AQUIFER MANAGEMENT PLAN OF BIDAR TALUK, BIDAR DISTRICT, KARNATAKA STATE

1. SALIENT INFORMATION

Name of the taluk: **BIDAR**

District: **BIDAR**; State: Karnataka

Area: 908 sq.km.

Population: 4,69,941

Annual Normal Rainfall: 947 mm

1.1 Study Area

Aquifer Mapping Studies have been carried out in Bidar taluk, Bidar district of Karnataka, covering an area of 908 sq.kms under National Aquifer Mapping (NAQUIM) during the AAP 2021-22. The Bidar taluk is located between North Latitudes $17^{\circ}43'33.6''$ and $18^{\circ}04'44.4''$ and East Longitudes between $77^{\circ}26'2.4''$ to $77^{\circ}59'16.8''$ and is falling in parts of Survey of India Toposheets 56G/5, 56G/6, 56G/9 56G/10 and 56 F/12. The study area is bounded, on the North by Aurad taluk, on the South by Humnabad taluk, on the East by Telangana State, on the West by Bhalki and Humnabad taluks. Location map of Bidar taluk of Bidar district is presented in **Fig-1**. Bidar is the taluk Headquarter. There are 134 villages and 35 gram panchayats in this taluk.

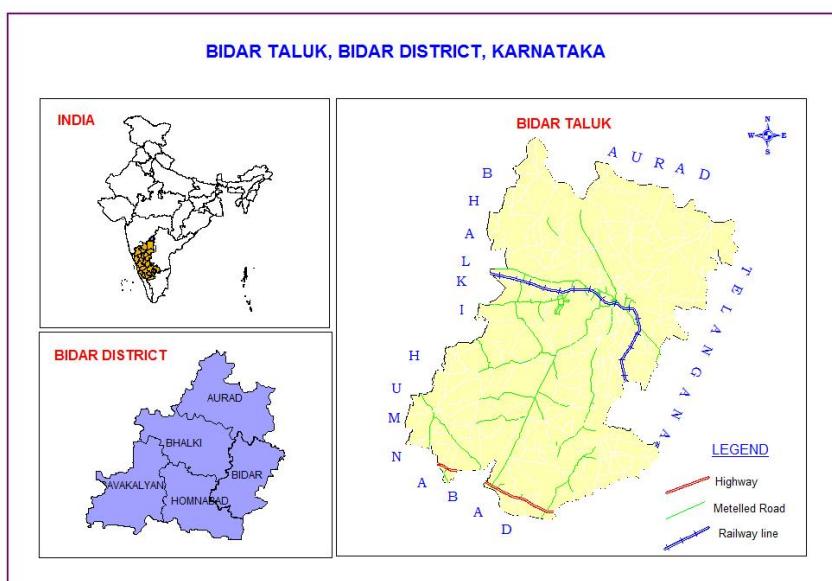

Fig-1: Location map.

1.2 Population

According to 2011 census, the population in Bidar taluk is 4,69,941. Out of which 2,41,095 are males while 2,28,846 are females. The average sex ratio of Bidar taluk is 949. The Bidar taluk has an overall population density of 507 persons per sq.km. The decadal variation in population from 2001-2011 is 15.88% in Bidar taluk. Details of Population of Bidar taluk is given in Table-1.

Table-1: Details of Population of Bidar taluk, Bidar district

Male	Female	SC	ST	TOTAL	No. of Villages	No. of GPS	Literacy %	Density
241095	228846	88752	56488	469941	134	35	74.51	507

1.3 Rainfall

Bidar taluk experiences semi arid climate with extreme summer and falls under Northern-Eastern Transitional Agro-Climatic Zone. The dust storms and severe heat waves are common in the taluk between April and May. The normal annual rainfall in Bidar taluk for the period 1981 to 2010 is 947 mm. Seasonal rainfall pattern indicates that, major amount of (718 mm) rainfall was recorded during South-West Monsoon seasons, which contributes about 82% of the annual normal rainfall, followed by North-East Monsoon season (139 mm) constituting 15% and remaining (90 mm) 3% in Pre-Monsoon season (**Table-2**).

Rainfall analysis for the period of thirty years block of 1981-2010, the mean monthly rainfall at Bidar taluk is ranging between 4 mm during February to 208 mm during August. The coefficient of variation percent for pre-monsoon, monsoon and post-monsoon season is 72, 31 & 73 percent respectively. Annual Co-efficient Variation at this taluk works out to be 21 percent (**Table-2**).

Table-2: Statistical Analysis of Rainfall Data of Bidar taluk, Bidar district (1981 to 2010)

	JAN	FEB	MAR	APR	MAY	PRE	JUN	JUL	AUG	SEP	SW	OCT	NOV	DEC	NE	Annual
NRM	9	4	17	31	29	90	137	193	208	180	718	106	29	4	139	947
STDEV	16	11	24	33	53	65	75	124	102	105	222	86	54	8	102	202
CV%	187	264	144	106	186	72	54	64	49	58	31	82	183	173	73	21

The annual rainfall data from 2009 to 2018 of the Bidar taluk is collected from the District statistical office, Bidar and is given in **Table.3**. The rainfall trend for the period from 2009 to 2018 and probability occurrence of rainfall of the taluk are shown in **Fig.2 & Fig-3** respectively.

Table-3 Actual Annual Rainfall of Bidar taluk from 2009 to 2018

Year	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Rainfall (mm)	754	1136	661	817	1088	611	608	1248	951	463

