- Annexure VI - Hydrochemical Data of NHS**

## **FOREWORD**

*Groundwater is a dynamic and replenishable precious natural resource which requires to be monitored regularly and also to be appraised of the changes that are taking place in its regime. In this regard, Central Ground Water Board collects the groundwater level and quality data from the National Hydrograph Network Stations. The water levels are monitored four times a year during the months of May, August, November and January and the samples for determination of the quality of the groundwater are collected once a year during the month of May. This report consists of the water level for the year 2014-15 and chemical quality data collected during the year 2013. Maps showing the depth to groundwater level in different parts of Karnataka and the changes observed in the water level in the last one-year and last one decade are included and discussed in the report. Groundwater stress areas where water levels are depleting as interpreted from the available data are also delineated. The report also consists of the discussions on distribution and variation of rainfall in the state for the year 2014. Chemical quality of groundwater on the basis of the samples collected during May 2013 and the interpretation of the data is included in the report.*

*The data have been compiled, interpreted and presented by Shri.H.P.Jayaprakash, Scientist 'C, Smt. Rakhi.U.R. Sc 'B, Dr. Lubna Kouser, AH and Smt. Hemalatha.V. STA (Hg.). Analysis and presentation of groundwater quality aspects are carried out by Shri. Rahul Vashist STA (Chem). A lot of labor has been put in by various personnel of SWR, Bangalore and WKSU Belgaum office for the collection of timely and reliable field data. The water samples were analysed by the Regional Chemical Laboratory to bring out the aspects of groundwater quality. Shri.S.S.Hegde Scientist 'D' of Report Processing Section has carried out the necessary processing of the report to bring the report to the final stage.*

*It is hoped that the information contained in this yearbook will be useful for planners and all the user agencies associated with development of water resources in Karnataka state.*

*Bangalore  
September 2015*

**(Dr.K.R.Sooryanarayana)  
Head of Office**

## **ABSTRACT**

*Karnataka state has a geographical area of 1,91,761 sq.km, divided into 30 districts and 176 taluks. The Central Ground Water Board has collected water level data of the phreatic aquifer from 1385 Ground Water Monitoring Stations during the months of May, August, November 2014 and January 2015. This report contains the analysis and interpretation of the data.*

*The actual average rainfall received in the State during the year 2014 was 1180 mm, 8 per cent more than the normal rainfall of 1091 mm and which fell under the 'normal' category. Annual Normal rainfall varies from as low as 276 mm at Kollegal of Chamrajnagar district to as high as 4633 mm at Belthangadi of Dakshin Kannada district. Bulk of the annual rainfall i.e., 69% is received during south-west monsoon season, 15% during north-east monsoon and the remaining 16% is received during pre-monsoon period. During the year 2014, the State as a whole recorded 8% more rainfall than its normal value.*

*Out of the depth to water level data recorded in the State during May 2014, about 74% of the wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 25% of wells and deep water levels of > 20 m is found in about 1% of the analysed wells. During August 2014, it is observed that, 85% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 14% of wells and deep water levels of more than 20 m is found in about 1% of the analysed wells. The water level recorded in the State during November 2014, shows 90% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 10% of wells and deep water levels of more than 20 m is found in about 0.5% of the analysed wells. During January 2015, the water levels reveals that, 85% of the analyzed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 14% wells and deep water levels of greater than 20 mbgl are found in about 1% of the analyzed wells.*

*The seasonal groundwater level analysis reveals that i.e comparison of May 2014 data with that of August 2014, 78% of the wells have a rise in water level and 22% have recorded a fall. The comparison of groundwater level of May 2014 with that of November 2014 shows that 93% of the analyzed wells have recorded a rise in water level and 7% have recorded a fall in water level.*

*Similarly, comparison of May 2014 data with that of January 2015 shows that, 80% of the analyzed wells have recorded a rise in water level and 20% have recorded a fall in water level.*

*Aanalysis of annual changes in ground water level have been carried out. Comparison of May 2014 data with that of May 2013 shows that 73 % of the analyzed wells have*

*recorded a rise in water level and 27% have recorded a fall; During August 2014 about 55% of the analyzed wells have recorded a fall in water level as compared with the water level of August 2013 and the remaining 45% have recorded a rise; During November 2014 analyzed wells show about 60% have recorded a rise in water level during as compared with the water level of November 2013 and the remaining 40% have recorded a fall in water level; The wells analyzed during January 2015 reveal that, about 60% of the wells have recorded a rise in water level and the remaining wells accounting 40% have recorded fall.*

*An analysis of decadal changes in groundwater levels have been carried out to know the long term variation in groundwater regime. About 59% have shown a rise in water level during May 2014 as compared to preceding decadal mean and the remaining 471 stations accounting for 41% have shown a fall in water level. The water level during August 2014 as compared to preceding decadal mean shows about 44% have a rise in and the remaining 655 stations accounting for 56% have showed a fall. During November 2014 water levels as compared to preceding decadal mean showed 60% have a rise in water level and the remaining 482 stations accounting for 40% have showed a fall in. The water level during January 2015 as compared to preceding decadal mean observed that 60% of the wells are showed a rise and the remaining 522 wells of 40% showed a fall.*

*The chemical quality of ground water collected from 1111 NHN Stations representing the shallow aquifers (Phreatic aquifer) during May 2013 indicated that, in general, 90 % of the samples in the State are in the 'desirable' limits prescribed for drinking. About 95 % samples fall in 'permissible' limit of drinking water standards. In about 5% of the samples, some of the constituents are high and fall above the 'permissible limit' prescribed and hence, are not suitable for drinking purpose. In respect of chloride, The data indicated that, 98% samples are within 'permissible' limit and about 2 % samples are unsuitable. Nitrate concentration in ground water has indicated that, 68% of the samples in the State are found to be falling under 'desirable limit' and 32% samples are beyond 'permissible' limit. Similarly, fluoride analysis indicates that, in the State, 88.6 % of the samples collected are found to contain fluoride less than the 'permissible' (1.5 mg/l) range. Thus, about 11.3 % of the analysed samples are in the 'unsuitable' class of drinking water standards.*

# GROUND WATER YEAR BOOK 2014-15

## KARNATAKA

### 1. GENERAL FEATURES

#### 1.1. Introduction

Central Ground Water Board, South Western Region, Bangalore, is monitoring water levels in the State of Karnataka from the established network of **1538** monitoring stations, as a part of 'Ground Water Monitoring' programme. The monitoring is carried out four times in a water year during May, August, November and January for water level. Water samples from these stations are collected once in a year, during the month of May to assess the ground water quality.

The Karnataka state, situated between  $11^{\circ} 31'$  and  $18^{\circ} 45'$  north latitudes and  $74^{\circ} 12'$  and  $78^{\circ} 40'$  east longitudes, in the west-central part of Peninsular India, has a total geographical area of 1,91,791 sq.kms. The State is administratively divided into 30 districts and 176 taluks (**Fig.1.1**). The district wise distribution of number of Groundwater monitoring stations by the Region is given in **table 1.1**.

The water levels monitored are analyzed to know the variations in ground water levels in space and time. This report discusses the regional behavior of ground water levels for the period between May 2014 and January 2015, based on data from the ground water monitoring stations, which brings out the status of ground water development in the State.

#### 1.2. Physiography

Physiographically the State is divided into four regions as below:

