefly during Northeast monsoon period. Rainfall data analysis shows that the normal annual rainfall in the Puducherry region is 1383 mm. Sixty two percent of the annual normal is received during northeast monsoon season and about 26% during the southwest monsoon season, with November being the rainiest month. The heaviest rainfall in 24 hours recorded at Puducherry station was 167.0 mm on 23rd October 1990. The region enjoys a hot and tropical climate characterised by little variation of temperature and humid weather. The summer season, which is very oppressive, is from March to May. January to the end of February is comparatively cool. The relative humidity is generally high, being about 80% during October to April. It is at its minimum of 70 to 73% in June and July.

Winds are moderately strong throughout the year, except during the months July to October.

Figure 30: Administrative map of the Puducherry region

During May to September winds are mainly southwesterly in the mornings. May and early part of June constitute the hottest period of the year, with the mean daily maximum temperature at about 37°C and the mean daily minimum temperature at about 27°C. On individual days, the maximum temperature may even reach 43°C. The lowest temperature recorded is of the order of 11.1°C.

Drainage, Geomorphology and Physiography

Puducherry region is part of the Varahanadi aquifer system. There are two major rivers draining this region 1) the Varahanadi, which traverses the region diagonally from north-west to

south-east and 2) the Ponnaiyar (Pennaiyar) river, which forms the southern border of the region. All the rivers are ephemeral in nature. The Varahanadi river is also known as Gingee, Sankaraparani and Chunnambar which has its source in the hills of Malayanur of Villupuram district, Tamil Nadu, has a course of 34 km in this region and flows into Bay of Bengal sea, south of Ariyankuppam in Puducherry. Varahnadi is the major river and forms the major watershed. The Puducherry region, in general, is a flat peneplain with an average elevation of 15 m above mean sea level.

The terrain becomes a little undulating with prominent high grounds varying from 30 to 100 m above mean sea level towards northwest and northeastern parts of the region. Three major physiographic units are generally observed, viz., (i) Coastal plain, (ii) Alluvial plain and (iii) Uplands. The coastal plain extends as a narrow stretch for about 22 km and of four to six hundred meters width on the eastern part of the region along the Bay of Bengal. The major part of the coastal plain comprises gently sloping land with a chain of sand dunes extending all along the coast. Other physiographic units, which are characteristic of the coastal plains such as spit bars, mud flats, lagoons and tidal inlets also occur. The alluvial plain, formed due to major river namely Varahanadi, in general is a monotonous plain with slope ranging from 1 to 3 percent. Besides the river, streams and major canals, there are depressions acting as storage tanks, which are spread all over the terrain, to serve as surface water reservoirs.

The high grounds are known as Uplands with elevations of about 30 to 100m above mean sea level. These uplands, which are popularly known as "Les Montagnes Rouges" or the "Red Hills of Puducherry" are intersected by a number of gullies and deep ravines giving rise to bad land topography.

Land use and Land cover

Agriculture land, including crop land, fallow land and plantation occupies 18169 ha. Barren/unculturable/wastelands, mostly of sandy area and scrub land occupies 661 ha. Buildup land including mining, rural and urban area occupies 7820 ha. Forest cover is 30 ha and wetlands and water bodies occupy 2608 ha.

Agriculture

The gross area irrigated in Puducherry region is 17241 ha, net area sown is 9795 ha and total cropped area is 19301 ha. The entire irrigation is covered from groundwater by means of tube wells, which constitute 100 percent of the net area irrigated. Irrigation by tanks and other sources constitutes a meager part of the net area irrigated.

Soils

Soils in the area have been classified into i) Red soil, ii) Black soil, iii) Alluvial soil and iv) Colluvial soil. The major part is covered by Red soil of red sandy/clay loam type. Ferruginous red soils are also seen at places. Alluvial soils occur along the river courses 4 and eastern part of the coastal areas. Sandy coastal alluvium (arenaceous soil) are seen all along the sea coast as a narrow belt.

Geology

Geologically, the entire Puducherry region is covered by the sedimentary formations comprising of Upper Cretaceous, Palaeogene and Neogene sediments of marine, estuarine and fluvial alluvium underlained by Precambrian rocks of Granitic gneiss, Hornblende Biotite Gniess and Charnockites. Geology map of the Puducherry region is presented in **Figure 31**.

