

**GROUND WATER YEAR BOOK**  
**UTTAR PRADESH**  
*(2014 - 2015)*

## **Foreword**

Groundwater on account of its universal availability, dependability and low capital cost, is the major source of water to meet the requirement of various sector in India. However, with a rapid growth of population and all round development, there is incessant pressure on the ground water withdrawal resulting compulsive awakening in terms of both the quality and quantity. Ground water has an important role in meeting the water requirements of agriculture, industrial and domestic sectors in the state. About 78% percent of irrigation requirements in the Uttar Pradesh state are being met from ground water resources. If the present trend of the increasing demand remains incontrollable, the resource may be as strategic as are the minerals resources. Though in contrast to this, the resource of groundwater as a part of hydrologic cycle is replenishable.

The indiscriminate exploitation of groundwater has led to depletion of storage is essential in order to avoid the adverse impact. This could be achieved only after careful monitoring of various inputs of hydrological system. Temporal variation in the Ground water system need to be studied for the scientific management of the resource. In view of this Central Ground Water Board, Northern Region, Lucknow has setup a network of 1241 Ground Water Monitoring Wells all over the state to maintain a regular database. The behavior of water level is monitored four times every year in May, August, November and January. To ascertain the hydrochemical behavior of ground water, samples are collected from representative wells once a year during the month of May and samples are analysed in the chemical laboratory of the office.

The data thus generated are analysed and subjected to various types of interpretation using dedicated software – GEMS (Ground Water Estimation and Management System).

The present report, Ground Water Year Book 2014 -15, is the outcome of efforts made by Dr. R.K. Prasad, Scientist ‘B’ (HM), Sri Anmol Sharma, Assistant Hydrogeologist Puja Mehrotra, Scientist ‘C’ (Chemist), Sri D.N. Arun, Regional Director(retired). Their efforts in compilation of report are praise worthy. The input data is generated by the untiring efforts of technical personnel in the field and chemical lab.

It is hoped that the information and data presented will be of immense use to planners and ground water managers associated with the development and management of ground water resources in the state.

## **EXECUTIVE SUMMARY**

The state of Uttar Pradesh covering an area of 2,40,928 Sq. km. forms a part of the vast Gangetic plain. It is a south easterly sloping flat terrain with a gentle, variable land slope, steeper in western part and flattening eastward. The river Ganga is the major drainage with Yamuna, Ram Ganga, Gomti and Ghagra as its main tributaries. The state is characterized by sub-tropical climate. The average annual rainfall is around 1000 mm, 85% of which occurs during monsoon period. The rainfall is highest in northern and eastern part of the state which gradually decreases towards west and south west.

The state consists of two geomorphic units (i) Ganga plains (ii) Bundelkhand plateau. The Ganga plain covers nearly 85% area and is underlain by a thick pile of unconsolidated alluvial sediments of Quaternary age overlying the Precambrian basement. These sediments consist of sands of different grades with clay, silt and occasional gravel and kankar. The southern part of the state comprises of hard rocks of Bijawar and Vindhyan groups. The alluvium forms a very rich reservoir of ground water. The exploratory data have shown that ground water occurs in a multiple aquifer system which can broadly be divided into four groups. The shallow aquifer is being extensively exploited and hence is under heavy stress.

The plentiful availability of ground water in the state has led to high level of development in certain parts of the state. The monitoring of hydrological regime is of utmost importance for a scientific and planned management of the resource. Central Ground water Board has been monitoring the ground water regime since 1969 and has generated a vast database to understand the behavior of water levels in response to recharge to ground water storage or withdrawal from it. The data is being analysed and reported annually. The present report is one in the series. There are 1241 Ground Water Monitoring Wells as on 01.4.14 out of which 298 are piezometers and 943 open dug wells. The observed number of data varies from season to season on account of problems of approachability to site.

