FOR E W O R D

Groundwater is a major natural replenishable resource to meet the water requirement for irrigation, domestic and industrial needs. It plays a key role in the agrarian economy of the state. Though richly endowed with various natural resources, the state of Orissa has a long way to go before it can call itself developed. Being heavily dependent on rain fed agriculture; the state is very often exposed to vagaries of monsoon like flood and drought. The importance of groundwater in mitigating the intermittent drought condition of a rain-fed economy cannot be overemphasized.

To monitor the effect caused by indiscriminate use of this precious resource on groundwater regime, Central Ground Water Board, South Eastern Region, Bhubaneswar has established about 1323 National Hydrograph Network Stations (NHNS) (open / dug wells) and 137 purpose built piezometres under Hydrology Project in the state of Orissa. The water levels are being monitored four times a year. Besides, to study the change in chemical quality of groundwater in time and space, the water samples from these NHNS are being collected once a year (Pre-monsoon) and analysed in the Water Quality Laboratory of the Region. The data of both water level and chemical analysis are being stored in computers using industry standard Relational Database Management System (RDBMS) like Oracle and MS SQL Server. This is very essential for easy retrieval and long-term sustainability of data.

Dissemination of technical information in a way that is very useful to the user agencies is an important aspect that plays a vital role in the safe and optimal development of groundwater resources of our country. As an effort in this direction, Central Ground Water Board is bringing out "Groundwater Year Book" each year. The present report contains the observations and results of water levels in the state of Orissa for the year 2013 (April) - 2014 (January). It is sincerely hoped that this report will be immensely useful to various user agencies, Engineers, Scientists, Administrators, Planners and others involved in groundwater planning, development and management.

The present compilation is outcome of commendable efforts put in by **Shri P. K. Mohapatra, Scientist 'D'**, **Smt. Sandhya Mohapatra Scientist-C**, **Smt. Khusboo Kumari, Scientist-B**, **Shri. B.B. Sahoo, Scientist-C (Chem)**, and **Shri. B.N. Dehury, Asst. (Chem)**. The maps included in the reports have been computer generated by them using sophisticated GIS software like MapInfo Professional and dedicated software GEMS. Officers of the Region have collected the monitoring data presented in the reports. Their efforts are also thankfully acknowledged.

Bhubaneswar

REGIONAL DIRECTOR**

EXECUTIVE SUMMARY

The State of Orissa spreading over an area of 1,55,707 sq. Km is bounded between North latitude $17^{\circ}49'$ to $22^{\circ}34'$ and East longitude $81^{\circ}24'$ to $87^{\circ}29'$. Success of agricultural operations and consequent economy of the state are related to the availability of water and its optimal utilization.

The average annual rainfall of the state is 1502.5mm. Nearly 86% of the annual rainfall is contributed by the southwest monsoon. During 1997 there were excess rainfall than the normal and negative departure is only seen at Bolangir, Gopalpur, Jharsuguda. From the departure data it is discerned that out of twenty six years (1981-2006), the years 1987, 1996, 2002, 2005 show negative departures in the annual rainfall for most of the districts. During 2006 there was more rainfall than the normal in all most all the districts. The state is underlain by diversified rock types which range in age from Precambrian to the Cenozoic age. The Precambrians occupy nearly 80% of the total geological area of the state.

A total number of 1323 Hydrograph Network Stations have so far been established and are being monitored in the state. Besides this 137 piezometers have been constructed under World Bank aided Hydrology Project and are being monitored manually.

During April 2013, the water level (meter below ground level) in the state varies from minimum of 0.45 mbgl in Bargarh district to a maximum of 17.4 mbgl in Mayurbhanj district. The state recorded water level in 5-10 m range in almost all the districts. 2-5 m range was found in the coastal districts as well as in command areas of the state. Some wells in the hilly districts recorded water level in 10-20 m range.

During August 2013, the depth to water level in majority (52.1%) of NHS wells was level in the range of 0-2 m below ground level, 40.2% of wells in 2 –5 m below ground level, 7.6% of wells in 5-10 m below ground level and only 1% wells in the range of 10-20 m below ground level.

During November 2013, the depth to water level in majority (48%) of NHS wells was level in the range of 0-2 m below ground level and 46.2% of wells in 2-5 m below ground level. In general the water level in the state during November 2013 monitoring is found in the range of 2-5 m bgl, whereas 0-2 m bgl water level is found in the coastal and command areas in the state.

During January 2014, the depth to water level in majority (64.18%) of NHS wells was level in the range of 2-5 m below ground level and 15.04 % of wells in 5-10 m below

ground level. In general the water level in the state during January 2014 monitoring is found in the range of 2-5 m bgl, whereas 0-2 m bgl water level is found in the coastal and command areas in the state.

The comparison of April 2013 water level with that of the decadal mean of the corresponding period shows that 9.2%, 1.2% and 0.1% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 41.7%, 35.5% and 12.4% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of August 2013 water level with that of the decadal mean of the corresponding period shows that 83.2%, 52.2% and 3.4% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 15.7%, 3.6% and 0.0% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of November 2013 water level with that of the decadal mean of the corresponding period shows that 65.2%, 20.2% and 2.0 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 11.9%, 0.6 % and 0.6% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of January 2014 water level with that of the decadal mean of the corresponding period shows that 47.4 %, 3.7% and 0.3 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 45.7%, 2.7% and 0.2% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of April 2013 water level with that of the same period of the previous year shows that 36.1%, 5.4% and 1.7% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 48.8%, 4.2%, 2.4% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of August 2013 water level with that of the same period of the previous year shows 28.6%, 4.6%, 0.9% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 55.6%, 8.5% recorded fall in water level in the range of 0-2, 2-4 respectively and 0.9% recorded more than 4m.

The comparison of November 2013 water level with that of the same period of the previous year shows that 53.5%, 10.6%, 1.6% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 30.9%, 2.1%, 0.3% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The comparison of January 2014 water level with that of the same period of the previous year shows that 59.9%, 10.7%, 3.2% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly, 23.4%, 1%, 0.3% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

A comparison of August 2013 water level with that of April 2013 shows that 33.5%, 37.6%, 27.1 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly only 1.6% and 0% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

A comparison of November 2013 water level with that of April 2013 shows that 26.3%, 42.1%, 28.1 % of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly only 3.2%, 0.1% and 0% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

A comparison of January 2014 water level with that of April 2013 shows that 48%, 32%, 12.0% of the total NHS wells recorded rise in water level in the range of 0-2, 2-4 and more than 4m respectively. Similarly 6.9%, 0.8% and 0.1% recorded fall in water level in the range of 0-2, 2-4 and more than 4m respectively.

The shallow aquifers of inland zone of the state are mostly fresh and dominated by Ca-Mg-HCO₃ and mixed types of water. In the coastal plain where most of the wells are located in alluvium, the water is relatively saline. The shallow aquifers of the coastal plain are of NaHCO₃ type with some isolated patches of NaCl and Ca-Mg-HCO₃ types, which may be due to Base Exchange process and also due to the vicinity of the sea. These aquifers, at places, are of high Electrical Conductivity and high Chloride, Nitrate, and Fluoride content. In the coastal districts the Electrical Conductivity concentration ranges from 20 to 8820 μ S/cm.

GROUND WATER YEAR BOOK OF ORISSA

2013– 2014

1.0 INTRODUCTION

The State of Orissa with a geographical area of 1,55,707 sq. km is bounded between North latitudes 17° 49' and 22° 34' and East longitudes 81° 24' and 87° 29'. The State comprises of 3 revenue divisions, 30 districts, 58 subdivisions and 314 community development blocks. The state's population largely depends on agriculture. Success of agricultural operations and the consequent agrarian economy of the state are dependent on the availability of water and its optimal utilization. The total population of the state as per 2011 census is 419.47 lakhs, out of which the rural population is 349.51 lakhs and the urban population is 69.96 lakhs. The rural population is almost dependent on agriculture for their livelihood and the agriculture on availability of water. A consistent ground water database is inevitable for planning of judicious and optimal utilization of ground water through an efficient resource management system for which the prerequisite is a reliable monitoring system.

Keeping this perspective in view, Central Ground Water Board carries out the ground water monitoring through a network of observation wells - the National Hydrograph Network Stations. The National Hydrograph stations set-up is a system of spatially distributed observation points for ground water regime monitoring at which periodic monitoring is carried out viz. recording of water levels, temperature and collection of water samples for chemical quality analysis for building a robust database to cater to multitude of needs for ground water management.

Groundwater monitoring data so collected forms an important input for water management. One of the main objectives is the prediction of future conditions or future scenarios, based on background samples of historical data, which may consist of repeated measurements from a single monitoring well. Also the monitoring is being carried out with a view to observe the rise or fall of the ground water levels and change in quality of water with changing stress conditions.

The studies include periodic measurement of water levels, temperature, and collection of water samples for determination of chemical constituents. Apart from evaluation of groundwater resources from time to time for developmental planning, this also helps in forecasting groundwater regime behaviour with progressive development of groundwater or effects of other recharge or discharge conditions, which helps in adopting remedial measures when necessitated. For achieving these objectives 1460 nos. of observation wells have so far been established all over the state by CGWB, to serve as permanent Hydrograph Network Stations for the

purpose of monitoring of groundwater regime. In selecting hydrograph stations due consideration has been given to the hydrogeological, hydrochemical aspects and their location in river Basin/ Sub basin/ Water shed etc.

To strengthen the water level monitoring network and to avoid the possibility of dug wells used as NHS being filled up due to extraneous activities, some purpose built piezometer have been constructed by the Central Ground Water Board under its normal activities as well as under World Bank Aided Hydrology Project. In course of time it is proposed to replace all the dug wells used as observation wells with piezometers for better monitoring.

2.0 PHYSIOGRAPHIC FEATURES

The State presents varied and picturesque landforms. The Southern and Central parts of the State in Rayagada, Kalahandi, Phulbani and Gajapati districts present a rugged hilly tract. Plateau occupies the Northern districts of Sundergarh, Keonjhar and Mayurbhanj and parts of Nawarangpur district in the Southwest. Undulating plains characterizes the major river valleys. A narrow coastal plain borders the Bay of Bengal.