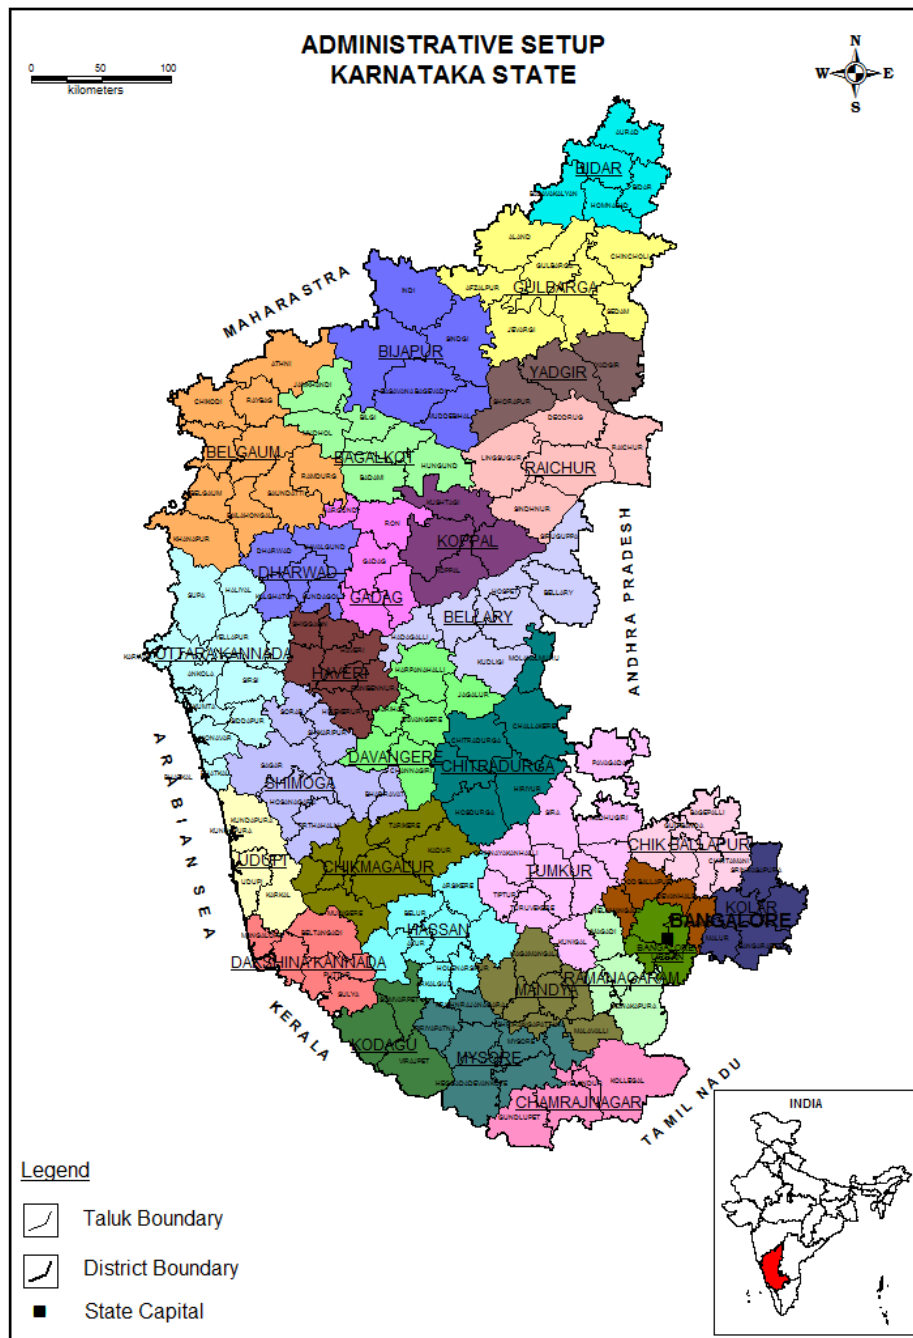

- a) The narrow **Coastal plain** along the west coast running to about 300 km from Karwar in the north to Mangalore in the south. The tract is generally very narrow reaching maximum width of about 40 km at places. The general elevation of the ground varies between 0 to 200 m above mean sea level. The rivers draining the area have a westerly course.
- b) The **Malnad region** with steep mountain ranges and valleys lying immediately east of the coastal plain. The general elevation of the area varies from 200 m above mean sea level along the boundary with the coastal plain to 1872 m above mean sea level at

Kudremukh. Its width varies from 50 to 100 kms. Several rivers like Cauvery and Tungabhadra originate from this region.

c) The **Northern Plain** of the state comprises a table-land and its general elevation ranges from 300 to 350 m above mean sea level.

d) The **Eastern Plain**, towards south form a plateau, which is characterized by rolling topography with sporadic hills. The general elevation in this track varies from 600 to 1000 m above mean sea level.

### 1.3 Drainage

The state of Karnataka is drained by the rivers Krishna, Cauvery, Godavari, West flowing minor rivers, Palar, Pennar and Ponnaiyar (**Fig. 1.3**).

The river Krishna with its major tributaries viz. Bhima, Malaprabha, Ghataprabha, Tungabhadra, Upper Krishna and Vedavathi drains nearly 60% of the State's area. Cauvery and its tributaries viz. Arkavathi, Hemavathi, Kabini, Shimsha, Suvarnavathi and Upper Cauvery drain about 18% of the area; Palar, Pennar and Ponnaiyar which originate from the Nandi hills in the southern part of the State drain about 7% of the area; About 2% of the area in the northern district of Bidar is drained by the Godavari river system; The remaining area is drained by the west flowing rivers such as Kalinadi, Netravathi, Sharavathi, Sita and Swarna etc. The details of the drainage basins and sub basins are given in **table 1.3**. Basin wise distribution of Groundwater Monitoring Stations is given in **table 1.4**.

**Fig. 1.2:** Agroclimatic zones of Karnataka

#### 1.4 Geology

Karnataka State is underlain by rock types ranging in age from the Archaean to the Recent. Major portion of the State is covered by Peninsular Gneisses, Granites and Dharwarian Schists of Archaean age. Substantial area in the northern part of Karnataka is underlain by basalts, which form a continuation of the Deccan Traps occurring in

Maharashtra. The sedimentaries comprising Bhima and Kaladgis occupy a small area in the northern districts. The Recent alluvium is restricted to a narrow belt in the coastal area and along stream courses (fig. 1.4). The geological succession in the State is presented in table 1.5. Formation wise distribution of Groundwater monitoring stations in the State is shown in Table 1.6. Majority of the stations are located in Granitic Gneissic region.

Except for the alluvium, which occurs in a limited area, the State is underlain mainly by crystalline rocks and consolidated sedimentaries, which do not possess primary porosity except for the Basalts, which have a limited primary porosity in the form of vesicular zones. Secondary porosity introduced in them through weathering, fracturing and jointing produces the void spaces to hold and transmit ground water. Solution cavities in the lime stones, when sufficiently large, can form good aquifers.

**Table 1.5.** The Geological succession in Karnataka state

Age	Series/System	Formation
Recent	Soil & Alluvium	Sand and Clay
Pleistocene	Laterite	Laterite
Tertiary to Mesozoic	Deccan Trap Basalt	Hard massive & vesicular
~~~~~ UNCONFORMITY ~~~~~		
Lower Paleozoic to upper Precambrian	Bhima Series	Quartzites, Sandstone, Limestone, Shale and
~~~~~ UNCONFORMITY ~~~~~		
Upper Precambrian	Kaladgi Series	Quartzites, Sandstones,
~~~~~ UNCONFORMITY ~~~~~		
Lower Precambrian	Dharwar system, Volcanics, Greenstone, metasediments	Dharwar Schists meta sediments Greenstone formations
~~~~~ UNCONFORMITY ~~~~~		
Archaean	Peninsular Gneissic Complex	Gneisses, Granites, Charnockites, Khondalites

## 2. RAINFALL DISTRIBUTION IN KARNATAKA STATE-2014

The state of Karnataka is situated between north latitudes 11° 32' & 18° 29' and east longitudes 74° 01' & 78° 32'. The total geographical area is 191791 square kilometers. Physiographically the state is divided into four regions. The northern plains and the southern plains are on the eastern side of the State; the coastal area to the west of the Western Ghats and the hilly region forming the Ghats. In the narrow coastal belt in the extreme west, the elevation ranges from 0 to 200 meters. In the hilly areas the elevation generally varies from 200 to 1900 meters. In the plains the elevation ranges from 300 to 1000 meters. Each of the physiographic regions has a distinct climate. While in the coastal and the hilly areas per humid to sub humid climate prevails, in the plains the climate is sub humid to semiarid in nature. A large part of the State area east of the ghats being in the rain shadow, is semi-arid and hence, drought prone.

The year is generally divided into four seasons. These are: dry season (Jan-Feb), premonsoon season (Mar-May), Monsoon season (Jun-Sep) and post monsoon season (Oct-Dec). The pre monsoon season is characterised by squally weather resulting in heavy rains often accompanied by hail. The Indian summer monsoon, the harbinger of hope for the farmers, normally sets in the state by the first week of June and covers the entire state in about two weeks time. It starts withdrawing by the end of September and totally goes out of the state by the middle of October. Bulk of the annual rainfall is contributed by the summer monsoon. It is replaced by the winter monsoon, which is relatively dry. Significant rainfall occurs due to passing depressions/cyclones. The annual rainfall varies from about 276mm (at Kollegal of Chamrajnagar district) in the eastern parts to over 4633mm (at Beltangadi of D. Kannada district) over the ghats in the west averaging 1180mm. Bulk of the annual rainfall i.e., 69% is received during south-west monsoon season, 15% during north-east monsoon and the remaining 16% is received during pre-monsoon period.