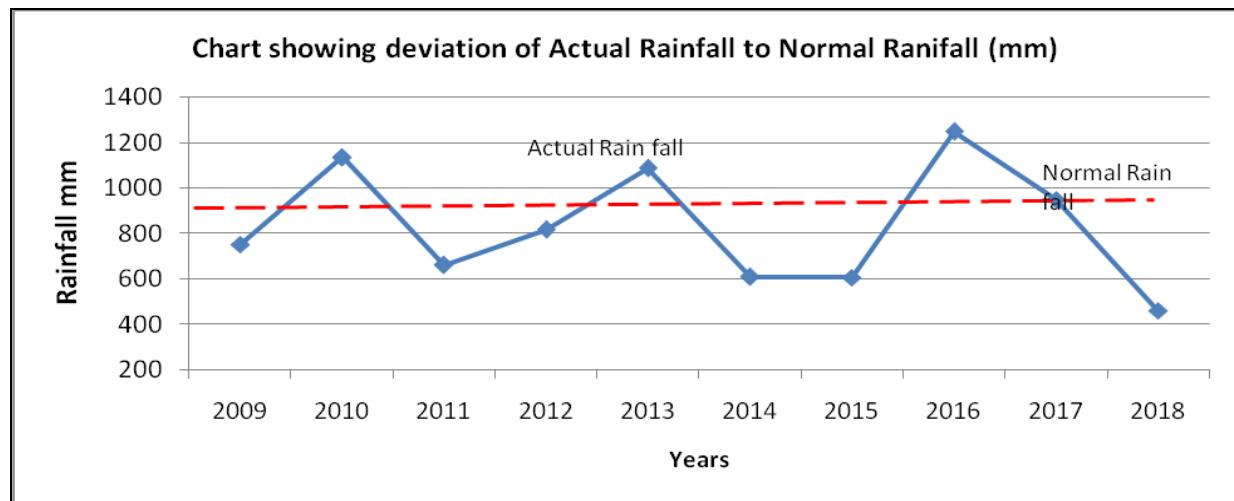

Fig-2. Rainfall trend in Bidar taluk of Bidar district

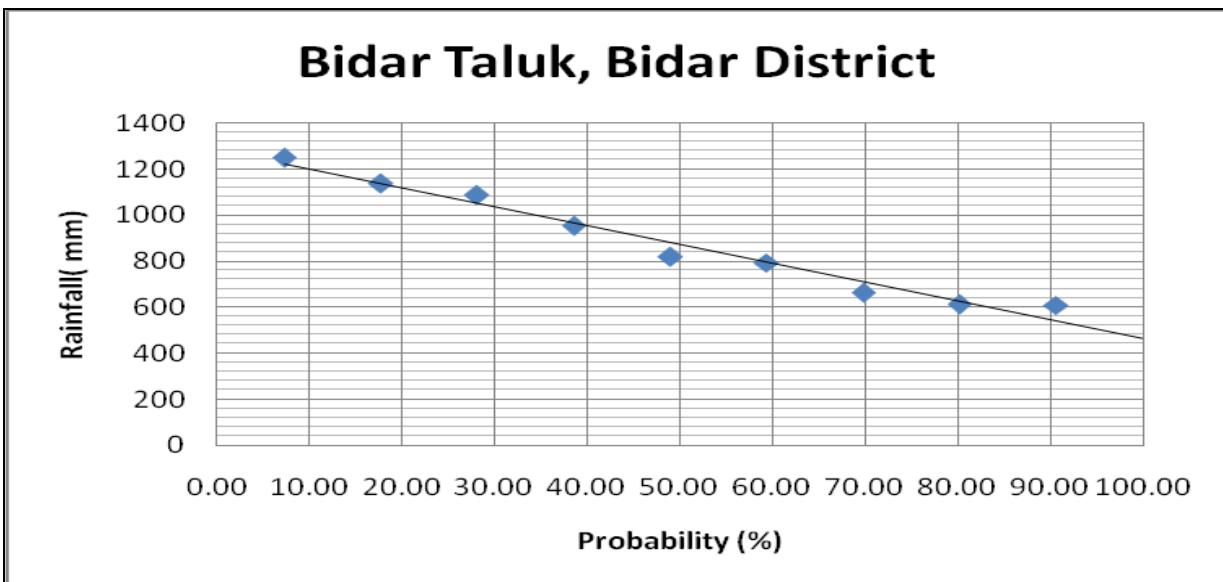

Fig-3. Probability occurrences of Rainfall in Bidar taluk of Bidar district

The rainfall pattern in the Bidar taluk reveals the irregularity of rainfall behavior (**Fig-2**) and the rainfall varies from 463 mm to 1248 mm (**Table-3**). As mentioned above, the normal annual rainfall of Bidar taluk is 947mm. Bidar taluk received rainfall above normal during the years 2010, 2013 and 2016.

Probability analysis of rainfall for the years from 2009 to 2019(**Fig-3**), indicating that the probability of occurrence of 70% of rainfall is about 700 mm in the taluk. The dependable rainfall of 700 mm can be used for construction of any ground water recharge structures in this taluk area.

1.4 Agriculture & Irrigation

Agriculture is the main occupation in Bidar taluk nearly 80% of working population is engaged in agriculture. Two cropping seasons namely, Kharif (June to September) and Rabi (October to March). Sugar Cane (water intensive crop) is the main commercial crop of the taluk and nearly 8 % of the net area sown is covered. Other principal crops are Jowar, Tur, Horse gram, Black gram, Green gram, Bengal gram, wheat, horse gram etc (**Table-4**). Jowar is grown in 13 % and oil seeds in 33% of total crop area of the taluk.

Table-4: Cropping pattern in Bidar taluk 2018-2019 (Ha)

Year	Paddy	Jowar	Bajara	Wheat	Pulses	Fruits	Oil seeds	Sugarcane	Cotton
2018-2019	320	7942	101	1274	28760	293	19759	5337	20

It is observed that net sown area accounts 76% and area sown more than once is 30% of total geographical area in Bidar taluk (**Table-5**). Area not available for cultivation and Fallow land cover 5% &6% of total geographical area respectively. About 76% of net area irrigated is from bore wells and dug wells (**Table-6**).

Table-5: Details of land use in Bidar taluk 2018-2019 (Ha)

Taluk	Total Geographical Area	Area under Forest	Area not available for cultivation	Other Uncultivated land	Fallow land	Net sown area	Area sown more than once
Bidar	92203	4655	7295	3477	16352	60424	4046

Lift Irrigation	-
Other Sources	62
Total	6001

Source: District at a glance 2018-19, Govt. of Karnataka

1.5 Geomorphology, Physiography & Drainage

Physiographically, the taluk can be divided into two regions. They are northern low lands and southern high lands. The southern high lands are popularly known as Bidar plateau, which is made up of laterite. The ground altitudes are varying from 540 to 684 m above MSL. Bidar plateau has an elevation range from 640 to 684 m above MSL. The ground surface is flat, gently sloping forming broad valleys and flat-topped hills. Flat topped hills with step like sides exhibit the terraced landscape. (**Fig.-4**).

The taluk falls within Godavari river basin with five minor sub-basins. The important rivers are in southern part namely, Karanja and Madhura Halla and in Northern part Manjara, Honnikeri Halla and Khanapur. The river Manjara flows in the northern part of the taluk, eastwards along the meandering course and forms the natural boundary between Bidar and adjoining Aurad taluk. The river Karanja enters the taluk in south-eastern parts and flows in north-west direction and joins the river Manjara near Naudi Sanagam. Madhura Halla enters the taluk in south-western parts and flows in South-Eastern direction. Beside these, there are various minor non-perennial nallas.sterams. The drainage pattern in the taluk varies from sub-dendritic to dendritic (**Fig.-5**). This has its bearing on the regional slope which are three directions (i) Southern part of the taluk slope towards West, (ii) Central part towards East and (iii) Northern part towards North. The differential altitude is significant because, it is likely to cause irregular ground water flow patterns on the micro scale. Topography is dominantly controlled by geological structures.