Physiographically the state can be divided into five distinct units, namely (i) Coastal plains, (ii) Northern uplands, (iii) The erosional plains of Mahanadi and other river valleys (iv) South Western hilly region and (v) Subdued plateaus. Physiography of the state has been presented in **Plate:-2.1**

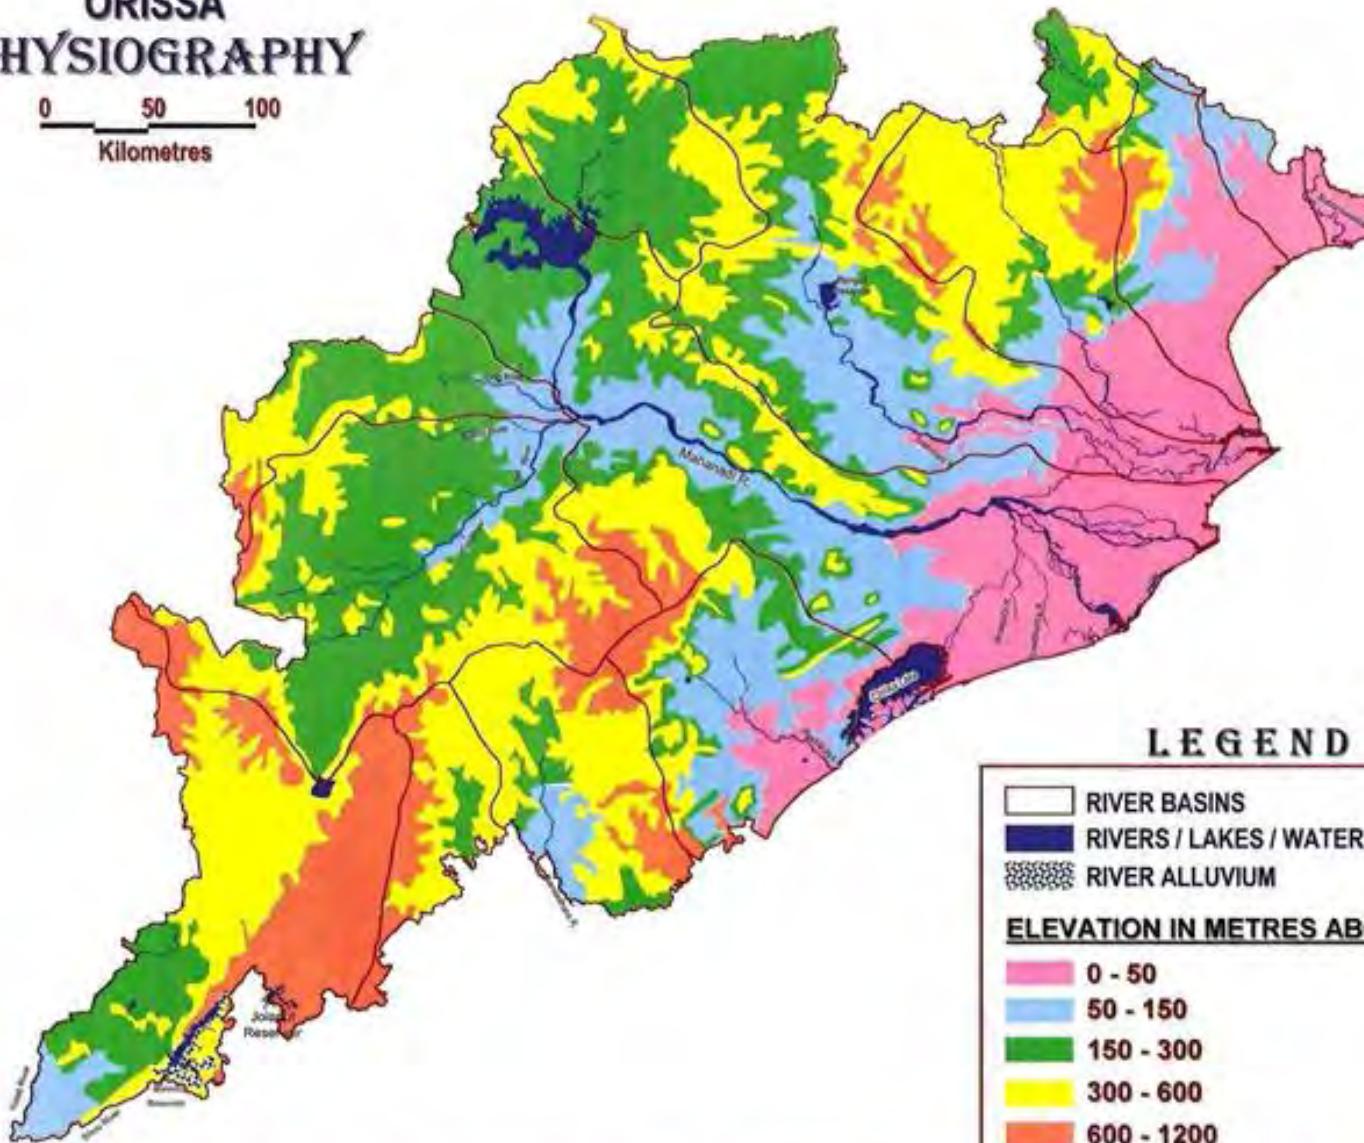

The coastal plains covering parts of Ganjam, Puri, Cuttack and Balasore districts from south to north form an extensive flat alluvial tract between the hills in the west and the coast in the east. It presents a flat topography gently sloping towards east with insignificant elevation difference. The general elevation of coastal plains varies from 1 to 10m above mean sea level (amsl).

Northern uplands covering Mayurbhanj, Keonjhar and Sundergarh districts and Pallahara subdivision of Dhenkanal district are undulating, frequently intersected by hill ranges with general slope from north to south. The elevation in the central part of the upland generally varies between 300 to 600 m and forms watersheds of Baitarani and Brahmani river systems. The erosional plains of Mahanadi river basin lie between the northern uplands and southern hilly region of the Eastern Ghats. The tract covers major parts of undivided districts of Sambalpur, Bolangir, Dhenkanal and northern parts of Phulbani (Khandamal) and Western part of Puri districts. The altitude of this tract lies between 150 to 300 m above mean sea level (amsl).

Plate-2.1

ORISSA PHYSIOGRAPHY

0 50 100
Kilometres

Southwestern hilly region lies to the south and southwest of Mahanadi valley region stretching through Phulbani, Ganjam districts and part of Koraput district. Major part of this region has an elevation over 600m, acting as the watershed of the two sets of rivers, one set flowing directly to the Bay of Bengal, namely Rushikulya, Nagavali and Vamsadhara and the others feeding the Godavari and Mahanadi river systems.

The plateaus extend throughout the western parts of Kalahandi, Nawapara, Koraput, Malkangiri , Rayagada and Nawarangpur districts with an average elevation varying from 300 to 600m above mean sea level (amsl).

3.0 DRAINAGE

There are eleven principal rivers traversing the entire state that can be grouped under eight major river basins within the state, whereas the Indravati, Kolab, Machkund sub-basins in the south forms part of Godavari river basin. Most of the major rivers flow in easterly and southeasterly direction with gentle gradient. Generally the rivers are effluent in nature. In general the drainage pattern is of both dendritic and radial types. The salient features of the major river basins are given in **table 3.1**. The major rivers are shown in **Plate 2.1**.

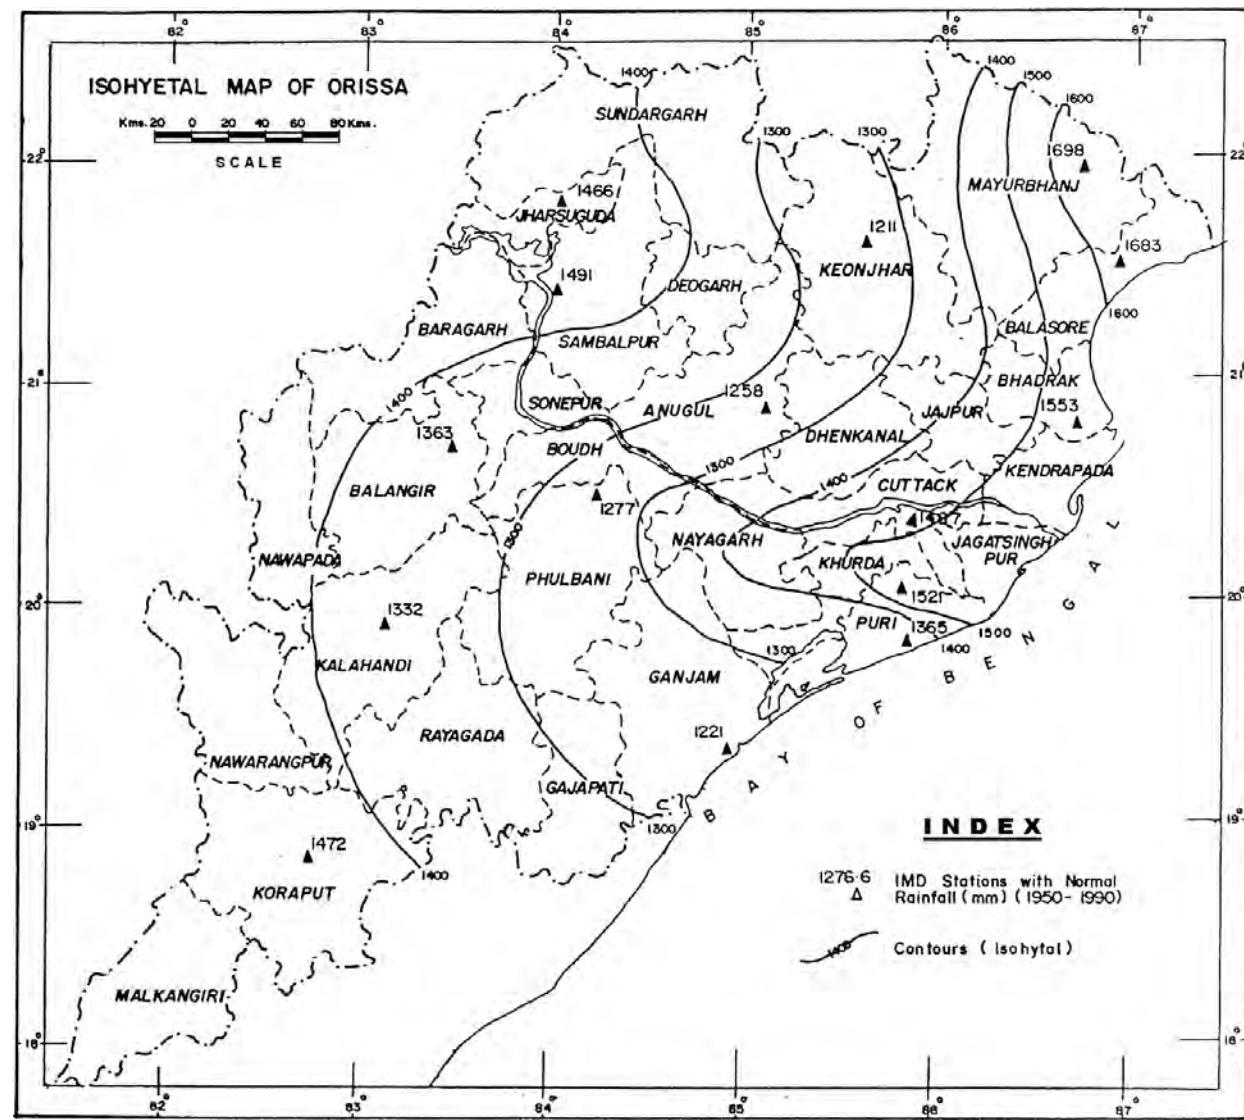

TABLE 3.1

River	Drainage Area In Sq.Km	Annual Flow In Mm ³
Mahanadi	65,579	51,061
Brahmani	22,248	18,311
Baitarani	12,789	5,452
Subarnarekha	2,123	7,941
Budhabalang	4,847	637
Rusikulya	7,753	1,762
Vamsadhara	8,015	3,460
Nagavali	3,746	2,430
Indravati	7,512	2,800
Kolab	7,639	2,615
Machkund	1,478	4,044

4.0 CLIMATE AND RAINFALL

The state enjoys a sub-tropical climate with three distinct seasons i.e. summer, monsoon and winter. The southwest monsoon rain starts from mid of June and continues till mid of October. Summer season extends from March to early part of June and winter season spreads from November to February.