The rainfall in various districts/regions/taluks has been classified as Excess (E), Normal (N) and Deficit (D) as per following criteria.

Excess	120% of normal or more
Normal	81% to 119% of normal
Deficit	80% of normal or less

Based on the above classification, districts falling under different classes are presented below.

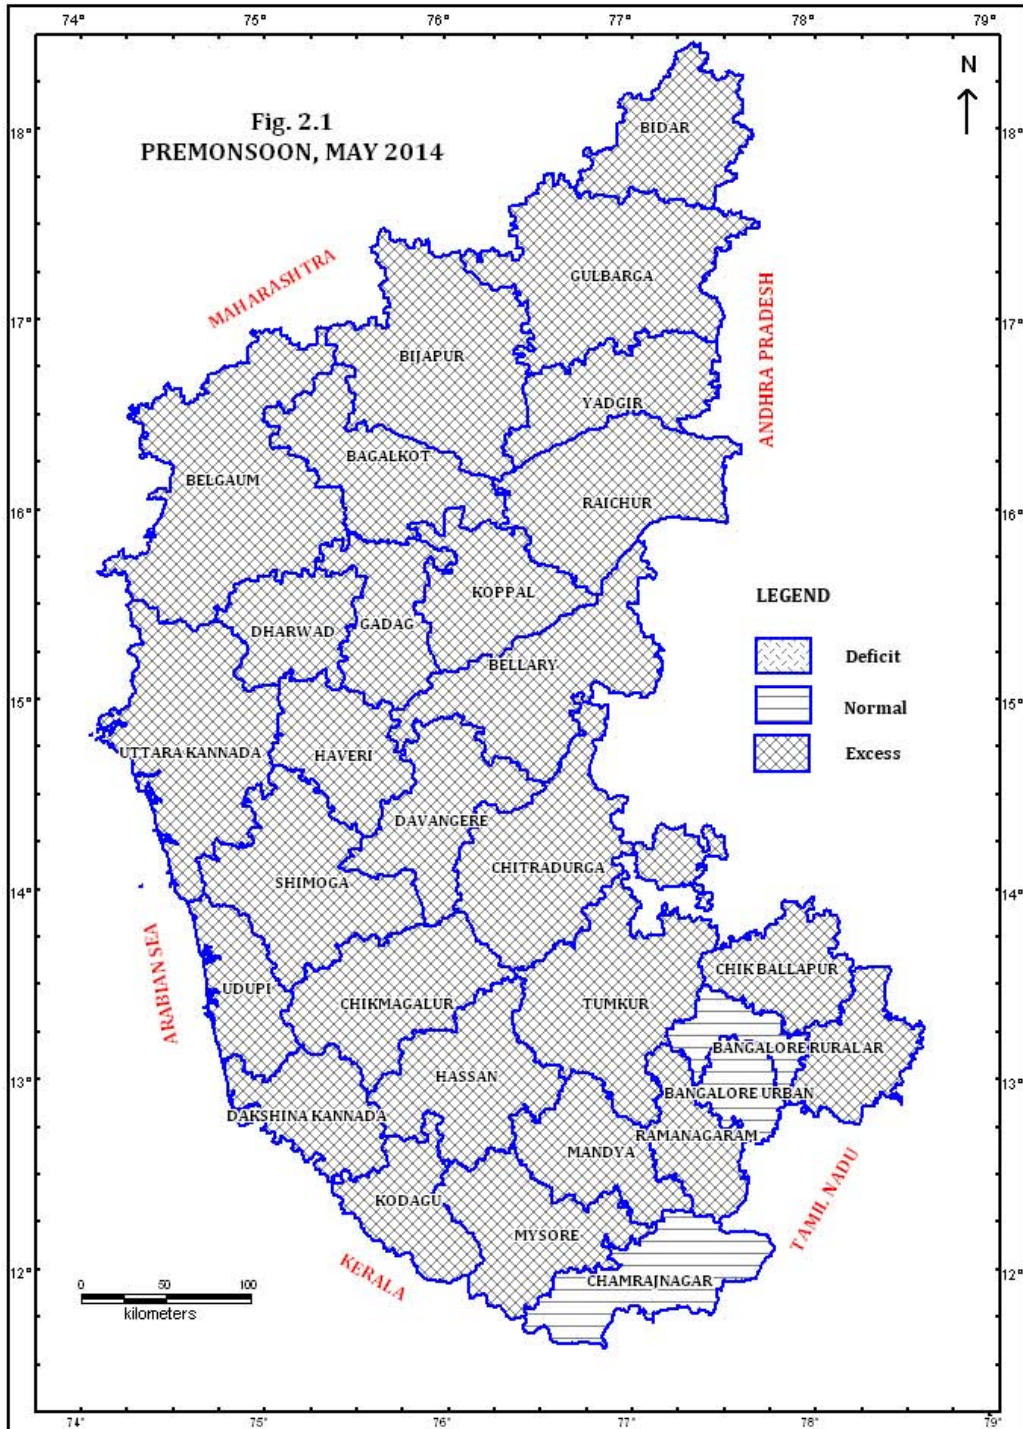

### 2.1 Pre-Monsoon Season: 2014 (January - May)

In general the pre-monsoon showers are received during April-May every year. For the Pre-monsoon season, the State had received an average rainfall of 181 mm, which is 90 percent greater than the normal of 95 mm and State falls under 'excess' category. Rainfall was excess in 27 districts and normal in 3 districts, (Table 2.1). Map showing the district-wise rainfall distribution in Karnataka State for the pre-monsoon period is given as Fig.2.1.