1.6 Soil

Three types of soils are noticed in the taluk namely, black soils, red soils and lateritic soils. Major parts of the taluk are made up of black soils derived from Deccan traps. These are deep black in colour and their texture varies from loam to clay. Lime concentration in this soil is high resulting in poor infiltration capacities. Their infiltration characteristics are poor to moderate. Red soils are pale to bright red in colour and clay to clayey loam in nature. This soil has moderate to good infiltration characteristics. A lateritic soil is confined to central portion of the taluk. This type of soils covers mainly in areas lying above 610 m contour and are pale to bright red in colour and clay to clayey loam in nature. This soil has moderate to good infiltration characteristics (**Fig-6**). The land use map of the taluk is shown in **Fig.7**. Major part of the taluk is covered by agriculture activity.

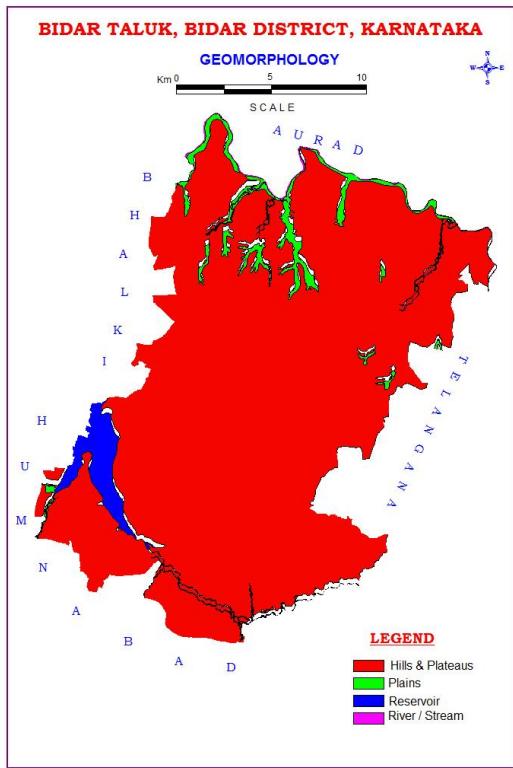

Fig-4: Geomorphology Map

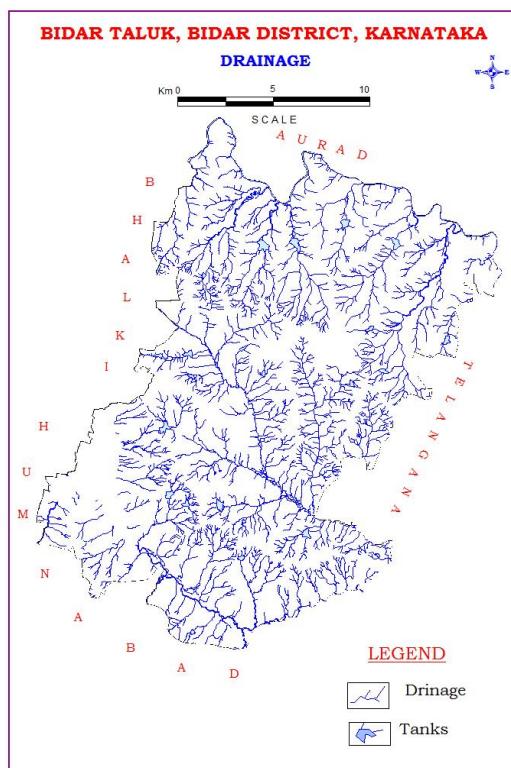

Fig-5: Drainage Map

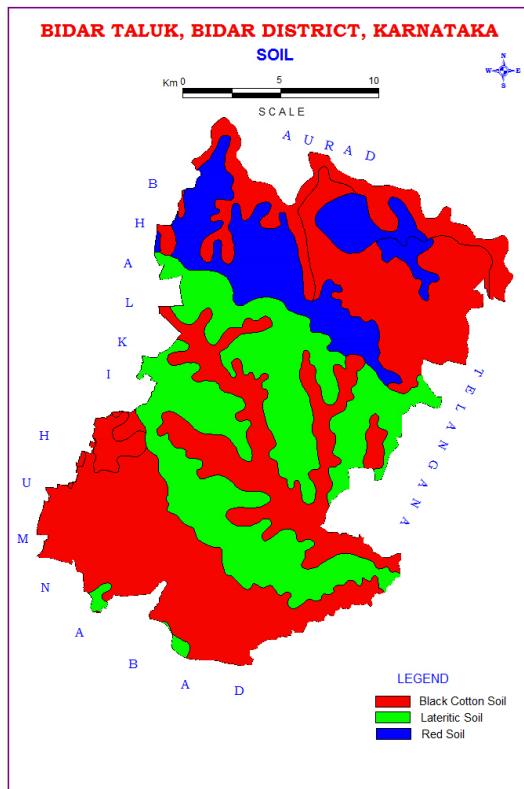

Fig-6: Soil Map

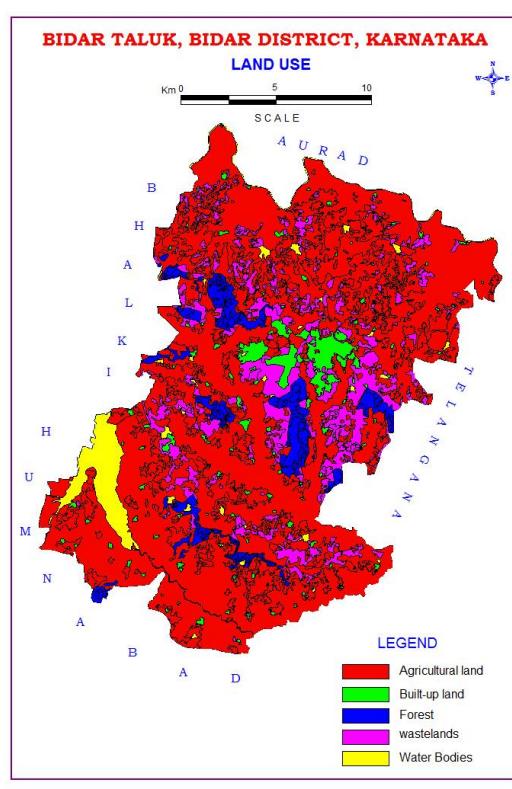

Fig-7: Land use Map

1.7 Ground water resource availability and extraction

Aquifer wise total ground water resources up to 200 m depth is given in **Table-7** below.