Paleozoic sediments

Paleozoic sediments of lower Permian and lower Gondwana group, the Talchir Formation (CP-Carboniferous to Permian) comprising boulder bed, conglomerates, olive green to khaki coloured splintery shale with minor pink sandstone occurs as NS linear formations in the northern part of the area. The palyno-fossil assemblage consists of Virkki pollenites, Plicatipollenites, Potoniei sporites, Lumati sporities, which are indicative of early Permian Age.

Mesozoic & Tertiary (Neogene and Paleogene) sediments

Marine upper Cretaceous and Palaeogene rocks, and Cuddalore formation of Mio-Pliocene age occur in the south eastern part known as Puducherry sub-basin. The upper Cretaceous and Palaeocene formations are equivalent to the Ariyalur group of the Trichinopoly Cretaceous-Tertiary sub-basin. The rocks are overlapped by Cuddalore formation towards south east.

Argillaceous sandstone with bands of limestone/calcareous sandstone, clays, shales/siltstone, fossiliferous limestone and marlstone are the main rocks of different formations *viz.*, Vanur formation (Valudavur beds), Nesal formation, Karasur formation and Manaveli formation, in an ascending order. The Vanur formation comprises argillaceous sandstone with thin bands of sandy limestone/calcareous sandstone. The rocks of the formation have been referred to as Valudavur beds. The Nesal formation is essentially made up of clays, shales, sandy shale/siltstone with lenticular bands and lenses of shell limestone with fossils comprising Trigonoarca, Exogyra, Turitella, baculites and Echinoids. Both Vanur and Nesal formations are of upper Cretaceous age.

The Karasur formation consists of bands and lenses of fossiliferous limestone alternating with argillaceous sandstone. This formation is known as 'Nerinea beds' and considered equivalent to Niniyur formation of Ariyalur group of Trichinoploy sub-basin. Manaveli formation, which lies above the Karasur formation comprises shale, silt and fine grained unconsolidated sandstone.

Figure 31: Geology map of the Puducherry region

The age of the formation is Paleocene, but the upper beds are suspected to transgress into Eocene. The Cuddalore formation overlies the marine upper Cretaceous and Paleogene formations. The area occupied by Cuddalore formations forms higher ground and is characterised by red/lateritic soil. The formation comprises argillaceous sandstone, pebbly

sandstone and lenses of clays, besides lignite seams. This formation contains large quantities of fossil wood around Tiruvakkarai, which have been declared and maintained as National fossil wood park by Geological Survey of India (G.S.I).

Quaternary

Quaternary sediments are found in the southern and eastern part of Varhanadi aquifer system all along the coast, river courses and in the southern part, the alluvium of Varahanadi/Gingee, youngest formations over lie Neogene, Paleogene and upper Cretaceous formations. The Quaternary sediments are of two types, deposited under fluvial environment (river deposits) and marine environment. The fluvial sediments include clays and sands, mud, silt and medium to coarse grained sand (beach deposits). The thickness of the alluvial deposits is about 50 m. The marine deposits extend all along the coast of Puducherry. They comprise tidalflat, mudflat deposits (black clays and muds), barrier dune sand deposits (grey brown medium sands). The dune mound deposits are widely displayed in the stretch between Kirumambakkam and Nakemedu areas.

Geological succession of the Puducherry region

S. No	Eon	Era	Era Series/Epoch Age Group/Formation Lithology		Groundwater relevance	
1.			Quaternary	Holocene-Pleistocene/ Fluvial sediments, Marine sediments	Soils, black clays, coastal /river alluvium (sand & silt), beach sand and laterite	Moderate to very good porous aquifer system
		Cenozoic	ary	Neogene/ Mio Pliocene Cuddalore	Pebbly, argillaceous and mottled sandstone Fossilliferous clays /	Very good porous aquifer
2.	Phanerozoic		Paleogene / Eocene, Paleocene Manaveli,		siltstone and Argillaceous sand stone	Very low porous Aquifer
	Phane			Karasur (Nerinea beds)	Fossiliferous limestone/ sandy limestone	Very low porous Aquifer