Plate :- 4.1

There are 15 rain gauge stations maintained by IMD in the State. The normal average rainfall of the state is 1482.2 mm . Nearly 86% of the annual rainfall is contributed by the southwest monsoon. The spatial distribution

of the rainfall in the State is uneven and erratic. A perusal of the Isohyetal map of the normal rainfall for the period 1951-2000 (**Plate -4.1**) shows that the rainfall is highest in the northern part of coastal tract, which ranges from 1520.32 to 1697.87 mm. The rainfall reduces westwards, from 1487.02 to 1211.08 mm in Phulbani, Angul, Keonjhar districts and also southwards to 1221.14 mm around Gopalpur in Ganjam district.

The rainfall ranges from 1331.85 mm to 1491.89 mm in Koraput, Kalahandi, Bolangir, Sambalpur and Sundergarh districts. The IMD rainfall data for nine years (**2005-2013**) has been given in **table 4.1**. From the rainfall departure data, it can be observed that the year 1990 and 1995 indicate excess rainfall in the major part of the state. **Table 4.2** presents the drought, flood and cyclone years in the state from **1980 to 2013**. A perusal of the table indicates that every alternate year, the state experiences a natural calamity in the way of drought or flood or cyclone. This has created a most unpredictable climate for any agricultural activity in the state.

4.1 TEMPERATURE

The state experiences hot summer with temperatures shooting up to 45°C in the east to 50°C in the west. During winter season mornings and nights are cool. However the mean monthly winter temperature varies from 18°C to 22°C in different parts of the state. The mean monthly summer temperature is 37°C in western parts and 28°C in southern parts. Humidity ranges from 70% to about 100% in the state. During monsoon period the humidity is very high in the eastern parts and during summer it is dry in the western part of the state.

5.0 HYDROGEOLOGICAL CONDITION

Geological setting, climate and topography plays a vital role in occurrence and movement of groundwater. The state is underlain by diverse rock types, which range in age from Precambrian to Cenozoic. The Precambrians occupy nearly 80% of the total geographical area of the state. The Tertiary and the Quaternary formations are restricted mainly to the narrow coastal tracts. The Gondwana group of rocks belonging to Paleozoic and Mesozoic age occur in isolated patches in different parts of the state. These formations occur in Talcher area of Angul district and Ib river valley area of Sambalpur and Sundergarh districts. Hydrogeologically, the state can broadly be divided into 3 distinct geological units. The hydrogeology of the state has been depicted in **Plate 5.1**.

Area with Precambrian Consolidated Formations –

Sundergarh, Keonjhar, Mayurbhanj, Subarnapur, Bolangir, Phulbani, Boudh, Gajapati, Nuapara, Kalahandi and parts of Nayagarh, Khurda, Balasore, Cuttack, Ganjam, Koraput, Kalahandi, Angul, Dhenkanal, Sambalpur and Bargarh districts.

Area with Semi-consolidated Gondwana & Tertiary Formations –

Parts of Sundergarh, Mayurbhanj, Angul, Dhenkanal, Khurda, Sambalpur, Phulbani and Bolangir districts.

Area with Unconsolidated Quaternary Formations –

Coastal tracts of Puri, Khurda, Cuttack, Jagatsinghpur, Jajpur, Kendrapara, Balasore, Bhadrak, Ganjam districts and inland river valleys.

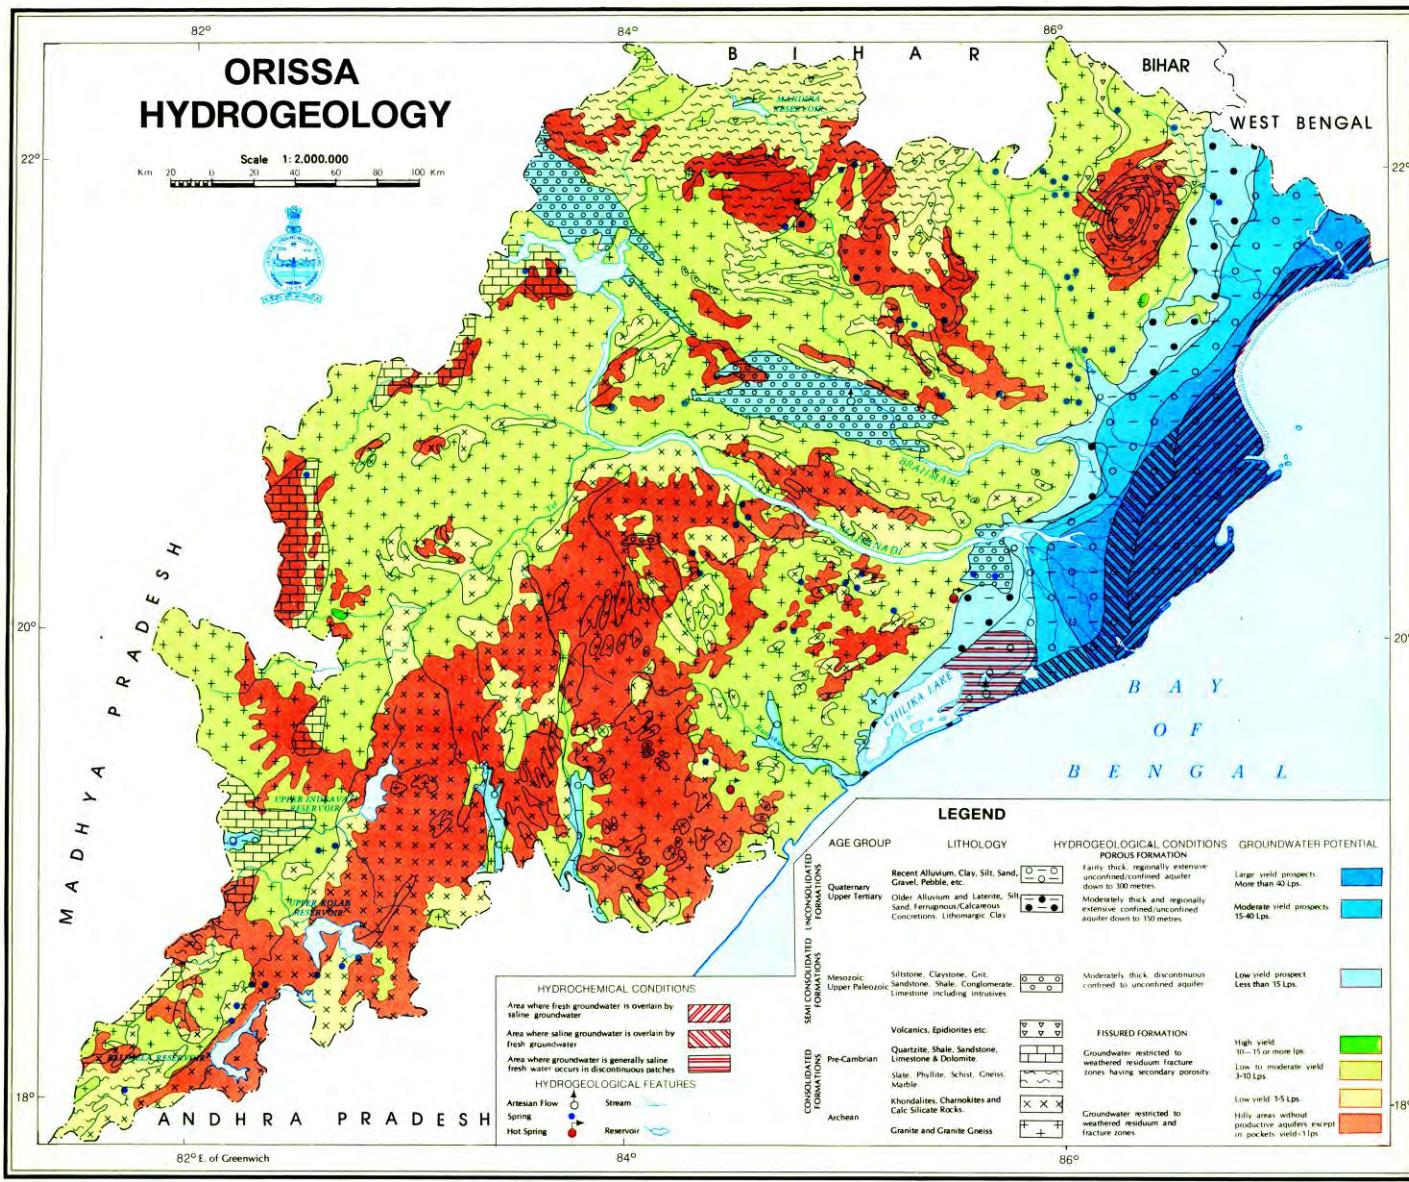

5.1 CONSOLIDATED FORMATIONS

The consolidated formations include the hard crystalline and partly metamorphosed compact sedimentary formations belonging to Pre-Cambrian. The rock types are mainly granites, granite gneisses, schistose rocks, khondalites, charnockites, quartzites, calc-silicates, shale, phyllite, sandstone, limestone, marble etc. These rocks are devoid of primary porosity. The ground water occurs in secondary porosity resulting from weathering fracturing and jointing. The hard rock aquifers exhibit considerable variation laterally as also in depth. The weathered mantle is composed of loose regolith with intergranular porosity, which facilitates free circulation of ground water through deeper fractures and forms potential repository of ground water. In general the average thickness of weathered residuum varies from 15 to 20 m. Ground water occurs under phreatic condition. The water bearing fracture zones generally occur within 100m depth but deeper potential fractures have also been encountered in some of the bore holes drilled by the Central Ground Water Board.