Table-7: Total Ground Water Resources (2017) (Ham)

Taluk	Annual replenishable GW resources	Fresh In-storage GW resources		Total availability of fresh GW resources
BIDAR	7052	Phreatic	Fractured (Down to 200m)	Dynamic + phreatic in-storage + fractured
		5795	2246	15093

1.8 Existing and future water demands (as per GEC-2017)

- Net ground water availability for future irrigation development: 5824 Ham
- Domestic (Industrial sector) demand for next 25 years: 34 Ham

1.9 Water level behavior

(a) Depth to water level: The depth to water level data is shown in **Table.8**

Aquifer-I

- Pre-monsoon: 5.29 – 20.80 mbgl (**Fig.-8**). In major part of the taluk, the range is 10-20 mbgl.
- Post-monsoon: 0.87 – 13.25 mbgl (**Fig.-9**). In major part of the taluk, the range is 5 -10 mbgl.

Aquifer-II

- Pre-monsoon: 8.95-28.00 mbgl
- Post-monsoon: 1.50-19.45 mbgl

(b) Water level fluctuation

Aquifer-I

- Seasonal Fluctuation: Rise ranges 1.35 – 10.70 m (**Fig.-10**).

Aquifer-II

- Seasonal Fluctuation: Rise ranges 5.55-9.50 m.

(c) Long-Term Water level trend: The data is shown in **Table.9**.

- Pre-monsoon: Falling ranges 0.00743-0.3270 m
Rising ranges 0.0910-0.1810 m
- Post-monsoon: Falling ranges 0.1859-0.5550 m
Rising ranges 0.0910-0.1608 m

Table-8: Depth to water level for pre-monsoon and post-monsoon

Sr. No	Village	Source	Pre-monsoon Depth to water May-2019 (mbgl)	Post-monsoon Depth to water Nov-2019 (mbgl)	Water level Fluctuation
Aquifer-I					
1	Bagdal	Dug Well	15.23	13.5	1.73

2 AQUIFER DISPOSITION

2.1 Number of aquifers:

In Bidar taluk, there are two types aquifers Laterite and Basaltic flows;

Aquifer-I (Phreatic aquifer) Laterite and Weathered Basalt

Aquifer-II (Fractured aquifer) Fractured Basalt and Vesicular Basalt

Bidar taluk is mainly composed of **Basaltic flows** of Deccan Traps In the Northern and Southern parts and in central parts a thick spread of laterite forms an elevated plateau, 600 m above MSL. Deccan Traps consist of successive lava flows, mainly basaltic in composition (Massive basalt and Vesicular basalt). Basalt and laterite are the main water bearing formations (**Fig-11**). Ground water occurs within the weathered and fractured basalt under water table condition and semi-confined condition. The size and inter connectivity of vesicles, the joint patterns and intertrappean beds control occurrence and movement of water in Basalts. The porous Laterite capping generally as shallow aquifer (dug wells) and yield good quantity of water for short duration.

In Bidar taluk bore wells were drilled from a minimum depth of 65.25 mbgl to a maximum of 308.40 mbgl. Depth of weathered zone ranges from 6.0 mbgl to 28 mbgl (**Table 10**). Ground water exploration reveals that aquifer-II fractured formation was encountered between the depth of 16 to 182 mbgl. Yield ranges from less than 1.00 to 9.90 lps. The basic characteristics of each aquifer are summarized in **Table-11**.

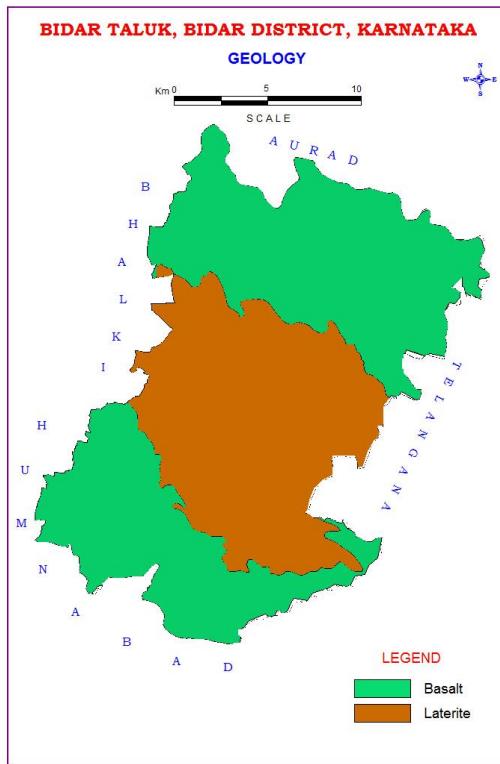

Fig-11: Geology Map

Table-10: Details of Ground Water Exploration

S. No	Location	Lat & Long	Depth m bgl	Casing (m)	Lithology	SWL (mbgl)	Q (lps)	DD (m)	T (m ² /day)
1	Mirzapur-EW	18°50'45" 77° 25'15"	220.00	28.0	Basalt	19.40	3.00	-	-
2	Chickpet-EW	18°57'15" 77° 30'30"	308.40	6.00	Basalt	49.16	0.20	-	-

Table-11: Basic characteristics of each aquifer

Aquifers	Weathered Zone (Aq.-I)	Fractured Zone (Aq.-II)
Prominent Lithology	Laterite and Weathered Basalt	Fractured / Jointed Basalt
Thickness range (mbgl)	3-30	Fractures upto 182.00mbgl
Depth range of occurrence of fractures (mbgl)	-	16.00-182.00
Range of yield potential (lps)	<1-3	<1 – 9.90
Specific Yield	2%	0.2%
T (m^2/day)	-	Maximum upto 393.19
Quality Suitability for Domestic & Irrigation	Suitable	Suitable

2.2 3-D aquifer disposition and Cross-Sections

2.2.1 Aquifer disposition – Rockworks output

Sub-surface aquifer disposition are prepared based upon the outcome of ground exploration programme. Mainly. Four zones are categorized namely Top soil, Weathered, Fractured and Massive zones. These zones are represented using rockworks to depict the subsurface sections and models and presented in **Fig.-12, Fig.-13 and Fig.14.**