				Unco	nformity	
5.	Precambrian	Archaean	Late 1	Archaean to Proterozoic	Gneisses and Charnockites	-

Hydrogeological data

The periodical monitoring of groundwater level implies the groundwater recharge and discharge (natural and manmade) occurring in the aquifer systems. It also reveals that the interaction between surface and sub-surface water systems. Puducherry region, 83 nos of groundwater monitoring wells which included 5 CGWB monitoring wells, 2 Tamil Nadu state department wells, 57 and 17 piezometers of Union Territory of Puducherry (UTP) and CGWB respectively, were monitored periodically. The monitoring was useful to record the temporal and spatial changes in the aquifer system. Pumping test data of 15 bore wells was collected and analysed for the aquifer parameters. (**Figure 32**)

Groundwater Exploration data

Data of 45 exploratory wells drilled in the Puducherry region (45 nos CGWB prior to National Aquifer Mapping project were compiled and analysed. These wells were plotted on the 1:50,000 scale topographical map and as per the NAQUIM guidelines for the hard rock & soft rocks, data requirements were identified on the plotted topographical map. Based on the data requirements, 11 Nos of exploratory wells have been recommended for drilling through outsourcing activity as part of the data generation. The data such as lithology, fracture depth, yield, water level, aquifer properties were generated and utilised to depict the prevailing aquifer systems of the basin. Similarly wells drilled by state department and CGWB totalling 45 Nos wells drilled upto the depth of 60 m bgl were used for deciphering the first aquifer. (Annexure-I).

Alluvium/ Sedimentary rocks

Whole of Puducherry region falls in Alluvium/Sedimentary rocks. The sedimentary region forms two aquifer units namely aquifer unit-I comprising alluvium, sandstone with laterite capping and conglomerates, and aquifer unit-II comprising of pebbly, argillaceous, micaceous and mottled sandstone. These are generally very good to moderate yielding aquifer units. Salient features of the aquifer units in alluvium/sedimentary regions of Puducherry region is given in **Table 12**

Aquifer Unit I: This aquifer unit comprises of alluvium, sandstone with laterite capping and conglomerates. The top of this aquifer unit occurs from ground level. The thickness of this aquifer unit ranges from 10 to 55 m. The maximum thickness of the laterite deposit is 8 m and is observed in the southern portion of the region (2D aquifer disposition along southwest to south-southeast and northwest to southeast is represented in Figure 17, 18 and Figure 19 respectively). Yield of this aquifer unit ranges from 11 to 25 m³/hr. Alluvium and sandstones have high yield. Conglomerates are good aquifers and wells tapping the shales and limestones form poor aquifers. Alluvium and sandstone aquifers sustain pumping for 4 to 6 hrs/day during monsoon and 2 to 3 hrs/day during non-monsoon i.e., May, June and July. Transmissivity value ranges from 245 to 770 m²/d. Transmissivity have high values in alluvium and sandstone regions. Groundwater occurs in unconfined condition. EC in this aquifer unit ranges from 646 to 2250 μ S/cm.

Aquifer Unit II: This aquifer unit comprises of Tertiary and upper Cretaceous sandstones. They are very good reservoir rocks. This aquifer unit- II occurs below the alluvium and exposed in south eastern part of the area. The top of this aquifer unit extends from 10 to 55 m bgl and has thickness ranging from 190 to beyond 300 m. 2D aquifer disposition along southwest to northnortheast, southwest to south southeast and northwest to southeast is

represented in **Figure 33**, and **Figure 34** respectively. Yield of this aquifer unit ranges from 18 to 72 m3/Hr and can sustain pumping for 8 to 10 hours /day during monsoon and non-monsoon periods. Salient features of this aquifer are presented in table 8. EC values in this aquifer unit ranges from 400 to 2250 μ S/cm. groundwater is generally potable except in brackish areas. 2D aquifer disposition with Aquifer properties is represented in **Figure 35**.

Groundwater Level

During Aquifer Mapping studies in Puducherry region of Varahanadi aquifer system, 83 wells were established in alluvium/sedimentary region. The water levels were monitored from May 2015 to May 2017 (four times in a year).

Depth to Water level for aguifer I (May2016)

Based on the data of key wells inventoried and NGWM wells, the depth to water level during May 2016 varied from 2.20 m bgl to 9.38 m bgl. Major part of the region shows water level in the range of 2 to 10 m bgl.