**Table 2.1: District-Wise Cumulative Rainfall and Percentage Departure, During Pre-Monsoon Period 2014**

Sl.No.	District	Normal	Actual	%Dep	Class
1	Bagalkote	49	170	247	Excess

	State	95	191	91	Excess

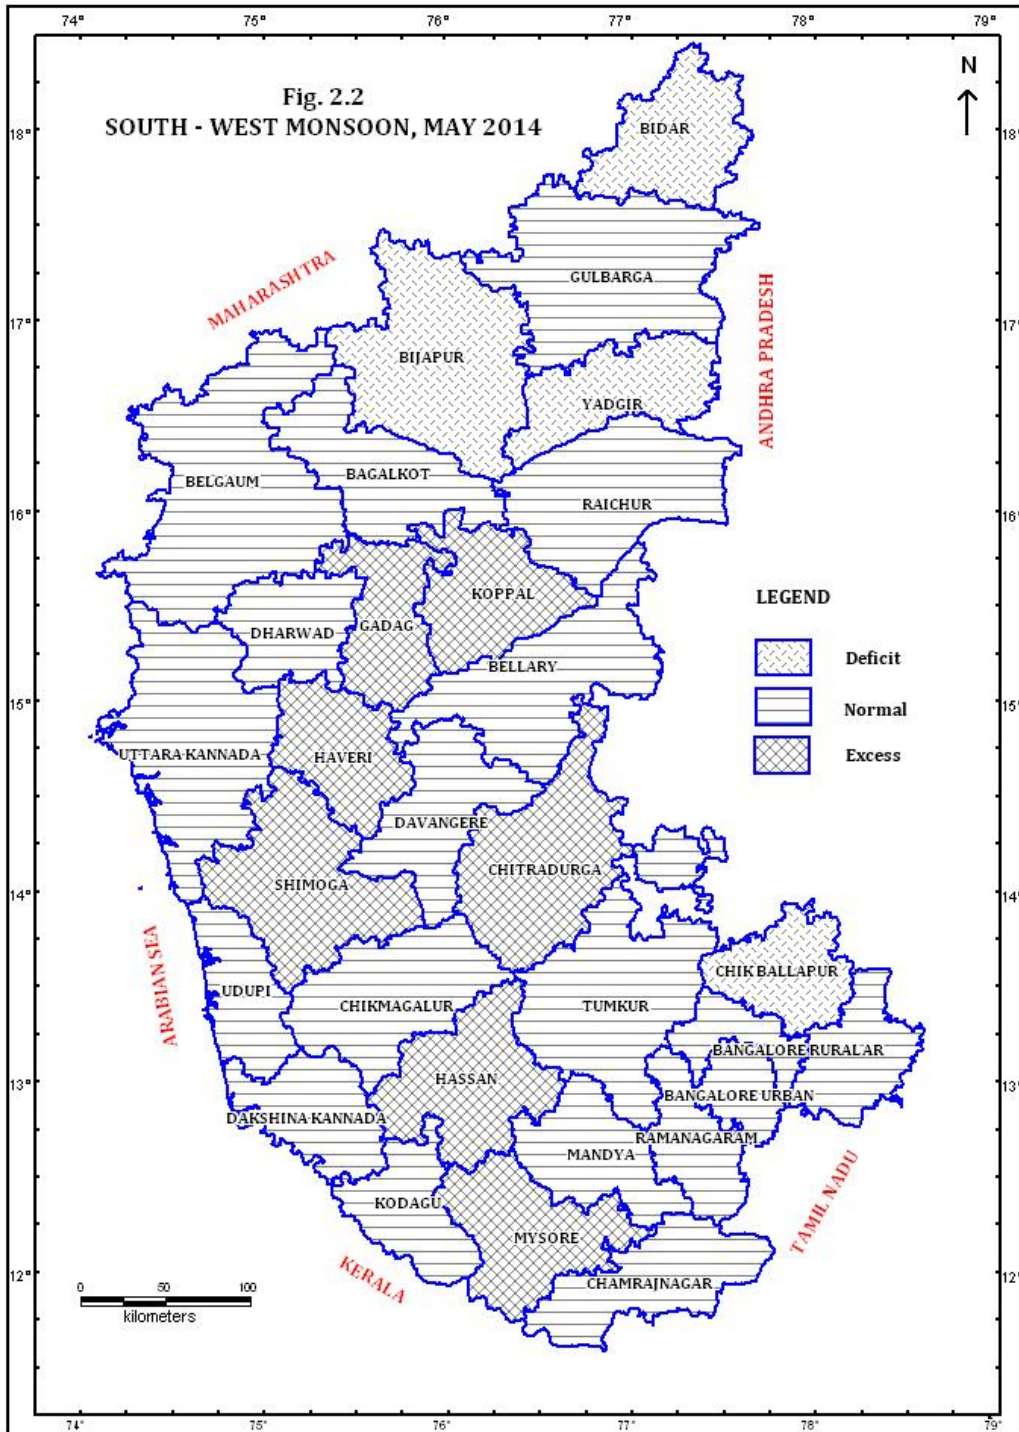

## 2.2 South west Monsoon Season: 2014 (June - September)

During the period from 1st June to 30th September 2014, the State as a whole recorded an actual amount of 827 mm of rainfall as against the normal rainfall of 820 mm with percentage departure being 1% and State falls under 'normal' category. Rainfall was normal in 20 districts, excess in 7 districts and deficit in 3 districts (Table 2.2). The map showing the district-wise rainfall category for the season is shown in Fig. 2.2.

**Table 2.2:** District-Wise Cumulative Rainfall (mm) and Percentage Departure During South-West Monsoon Period 2014

Sl.No.	District	Normal	Actual	%Dep	Class
1	Bagalkote	361	358	-1	Normal
2	Bangalore Rural	426	481	13	Normal

	<b>State</b>	820	827	1	Normal

**Fig.2.2:** South-West monsoon rainfall (May 2014)

### 2.3 Northeast Monsoon Season: 2014 (October – December)

During the period from 1st October to 30th December 2014, the State as a whole recorded an actual amount of 172 mm of rainfall as against the normal rainfall of 179 mm with percentage departure being - 4% and State falls under ‘Normal’ category. Rainfall was excess in 7 districts, normal in 14 districts and deficit in 9 districts (Table 2.3). The map showing the district-wise rainfall category for the season is shown in Fig. 2.3.

**Table 2.3:** District-Wise Cumulative Rainfall (mm) and Departure During North-East Monsoon Period 2014

Sl.No.	District	Normal	Actual	%Dep	Class
1	Bagalkote	130	111	-14	Normal
2	Bangalore Rural	222	286	29	Excess
3	Bangalore Urban	209	272	30	Excess
4	Belgaum	142	171	20	Excess
5	Bellary	136	136	0	Normal
6	Bidar	100	36	-64	Deficit
7	Bijapur	125	80	-36	Deficit

### **3. GROUND WATER LEVELS IN KARNATAKA DURING WATER YEAR 2014-15**

Central Ground Water Board, South Western Region, Bangalore has a network of 1538 stations in Karnataka under the program 'Ground Water Regime Monitoring' of the Board which works out to be one Groundwater Monitoring station in 101 Sq. Km.

The above network comprises of 1538 stations, which are predominantly domestic dug wells and are monitored four times a year during the months of January, May, August and November for water levels and once a year for quality during May. The wells are monitored between 1<sup>st</sup> to 10<sup>th</sup> during January and November and between 20<sup>th</sup> and 30<sup>th</sup> during May and August.

In addition, the Board has a network of 383 piezometers drilled under Hydrology Project and other activities of the Board in the state. These piezometers are also monitored for manual water level along with the dug well network four times a year. Some of these piezometers are also fitted with digital water level recorders for continuous water level monitoring. The water level data of these piezometers during the water year 2014-15 is given in annexure-V &VI. However the piezometers water levels are not incorporated in the preparation of water level and fluctuation maps.

Sample collection for quality monitoring is done along with water level monitoring during the month of May. The samples are collected from the dug wells in the above network and samples from piezometers are not being collected at present.

The analysis of the data collected and the findings are as follows:

#### **3.1 Depth to Ground Water Levels**

Monitoring of Groundwater Monitoring stations in Karnataka was carried out during May, August, November 2014 and January 2015. The data of water levels is given in **Annexure-III**. The analysis/findings are as below:

##### **Depth to Water Level: May 2014**

The depth to water level recorded in the state during May 2014 ranged from 0.05 mbgl to 31.50 mbgl. A total of 1353 old stations are monitored and 59 new water level stations are established during this monitoring season. Out of this 1384 wells were

analysed including new wells established, 9 % of wells have water level less than 2 mbgl, 25% of wells have water level in the range of 2 to 5 mbgl and 40 % of wells have water level in the range of 5 to 10 mbgl. Thus, about 74% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 25% of wells and deep water levels of > 20 m is found in about 1% of the analysed wells (**Table.3.1**). A total of 62 stations were found to be dry during the period.

A map showing the depth to water level in the ranges of <2, 2 to 5, 5 to10, 10 to 20 and >20 mbgl was prepared and is enclosed as Depth to Water Level Map of Karnataka, May 2014 (**Fig-3.1**). The map shows that the depth to water levels in the range of 5 to 10 mbgl is recorded in entire Karnataka State. Depth to water level in the range of <2 mbgl is observed in Gulbarga, Raichur, Koppal, Bellary, Davanagere, Chikmagalur, Shimoga, Chitradurga, Tumkur, Mandya, Chamrajnagar and Kolar districts. Depth to water level in the range of 2-5 and 10-20mbgl is noticed as patches in almost all parts of Karnataka State. Depth to water level of >20 mbgl is recorded in Belgaum, Bidar, Chamrajnagar, Dharwad, Gadag, Gulbarga, Koppal, Mandya and Mysore districts as isolated packets.

#### **Depth to Water Level: August 2014**

The depth to water level recorded in the state during August 2014 ranged from 0.03mbgl to 39.02 mbgl. It is seen that out of 1396 stations monitored during the month, only 21% of wells have water level less than 0- 2 mbgl, 34% of wells have water level in the range of 2 to 5 mbgl and 30% of wells have water level in the range of 5 to 10 mbgl. Thus, about 85% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 14% of wells and deep water levels of more than 20 m is found in about 1% of the analysed wells (**Table.3.2**). A total of 137 stations were found to be dry during the period.

A map showing the depth to water level in the ranges of less than 2, 2 to 5, 5 to10, 10 to 20 and more than20 mbgl was prepared and is enclosed as Depth to Water Level Map of Karnataka, August 2014 (**Fig-3.2**). The map shows that the water levels in the range of 2 to5 and 5 to 10 mbgl are the general water levels prevalent in the State. Water levels in range of less than 2 mbgl occur in parts of Uttara Kannada, Haveri, Shimoga and as small isolated pockets in Bellary, Chitradurga, Davanagere, Mandya, Raichur

and Belgaum districts. Depth to water level between 10-20 mbgl is observed as small patches in almost all the districts except in Bangalore Urban, coastal and Malnad regions and water level more than 20mbgl occur as a small patch in Bagalkote, Koppal, Gadag, Chamarajnagar, Dharwad, Gulbarga, Mandya and Mysore districts.