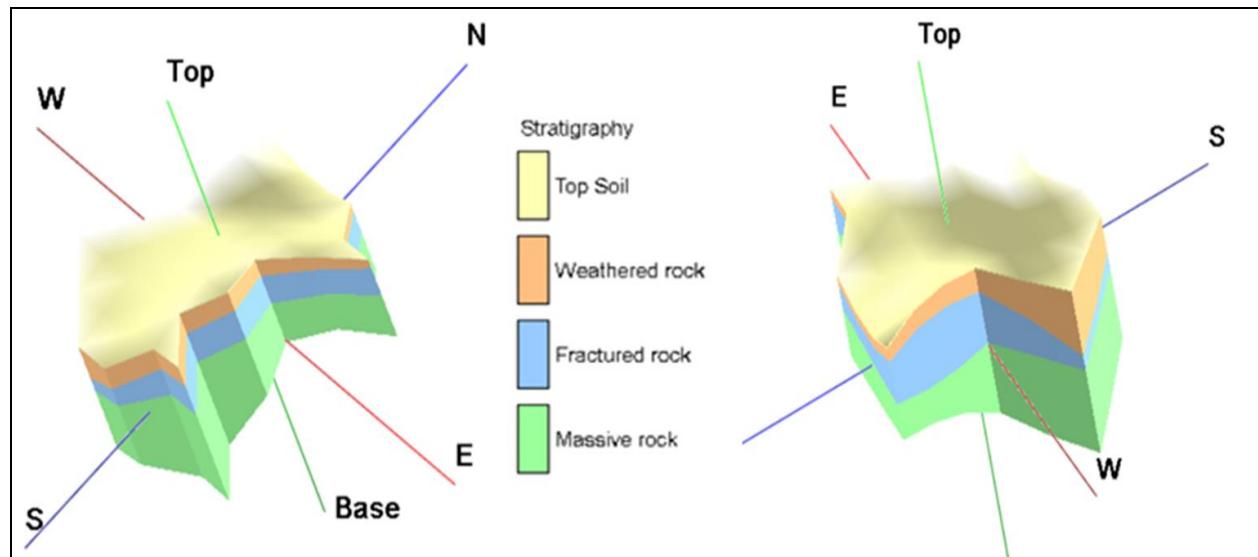

Fig-12: 3D Aquifer Disposition

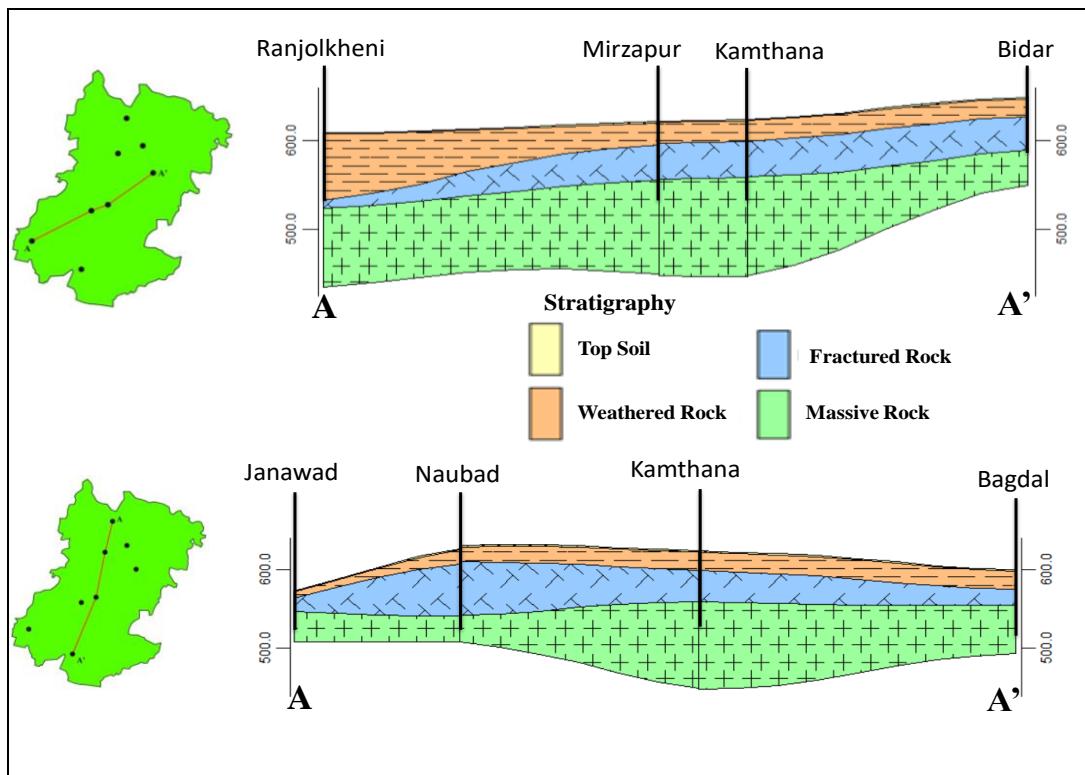

Fig-13: Cross sections in different directions

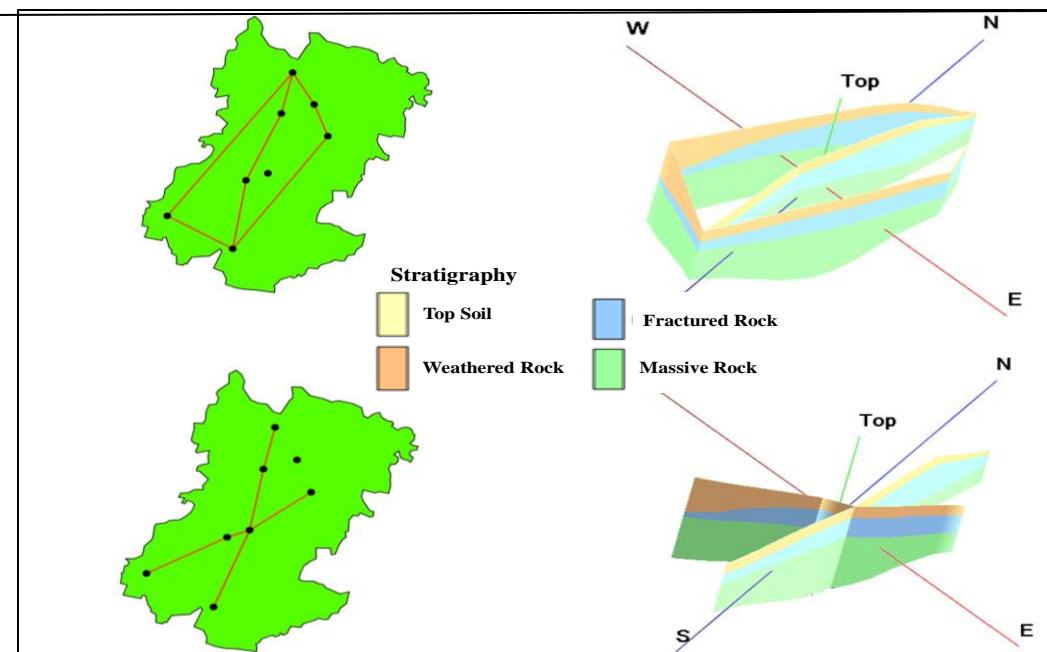

Fig-14: 3D Aquifer Fence Diagram

3 GROUND WATER RESOURCE, EXTRACTION, CONTAMINATION AND OTHER ISSUES

3.1 Aquifer wise resource availability and extraction

Present Dynamic Ground Water Resource of Bidar Taluk (2020)