5.2 SEMI CONSOLIDATED FORMATIONS

The semi-consolidated formations include Gondwana sedimentaries ranging in age from Upper Carboniferous to Cretaceous and the Baripada beds of Middle-Pliocene age. The Gondwanas include sandstones, shales, siltstones and conglomeratic beds, while the Baripada beds consist of fossiliferous limestones, stratified semi-consolidated sand beds with intercalated shales. The coarse to medium grained, weathered, fractured and friable Gondwana sandstones and the semi-consolidated sand beds of Baripada formation form the aquifers. The ground water occurs under water table condition in the shallow aquifers and under semi-confined to confined conditions in the deeper aquifers. The depth of weathering in Gondwanas generally extends to a depth of 15m.

Plate :- 5.1

5.3 UNCONSOLIDATED FORMATIONS

The unconsolidated sediments include Pleistocene and Recent alluvium. The older alluvium, which forms conspicuous and significant horizon, is generally overlain by laterites. The laterites are vesicular, essentially ferruginous and form the shallow aquifer. Maximum development of alluvial formations occurs along the coastal tract, with a maximum thickness of about 600m. Alluvium also occurs as discontinuous patches adjoining the river courses, where the thickness is limited to about 45m. The sand and gravel layers act as good repository of ground water. Groundwater occurs under unconfined condition in the shallow zone and under semi-confined to confined condition in the deeper zone. The coastal tract holds potential for large- scale ground water development as the sand zone forms prolific aquifers. But the coastal tract is beset with salinity problems both in shallow as well as deeper aquifers at different locales at different levels.

6.0 GROUND WATER REGIME MONITORING

Ground water monitoring is carried out by CGWB through a network of observation wells (dug wells and piezometers) spread all over the state. These wells serve as permanent National Hydrograph Stations (NHS). The existing network provides an optimal spatial distribution of observation stations in the region, through which necessary information on ground water regime is available with a fair degree of accuracy. Through interpolation between data sets at different stations, it is possible to determine the characteristics of elements at any point in the region. Under normal circumstances, the water level of the observation wells are being measured four times in a year during fixed period of time as given below –

April	– 20 th to 30 th of the month	Represents water level situation in Pre-monsoon period
August	– 20 th to 30 th of the month	Represents peak water level of monsoon period.
November	– 1 st to 10 th of the month	Represents situation of water level in Post-monsoon period.
January	– 1 st to 10 th of the month	Represents water level during irrigation period.

Water samples were collected from each of the network stations only during April (Pre-monsoon) every year, to assess the chemical quality of ground water.

Table – 6.1

6.1 DISTRIBUTION OF NATIONAL HYDROGRAPH STATIONS

A total number of 1460 Hydrograph Network Stations have so far been established and are being monitored in the state. Out of 1460 network hydrograph stations, open/dug wells are 1323 in numbers and 137 are Piezometers in hard rock and coastal tract (including piezometers under Hydrology Project) and are being monitored manually. The district wise, basin wise and command area wise distribution of NHS wells is furnished in Table 6.1, 6.2 and 6.3 respectively. Locations of hydrograph network stations are shown in Plate-6.1 and the general details of hydrograph network stations are given in Annexure-1. Locations of piezometers constructed under Hydrology Project have been given in Plate 6.2 and provided in Annexure – 2

6.2 ANALYSIS OF DATA

The water levels reflect the cumulative effect of natural recharge discharge conditions and ground water draft on the ground water regime. Where the draft exceeds the recharge, its manifestation is reflected by distinct decline in normal water level and where recharge is more than the draft rising trend is seen in water levels. The hydrographs given in Plate 6.3 show the periods of recharge and discharge.

LOCATION OF NATIONAL HYDROGRAPH STATIONS IN ORISSA

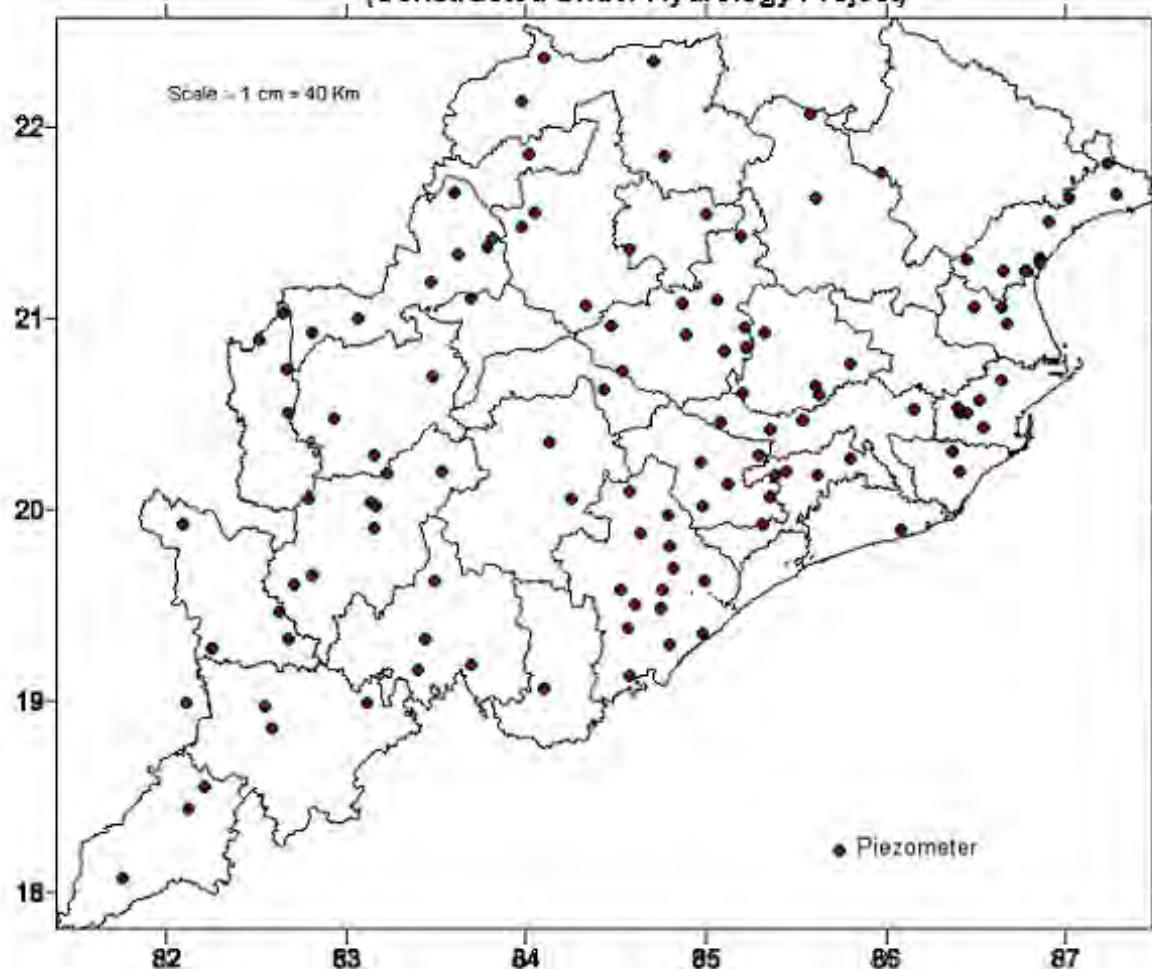

Water level data collected four times a year is subjected to analysis for inferring the change in water levels i.e. rise/ fall and trend in water levels with reference to time and space.

Table -6.3
DISTRIBUTION OF NHS IN IRRIGATION COMMAND AREAS

Sl.N o	Command Area	Districts falling in the Command Area	Irrigated Area in Sq. Km.	No. of NHS

Plate :- 6.2

6.2.1 HYDROGRAPH ANALYSIS

Long Term Water Level Trend Analysis

Hydrographs with Long term water level trend and comparison is given in **Plate 6.3**

6.2.2 WATER LEVEL ANALYSIS

- i) General range of water level fluctuation as compared with previous measurement.
- ii) Water level data of specific period as compared with corresponding water level data of previous year.
- iii) Comparison of water level data with the mean water level data of the preceding decade.
- iv) Comparison of water level data of different measurements with pre-monsoon (April) data.

7.0 BEHAVIOUR OF WATER LEVEL DURING 2013 - 2014

During 2013-2014 the existing 1460 National Hydrograph stations were monitored four times and behaviour of the ground water regime during the year was inferred comparing the same with the decade mean, corresponding previous year data and pre-monsoon water level data. On the basis of water level data of NHS, for each measurement the following maps have been prepared.

1. Depth to water level for each measurement
2. Water level fluctuation in comparison to decade average.
3. Comparison of water levels to Pre-monsoon water levels.
4. Water level fluctuation in comparison to corresponding period of previous year.