#### **Depth to Water Level: November 2014**

The depth to water level recorded in the state during November 2014 ranged from 0.05mbgl to 29.80 mbgl. It is seen that out of 1387 station's data analysed for the month, only 26% of wells have water level less than 0-2 mbgl, 37% of wells have water level in the range of 2 to 5 mbgl and 27% of wells have water level in the range of 5 to 10 mbgl. Thus, about 90% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 10% of wells and deep water levels of more than 20 m is found in about 0.5% of the analysed wells (**Table.3.3**). A total of 71 stations were found to be dry during the period.

A map showing the depth to water level in the ranges of less than 2, 2 to 5, 5 to10, 10 to 20 and more than 20 mbgl was prepared and is enclosed as Depth to Water Level Map of Karnataka, November 2014 (**Fig-3.3**). The map shows that the water levels in the range of 2 to5 and 5 to 10 mbgl are the general water levels prevalent in the State. Water levels in range of less than 2 mbgl occur in parts of Mandya, Raichur, Shimoga, U. Kannada and Belgaum Districts and as small isolated pockets in Bellary, Chitradurga, Davanagere, Mysore and Kodagu districts. Depth to water level between 10-20 mbgl is observed as small patches in almost all the districts except in Bangalore Urban, Raichur and coastal and Malnad regions and water level more than 20 mbgl occur as a small patch in Belgaum, Dharwad, Gadag and Mandya districts.

#### **Depth to Water Level: January 2015**

The depth to water level recorded in the state during January 2015 ranged from 0.11 mbgl to 26.95 mbgl. It is seen that out of 1438 stations analyzed, 14% wells have less than 2 mbgl water level, 36% wells have 2 to 5 mbgl water level, 35% wells have 5 to 10 mbgl water level. Thus, about 85% of the analyzed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 14% wells and deep water levels of greater than 20 mbgl are found in about 1% of the analyzed wells (**Table.3.4**). A total of 111 stations were found to be dry during the period.

A map showing the depth to water level in the ranges of <2, 2 to 5, 5 to 10, 10 to 20 and >20 mbgl was prepared and is enclosed as **(Fig.3.4)** Depth to Water Level Map of Karnataka (January 2015). It is seen from the map that water level in the range of 2 to 5 & 5 to 10 mbgl covers major portion of the state covering parts of almost all the districts. Depth to water level of less than 2 mbgl is noticed as small patches in almost all districts of Karnataka State. Depth to water level of 10 to 20 mbgl is observed as patches in almost all districts and greater than 20 mbgl is observed in Raichur, Koppala, Gadag, Bellary, Dharwad, Mandya and Chamrajanagar.

### **3.2 Fluctuations in Ground Water Levels**

Analysis of fluctuation / rise and fall of ground water levels measured during the different periods was carried out. Pre monsoon water levels measured during May 2014 are compared with water levels during August 2014, November 2014 and January 2015 to know the Seasonal Fluctuation. Water levels measured for a given month during consecutive years are compared to know the annual fluctuation. Further water levels of each measurement are compared with the mean water levels pertaining to the same months of the preceding decade to know the long term changes. The fluctuation details are given in **Annexure-IV**. Summary of the analysis is given below

#### **Change in Groundwater Level: May 2014 to August 2014**

Water levels from 1352 stations were analyzed to know the seasonal change in groundwater level in May 2014 with that of August 2014. Out of 1352 stations 1244 stations were compared as the non availability of data for a particular station in current season. On the whole 970 wells accounting for 78% of the analyzed wells have recorded a rise in water level during August 2014 as compared with the water level of May 2014. The remaining 274 wells accounting for 22% have recorded a fall in water level. **(Table.3.5)**

In the rise category, the water level in the range 0-2 m is observed in 455 wells accounting for 37% of the analyzed wells. Rise in water level in the range of 2 to 4 m and more than 4 m is recorded in 219 wells (18%) and 296 wells (23%) respectively. In the fall category, the fall of water level in the range of 0 – 2 m is observed in 235 wells accounting for 19% of analyzed wells. Fall in water level in the range of 2 to 4 m and more than 4 m are seen in 23 wells (2%) and 16 wells (1%) respectively.

A map depicting the fluctuation in groundwater level in August 2014 as compared to May 2014 could not be prepared, as GEMS do not have this option.

#### **Change in Groundwater Level: May 2014 to November 2014**

Water levels data from 1335 stations were analyzed to know the seasonal change in groundwater level in May 2014 with that of November 2014. Out of 1335 stations 1277 stations were compared as the non availability of data for a particular station in current season. On the whole, 1179 wells accounting for 93% of the analyzed wells have recorded a rise in water level during November 2014 as compared with the water level of May 2014. The remaining 98 wells accounting for 7% have recorded a fall in water level. **(Table.3.6)**

In the rise category, the water level in the range 0-2 m is observed in 507 wells accounting for 40% of the analyzed wells. Rise in water level in the range of 2 to 4 m and more than 4 m is recorded in 360 wells (28%) and 312 wells (25%) respectively. In the fall category, the fall of water level in the range of 0 – 2 m is observed in 75 of wells accounting for 6% of analyzed wells. Fall in water level in the range of 2 to 4 m and more than 4 m are seen in 13 wells (1%) and 16 wells (0.78%) respectively.

A map depicting the fluctuation in groundwater level in November 2014 as compared to May 2014 is presented in **Fig 3.5**.

#### **Change in Groundwater Level: May 2014 to January 2015**

Water levels data from 1369 stations were analyzed to know the seasonal change in groundwater level in May 2014 with that of January 2015. Out of 1369 stations 1276 stations were compared and rest could not be compared due to the non availability of data for a particular station in either of the season. On the whole, 1020 wells accounting for 80% of the analyzed wells have recorded a rise in water level during January 2015 as compared with the water level of May 2014. The remaining 256 wells accounting for 20% have recorded a fall in water level. **(Table.3.7)**

In the rise category, the rise of water level in the range 0-2 m is observed in 570 wells accounting for 45% of the analyzed wells. Rise in water level in the range of 2 to 4 m and >4 m is recorded in 265 wells (21%) and 185 wells (14%) respectively. In the fall category, the fall of water level in the range of 0 – 2 m is observed in 198 wells

accounting for 15 % of analyzed wells. Fall of water level in the range of 2 to 4 m and > 4 m are seen in 33 wells (3%) and 25 wells (2%) respectively.

A map depicting the fluctuation in groundwater level in January 2015 as compared to May 2014, showing rise/fall in the ranges of 0 to 2 m, 2 to 4 m and >4 m was prepared and is enclosed as **(Fig.3.6) Water Level Fluctuation Map of Karnataka (May 2014 – Jan 2015)**. The map shows that major portions of the state show a rise in water level.

In the rise category, the map shows that rise in ground water level of 0 to 2 m occupies a larger areal extent as compared to the other two categories and is observed in almost all parts of Karnataka. Rise in water level of 2 to 4 m is observed as patches in almost all districts greater than 4 m is observed in almost all districts of Karnataka State. In the fall category a fall of 0-2 m is recorded as patches in almost all districts of Karnataka State. Fall in water level of 2-4 m is observed in all districts of Karnataka State except Bagalkot, Bangalore Urban, Dharwad, Chitradurga and Mandya districts. Fall in water level of greater than 4 m is recorded in districts like Bangalore Rural, Belgaum, Bellary, Bidar, Bijapur, Chamrajnagar, Chikmagalur, Gadag, Gulbarga, Kolar, Mysore, Raichur, Shimoga, Udupi and Uttara Kannada districts.

#### **Change in Groundwater Level: May 2013 to May 2014**

Water levels from 1103 stations were analyzed to know the annual change in groundwater level in May 2014 with that of May 2013. On the whole 722 wells accounting for 73 % of the analyzed wells have recorded a rise in water level during May 2014 as compared with the water level of May 2013. The remaining 266 wells accounting for 27% have recorded a fall in water level. **(Table.3.8)**

In the rise category, the rise of water level in the range of 0 – 2 m is observed in 464 wells accounting for 47 % of analyzed wells. Rise of water level in the range of 2 to 4 m and > 4 m are seen in 148 wells (15%) and 110 wells (11%) respectively.

In the fall category, the fall of water level in the range 0-2 m is observed in 183 wells accounting for 19 % of the analyzed wells. Fall in water level in the range of 2 to 4 m and >4 m is recorded in 52 wells (5 %) and 31 wells (3 %) respectively.