The depth to water level was found to vary from season to season over the state. The percentage of wells showing water level depth of different range during the year is summarised below:

DEPTH RANGE (m)	No. and Percentage of wells			
	May'14	Aug'14	Nov'14	Jan'15
0-2	22(2.1%)	189(19.6%)	121(12.9%)	66(8.6%)
2-5	391(37.6%)	333(34.6%)	354(37.8%)	312(40.6%)
5-10	404(38.9%)	262(27.2%)	270 (28.8%)	249(32.4%)
10-20	180(17.3%)	143(14.8%)	151(16.1%)	111(14.5%)
>20	39(3.7%)	32(3.3%)	38(4%)	27(3.5%)

The different range of depth to water level in different seasons show that ground water was recharged due to rainfall infiltration during monsoon. During the monsoon period (Aug'14) water levels of less than 2 mbgl is observed at 19.6% of the wells causing water logging in canal command areas. The number of wells showing water level in the range 2-5 m decreased in Aug'14 and increased in Nov'14. The number of wells showing water level in the range 5-10 m reduces in Aug'14 and further increases in Nov'14. The deep water level area remained stable indicating very less immediate response to rainfall.

The quantum of fluctuation during the year was assessed using pre and post monsoon DWL data of the year. The data indicates that 95% of well have shown a rise. The replenishment of ground water has taken place during monsoon.

#### Fluctuation Change of Groundwater Storage in U.P. (2014-15)

Magnitude of Change (m)	May'14 – Nov'14		May'14 – Jan'15	
	Rise (%)	Fall (%)	Rise (%)	Fall (%)
0-2	46.2	33.7	54	4
2-4	14.8	1	31	0.40
>4	1.4	0.79	10	0.40

The quantum of fluctuation during the year was assessed using pre and post monsoon DWL data of the year. The fluctuation of DWL between May'14 and Jan'15 indicate that 95% wells show rise and 5% fall. The behavior of water level during the year was compared with previous year which on district level have been presented in the present report. The position of the state as a whole may be evaluated from the following figures:

### Annual Fluctuation in Water Level During 2014 –15, U.P.

FLUCTUATION RANGE	May 13 - May 14		August 13 - August 14		November 13 - November 14		January 14 - January 15	
	Rise (%)	Fall (%)	Rise (%)	Fall (%)	Rise (%)	Fall (%)	Rise (%)	Fall (%)
0-2	470 (58.8%)	224 (28%)	154 (20.39%)	392 (51.9%)	167 (20.9%)	476 (59.7%)	76 (11.6%)	465 (71.4%)
2-4	65 (8.1%)	14 (1.7%)	22 (2.9%)	130 (17.2%)	8 (1%)	110 (13.8%)	3 (0.46%)	89 (13.6%)
>4	10 (1.2%)	7 (0.87)	8 (1%)	5 (5.6%)	1 (0.12%)	28 (3.5%)	1 (0.15%)	15
TOTAL	545 (68.2%)	245 (30.7%)	184 (24.3%)	565 (74.8%)	176 (22.1%)	614 (77.13%)	80 (12.2%)	569 (87.4%)

From the analysis of table it is evident that the water level has shown a fall in more than half of the wells in August'14, November'14 and January'15 as compared to previous years. This is due to less monsoon rainfall experienced in almost all parts of the state in 2014. The magnitude of rise and decline is largely 0 – 2m.

The behavior of water level on long term basis has been studied by comparing the current water level with the ten year average water level. This would take into account the various highs and lows and give a more realistic picture. The status for the state as a whole is summarized as under:

### DECADAL FLUCTUATION 2014 – 15, U.P.

FLUCTUATION RANGE	Mean May(2004-13) to May'14		Mean August(2004-13) to August'14		Mean Nov(2004-13) to November'14		Mean Jan(2005-14) to January'15	
	Rise (%)	Fall (%)	Rise (%)	Fall (%)	Rise (%)	Fall (%)	Rise (%)	Fall (%)
0-2	447 (49.7%)	293 (32.6%)	260 (31.4%)	406 (49.1%)	251 (29.7%)	459 (54.3%)	209 (30.3%)	402 (58.4%)
2-4	95 (10.5%)	31 (3.4%)	42 (5.0%)	92 (11.1%)	22 (2.6%)	88 (10.4%)	11 (1.5%)	53 (7.7%)
>4	20 (2.2%)	8 (0.89%)	11 (1.33%)	15 (1.8%)	4 (0.47%)	21 (2.4%)	4 (0.58%)	9 (1.3%)
Total	562 (62.5%)	332 (36.9%)	313 (37.8%)	513 (62.1%)	277 (32.7%)	568 (67.2%)	224 (32.5%)	464 (67.4%)