7.1 DEPTH TO WATER LEVEL

7.1.1 DEPTH TO WATER LEVEL OF APRIL 2013

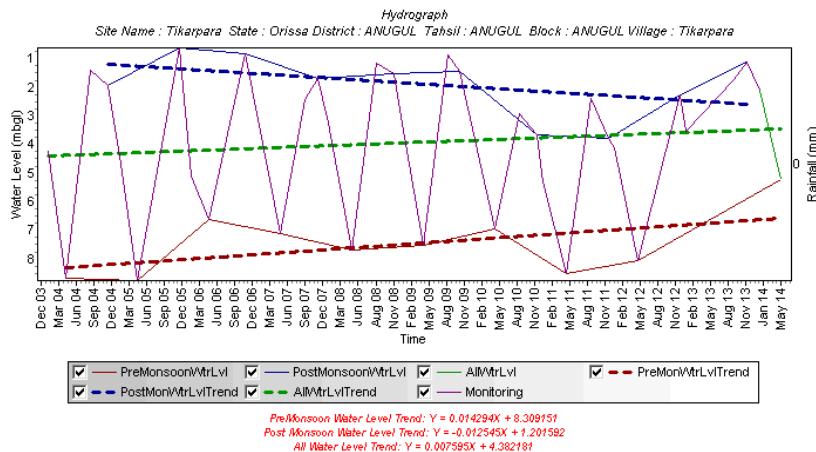

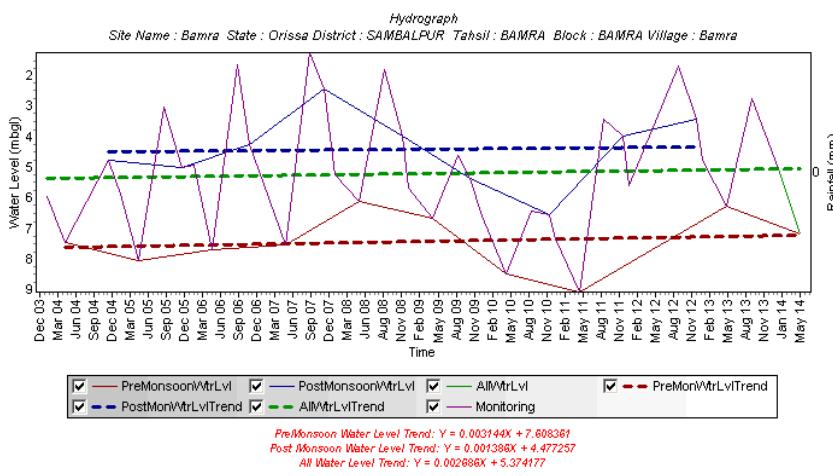

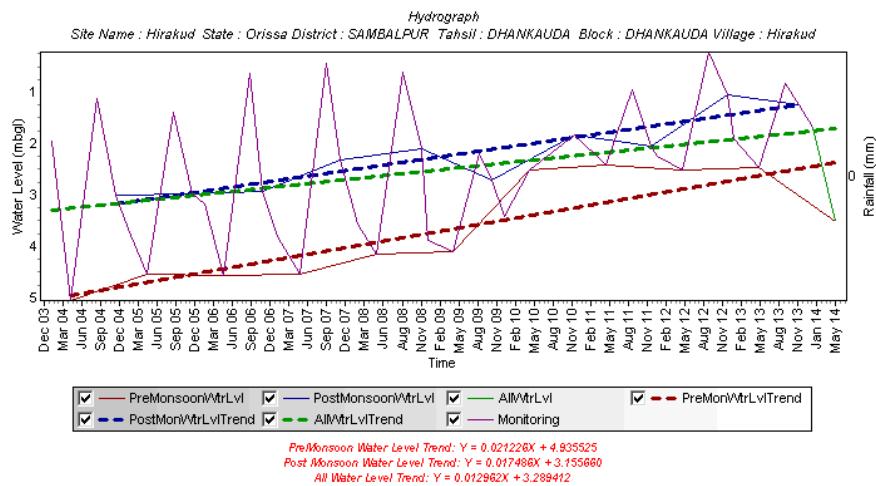

During April 2013, the water level (meter below ground level) in the state varies from minimum of 0.45 magl in Bargarh, Sambalpur, Sonapur district to a maximum of 13.6 mbgl in Anugul district and water levels mostly range from 2 to 10 mbgl. The depth to water level has been shown in **Plate-7.1** and district wise well frequency for different ranges of depth to water level are given in **Table- 7.1**.

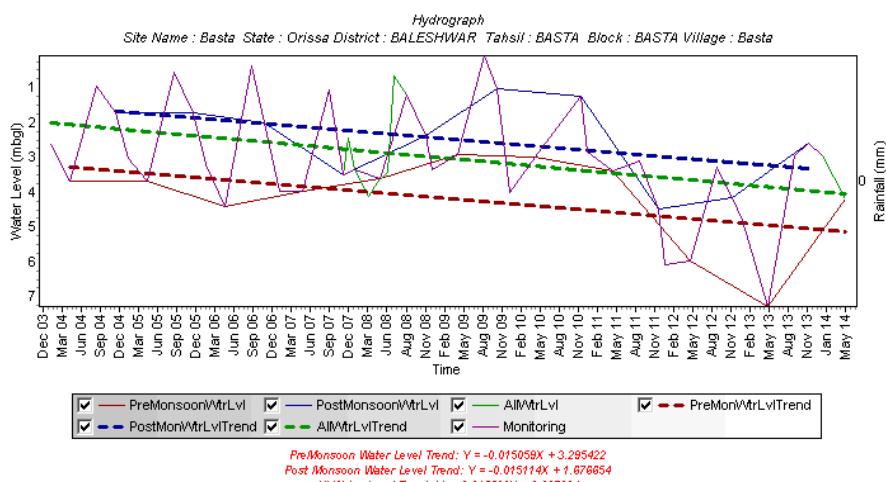

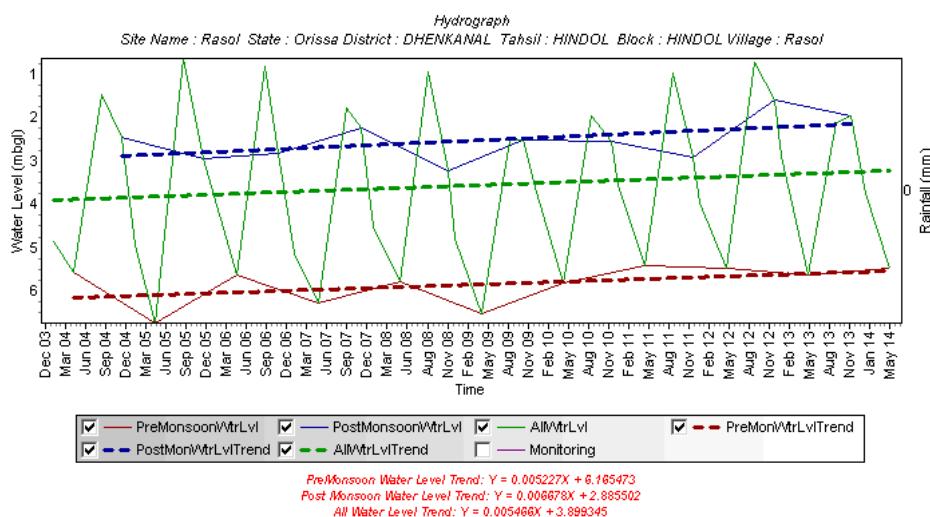

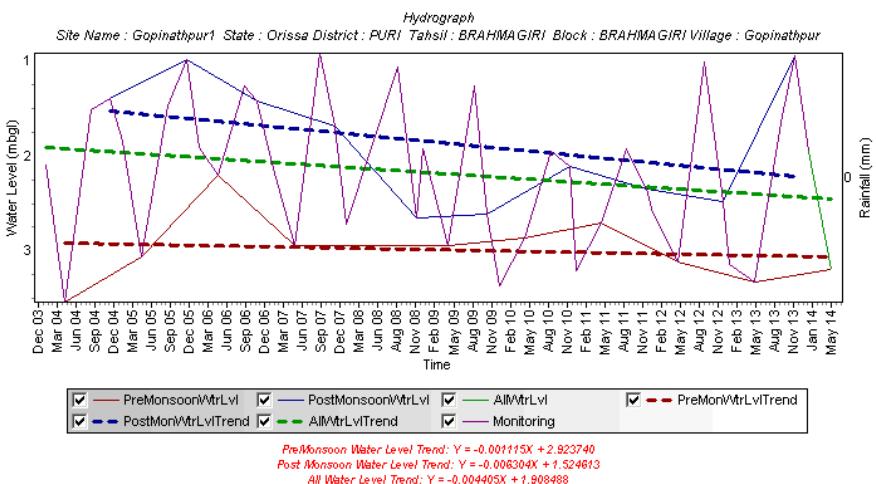

Water level between 0-2 m

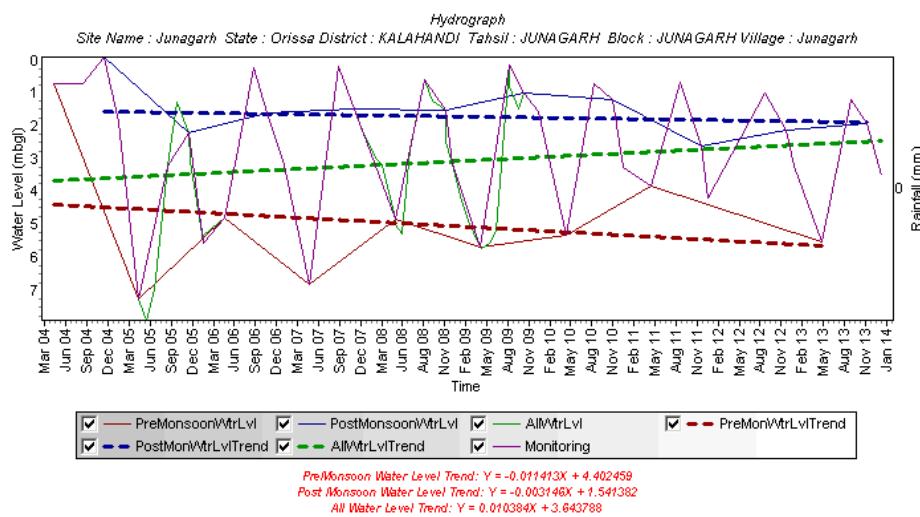

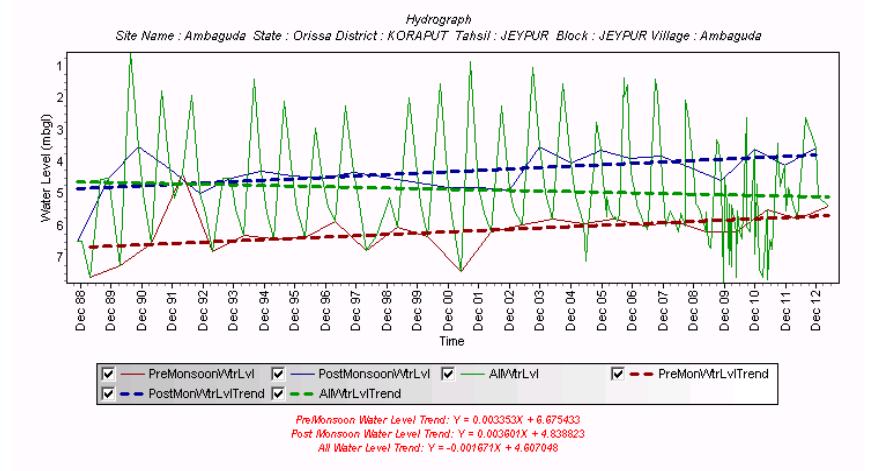

Only 6.75% of the NHS wells recorded water level in this range during April 2013. This range generally appears as small and isolated patches. Also this range is seen in isolated patches in Canal command areas of Bargarh, Sonapur, Nayagarh, Koraput, Kalahandi and Sambalpur districts with maximum 44% of wells in Bargarh district.

TOTAL	1169			79	6.8	470	40.2	569	48.7	51	4.4	0	0.0	0	0

Water level between 2-5 m

40.2% of the total NHS wells recorded water level in this range during April 2013. The coastal districts of the state has the maximum number of wells showing this range of water level i.e., Puri (86.25%), Cuttack (87.3%), Ganjam (43.3%) Kendrapara (94.7%), and Jagatsinghpur (95.2%). The major command areas of the state like Hirakud, Mahanadi, delta stage I & II, Baitarani, Salandi and Anandpur have shown water level in this range.