A map depicting the fluctuation in groundwater level in May 2014 as compared to May 2013, showing rise/fall in the ranges of 0 to 2 m, 2 to 4 m and >4 m was prepared and is enclosed as Water Level Fluctuation Map (Annual) of Karnataka 2014 May (**Fig-3.7**). Rise in water level in the range of 0-2 m is observed in almost all parts of Karnataka State. Rise in water level of 2-4 m is noticed as patches in almost all parts of the State. Rise in water level of >4 m is noticed as patches in almost all parts of the State except Bagalkot and Chitradurga districts. Fall in water level in the range of 0-2 m is observed in almost all parts of the State. Fall in water level in the range of 2-4 m is noticed in Bangalore rural, Belgaum, Bellary, Bidar, Bijapur, Chamrajanagar, Chikmagalur, Dakshina Kannada, Davanagere, Gadag Gulbarga, Hassan, Haveri, Kodagu, Kolar, Mandya, Mysore, Raichur, Shimoga, Tumkur, Udupi and Uttara Kannada districts. Fall in water level of > 4 m is noticed in Kolar, Tumkur, Hassan, Kodagu, Mandya, Belgaum, Bellary, Bidar, Bijapur, Chitradurga, Davanagere, Dharwad, Gadag Gulbarga, Shimoga and Udupi districts.

#### **Change in Groundwater level: August 2013 to August 2014**

Water levels from 1077 stations were analyzed and about 1031 stations were compared to know the annual change in groundwater level in August 2014 with that of August 2013. On the whole 563 wells accounting for 55% of the analyzed wells have recorded a fall in water level during August 2014 as compared with the water level of August 2013. The remaining 468 wells accounting for 45% have recorded a rise in water level. (**Table.3.9**)

In the fall category, the fall of water level in the range 0-2 m is observed in 420 wells accounting for 41% of the analyzed wells. Fall in water level in the range of 2 to 4 m and more than 4 m is recorded in 84 wells (8%) and 59 wells (6%) respectively. In the rise category, the rise of water level in the range of 0 – 2 m is observed in 361 wells accounting for 35% of analyzed wells. Rise of water level in the range of 2 to 4 m and more than 4 m are seen in 70 wells (7%) and 37 wells (4%) respectively.

A map depicting the fluctuation in groundwater level in August 2014 as compared to August 2013, showing rise/fall in the ranges of 0 to 2 m, 2 to 4 m and more than 4 m was prepared and is enclosed as Water Level Fluctuation Map of Karnataka Aug 2013 – Aug 2014(**Fig-3.8**). The map shows that fall in ground water level of 0-2m occur as patches and small pockets in almost all districts except Hassan district. The fall in water level 2-4 and more than 4.0m is also occur as major pockets in Bidar, Gulbarga, Chamrajanagar, Mandya, Tumkur, Belgaum, Chitradurga, Bellary, Bijapur, Mysore, Kolar, Dakshina kannada and Udupi and isolated patches in Raichur, Gadag, and Davanagere districts. In the rise category the map shows that fall in ground water level of 0-2m occupies a maximum areal extent in all most all districts. Rise of 2-4m & more than 4m occurs as small pockets in parts of Bidar, Gulbarga, Bijapur, Belgaum, Raichur, Gadag, Koppal, Haveri, Davanagere, Shimoga, Chikmagalur, Hassan, Kodagu, Mysore, Chamrajnagar, Bangalore Urban, and Mandya districts.

#### **Change in Groundwater Level: November 2013 to November 2014**

Water levels from 1173 stations were analyzed and 1126 stations were compared to know the annual change in groundwater level in November 2014 with that of November 2013. On the whole, 675 wells accounting for 60% of the analyzed wells have recorded a rise in water level during November 2014 as compared with the water level of November 2013. The remaining 451 wells accounting for 40% have recorded a fall in water level. (**Table.3.10**)

In the fall category, the fall of water level in the range 0-2 m is observed in 366 wells accounting for 32% of the analyzed wells. Fall in water level in the range of 2 to 4 m and more than 4 m is recorded in 52 wells (5%) and 33 wells (3%) respectively. In the rise category, the rise of water level in the range of 0 – 2 m is observed in 522 wells accounting for 46% of analyzed wells. Rise of water level in the range of 2 to 4 m and more than 4 m are seen in 100 wells (9%) and 53 wells (5%) respectively.

A map depicting the fluctuation in groundwater level in November 2014 as compared to November 2013, showing rise/fall in the ranges of 0 to 2 m, 2 to 4 m and more than 4 m

was prepared and is enclosed as Water Level Fluctuation Map of Karnataka Aug 2013 – Aug 2014 (**Fig-3.9**).

The map shows that rise in ground water level in the range of 0-2 m is observed in parts of all the districts. Rise of water level in the range of 2-4 m is observed in parts of all the districts except Bagalkot, Bangalore Urban and Bidar districts. Rise of more than 4m is observed in parts of all the districts as patches except Bagalkot, Bangalore Urban, Davanagere, Gadag, Kolar, Raichur and Udupi Districts.

Water level fall of less than 2m is recorded in parts of all the districts of the state. Water level fall in the range of 2-4m is recorded in all the districts except Belgaum, Bellary, Chikmagalur, Davanagere, Mandya, Shimoga and Udupi Districts. Fall of more than 4m is recorded as patches in Bagalkot, Bellary, Bijapur, D. Kannada, Dharwad, Gadag, Gulbarga, Kodagu, Koppala, Mandya, Raichur, Shimoga, Tumkur and Udupi Districts.

#### **Change in Groundwater Level: January 2014 to January 2015**

Water levels from 1272 stations were compared to know the annual change in groundwater level in January 2015 with that of January 2014. Out of 1272 stations 1185 stations were compared and rest could not be compared due to the non availability of data for a particular station in either of the season. On the whole, 707 wells accounting to 60% of the analyzed wells have recorded a rise in water level during January 2015. The remaining 478 wells accounting to 40% have recorded fall in water level (**Table.3.11**)

In the rise category the rise in water level in the range of 0-2 m is observed in 555 wells accounting for 47% of analyzed wells. Rise of water level in the range of 2-4 m and greater than 4 m are seen in 82 wells (7%) and 70 wells (6%) respectively. In the fall category, the fall of water level in the range 0-2 m is observed in 375 wells accounting for 32% of the analyzed wells. Fall in water level in the range of 2-4 m and greater than 4 m is recorded in 64 wells(5%) and 39 wells (3%) respectively.

A map showing the fluctuation in groundwater level in January 2015 as compared to January 2014, showing rise/fall in the ranges of 0 to 2 m, 2 to 4 m and > 4 m was prepared and enclosed as (**Fig.3.10**) Water Level Fluctuation Map of Karnataka (Jan

2014 – Jan 2015). The map shows that major portions of the state show a rise in groundwater level.

It is seen from the map that rise in water level of 0-2 m is noticed in almost all districts of Karnataka. Rise in water level of 2-4 m is recorded as patches in almost all districts except Bagalkot and rise in water level of greater than 4 m is noticed as small patches in all districts except Bagalkot, Bangalore Urban and Uttara Kannada districts. In the fall category, fall in water level of less than 2 m is noticed as patches in almost all parts of the Karnataka State. Fall in water level of 2-4 m is observed in all districts of Karnataka State except Chitradurga and Dakshin Kannada district. Fall in water level of greater than 4 m is noticed as patches in Bagalkot, Bangalore rural, Bangalore Urban, Belgaum, Bellary, Bidar, Bijapur, Chamrajanagar, Davanagere, Dharwad, Gulbarga, Hassan, Kolar, Mysore, Raichur, Shimoga, Tumkur, Udupi and Uttara Kannada districts of Karnataka State.

#### **Change in Water Level: Mean (May 2004 to May 2013) – May 2014**

Mean groundwater level for the period May 2004 to May 2013 was compared with the groundwater level in May 2014. It is seen that, out of the 1166 stations analyzed, 673 stations accounting for 59% have shown a rise in water level during May 2014 as compared to preceding decadal mean and the remaining 471 stations accounting for 41% have shown a fall in water level (**Table.3.12**).

In the water level rise category, a rise of 0-2 m range is prominent and is recorded in 473 stations accounting to 41 % of analysed wells. A rise of 2-4 m and >4 m is seen in 130 stations (11%) and 70 stations (6%) respectively. In the fall category, a fall in water level of 0 – 2 m range is recorded in 308 wells accounting for 27% of analyzed wells. Fall in water level of 2 to 4 m and >4 m range is seen in 100 wells (9%) and 63 wells (6%) respectively.

A map in respect of the change in water levels showing rise/fall in the ranges of 0-2 m, 2-4 m and >4 m has been prepared and enclosed as Water Level Fluctuation Map of Karnataka, Decadal Mean (May 2004 to May 2013) – May 2014 (**Fig-3.11**).