From the analysis of table it is evident that 36.9 % of the wells have shown the water level fall in May'14 as compared to mean of last ten years. The decline in water level has

gradually increases in more than half of the wells in Aug'14, Nov'14 and January'15 as compared to mean of last ten years because of less monsoonal rain fall in 2014. The changes in water level with respect to mean were confined to a magnitude of 0-2 m. The rise/fall of higher magnitude was limited and isolated in nature.

#### **Trend of Water Level:**

The seasonal, annual and decadal fluctuations give an idea of the behavior of the water level but are subjected to many anomalous factors which give a short term picture. To have a true picture where highs and lows are balanced out, the long term trend for ten years 2005 to 2014 has been worked out and analyzed on the basis of DWL data of Ground Water Monitoring Wells. The pre monsoon, post monsoon and annual trend for the mentioned period is given in Annexure-II.

The declining trend data during Pre-monsoon for the period 2005-2014 are summarized as follows:

<b>Percentage of wells showing Decline in Pre-monsoon DWL (cm/year)</b>		
<b>0-20cm</b>	<b>20-40 cm</b>	<b>&gt;40 cm</b>
73.1 %	15.8 %	10.7 %

There is a declining trend in 51.4% of the monitoring wells covering over 10 years period. Decline of 0 – 20 cm/yr is most extensive covering 73% wells followed by 20 – 40 cm/yr in 15.8% wells and >40 cm/yr in 10.7%. The low decline is spread all over the state but dominant in eastern and central parts and along Terai belt of the state. Higher decline occurs in most of the districts of western and southern regions. There is a rise in trend in 49.6 % of the monitoring wells over 10 years period.

The declining trend data during Post-monsoon for the period 2005-2014 are summarized as follows:

<b>Percentage of wells showing Decline in Post-monsoon DWL (cm/year)</b>		
<b>0-20cm</b>	<b>20-40 cm</b>	<b>&gt;40 cm</b>
71%	13.9 %	13.9 %

There is a declining trend in 50.6% of the monitoring wells over 10 years period. Decline of 0 – 20 cm/yr is most extensive covering 71% wells followed by 20 – 40 cm/yr in 13.9% wells and >40 cm/yr also in 13.9% wells. The low decline is spread all over the state but dominant in central, eastern part and along Terai belt of the state. Higher decline occurs in most of the districts of western, north western and southern parts and along Yamuna River. There is a rise in trend of 50.4 % of the monitoring wells over 10 years period.

## **GROUND WATER YEAR BOOK**

### **UTTAR PRADESH (2014 – 15)**

#### **CHAPTER 1 INTRODUCTION**

The State of Uttar Pradesh forms a part of vast Gangetic Alluvial Plain covering an area of 2,40,928 Sq. Km. and lies between North latitude  $23^{\circ}52'12''$  &  $30^{\circ}24'30''$  and East longitude  $77^{\circ}05'38''$  &  $84^{\circ}38'30''$ . It is bounded by Uttaranchal on the NW, Nepal on the NE, Bihar on the East, Madhya Pradesh in the South, and Haryana, Delhi & Rajasthan in the West.

The state is covered with rich fertile soil and underlain by a large thickness of alluvium making it one of the richest ground water repositories of the world. Ground water is a major source of fresh water on earth. It is the most dependable source of water, comparatively free from the vagaries of nature, easily accessible, available at the point of use and economical. Hence it is being developed indiscriminately and the ground water reservoir is stressed. The State being the most populous in the country with a population density of 649 persons per sq. km and a high rate of population growth (26%) its demand for water is soaring. Also due to industrialization, urbanization and modern farming practices its quality is also at stake.