Depth to Water level For aquifer I (Jan-2017)

The depth to water level during Jan 2017 varied from 4.65 m bgl to 10.10 m bgl. It is observed that the water levels in all the monitoring wells are mostly less than 10 mbgl

Water Level Fluctuation

Water level fluctuation in the observation wells in an area between two periods is indicative of the net changes in the groundwater storage during the period in response to the recharge and discharge components and is an important parameter for planning for sustainable groundwater development. The seasonal water level fluctuation in the area has been analysed using the water level data of May 2016 and January 2017. As both southwest and northeast monsoons

are active in the area the fluctuation recorded in groundwater levels of January 2017 in comparison to the water levels of May 2016 indicate the extent of replenishment of the shallow aquifer due to the monsoon rainfall.

Groundwater quality

Electrical Conductivity

Electrical conductivity is the indicator of the total mineral content of water and hence it indicates the total dissolved solids (TDS) present in water. TDS of water determines its usefulness to various purposes. Generally water having TDS <500 mg/L is good for drinking and other domestic uses. However, in the absence of alternative sources TDS up to 2000 mg/L may be used for drinking purposes. The distribution of EC in different aquifers are shown in **Figure 36.**

One groundwater sample shows EC ranges between $> 2250\text{-}3000~\mu\text{s/cm}$ at 25° C indicating that the groundwater is slightly mineralized

Chloride

In two samples, the concentration of chloride in phreatic aquifer are more than the desirable limit (>250 mg/l). In rest of the samples of phreatic aquifer, the concentration of chloride is within the desirable limit

Ground Water Resources

The groundwater recharge is calculated both by groundwater fluctuation-specific yield method and by rainfall infiltration method. The annual replenishable groundwater recharge is the summation of four components viz.,

- i) Monsoon recharge due to rainfall
- ii) Monsoon recharge from other sources
- iii) Non-monsoon recharge due to rainfall
- iv) Non-monsoon recharge due to other sources

Dynamic groundwater resources have been taken from the approved resources estimation done as on March 2017, jointly by Department of Agriculture and Farmers welfare, Govt. of Puducherry and CGWB, to arrive at the total resources available in the Puducherry region. Puducherry region is over exploited. The net groundwater availability of the region is 13698.52 Ha.M, The gross groundwater draft has been assessed as 10338.00 Ha.M. 74% of Groundwater is used for irrigation purposes from available groundwater resources. The groundwater resources are given in below **Table 13.**

GROUNDWATER RELATED ISSUES:

Ground water is extensively utilized for irrigation in the entire region for the past two decades, Following steps to be undertaken for the groundwater depleted area

- Maintenance of Existing Water bodies/Recharge sources (Tanks and Ponds).
- Construction of additional Artificial Recharge & Water Conservation structures.
- Nala bunds and Check Dams, Percolation ponds
- Desilting of the tanks along with construction of recharge shaft or recharge bore wells.
- Construction of Recharge Ponds.
- Rainwater harvesting through dug wells.
- Less water intensive crops like vegetables, flowers, etc may be encouraged.

Following measures can be taken up in the coastal region to prevent the seawater intrusion

- Stopping of heavy pumping of GW near coastal area.
- Construction of percolation tanks in the affected area to make fresh water ridge.
- Coconut and saline resistance crops are to be grown in areas having TDS 1500 2500 mg/l)

Management Strategies

The groundwater management strategies are inevitable either when there is much demand to the resource than the available quantity or when the quality of resource deteriorates due to contamination in a given geographical unit. In recent years water resources are used extensively both for irrigation and industrial needs. In addition, to meet the domestic requirements of the fast growing urban agglomerations the administrators are compelled to allocate a considerable quantum of resource, which otherwise is being used for irrigation purpose. So, the urbanization has a negative impact on the food production as well as grabbing

the employment of the agricultural labourers. Hence, it is the need of the hour to formulate sustainable management of the groundwater resource in a more rational and scientific way.

In Puducherry region, the sustainable management plan for groundwater is being proposed after a thorough understanding of the aquifer disposition down to a depth of 200 m bgl. The area is characterized by alluvium with very heavy abstraction of groundwater for irrigation practices.