Annual extractable ground water resources (ham)	Existing gross ground water draft for irrigation (ham)	Existing gross ground water draft for domestic and industrial water supply (ham)	Existing gross ground water extraction for all uses (ham)	Allocation for domestic and industrial use for next 25 years (ham)	Net ground water availability for future irrigation development (ham)	Existing stage of ground water extraction (%)	Category
5037.94	1605.82	35.89	1641.71	38.68	3393.44	32.59	SAFE

Comparison of ground water availability and draft scenario in Bidar taluk

Taluk	GW availability (in ham)	GW draft (in ham)	Stage of GW development (%)	GW availability (in ham)	GW draft (in ham)	Stage of GW development (%)	GW availability (in ham)	GW draft (in ham)	Stage of GW development (%)
	2013			2017			2020		
BIDAR	6881	4162	60	7052	1225	17	5037.9	1642	32.59

It is seen that the stage of ground water extraction is improved in the taluk in comparison with 2013. However, with respect to 2017 estimations, there is an increase of 16% in the stage of ground water development i.e., 17 to 33% though the taluk is categorized as “Safe”.

3.2 Chemical quality of ground water and contamination

Interpretation from Chemical Analysis results in Bidar taluk is mentioned as under and the data is shown in Table.12.

- **ELECTRICAL CONDUCTIVITY:** In general, EC values range from 200 to 1685 µ/mhos/cm in the aquifer-I at 25°C (Fig-15) and range from 450 to 1100 µ/mhos/cm in the aquifer-II.
- **CHLORIDE:** Chloride concentration in ground water ranges between 33 and 288 mg/l in the aquifer-I (Fig-16)) and ranges between 50.0 and 121.0 mg/l in the aquifer-II.
- **NITRATE:** Nitrate concentration in ground water ranges from 10 and 159 mg/l in the Aquifer –I (Fig-17) and ranges from 6.0 and 17.0 mg/l in the Aquifer –II.
- **FLUORIDE:** Fluoride concentration in ground water ranges between 0.390 and 1.006 mg/l in the aquifer-I (Fig-18) and ranges between 0.4 and 3.9 mg/l in the aquifer-II.

Table-12: Quality of ground water in Bidar taluk of Bidar district

S. No.	Location	pH	EC (mg/L)	Cl (mg/L)	NO3 (mg/L)	F (mg/L)
Aquifer-I						
1.	Andur	7.48	744	112	35	0.365
2.	Bagdhala	7.78	1242	188	44	0.503
3.	Balehalli (Halehalli)	7.81	1320	203	88	0.472
4.	Bidar	7.92	430	62	18	1.006
5.	Chickpet	8.10	531	63	10	0.390
6.	Hallikheda	7.76	1685	288	159	0.403
7.	Janawada	7.81	991	141	37	0.642
8.	Kamthana	7.88	200	33	11	0.748
9.	Khanapur	8.03	573	51	62	0.96

Aquifer-II						
10.	Mirzapur-EW	8.0	470	57.0	6.0	0.6
11.	Chickpet-EW	7.9	1100	121.0	17.0	3.6
12.	Ranjolkheni-EW	7.8	620	99	10	3.9
13.	Ranjolkheni-OW	7.8	450	50	14	0.4

In general, ground water quality in Bidar taluk is good for drinking purpose except at 2 places where nitrate is found to be greater than the permissible limit as per "Indian Standard Drinking Water Specification 2012". Ground water samples have also been tested and found suitable for agriculture & irrigation purposes in major part of the taluk, where EC is less than 750 $\mu\text{mhos/cm}$.

Fig-16 Distribution of Chloride (Aq-I)

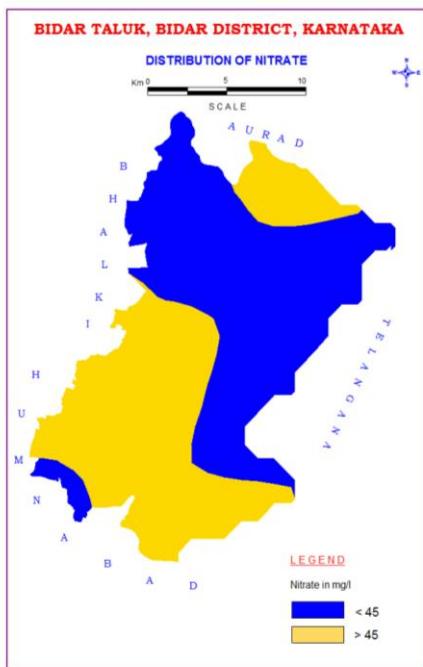

Fig-17 Distribution of Nitrate (Aq-I)

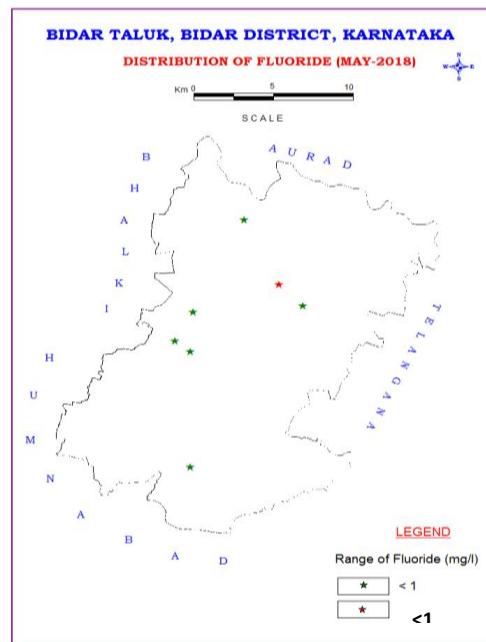

Fig-16 Distribution of Fluoride (Aq-I)