The food production in UP is commensurate with the self sufficiency of the country. One of the major contributors for this sufficiency is irrigation. To meet this high irrigational requirement, water resources are being increasingly developed. Ground water contributes to about 71% of the irrigation needs of the State. The indiscriminate development of ground water has resulted in depletion of groundwater storage and lowering of water level in certain areas on one hand. On other side the surface water development in areas having shallow water level has resulted in water logging and soil salinisation.

All these negative impacts on the resource give rise to the need for regular and continuous monitoring of the ground water regime. The monitoring data forms the base of management practices. In order to manage the water resources and plan development on scientific lines a data base needs to be generated. In view of relative importance of this valuable resource it becomes imperative to adopt sound and scientific management of groundwater resources.

With this in view the Central Ground Water Board, an apex organisation of India in the field of ground water studies has established a network of 1241 monitoring wells, mostly

open wells spread all over the State. These are being monitored four times a year (January, May, August & November). Few wells are being monitored through Participatory monitoring Programme for the remaining eight months. To study the hydro chemical behavior ground water samples are collected from these stations once a year in May and analysed in the Regional chemical laboratory. The data thus generated are carefully analysed and interpreted to study the impact of various developmental activities on the groundwater regime. As dug wells are fast becoming obsolete, these are slowly being replaced by special bore wells for monitoring called Piezometers.

The statistical analysis of water level is carried out to decipher the water level status during different seasons of the year and prepare a zoning. The water levels of different periods are compared to analyse the behavioral patterns. The trend of water level behavior is worked out and future predictions are estimated made. The management programmes are framed safe guarding the environment and meet the requirement to optimal possibility.

Ground water is a dynamic resource, hence it requires continuous monitoring both in terms of quality and quantity. The main objectives of ground water monitoring are :

- To study the behavior of the water level in space and time in response to recharge and discharge.
- To study the long term behavior and trends for future predictions.
- To assess the ground water resource.
- To study the hydro chemical behavior of shallow ground water.
- To develop Artificial Recharge plan.

The district wise status of Ground Water Monitoring Wells (G.W.M.W.) as on 01.4.2015 are shown in Table-1 and location of wells are shown in Plate -1

## **Chapter 2**

### **PHYSIOGRAPHY AND DRAINAGE**

The State of Uttar Pradesh can broadly be divided into 2 physiographic units, the Ganga Plain and the Bundelkhand and Vindhyan Plateau.

The Ganga Plain covering 85% of the State is a vast, flat expanse of alluvium having a gentle south easterly regional slope. The highest elevation is around 350 mamsl in the north western parts and lowest 60 mamsl in extreme south eastern part of the state. The land slope is variable, being steep in the north western parts and gradually diminishing south east wards. The slope ranges between less than a metre per kilometer to 5m/km. This Plain has three subdivisions – the Terai in the northwest, the Central Ganga Plain in the centre and the Marginal alluvial Plain in the south.

The southern part of the state south of the Marginal Alluvial Plain is a part of Bundelkhand and Vindhyan plateau. This plateau region slopes northerly and is represented by undulating hilly terrain. The land slope varies from 550 – 130 mamsl in the western part and 650 – 100 mamsl in the eastern part with steeper gradients than those in the northern Ganga plain.

The State forms a part of Ganga basin. The master drainage of the state is river Ganga and its tributaries. The Ramganga, Ghagra and Gomti are the main left bank tributaries, while the Yamuna is the main right bank tributary. All these rivers except Gomti originate from Himalayan ranges and are snow fed. Initially the rivers flow southward in the northwestern part of the State, then turn south eastward and finally leave the State in an easterly direction.