Water level between 5-10 m

48.67% of the NHS wells have shown water level in this range of 5 –10 mbgl. All the districts have recorded water level in this range, i.e., this range gives the general water level in the state for April 2013. The hard rock and hilly terrains of the state has recorded water level in this range in majority of wells. The maximum percentage of wells in this range is recorded in Baleswar (100%), Bhadrak(95.5%), Boudh (60.6%), Jharsuguda (58.3%) and minimum in Jagatsingpur (4.8%) district. Partially all the district of Orissa show this category.

Water level between 10-20 m

4.3% of the wells of the state fall in this category. It is mostly in the hilly districts like Mayurbhanj (24%), Sundargarh (8.1%), Anugul (8.3%), Khorda(4.2%), Rayagada (6.3%), and Keonjhar (10%).

Water level more than 20m

No well have shown more than 20m of water level during April 2013.

In general, it can be said that during the month of April 2013, the state recorded water level in 5-10 m range in almost all the districts. 2-5 m range was found in the coastal districts as well as in command areas of the state. Some wells in the hilly districts recorded water level in 10-20 m range.

7.1.2 DEPTH TO WATER LEVEL OF AUGUST 2013

A perusal of data and maps pertaining to August 2013 shows that the depth to water level ranges from 0.01 to 11.7 mbgl and in majority (52%) of NHS wells level was in the range of 0-2 m below ground level and 40.2% of wells in 2-5 m below ground level. The district-wise depth to water level of August 2013 is shown in **Table 7.2** and the depth to water level map has been shown in **Plate-7.2**.

Water level between 0-2 m

52% of the wells monitored in the state has water level in this range. The coastal districts like Jagatsinghpur (90%), Kendrapara (100%), Malkangiri (100%) and Sonapur (85%) have majority of wells with water level in this range. In most of the command areas of the state like the Hirakud, Rusikulya, Mahanadi stage I & II, Upper Kolab and Potteru the water level is in this range.

Water level between 2-5 m

40.2 % of the wells monitored showed water level in this range. Among the coastal district Bhadrak (77.3 %), Jajpur (67.6%) and parts of Puri, Ganjam and Gajapati had 2 to 5 mbgl of water level. In the central and western Odisha, Boudh (88.6%), Nayapara (50%), Balangir (77.5%), Anugul (38.8%), Mayurbhanj (31.1%) and Sundargarh (40.81%) showed more than or equal to 50% of the wells in this range. All the districts of the state have recorded in this range expect Baleshwar, Bhadrak, and Jajapur where all the wells fall in the range of 0-2 m.

Water level between 5-10 m

Water level in this range was recorded in 7.6% of the wells in the state. 33.3 % of wells in Baleshwar, Jajapur (32.4%), and Bhadrak (22.7%) district showed water level more than 10% of the wells in this range. They occur as isolated patches in areas where the water level is generally in 2-5 m range.

Water level between 10-20 m

Only a negligible 1 well fall in this category and both are from Koraput district.

Water level greater than 20 m

None of the wells monitored during August 2013 showed water level in this range.

In general the water level in the state during August 2013 monitoring is found in the range of 0-2 m bgl especially in the coastal stretch and in parts of the hilly terrain, whereas 2-5 m bgl water level is found in the coastal and hard rock terrain.

7.1.3 DEPTH TO WATER LEVEL OF NOVEMBER 2013

A perusal of data and maps pertaining to November 2013 shows that the depth to water level ranges from 0.14 to 12.1 mbgl and in majority (48%) of NHS wells level was in the range of 0-2 m below ground level and 46.2% of

wells in 2-5 m below ground level. The district-wise depth to water level of November 2013 is shown in **Table7.3** and the depth to water level map has been shown in **Plate-7.3**.

Water level between 0-2 m

48% of the wells monitored in the state has water level in this range. The coastal districts like Jagatsinghpur (100%), Puri (87%), Kendrapara (100%), ganjam (69%) and Puri (87%) have majority of wells with water level in this range. In most of the command areas of the state like the Hirakud, Rusikulya, Mahanadi stage I & II, Upper Kolab and Potteru the water level is in this range.

Water level between 2-5 m

46.2 % of the wells monitored showed water level in this range. Among the coastal district Balasore (71.4 %), Bhadrak (65 %), Jajpur (76.3%) and parts of Puri, Ganjam and Gajapati had 2 to 5 mbgl of water level. In the central and western Odisha, Boudh (68.4%), Nayapara (72.2%), Mayurbhanj (69.7%), Balangir (75.5%), Anugul (63.3%), Mayurbhank (69%) and Sundargarh (46.1%) showed more than or equal to 50% of the wells in this range. All the districts of the state have recorded in this range expect jagatsinghpur and kendrapara where all the wells fall in the range of 0-2 m.

Water level between 5-10 m

Water level in this range was recorded in 5.5% of the wells in the state. 18.8 % of wells in Rayagada, Koraput (17.0%), and kalahandi (12.2%) district showed water level more than 10% of the wells in this range. They occur as isolated patches in areas where the water level is generally in 2-5 m range.

Water level between 10-20 m

Only a negligible 2 wells fall in this category and both are from Koraput district.

Water level more than 20m

None of the wells monitored during November 2013 showed water level in this range.

In general the water level in the state during November 2013 monitoring is found in the range of 0-2 m bgl especially in the coastal stretch and in parts of the hilly terrain, whereas 2-5 m bgl water level is found in the coastal and hard rock terrain.

7.1.4. DEPTH TO WATER LEVEL OF JANUARY 2014

A perusal of data and maps pertaining to January 2014 shows that the depth to water level in majority (64.18%) of NHS wells was level in the range of 2-5 m below ground level and 15.04 % of wells in 5-10 m below ground level. The depth to water level map is presented in Plate-7.4 and the district wise frequency for different ranges of depth to water level has been given in Table- 7.4.

Water level between 0-2m

20.44% of the wells monitored in the state has water level between 0-2 m. The districts like Jagatsinghpur (57.1%), Puri (46.5%), Khorda (30%)and Bargarh (35.1%) have majority of wells with water level in this range. In most of the command areas of the state like the Hirakud, Rusikulya, Mahanadi stage I & II, Upper Kolab and Potteru the water level is in this range shown in the plate as isolated patches.

Water level between 2-5m

64.2% of the wells monitored showed water level in this range. All wells of the Bhadrak district falls in this range. Districts like Mayurbhanj (92.1%), Keonjhar (90%), Baleshwar (88.2%), Jajpur (80.6%), Baudh (77.1%), Kalahandi (76.7%), Gajapati (75.0%), Balangir (74.4%), Nuapada (72.2%), Sonapur (71.9%), Kendrapara (68.4%), Cuttack (67.5%), Malkangiri (62.5%), Nayagarh (65.4%), Anugul (62.0%), Debagarh (62.5%), Jharsuguda (61.5%), Sambalpur (60.4%) showed more than 60% of the wells in this range. All the districts of the state have recorded in this range.

Water level between 5-10m

Water level in this range was recorded in 15.04% of the wells in the state. The districts namely Koraput (42.6%), Khordha (34.2%) Dhenkanal (32.6%)and Anugul (30.0%) were having water level in this range in majority of area. All the districts of the state except Bhadrak, Jagatsingpur and Kendrapara have recorded in this range.

Water level between 10-20m

Only a negligible 0.3% well measured in this category. There are 2 wells having deeper water level in the Anugul and Koraput districts.

Water level greater than 20m

None of the wells monitored during January 2012 showed water level in this range.

In general the water level in the state during January 2014 monitoring is found in the range of 2-5 m bgl especially in the coastal stretch and in parts of the hilly terrain, whereas 0-2 m bgl water level is found in the coastal and command areas in the state.

7.2 WATER LEVEL FLUCTUATION WITH RESPECT TO DECADE MEAN

7.2.1 APRIL 2013 - DECADAL MEAN (APR' 03 - APR' 12)

The district-wise categorisation of change in water level in April-2013 with respect to the decade mean (April 03 to April 2012) has been given in **table-7.5** and rise and fall map has been presented in **Plate-7.5**.

Fall in water level

A perusal of the data and map pertaining to April 2013 with reference to decadal mean (2003-2012) shows fall in water level is observed in 89.54% of the total wells in the state. 41.7% of the wells have shown fall in the 0-2m range. It varies from minimum of 4.3% of wells in Jajpur district to a maximum of 92.3% of wells in Kendrapara district. The districts of Bolangir, Baudh, Cuttack, Jagatsinghpur, Jharsuguda, Kendrapara, Malkangiri, Nayagarh, Nuapada, Puri, Rayagada and Sonepur have recorded more than 50% of wells showing a fall in this range. The range of 2-4m fall in water level has been observed in 35.5% of the state. The maximum is in Nabarangpur district (66.7%). A fall of more than 4m have been observed only in 12.4% of the total NHS monitored in the state which are in Anugul, Balasore, Bhadrak, Cuttack, Dhenkanal, Gajapati, Ganjam, Jajpur, Keonjhar, Khurda, Malkangiri, Mayurbhanj and Sundargarh districts.

Rise in water level

A perusal of the data and map pertaining to April 2013 with reference to Decadal mean (2003-2012) shows that rise 10.45% of total NHS wells in the state. Rise in water level between 0-2m has been observed in 9.2% of the network stations in the state. It varies from minimum of 3.3% in Balangir to a maximum of 45.5% in Bargarh district. All the districts have recorded rise of water level in some of the NHSs except Baleswar, Baudh, Bhadrak, jajpur, jharsuguda and jagatsinghpur where all the NHSs shown fall in water level. The rise in water level between the range of 2-4m has been noticed in 1.2% of wells mainly in the districts of Bargarh (12.1%), Mayurbhanj(3.6%), Nuapada (8.3%), Sonapur (4.5%), Only 0.1% of wells show more than 4m rise in water level in one well each in Mayurbhanj district.

In general a fall has been recorded in water level of April 2013 when compared with the decadal mean (April 2003-2012).

7.2.2 AUGUST 2013 - DECADAL MEAN (AUGUST 2003- 2012)

The district-wise categorisation of change in water level of August-2013 with respect to the decadal mean (August 2003 – August 2012) has been given in **table 7.6** and rise and fall map has been presented in **Plate 7.6**.

Rise in water level

A perusal of the data and map pertaining to August 2013 with reference to decadal mean (2003-12) shows that rise in water level between 0-2m has been observed in 83.2% of the network stations in the state. All the districts have recorded rise of water level in this range. Rise in water level between the ranges of 2-4m has been noticed in 52.2% wells in isolated locations and more than 4m have been observed in 3.4% of wells.