4 GROUND WATER MANAGEMENT PLAN

4.1 Resource Enhancement by Supply Side Interventions

Recharge to dry **phreatic aquifer zone (Aq-I)** through construction of artificial recharge structures, viz; check dams, percolation tanks & Sub surface dyke (**Table-13**) is recommended. The choice of recharge structures should be site specific and such structures need to be constructed in areas already identified as feasible for artificial recharge. The area feasible for artificial recharge are given in **Fig. 19.**

The entire area of Bidar taluk is feasible for recharge i.e., 926 sq.km. and the surface surplus non-committed runoff availability is 149.54 MCM, which is considered for planning of AR structures. For this, a total of 4 sub-surface dykes, 135 percolation tank and 684 Check dams are proposed. The volume of water expected to be conserved/recharged @75% efficiency is 112.35 MCM through these AR structures. The approximate cost estimate for construction of these AR structures is Rs. 96.15 Cr. The additional area which can be brought under assured ground water irrigation will be about 13500 hectares. However, the figures given are tentative and pre-field studies / DPR are recommended prior to implementation of these recharge structures.

Table-13: Quantity of non-committed surface runoff & expected recharge through AR structures

Artificial Recharge Structures Proposed	Bidar taluk
Area feasible for artificial recharge (sq.km)	926
Non committed monsoon runoff available (MCM)	149.54
Total no. of existing artificial recharge structures	185
Ni Fig-17 Distribution of Nitrate (Aq-I)	Fig-18 Distribution of Fluoride (Aq-I)
Number of Sub surface dykes	4
Tentative total cost of the project (Rs. in Cr)	96.15
Excepted recharge (MCM)	112.35
Additional irrigation potential (Hectares)	13500

Note: The numbers proposed are tentative and detailed feasibility studies are required in field to finalize the actual locations for the construction of AR structures.

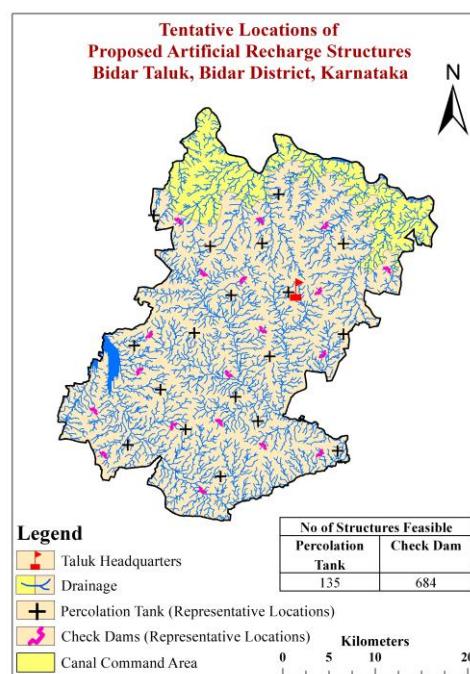

Fig.19: Locations of Proposed Representative Artificial Recharge Structures

4.2 Resource Savings by Demand Side Interventions

4.2.1 Water Use Efficiency by Micro Irrigation Practices

It is observed that dug wells and bore wells contribute 99% of the source for irrigation in Bidar taluk. The water efficient methodology may be applied for growing sugarcane which is grown in 5337 ha and is ground water dependent as compared to the other crops which are mainly grown during kharif. Initially, the micro irrigation techniques (drip) are proposed in 25% of sugarcane cultivated area of 5337 ha i.e., 1334 ha. Considering the crop water requirement of 2.00 m and savings of 25% i.e., 0.50 m by drip irrigation, it will contribute in saving ground water by 667 ham and thus will improve stage of development marginally. However, in long run the practice of Efficient irrigation techniques will add to the ground water resource in large extent. (**Table-14**).

Table 14: Improvement in GW availability (2020) due to savings by adopting water use efficiency

Annual Extractable GW Resource (Ham)	Total GW extractio n for all uses	Stage of ground water extraction	Sugarcane Area propos ed for WUE	Unit savings	Total Saving due to adoptin g WUE measur es	Cumulativ e annual Extractable GW Resource	Expected improvement in stage of ground water extraction after the implementation of the project	Expected improvement in overall stage of ground water extraction
HAM	HAM	%	HA	M	HAM	HAM	%	%
5037.94	1641.72	32.59	1334	0.50	667	5705	3.80	32.59 to 28.78

4.2.2 Change in cropping pattern

Water intensive crop like sugarcane are grown in 9% of total cropped area. At present, the stage of ground water extraction is also on lower side @ 32.59% (2020), thus change in cropping pattern has not been suggested.

4.3 Ground Water Development Plan

In Bidar taluk, the present stage of ground water extraction (2020) is merely 32.59 %, say 33% with net ground water availability for future use of 3393.44 ham and total extraction of 1641.71 ham. The ground water draft for irrigation purpose is estimated to be 1605.82 ham and there is further scope for developing the resource for irrigation as a part of development with appropriate scientific backing. The implementation of the plan should be based on site specific detailed hydrogeological and scientific surveys for pinpointing the sites for construction additional abstraction structures.

As per tentative estimates, 345 dug wells and 829 bore wells are recommended to be constructed in feasible areas which is likely to create about 2125 hectares of additional irrigation potential.

Table – 15: Feasibility of Additional GW abstraction structures based on GWRA 2020 availability

Annual Extractable GW Resource (Ham)	5037.94
Net GW Availability for future use (Ham)	3393.44
Stage of GW Extraction (%)	32.59
GW Resources available to increase SOE to 60% (Ham)	3022.764
Total Extraction / Draft (Ham)	1641.72
Balance GWR available to enhance SOE 60% (Ham)	1381.04
DW unit draft (Ham)	1.00
BW unit draft (Ham)	1.25
No. of DW feasible considering 25% of balance GWR with unit draft of 1 ham	345
No. of BWs feasible considering 75% of balance GWR with unit	829

draft of 1.25 ham	
Additional irrigation potential created by DW's considering crop water requirement of 0.65 m (Ha)	531
Additional irrigation potential created by BW's considering crop water requirement of 0.65 m (Ha)	1594
Total irrigation potential created by DW's and BW's (Ha)	2125

Note- Hydrogeological and scientific intervention is needed for pinpointing the sites for construction of dugwells and Borewells

4.4 Regulation and Control

Bidar taluk has been categorized as "Safe". However, the mandatory guidelines like rainwater harvesting and artificial recharge issued by Karnataka Ground Water Authority(KGWA) needs to be strictly implemented to avoid the taluk from safe category to semi critical or higher category in the future.