## **Chapter 3**

### **CLIMATE AND RAINFALL**

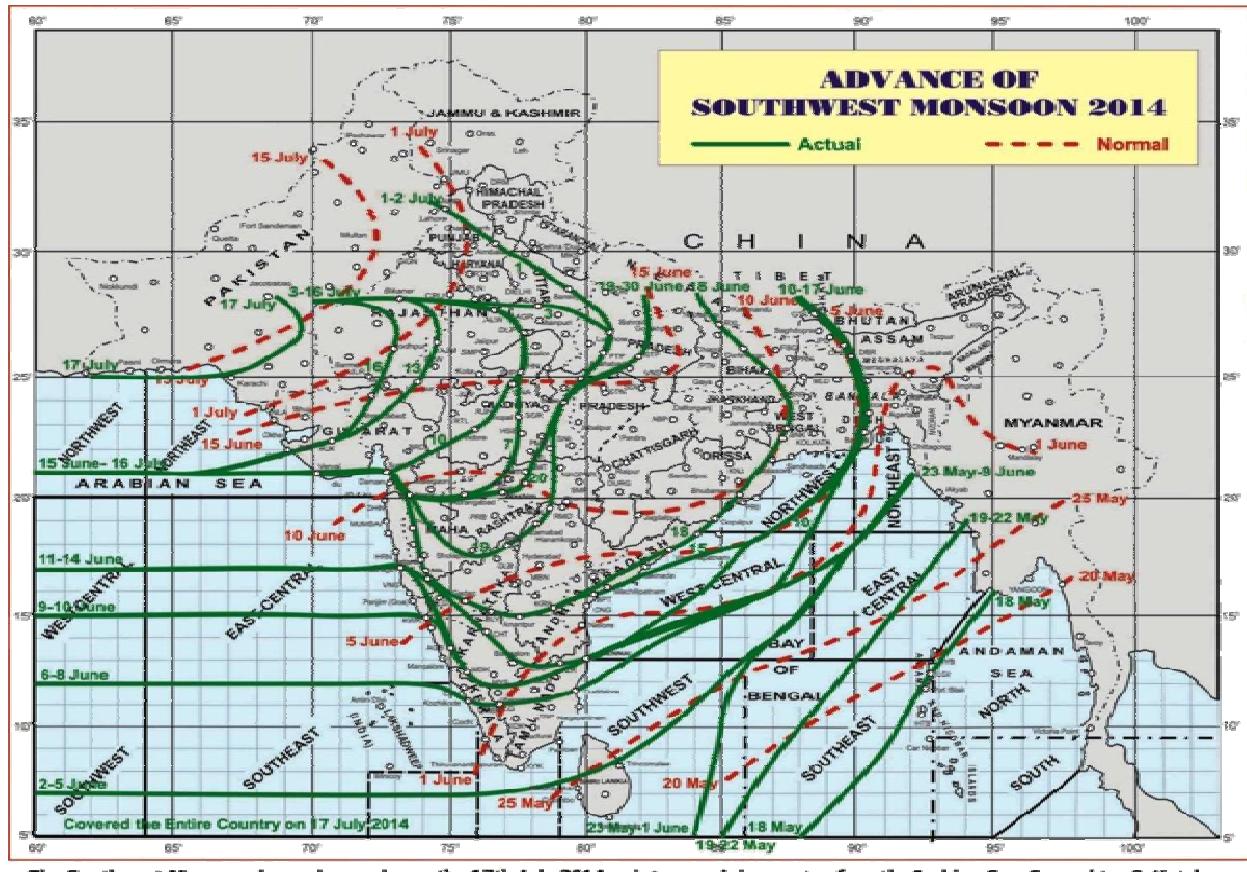

The State experiences a sub-humid and tropical climate with three distinct seasons summer, monsoon & winter. The intervening periods are transitional period on the basis of IMD long term normal data. The summer is hot and dry with maximum daily temperature ranging between 38°C. to 43°C. The humidity during this season is lowest ranging between 30% to 53% at 08.30 hrs and 18% to 42% at 17.30 hrs. Summer seasons ends by May and transition period starts. The rainy season commences by late June when south western monsoon sets in over the State. The humidity gradually increases and reaches above 80%. August is the peak rainy season. The bulk of annual rainfall about 85% occurs during monsoon period (June to September). The monsoon starts retreating from the State in late September or early October. Then commences another transitional period followed by winter from late November till February. January is the coldest month of the period. Another transitional period follows between winter and summer.