Sustainable Management Plan

The groundwater resource is over-exploited in Puducherry region. Irrigation draft of 10338.00 Ha.M and domestic draft & industrial water supply of 3632.50 Ha.M, is estimated as per the GEC 2017 against the Net availability of the resource of 13698.52 Ha.M. A 2 % draft in excess was drawn from the groundwater system. Therefore, the usage of groundwater has to be reduced from the existing draft for the sustainability of the resource. Or else the availability has to be augmented through artificial recharge methods to bridge the gap between draft and availability. The draft can be reduced through application of water efficiency methods in irrigation sector and through changing the irrigation practices from wet to dry cash crops.

Augmentation Plan

Augmentation of groundwater can be achieved through construction of percolation ponds and recharge shafts where the top soil zone is clayey which does not allow infiltration. Normally it can be achieved through capturing surface runoff. Surface water transfer also can be planned in the absence of surface runoff during droughts. It needs uncommitted runoff from the adjoining localities to transport to the needy areas through diversion channels.

Due to over exploitation of groundwater, the water levels are depleting in this area. The natural rainfall recharge is insufficient to recoup the extracted groundwater. Artificial Recharge and Water conservation plans are proposed in the region through utilizing the uncommitted surface runoff of 50 MCM.

Artificial Recharge Plan

Based on the water level monitoring in different seasons across the region, as well as after having better understanding of the disposition and extent of the aquifer system through exploratory drilling, pumping tests, etc., the potential volume of void space available within the weathered zone/ Alluvium (3 mbgl) of first aquifer of the basin has been estimated of as 352.80 MCM. The annual uncommitted runoff is only 50 MCM and harnessable runoff is 40 MCM. Artificial recharge and Water conservation plan is prepared for the over exploited area through harnessing the uncommitted runoff of 40 MCM, with a total out lay of ₹. 18.91 crores.

The suggested artificial recharge structures are mainly Nala bunds, Check Dams and Recharge Shafts and Recharge ponds in addition to removal of silt in the surface tanks. Selection of the site locations of these structures are based on the critical analysis of the hydrogeological, geophysical and exploration data of the basin. Particularly geomorphological and drainage aspects are being given more weightage in selection of the Artificial Recharge structures.

A total number of 14 nala bunds and 94 recharge shafts are proposed in the area (**Figure 37** and **Annexure-II**). A total number of 275 Recharge Rejuvenation ponds are selected for desilting followed by construction of recharge shafts within the tanks. The expected recharge

through these artificial recharge structures is in the order of 6.677 MCM. The expected benefit by the recharge structures in the Puducherry region of U T of Puducherry area will be creation of additional crop area.

Demand side Management Plan

Demand side management can be accomplished through change in irrigation pattern. It is recommended to change the irrigation pattern for paddy, Sugarcane and Banana crops. The general practice for paddy irrigation is by flooding method. It is recommended for System of Rice Intensification (SRI) instead of flooding method and similarly for sugarcane and banana crops shift from flooding to Micro irrigation(MI). The total draft for irrigation is 103.38 MCM and by adopting MI about 20 % of the irrigation draft i.e., about 20.67 MCM can be conserved.

Additional Groundwater availability after Artificial Recharge, Water Conservation measures and Change in irrigation pattern

measures and Change in Frigation pattern	
Artificial recharge/ conservation measures	Nos
Water conservation measures	
Nala bunds	14
Recharge Shafts	94
Recharge Rejuvenation ponds	275
Tentative cost (including O & M)	₹.18.91 Cr
Vol. of unsaturated zone available for Recharge (up to 3m bgl)	352.80 MCM
Uncommitted Surplus runoff	50 MCM
Harnessable runoff	40 MCM
Expected recharge from all AR structures and conservation measures	6.677 MCM
Improving water efficiency through micro irrigation (MI)	20.67 MCM
Water available after MI, AR and water conservation measures	27.347 MCM
Additional crop area created for 27.347 MCM water with MI	
Groundnut or Pulses or Vegetables or Sesame or	
Rise in water level	_
Sustainability of wells and increase in pumping hours or	
Change in Stage of groundwater withdrawal	
102 to 72 %