Fall in water level

Fall in water level is seen in patches mostly in the hard rock and hilly terrain of the state. Fall in water level between 0-2 m has been observed in 15.6% of the network monitoring wells in the state. Fall in water level between the ranges of 2-4m has been observed in 3.6% of network wells in the state. Fall in water level of more 4m, is 0% of the total wells in the state.

In general a rise has been recorded in water level of August 2013 when compared with the decadal mean (August 2003-2012). It can be safely concluded that variation in water level is not due to over development; rather the water levels reflect the variation of rainfall in space and time.

7.2.3 NOVEMBER 2013 - DECADAL MEAN (NOVEMBER 2003 - 2012)

The district-wise categorisation of change in water level during November-2013 with respect to the decadal mean (November 2003- November-2012) has been given in **table 7.7** and presented in **Plate 7.7**.

Rise in water level

A perusal of the data and map pertaining to November 2013 with reference to decadal mean (2003-12) shows that rise in water level between 0-2m has been observed in 65.2% of the network stations in the state. All the districts have recorded rise of water level in this range. Rise in water level between the range of 2-4m has been noticed in 20.2% wells in isolated locations and more than 4m have been observed in 2.0% of wells.

Fall in water level

Fall in water level is seen in patches mostly in the hard rock and hilly terrain of the state. Fall in water level between 0-2 m has been observed in 11.9% of the network monitoring wells in the state. Fall in water level between the range of 2-4m has been observed in 0.6% of network wells in the state. Fall in water level of more 4m, is present in isolated areas with 0.1% of the total wells in the state.

In general a rise has been recorded in water level of November 2013 when compared with the decadal mean (November 2003-2012). It can be safely concluded that variation in water level is not due to over development; rather the water levels reflect the variation of rainfall in space and time.

7.2.4 JANUARY' 2014 - DECADAL MEAN (JANUARY 2004- 2013)

The district-wise categorisation of change in water level during January 2014 with respect to the decadal mean (2004-2013) has been given in **table 7.8** and the fluctuation map in **Plate 7.8**.

Rise in water level

A perusal of the data and map pertaining to January 2014 with reference to Decadal mean (2004-2013) shows that rise 51.39% of total NHS wells in the state. Rise in water level between 0-2m has been observed in 47.4% of the network stations in the state. All the districts have recorded rise of water level in this range. It varies from minimum of 23.1% in Jharsuguda to a maximum rise of 71.4% in Bhadrak and Baudh district.. The rise in water level between the range of 2-4m has been noticed in 3.7% of wells mainly in the Mayurbhanj (17.1%), Kendujhar (11.4%) and Nayagarh (7.7%) districts. Only 0.3% of wells show more than 4m rise in water level in one well each in Mayurbhanj, Kendujhar and Nayagarh districts.

Fall in water level

Fall in water level is seen in the 48.6 % of NHS wells of the state. Fall in water level between 0-2 m has been observed in 45.7% of the network monitoring wells in the state. It ranges between 76.9% in Jharsuguda to 15.4% in Nayagarh district. The Khorda, Bargarh, Jagatsinghpur, Jajpur, , Bargarh Cuttack Sonepur, , Nuapada, Sundargarh, Sambalpur, Koraput, Jajpur, and Kalahandi districts recorded more than 50% of wells in 0-2m range. The range of 2-4m fall in water level has been observed in 2.7% of the state. The maximum is in Debagarh district (12.5%). A fall of more than 4m have been observed only in 0.2% of the total NHS monitored in the state which are in Anugul and Malkangiri districts.

In general both rise and fall has been recorded in water level of January 2014 when compared with the decadal mean (January 2004-2013). The year 2013 receives heavy rainfall in the monsoon period, the variation in water level may be the reflection of the variation of rainfall in space and time.

7.3 FLUCTUATION IN COMPARISON TO CORRESPONDING PERIOD OF PREVIOUS YEAR

7.3.1 APRIL 2012 - APRIL 2013

The district-wise categorisation of change in water level during April-2013 with respect to that of April-2012 has been given in **table 7.9** and has been presented in **Plate 7.9**.

Rise of water level

A perusal of data and map showing the variation in water level of April 2013 with respect to April 2012 shows that 44.63% of the wells recorded a rise in water level. Maximum number of wells have shown rise in 0-2m range, i.e., 36.1% of the total wells analysed. All the districts show this range of rise. The command areas of the state have recorded a rise in this range. Rise in 2-4m range is noticed only in 5.4% of the wells, mainly in Balasore, Debagarh, Gajapati, Kalahandi, Keonjhar, Koraput, Mayurbhanj and Nowrangpur districts. Rise of more than 4m is observed only in 1.7% of the wells, which occur in isolated wells in the state.

Fall of water level

A perusal of data and map pertaining to the fluctuation of April 2013 with respect to April 2012 shows that in 55.3% of wells there has been fall in water level. The fall in water level in the range of 0-2m have been observed in 48.8 % of the wells in the state. It varies from minimum of 28.1% in Bargarh district to maximum of 85.7% in Jharsuguda district. Fall in 2-4m range is observed only in 4.2% of wells. More than 4 m fall in water level has been observed in a minor 2.4% wells of the state.

In general a rise and fall in water level has been observed in April 2013 with respect to April 2012.

7.3.2 AUGUST 2012 - AUGUST 2013

The district-wise categorization of change in water level during August-2013 with respect to August-2012 has been given in **table 7.10** and rise/ fall map has been presented in **Plate 7.10**.

Rise in water level

A perusal of data and maps pertaining to fluctuation of August 2013 water level with that of August 2012 showed that 34.64% of the total stations showed a rise in water level. The rise is more in 0-2 m range ie 28.6%; 4.6% in 2-4 m range and 0.9% in greater than 4 m range. All the districts have recorded in 0-2m range except Debagarh, Jharsuguda, Khordha, Malkangiri, and Puri. 2-4m range occurs in isolated patches throughout the state. Only 5 wells (0.9%) of the total wells monitored showed greater than 4 m rise. They occur as minor patches within areas showing rise in 2-4m range.

Fall in water level

A total of 65.35% NHS showed a fall in water level in August 2013. Out of which 65.6% wells showed fall in 0-2m range, 8.5% in 2-4m range and a minor 1.2% in greater than 4 m range. All the districts have recorded fall in the range of 0-2m except Baleshwar, Bhadrak, Debagarh, have recorded 0-2 m fall in more than 50% wells. Fall in 2-4m range is found in isolated patches in the state with districts mainly Bhardarh, Debagarh, Jajapur, Khordha, and Nayagarh districts.

Greater than 4m fall in water level is found in very few isolated wells i.e., only 4 wells fall in this category. They occur as minor patches within areas showing fall in 2-4m range.

In general, majority of wells in the state recorded a fall in water level during August 2013 with respect to August 2012.

7.3.3 NOVEMBER 2012 - NOVEMBER 2013

The district-wise categorisation of change in water level during November-2013 with respect to November-2012 has been given in **table 7.11** and rise/ fall map has been presented in **Plate 7.11**.

Rise in water level

A perusal of data and maps pertaining to fluctuation of November 2013 water level with that of November 2012 showed that 66.75% of the total stations showed a rise in water level. The rise is more in 0-2 m range ie 53.5%; 10.6% in 2-4 m range and 1.6% in greater than 4 m range. All the districts have recorded in 0-2m range. 2-4m range occurs in isolated patches throughout the state. Only 12 wells (1.6%) of the total wells monitored showed greater than 4 m rise. They occur as minor patches within areas showing rise in 2-4m range.

Fall in water level

A total of 33.2% NHS showed a fall in water level in November 2013. Out of which 30.9% wells showed fall in 0-2m range, 2.1% in 2-4m range and a minor 0.3% in greater than 4 m range. All the districts have recorded fall in the range of 0-2m except Baleshwar, Bhadrak, Debagarh, have recorded 0-2 m fall in more than 50% wells. Fall in 2-4m range is found in isolated patches in the state with districts mainly Anugul, Balangir, Dhenkanal, Ganjam, Jajpur, Koraput, Malkangiri, districts. Greater than 4m fall in water level is found in very few isolated wells i.e., only 2 wells fall in this category. They occur as minor patches within areas showing fall in 2-4m range.

In general, majority of wells in the state recorded a rise in water level during November 2013 with respect to November 2012.

7.3.4 JANUARY 2013 – JANUARY 2014

The district-wise categorisation of change in water level during January-2014 with respect to that of January-2013 has been given in **table 7.12** and has been presented in **Plate 7.12**.

Rise in water level

A perusal of data and maps pertaining to fluctuation of January 2014 water level with that of January 2013 showed that 75.3% of the total stations showed a rise in water level. The rise is more in 0-2 m range i.e 59.9%; All the districts have recorded rise in 0-2m range the districts namely Kendrapara (94.4%), Jagatsinghapur (90%), Khordha (88.9%), Puri (88.6%), Malkangiri (80%), Cuttack (77.6%) Debagarh (75.0%) Nabarangapur (73.7%) have recorded rise in this range in 70% wells. 10.7% wells in 2- 4 m range, occurs in isolated patches throughout the state. 3.2 % of the total wells monitored showed greater than 4 m rise. They occur as minor patches within areas showing rise in 2- 4 m range.

Fall in water level

A total of 24.6% NHS showed a fall in water level in January 2014. Out of all stations, 23.4% wells showed fall in 0-2m range, 1% in 2-4m range and a minor 0.3 % in greater than 4 m range. Fall in 0-2m range is found in isolated wells in the state with maximum of 43.2% in Sundargarh and minimum of 3.7% in Khordha district showing water level fall in this range. Greater than 4m fall in water level is found in only one well in Ganjam district and two numbers in Anugul district.

In general, majority of wells in the state recorded a rise in water level during January 2014 with respect to January 2013.

7.4 FLUCTUATION WITH RESPECT TO PRE-MONSOON WATER LEVEL

7.4.1 APRIL 2013- AUGUST 2013

The district-wise categorisation of water level fluctuation of April-2013 with respect to August-2013 has been given in **table 7.13** and rise / fall map has been presented in **Plate 7.13**.

Rise in water level

98.4 % of the wells monitored in August 2013 showed a rise in water level when compared with that of April 2013 (Pre-monsoon). 33.5% of wells showed rise in 0-2 m range, 37.6% in 2-4 m range,

and 27.1 % rise in the range of more than 4m. A maximum of 44.9% of wells in Cuttack district and a minimum of 9.5% in Jagatsinghpur district recorded a rise in the range of 0-2m. A maximum of 84.4% of wells in Baleshwar and a minimum of 11.8% in Puri district recorded rise in the range of 2 – 4m with majority of the districts in the state have more than 25% of the wells showing rise in this range. 1.6 % of wells shows fall in the range of 0-2 m and only 0% shows fall between 2-4m.