There is large variation in temperature both in time and space. The lowest temperature is observed during January when night temperature ranges between 2°C & 6°C over the state. With the start of summer the temperature starts rising with maximum during May when the mercury may touch 45°C in central and eastern parts of the State. Gradually with the beginning of rainy season the temperature drops which again shows a mild rising trend during the intervening period before winter (October, November). The wind speed varies between 8-10 km/hr during summer season and 4-6 km/hr during winter and rainy seasons. The wind is mainly south westerly during summer and south easterly during winter. The Normal annual potential Evapotranspiration of Uttar Pradesh is 1491.5 mm. The Normal annual potential Evapotranspiration of East Uttar Pradesh is 1484.0 mm and of West Uttar Pradesh is 1499.0 mm. The monthly normal potential Evapotranspiration is high in hot months and low in winter months. Normal potential Evapotranspiration is highest in the month of May with value of 217.8 mm followed by June with value of 201.6 mm. The normal potential Evapotranspiration is lowest in the month of December with value of 50.7 mm followed by January with value of 55.6 mm.

The South West Monsoon entered in East Uttar Pradesh on 17<sup>th</sup> June, 2 days later than its normal dates of 15<sup>th</sup> June and covered whole Uttar Pradesh for 14 days later i.e. on 14<sup>th</sup> July. The

southwest monsoon currents covered the entire country by 17<sup>th</sup> July, 2 days later than its normal date of 15<sup>th</sup> July. Withdrawal of monsoon from West Uttar Pradesh commenced on 27<sup>th</sup> September against its normal date of 15<sup>th</sup> September and it completely withdrew from the state on 18<sup>th</sup> October. Isochrones of advance of Monsoon and withdrawal of monsoon 2014 are shown in fig1 and fig.2

#### Rainfall :

The rainfall is variable over the State ranging from above 1600 mm in the southern part to above 350 mm in the north- western part of the State. In central part of the state annual rainfall is received above 700 mm. The normal rainfall of the State for the year 2014 is 846.5 mm and the actual amount of rainfall received is 447.6 mm (IMD monsoon report 2014). So there is negative deviation of 47% from normal. The rainfall distribution was very uneven over the State. Out of 71 districts of Uttar Pradesh 42 districts received deficient, 26 districts received scanty, 2 districts received normal and only 1 district received

excess rainfalls. Overall this year 59% area received deficit, 37% received scanty, 3% area received normal and 1% area of Uttar Pradesh received excess rainfall. So it gives clear indication that monsoon remained weak for the state. The rainfall distribution of the State during monsoon season is shown in table 1 and monthly distribution of monsoonal rainfall for the state and its two meteorological sub-station –East Uttar Pradesh and West Uttar Pradesh is shown in table 1(a-c).

**Table 1: Rainfall Distribution of the State (June – September 2014)**

Region	Actual (in mm)	Long period average (LPA) ( in mm)	Departure from normal ( in %)
Uttar Pradesh	447.6	846.5	-47
East- UP	518.1	897.5	-42
West-UP	340.3	768.8	-56

**Table 1a: Monthly distribution of rainfall over the state-U.P- 2014**

MONTH	Actual Rainfall (in mm)	Normal Rainfall (in mm)	% Departure from Normal
June	37.5	93.2	-60
July	196.2	282.3	-30
August	115.2	293.1	-61
September	98.7	177.9	-44

**Table 1b: Monthly distribution of rainfall over the East Uttar Pradesh-2014**

MONTH	Actual Rainfall (in mm)	Normal Rainfall (in mm)	% Departure from Normal
June	47.8	107.7	-56
July	224.5	297.9	-25
August	138.1	294.5	-53
September	107.7	197.4	-45