Rise in water level of <2m is noticed in almost all parts of the State. Rise in water level of 2-4 m is noticed as patches in almost all parts of the State except Udupi district. Rise in water level of >4m is noticed in all districts except Udupi, Bagalkot, Kolar, Koppala

and Bangalore Urban districts. Fall in water level of <2 m is noticed in almost all parts of the State. Water level of 2-4 m is noticed in almost all parts of the State except Gadag district. Fall in water level of >4 m is noticed as small patches in almost all parts of the State except Chikmagalur and Dakshin Kannada district.

#### **Change in Water Level: Mean (Aug 2004 to Aug 2013)-Aug 2014**

Mean groundwater level for the period August 2004 to August 2013 is compared with the groundwater level in August 2014 for 1168 stations out of 1182 stations analyzed. It is seen that out of the **1168** stations compared, 513 stations accounting for 44% have showed a rise in water level during August 2014 as compared to preceding decadal mean and the remaining 655 stations accounting for 56% have showed a fall in water level (**Table.3.13**).

In the water level rise category, a rise of 0-2 m range is prominent and is recorded in 411 stations accounting to 35% of analyzed wells. A rise of 2-4 m and more than 4 m is seen in 75 stations (6%) and 27 stations (2%) respectively. In the fall category, fall in water level in the range of 0 – 2 m is recorded in 470 wells accounting for 40% of analyzed wells. Fall in water level of 2 to 4 m and more than 4 m range is seen in 110 wells (10%) and 75 wells (7%) respectively.

A map for the change in water levels showing rise/fall in the ranges of 0-2 m, 2-4 m and more than 4 m was prepared and enclosed as “Water Level Fluctuation Map of Karnataka (Decadal Mean of August 2004-2013 to August 2014)” (**Fig-3.12**).

Major part of the State is showing fall in water level compared to decadal mean water level of 2004-2013 with respect to August 2014 water level. In the rise category water level less than 2m rise observed in almost all districts. Rise of 2-4m and more than 4m water level is observed in Belgaum, Dharwad, Gadag, Haveri, Bellary, Davanagere, Shimoga and as small patches in Tumkur, Bangalore Urban, Hassan, Mandya and Mysore districts.

Fall in water level less than 2m noticed in almost all districts. Fall of 2-4m and more than 4m observed in all the districts except in DakshinaKannada, Uttarakannada, Shimoga, Chikmagalur, Kodagu and Bellary districts.

### **Change in Water Level: Mean (Nov 2004 to Nov 2013) – Nov 2014**

Mean groundwater level for the period November 2004 to November 2013 is analyzed and compared with the groundwater level in November 2014 for 1211 stations out of 1218 stations. It is seen that out of the 1211 stations compared, 729 stations accounting for 60% have showed a rise in water level during November 2014 as compared to preceding decadal mean and the remaining 482 stations accounting for 40% have showed a fall in water level (**Table.3.14**).

In the water level rise category, a rise of 0-2 m range is prominent and is recorded in 582 stations accounting to 48% of analyzed wells. A rise of 2-4 m and more than 4 m is seen in 97 stations (8%) and 50 stations (4%) respectively. In the fall category, fall in water level in the range of 0 – 2 m is recorded in 358 wells accounting for 30% of analyzed wells. Fall in water level of 2 to 4 m and more than 4 m range is seen in 75 wells (6%) and 49 wells (4%) respectively.

A map for the change in water levels showing rise/fall in the ranges of 0-2 m, 2-4 m and more than 4 m was prepared and enclosed as “Water Level Fluctuation Map of Karnataka (Decadal Mean of November 2004-2013 to November 2014)”(**Fig-3.13**).

Major part of the State is showing rise in water level as compared to decadal mean water level of 2004-2013 with respect to November 2014 water level. In the rise category, water level showing less than 2m and 2-4m rise is observed in parts of almost all districts. Rise of more than 4m water level is observed as patches in parts of all districts except Bagalkot, Bangalore Urban, Bijapur, Davanagere, Kolar and Koppala Districts.

Fall in water level less than 2m noticed in parts of almost all districts. Fall of 2-4m is observed in parts of all districts except Davanagere, Dharwad, Mandya and Shimoga districts. Fall of water level of more than 4m is observed as patches in all the districts except Bagalkot, Bangalore Urban, D. Kannada, Davanagere, Hassan, Shimoga and Tumkur Districts.

### **Change in Water Level: Mean (January 2005 to January 2014)-Jan 2015**

Water levels from 1318 stations were compared to know the decadal change in groundwater level in January 2015 with that of mean January 2005 to January 2014.

Out of 1318 stations 1309 stations were compared and rest could not be compared due to the non availability of data for a particular station in either of the season. It is seen that out of the stations compared, 787 stations accounting for 60% showed a rise in water level during January 2015 as compared to preceding decadal mean and the remaining 522 wells of 40% showed a fall (**Table. 3.15**).

Major part of the state belongs to the rise category. In the rise category, a rise of 0-2 m is recorded in 633 stations accounting to 48% of analyzed wells. A rise of 2-4 m and greater than 4 m is seen in 105 wells (8%) and 49 wells (4%) respectively. In the fall category, a fall of 0 – 2 m is prominent and is recorded in 391 wells accounting to 30% of analyzed wells. Fall of 2 to 4 m and greater than 4 m is seen in 81 wells (6%) and 50 wells (4%) respectively.

A map for the change in water levels showing rise/fall in the ranges of 0-2 m, 2-4 m and >4 m was prepared and enclosed as Water Level Fluctuation Map of Karnataka Decadal Mean (January 2005 to January 2014) – January 2015 (**Fig.3.14**).

In the rise category, rise of 0 to 2 m is observed in entire Karnataka State. Rise in water level of 2 to 4 m is noticed as patches in almost all districts of Karnataka State. Rise in water level of greater than 4 m is recorded as small patches in Bangalore Rural, Belgaum, Bellary, Bidar, Chamrajanagar, Chikmagalur, Chitradurga, Dakshin Kannada, Dharwad, Gadag, Gulbarga, Hassan, Haveri, Kodagu, Mandya, Raichur, Shimoga, Tumkur and Udupi districts of Karnataka State. In fall category, fall in water level of 0-2 m is seen in almost in all districts of Karnataka State. Fall in water level of 2 to 4 m is noticed as patches in almost all districts of Karnataka State except Dakshin Kannada district. Fall in water level of greater than 4 m is seen in almost all districts except Dakshin Kannada, Haveri and Kodagu districts.

#### 4. HYDROCHEMISTRY

Water samples from the Ground Water Level Monitoring Stations (GWMS) are collected once in a year during the month of May. The assessment of chemical quality of ground water samples from GWMS of Karnataka State for the year 2013 is presented as follows.

The water samples from 1111 shallow aquifers of NHNS from 30 districts were collected in the month of May 2013 and analysed in the Regional Chemical Laboratory for pH, Electrical Conductivity (EC), Chloride, Nitrate and Fluoride by employing Standard methods. Based on the hydro chemical data, the portability of these samples has been assessed as per the Standards prescribed by the Bureau of Indian Standards (IS 10500: 2012) and categorized into 'Desirable', 'Permissible' and 'Unsuitable' classes.

##### **Distribution of pH,**

The hydrogen ion concentration (pH) of water is a measure of its acidity or alkalinity. A neutral pH, neither acid nor alkaline, is 7.0; water with pH below 7 is acidic and above 7 is considered as alkaline.

The perusal of the data indicates that the distribution of pH in the State shows wide variations from 6.8 to 10.3. The maximum value for the parameter was recorded in the sample collected from Malur, Shimoga district. In the State, 88.1 % of the samples collected were found well within the permissible limit for drinking water standard. The data shows that a 13.8 % of samples collected from Bagalkot, Bijapur, Belgaum, Bidar, Bellary, Bangalore (Urban, Rural) Koppala, Shimoga, Yadgiri, Chickmangalur, Dharwar, Gulbarga, Hassan, Haveri, Kolar, Tumkur, Uttar Kannada districts showed pH above 8.5 rendering them unsuitable for drinking purpose. The high pH causes a bitter taste, due to this the water pipes and water-using appliances become encrusted.