Fall in water level

Only 1.6% of the wells monitored showed a fall in water level. 1.6% of wells showed fall in 0-2 m range. The fall in 0-2m range is seen in adequate number of wells in Bargarh, Kalahandi, Malkangiri and Sonapur districts. 0% of wells in the state showed fall in water level in 2-4 m.

In general as it should be, a rise in water level is observed throughout the state during August 2013 with respect to April 2013 and majority of wells recorded a greater than 4 m rise because of recharge of aquifer due to monsoon rainfall.

7.4.2 APRIL 2013 - NOVEMBER 2013

The district-wise categorisation of water level fluctuation of November 2013 with respect to April-2013 has given in **table 7.14** has been shown in **Plate :- 7.14** .

Rise in water level

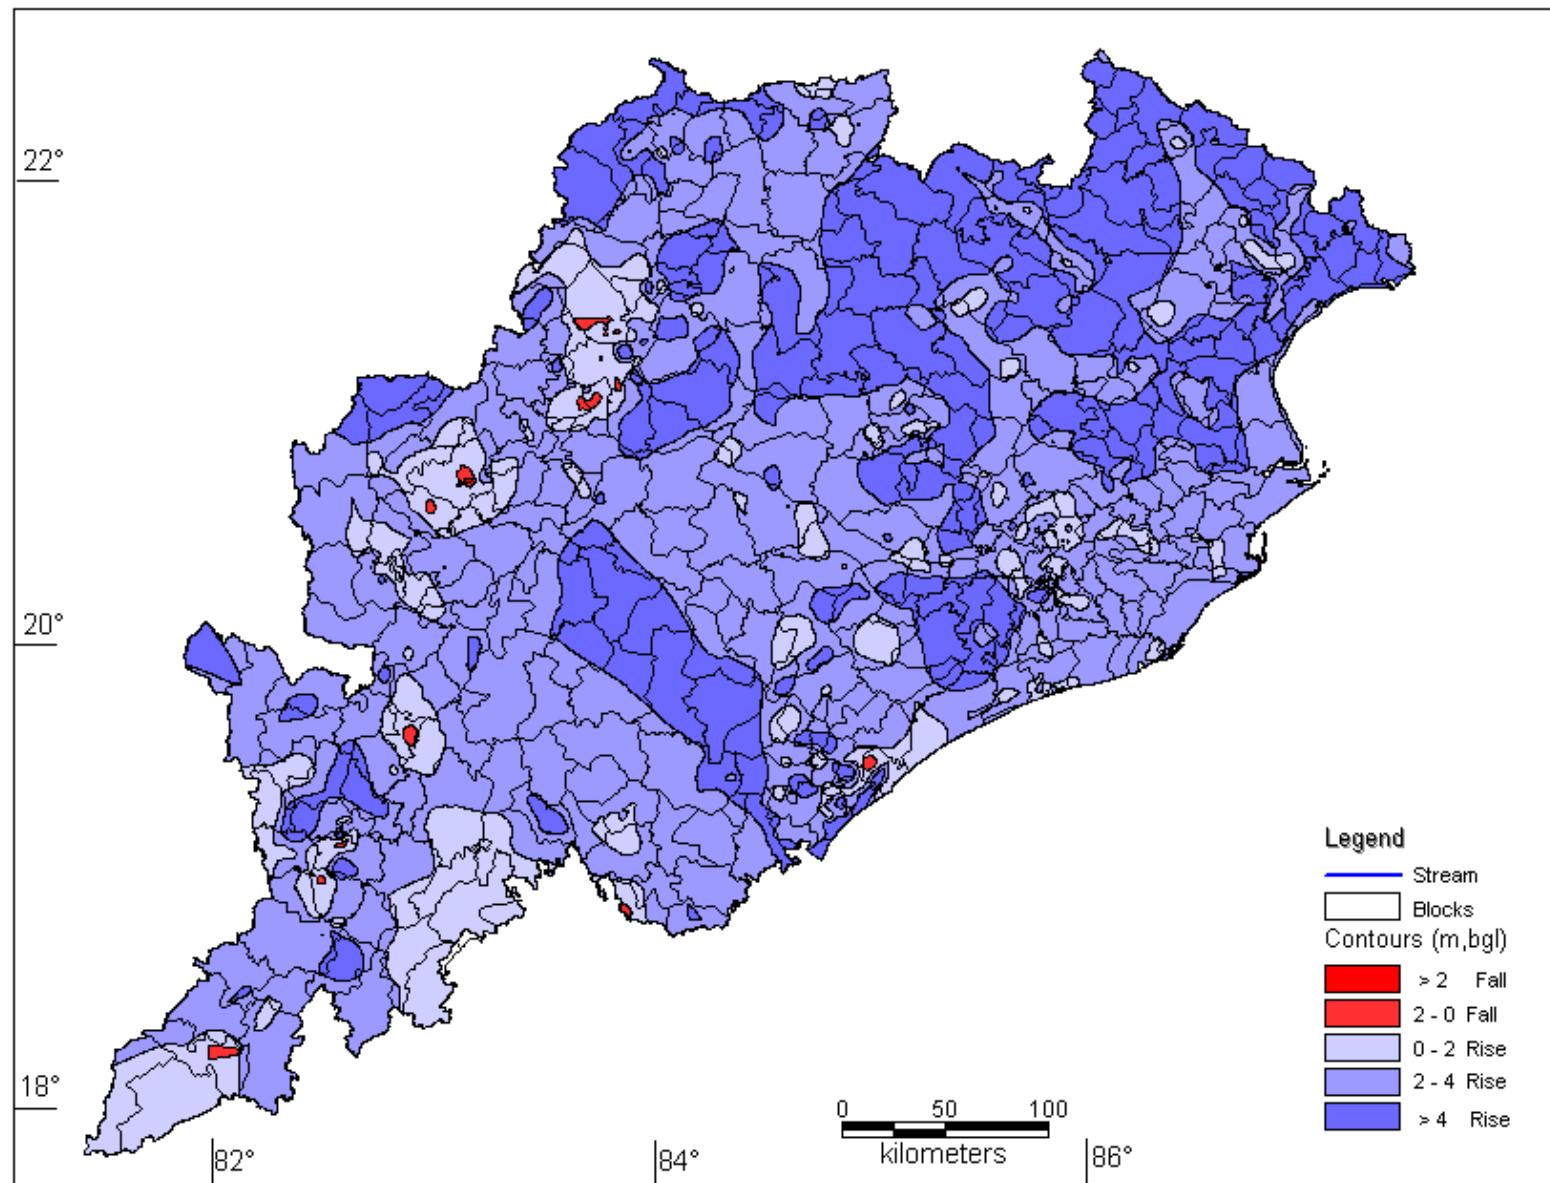

96.6 % of the wells monitored in November 2013 showed a rise in water level when compared with that of April 2013 (Pre-monsoon). 26.3% of wells showed rise in 0-2 m range, 42.1% in 2-4 m range and 28.1 % rise in the range of more than 4m. A maximum of 44.9% of wells in Cuttack district and a minimum of 9.5% in Jagatsinghpur district recorded a rise in the range of 0-2m. A maximum of 80.7% of wells in Jagatsingpur and a minimum of 19.2% in Bargarh district recorded rise in the range of 2 – 4m with majority of the districts in the state have more than 25% of the wells showing rise in this range. 3.2 % of wells shows fall in the range of 0-2 m and only 0.1% shows fall between 2-4m.

Fall in water level

Only 3.30% of the wells monitored showed a fall in water level. 3.2% of wells showed fall in 0-2 m range. The fall in 0-2m range is seen in adequate number of wells in Bargarh, Kalahandi, Koraput and Sonapur districts. only 0.1% i.e. 1 well in the state showed fall in water level in 2-4 m patches

In general as it should be, a rise in water level is observed throughout the state during November 2013 with respect to April 2013 and majority of wells recorded 2- 4 m rise because of recharge of aquifer due to monsoon rainfall.

7.4.3 APRIL 2013 – JANUARY 2014

The district-wise categorisation of water level fluctuation of January 2014 with respect to April-2013 has been given in **table 7.15** and has been presented in **Plate 7.15**.

Rise in water level

92.22% of the wells monitored in January 2014 showed a rise in water level when compared with that of April 2013 (Pre-monsoon). 48% of wells showed rise in 0-2 m range. 32% in 2-4 m range and 12 % rise in the range of more than 4m. A maximum of 94.7% of wells in Kendrapara and Jagatsinghpur district and a minimum of 6.3 % in Gajapati district recorded a rise in the range of 0-2m. A maximum of 63.6% of wells in Jajpur and a minimum of 5.3% in Jagatsinghpur district recorded rise in the range of 2 – 4m. The percentage of wells falling in greater than 4 m range varies from 44.8% in Baleshwar district to 2.3% in Koraput district.

Fall in water level

Only 7.76% of the wells monitored showed a fall in water level. 6.9% of wells showed fall in 0-2 m range. The fall in 0-2m range is seen in adequate number of wells in Bargarh, Sonapur, Malkangiri, Debagarh and Koraput districts. Only 6.9% wells in the state showed fall in water level in 2-4 m patches and 0.1% i.e., only 1 well in Koraput district recorded fall in the range of greater than 4 m .

In general as it should be, a rise in water level is observed throughout the state during January 2014 with respect to April 2013 and majority of wells recorded in 0-2m rise category.

8.0 HYDROCHEMISTRY

The chemical quality of ground water has been evaluated by chemically analyzing water samples collected from National Hydrograph Network Stations (NHNS) during April 2013. The water samples for these purposes were collected in clean 1.0 litre plastic bottles after rinsing 2 to 3 times with the water samples to be collected. Various chemical constituents present in ground water samples were analysed at Regional Chemical Laboratory, Central Ground Water, Board, South Eastern Region, Bhubaneswar, as per standard methods available.

The chemical quality of ground water of shallow wells in the state is found to vary widely, depending upon the physiography, soil texture and underlain soil formations. The shallow aquifer of inland zone is mostly fresh and relatively saline for coastal plain where most of the wells are located in alluvium. These aquifers at places are of high electrical conductivity (E.C.) and chloride concentration. Some of the locations having high values of E.C. are incorporated in Table 8.1

Table 8.1 Location of wells having high electrical conductivity (E.C. > 2000 μ S/cm)

The distribution of fluoride in shallow aquifer show that Angul, Bargarh, Bhadrak, Boudh, Dhenkanal, Jagatsinghpur, Kalahandi, Khurdha, Kendrapara, Nayagarh, Nuapara, Puri, Sambalpur, Suvarnapur, districts are above the desirable limit (1.0 mg/L) may be due to anthropogenic activities.

Some of the prime locations having high values of fluoride are given in Table-8.3

Table 8.3 Location of wells having high fluoride (>1.0 mg/L)