**Table 1c: Monthly distribution of rainfall over the West Uttar Pradesh-2014**

MONTH	Actual Rainfall (in mm)	Normal Rainfall (in mm)	% Departure from Normal
June	218	71.1	-69
July	153.1	258.4	-41
August	80.4	291.0	-72
September	85.0	148.3	-43

The results of the above table suggest that, the month wise rainfall over the state during June and August was scanty and July and September was deficient and was of the order of 40%, 70%, 39% and 56% for June, July, August and September respectively of

its monthly LPAs. During monsoon period 2014, the amount of rainfall (in terms of % of LPA) was more over the East-UP as compare to West-UP. This year 68% areas of East-UP received deficient rainfall, 24% areas received scanty rainfall, 5% areas received normal rainfall and only 3% areas received excess rainfall. In the West-UP, 53% areas received scanty rainfall and 47% areas received deficient rainfall. In this way performance of monsoon 2014 was poor over West-UP in compare to East-UP.

District wise monsoonal rainfall for year 2014 is given in table 2. The cumulative seasonal rainfall for the State as a whole was 53% of its LPA, East-Uttar Pradesh 58% of its LP A and West Uttar Pradesh 44% of its LPA. The rainfall distribution was very uneven over the State. Out of 71 districts of Uttar Pradesh 42 districts received deficient rainfall, 26 districts received scanty rainfall, 2 districts received normal rainfall and only 1 district received excess rainfall. Shrawasti district got the highest rainfall (127%) and Gautam Buddh Nagar least rainfall (23%) of its LPA.

## Chapter 4

### HYDROGEOLOGICAL FRAME WORK

The geology and structure of the formations existing in an area control occurrence and movement of ground water. The geomorphic conditions also have a great impact on ground water scenario. The larger part of the State is underlain by fluvial sediments laid down in the fore deep between Plateau region in south and Himalayas in north during the Quaternary period by the Indus-Ganga system of drainage over the Precambrian topography existing during geological past. These deposits owe their origin to riverine activity. The southern part of the State has entirely different geological conditions being underlain by Precambrian formations under a thin alluvial cover. Broadly, the State can be divided into two hydrogeological units.

1. Unconsolidated zone.
2. Consolidated, hard rock zone.

The hydrogeological conditions of the above two units widely differ and are discussed subsequently in brief.

#### **Unconsolidated Zone:**

This unit covers nearly 85% of the State area. The unconsolidated formations comprising the area have been deposited through mighty rivers originating from great Himalayan Mountains. These sediments are an admixture of pebble, gravel, sand, silt, clay and kankar. The sediments are generally coarser in the north and gradually become finer south east ward along downstream of the drainage which is a typical feature of fluvial deposits. This zone consists of mainly two parts, the Terai and the Alluvial Plain. However, foot hill zone is very small part of Bhaber belt and lies in the northern parts of Bijnore and Saharanpur districts. The Terai is a narrow disconnected belt along the north western fringe of the State. The Alluvial Plain occupies the area south of Terai and can further be divided in two sub units - Younger Alluvium and Older Alluvium.

The younger alluvium occurs mostly along the present day flood plain area. The continuous shifting of the drainage network with time caused reworking of their earlier deposits giving rise to the younger alluvium. The older alluvium occupying comparatively high area covers major part of the Plain. A typical characteristic of older alluvium is formation of kankar within itself due to leaching of calcium carbonate under favourable climatic conditions. The kankar occasionally forms pans restricting downward movement of water.

The thickness of alluvial sediments is variable and generally goes upto 500m. below which occur the semi-consolidated Upper Siwalik formations. The Shallower basement occurs in isolated areas which are known as "Basement highs."