##### **Distribution of Electrical Conductivity.**

The electrical conductivity in water samples is an indication of total dissolved ions. Thus the higher the EC, the higher the levels of dissolved ions in the sample. The perusal of the data indicates that the distribution of electrical conductivity in the State shows wide variations (43–11380  $\mu\text{S}/\text{cm}$  at 25° C). The maximum value for the

parameter was recorded in the sample collected from Algur, Bijapur district. The EC values of samples collected from coastal districts such as Dakshina Kannada, Uttara Kannada and Udupi were generally below 750  $\mu\text{S}/\text{cm}$  at 25°C rendering the samples suitable for drinking purpose. In general 90 % of the samples in the State were in the 'desirable limits for drinking. About 95 % samples show 'permissible limit for drinking water. The About 5% of the samples in state (Bijapur, Bagalkot, Dharwad, Gadag, Raichur, Koppala and Gulbarga districts) were shows more than 'permissible limit which is not considered for drinking purpose (**Fig.4.1**). The BIS has recommended a drinking water standard for total dissolved solids a limit of 500mg/l (corresponding to about EC of 750  $\mu\text{S}/\text{cm}$  at 25°C) can be extended to a TDS of 2000mg/l (corresponding to about 3000  $\mu\text{S}/\text{cm}$  at 25°C) in case of an alternate source. Water samples having TDS more than 2000mg/l are not suitable for drinking purpose.

#### **Distribution of Chloride.**

Chloride is one of the major anion present in water and is generally associated with sodium. High concentrations of chloride ions may result in an objectionable salty taste in water. In general, the chloride content recorded mostly below 250 mg/l except in cases where inland salinity is prevalent and in coastal areas and due to mineral dissolution, industrial and domestic waste.

The distribution of chloride followed similar trend as that of EC and the values were in the range of 7 to 2659 mg/l, the highest value recorded is for the sample collected from Mallanagekamhalli, Haveri district which shows a value of 2659 mg/l. The data indicated that, 98% samples are within 'permissible' limits for drinking and about 2 % samples are unsuitable for drinking purpose (**Fig 4.2**). The BIS (Bureau of Indian Standard) IS 10500:2012 has recommended a desirable limit of 250 mg /l of chloride in drinking water and have extended to a maximum of 1000 mg/l.

#### **Distribution of Nitrate.**

Nitrate is a problem as a contaminant in drinking water (primarily from groundwater and wells) due to its harmful biological effects. High concentrations can cause methemoglobinemia, and have been cited as a risk factor in developing gastric, an intestinal cancer.

The distribution of nitrate in the State indicated that the values are in the range of 0.05 to 1000 mg/l. Nitrate in drinking water should not exceed 45 mg/l as per BIS (ISO: 10500: 2012) standard and the highest value 1000 mg/l was recorded in the sample collected from Nargund, Gadag district. The data indicated that, 68.04% of the samples in the State are found to be falling under 'Acceptable' classes of BIS Standards.

It can be seen from the Table that a significant percentage of samples collected from Bagalkot, Bangalore, Gulbarga, Bijapur Chamarajanagar, Chitradurga, Davanagere, Dharwar, Gadag, Hassan, Kolar, Mandya, Mysore and Tumkur districts showed nitrate concentration greater than 45 mg/l rendering them unsuitable for drinking (**Fig.4.3**). The contamination of ground water by nitrates is mainly due to anthropogenic causes, owing its origin to septic systems, fertilizers and livestock wastes. It is usually difficult to assess the particular nitrate source, since; often the contamination is a result of many sources.

#### **Distribution of Fluoride.**

One of the essential elements for maintaining normal development of healthy teeth and bones is Fluoride. Lower concentrations of fluoride usually below 0.6mg/l may contribute to dental caries. However, continuing consumption of higher concentrations, above 1.2mg/l however cause dental flourosis and in extreme cases even skeletal flourosis. Most of the fluoride found in groundwater is of geogenic origin.

The occurrence of fluoride in ground water in the State exhibited wide variations from 0.002 mg/l to 9.6mg/l. The sample collected from Bandri, Bellary district recorded the highest value of 9.6 mg/l. In the State, 88.6 % of the samples collected were found to contain fluoride concentration in the 'permissible' (1.5 mg/l) range. Thus, about 11.3 % of the analysed samples are in the 'unsuitable' range. The data shows that a considerable percentage of samples collected from Bagalkot, Bijapur, Bellary, Bangalore (Urban, Rural) Raichur, Koppala, Gadag, Yadgiri, Chitradurga, Chickballapur, C.R.Nagar, Davanagere, Gulbarga, Haveri, Kolar, Mandya and Tumkur districts showed fluoride concentration beyond 1.5 mg/l rendering them unsuitable for drinking purpose (**Fig.4.4**).

## 5. CONCLUSIONS

CGWB, SWR, Bangalore has a network of 1538 Dug wells and 383 Piezometers (PZ) as Groundwater monitoring stations in Karnataka state under the program of Groundwater Regime Monitoring. The monitoring station density works out to be one well per hundred square kilometre. These monitoring stations are monitoring 4 times during January, May, August and November.

About 50% of the wells are represented by Krishna basin and the remaining 50% represents Cauvery, Palar, Pennar, West flowing and Godavari. Granitic Gneiss formation has a representation of 65% wells in the State. Remaining formations like Basalt, Schist, Laterite, Granite, Alluvium and Slate/Limestone/Sandstone represents 14%, 9%, 5%, 3%, 2% & 2% respectively.

The rainfall received in the State during the year 2014 was 1091 mm, Annual Normal rainfall varies from as low as 527 mm at Chitradurga district to as high as 4041 mm at Udupi district. Bulk of the annual rainfall i.e., 75% is received during south-west monsoon season, 19% during north-east monsoon and the remaining 6% is received during pre-monsoon period. During the year 2014, the State as a whole recorded 85% of the district shows normal rainfall and 10% of wells shows excess rainfall and 5% shows deficit rainfall.

The depth to water level recorded in the state during May 2014 about 74% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 25% of wells and deep water levels of > 20 m is found in about 1% of the analysed wells. During August 2014, it is observed that, 85% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 14% of wells and deep water levels of more than 20 m is found in about 1% of the analysed wells. The water level recorded in the state during November 2014, shows 90% of the analysed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 10% of wells and deep water levels of more than 20 m is found in about 0.5% of the analysed wells. During January 2015, the water levels reveals that 85% of the analyzed wells have water level within 10 mbgl. Moderately deep water levels of 10 to 20 mbgl are seen in 14%

wells and deep water levels of greater than 20 mbgl are found in about 1% of the analysed wells.

The seasonal groundwater level analysis reveals that i.e May 2014 with that of August 2014 78% of the wells have a rise in water level and 22% have recorded a fall. The Change in groundwater level in May 2014 with that of November 2014 shows that 93% of the analyzed wells have recorded a rise in water level and 7% have recorded a fall in water level. Similarly

The change in groundwater level in May 2014 with that of January 2015 shows that, 80% of the analyzed wells have recorded a rise in water level and 20% have recorded a fall in water level.

The groundwater level change in May 2014 with that of May 2013 shows that 73 % of the analyzed wells have recorded a rise in water level and 27% have recorded a fall. During August 2014 about 55% of the analyzed wells have recorded a fall in water level as compared with the water level of August 2013 and the remaining 45% have recorded a rise. November 2014 analyzed wells shows about 60% have recorded a rise in water level during as compared with the water level of November 2013 and the remaining 40% have recorded a fall in water level. The wells analyzed during January 2015 reveals about 60% of the wells have recorded a rise in water level and the remaining wells accounting 40% have recorded fall. About 59% have shown a rise in water level during May 2014 as compared to preceding decadal mean and the remaining 471 stations accounting for 41% have shown a fall in water level.

The water level during August 2014 as compared to preceding decadal mean shows about 44% have a rise in and the remaining 655 stations accounting for 56% have showed a fall. During November 2014 water levels as compared to preceding decadal mean showed 60% have a rise in water level and the remaining 482 stations accounting for 40% have showed a fall in. The water level during January 2015 as compared to preceding decadal mean observed that 60% of the wells are showed a rise and the remaining 522 wells of 40% showed a fall.

The chemical quality of ground water collected from 1111 NHN stations representing the shallow aquifers during May 2013 indicated that, In general 90 % of the samples in the State were in the 'desirable limits for drinking. About 95 % samples show

'permissible limit for drinking water. The About 5% of the sample shows more than 'permissible limit which is not considered for drinking purpose In respect of chloride, The data indicated that, 98% samples are within 'permissible' limits for drinking and about 2 % samples are unsuitable for drinking purpose. Nitrate concentration in ground water is indicated that, 68% of the samples in the State are found to be falling under 'desirable limit 'and 32% samples are beyond permissible limits. Similarly analysis indicates that, In the State, 88.6 % of the samples collected were found to contain fluoride concentration in the 'permissible' (1.5 mg/l) range. Thus, about 11.3 % of the analysed samples are in the 'unsuitable' range of Drinking Water Standards.