4.5 Other interventions proposed

- Periodical maintenance of artificial recharge structures should also be incorporated in the Recharge Plan.
- Excess nitrate concentration is found in ground water samples requires remedial measures viz.
 - Dilution of nitrate rich ground water through artificial recharge & water conservation.
 - Roof top rain water harvesting.
 - Improving quality by proper drainage and limited usage of Nitrogenous fertilizers
- Excess fluoride concentration is found in ground water samples of deeper aquifer require remedial measures viz.
 - Alternate source
 - Removal technology

5 SUMMARY AND RECOMMENDATIONS

The main ground water issues are Low Ground Water Development, Limited Ground Water Potential / Limited Aquifer Thickness / Sustainability, Deeper Water Levels particularly in Aquifer-II in some parts, hilly and plateau areas which are all inter-related or inter dependent and Inferior Ground Water Quality due to fluoride contamination especially in deeper aquifer. The summary of ground water management plan of Bidar taluk is given in **Table-16**.

Table 16: Summary of Management plan of Bidar taluk

Present stage of Ground water Extraction and Category as per GEC-2020(%)	32.59, Safe
Annual Extractable Ground Water Resources (ham)	5037.94
Existing Gross Ground Water Extraction for all uses	1641.72
Total Ground water Resources (Dynamic & Static upto the depth of 200 mbgl) (ham)	13078
Ground Water Resource Enhancement by Supply side Interventions	
Area Feasible for Artificial Recharge (ha)	92600
Expected additional recharge from monsoon surplus runoff (ham)	11235
Additional irrigation potential (Hectares)	13500
Sugarcane Area proposed for WUE (ha)	1334
Ground Water Resource Savings by Demand side Interventions	
Expected Saving due to adopting WUE measures (ham)	667
Expected improvement in stage of ground water extraction after adopting WUE measures and implementation of the project (%)	32.59 to 28.78

Government to take initiatives to encourage at least 70% farmers to adopt water use efficiency irrigations practices like dip & sprinkler irrigation	-
Ground Water Resource Development Plan	
Balance GWR available to enhance SOE 60% (Ham)	1381.04
No. of DW feasible considering 25% of balance GWR with unit draft of 1 ham	345
No. of BWs feasible considering 75% of balance GWR with unit draft of 1.25 ham	829
Additional irrigation potential created by DW's considering crop water requirement of 0.65 m (Ha)	531
Additional irrigation potential created by BW's considering crop water requirement of 0.65 m (Ha)	1594
Total irrigation potential created by DW's and BW's (Ha)	2125
Excess Nitrate concentration	In limited places especially in shallow aquifer Dilution of nitrate rich ground water through artificial recharge & water conservation. Roof top rain water harvesting Improving quality by controlling usage of Nitrogenous fertilizers in agriculture field and maintaining the proper domestic drainage network system
Excess Fluoride concentration	In limited places especially in deeper aquifer Alternate source Removal technology

As per the resource estimation – 2020, Bidar taluk falls under Safe category with the stage of ground water extraction is 32.59 %. However, there is need to formulate management strategy to tackle the water scarcity related issues in the taluk in the coming days to avoid water crisis in the future. It is suggested to adopt a scientific and multi-pronged ground water management strategy covering supply side interventions, demand side interventions, ground water development interventions and ground water quality protection aspects as mentioned in the management plan suggested above

Ground water resource enhancement by supply side interventions: The surface surplus non-committed runoff availability is 149.54 MCM, which is considered for planning of AR structures. For this, a total of 4 sub-surface dykes, 135 percolation tank and 684 Check dams are proposed. The volume of water expected to be conserved/recharged @75% efficiency is 112.35 MCM through these AR structures. The approximate cost estimate for construction of these AR structures is Rs. 96.15 Cr. The additional area which can be brought under assured ground water irrigation will be about 13500 hectares. However, the figures given are tentative and pre-field studies / DPR are recommended prior to implementation of these recharge structures.

Ground water resource enhancement by demand side interventions: It is observed that dug wells and bore wells contribute 99% of the source for irrigation in Bidar taluk. The water efficient methodology may be applied for growing sugarcane which is grown in 5337 ha and is ground water dependent as compared to the other crops which are mainly grown during kharif. Initially, the micro irrigation techniques (drip) are proposed in 25% of sugarcane cultivated area of 5337 ha i.e., 1334 ha. Considering the crop water requirement of 2.00 m and savings of 25% i.e., 0.50 m by drip irrigation, it will contribute in saving ground water by 667 ham and thus will improve stage of development marginally.

Change in cropping pattern: Water intensive crop like sugarcane are grown in 9% of total cropped area. At present, the stage of ground water extraction is also on lower side @ 32.59% (2020), **thus change in cropping pattern has not been suggested.**

Ground Water Resource Development Plan: the present stage of ground water extraction (2020) is merely 32.59 %, say 33% with net ground water availability for future use of 3393.44 ham and total

extraction of 1641.71 ham. The ground water draft for irrigation purpose is estimated to be 1605.82 ham and there is further scope for developing the resource for irrigation as a part of development with appropriate scientific backing. The implementation of the plan should be based on site specific detailed hydrogeological and scientific surveys for pinpointing the sites for construction additional abstraction structures. As per tentative estimates, 345 dug wells and 829 bore wells are recommended to be constructed in feasible areas which is likely to create about 2125 hectares of additional irrigation potential.

Nitrate Contamination: Proper drainage of sewage and scientific disposal of sewage water by the concerned urban/rural agency needs to be adopted along with limited usage of Nitrogenous fertilizers by farmers to avoid nitrate contamination. All the ground water sources for drinking water supply may be checked for ground water quality parameters as per BIS norms.

WUE in Domestic Sector: WUE practices are the prime management option in domestic sector as well in view of having high density clusters of urban households and establishments. In premium apartments and infrastructure projects, use of three-way line for fresh water, bathroom water and toilet water will enable reuse of grey water for gardening, car washing and flushes etc. The water saver fixtures/aerators can be used for kitchen & bathroom pipes, bath showers and water free urinals.

Regulation and Control: Taluk is categorised as "Safe". However, the mandatory guidelines like rainwater harvesting and artificial recharge issued by Karnataka Ground Water Authority needs to be strictly implemented to avoid the taluk from deteriorating from safe category to semi critical category in the future.

Water Linkages with other Activities: Water sector has strong linkages with other developmental activities. Hence, the proposed management plans cannot be considered as static and needs to be reviewed and improved from time to time.

Annexure-I: Tentative locations of proposed Check Dams