This unconsolidated zone is porous and permeable with primary intergranular porosity and has good ground water potential. The sub-surface correlation of formations in the state has shown presence of several aquifers down to a depth of 750 m below the ground. These aquifers mainly encountered in Central Ganga Plain have been grouped on the basis of lithological characters as well as based on interpretation of electrical logs of Boreholes drilled and are as follows

- |                       |                      |
|-----------------------|----------------------|
| 1. First aquifer      | 0.0 – 150.00 mbgl    |
| 2. Second aquifer     | 160.00 – 210.00 mbgl |
| 3. Third aquifer      | 250.00 – 360.00 mbgl |
| 4. Forth deep aquifer | 380.00 – 600.00 mbgl |

The upper part of first aquifer down to 50 mbgl is the main source of drinking water through hand pumps and dug wells and is unconfined in nature. The first aquifer as a whole which is under unconfined to semi-confined conditions t is the most potential aquifer group which is the main source of groundwater in the State extensively exploited through private as well as Government tube wells to meet the drinking water and irrigation needs. The deeper aquifers are confined in nature being exploited to a very limited extent. The yield of second aquifer is limited while the third aquifer is potential. The shallow and phreatic aquifers are under heavy stress.

### **Consolidated Zone:**

The Bundelkhand Vindhyan plateau region is underlain by variety of Precambrian formations, mostly granite and granite gneisses, Vindhyan sandstone, limestone & shale, under a thin a alluvial cover or without alluvial cover. As such these formations are hard and compact and devoid of any primary porosity. The ground water in these formations occurs in the secondary porosity of these formations. The secondary porosity has developed due to cracks and fractures which are open at the surface and tighten at depth. The ground water occurs under unconfined or water level conditions in these formations. The alluvial sediments of moderate depth along the river courses and in valleys form potential groundwater repositories. The weathered mantle over the entire unit also forms potential aquifers. These aquifers are being monitored mostly through open wells over the area.

## **Chapter 5**

### **BEHAVIOUR OF WATER LEVEL**

The groundwater storage is largely controlled by the prevailing hydrogeological and geomorphic conditions. Besides, magnitude of input (recharge) to the ground water system and output (discharge) from it also influences the status of groundwater regime. In the State of Uttar Pradesh hydrogeological as well as the geomorphological conditions are highly variable as evident from earlier chapters. The chief source of recharge to storage is rainfall which is highly variable over space and time. The main source of discharge is ground water abstraction which is also varying and also growing exponentially. The regions having ground water as the main source for irrigation always remain under heavy stress. The imbalance between the recharge and discharge expresses itself in terms of variations in the ground water level. Thus, the water level is a very important parameter for ground water studies. The behavior of the water level in the state during year 2014-15 has been studied based upon the observations made on the permanent Ground Water Monitoring Wells and described in the following paragraphs.

#### **Depth to Water Level during 2014 -15**

The depth to ground water level in the state is highly variable throughout the year ranging from ground level to 38.5 m bgl. The distribution pattern remains same during the year with the areas under different ranges increasing/reducing in different seasons.

The water level in general increases from north-east to south-west roughly parallel to the northern boundary of the State. The shallow water level occurs in the north, north eastern part and parts of central region of the state. The moderate water level occurs in the north western part, the central part and along the southern boundary. The deeper water level occurs in the western part, along Yamuna river, parts of southern U.P. and cities.

There are four canal command areas in the state but these do not have the same depth to water level pattern and all do not necessarily show very shallow ground water levels. The Gandak and Saryu command areas in general show very shallow water level 2 – 5 mbgl and water logging conditions exists in the monsoon and post monsoon period with few areas within these zones showing 5 – 10 mbgl. Generally the larger areas in Sharda Sahayak command fall

under 5 – 10 mbgl water level range. In comparison to above commands, in Ramganga command the water level is generally deeper falling in the range of 5 – 10 mbgl in the north eastern part and 10 – 20 mbgl in the south western part along the River Yamuna.

The different water level zones are controlled by geomorphological features such as flood plains, natural levees of main rivers, interfluves areas etc. as well as by the nature of deposits.

#### **May 2014 :**

This is the pre-monsoon period as it appears after one complete cycle of inputs and outputs. Generally this period shows the deepest water levels during the year. May is the dry season and the water levels are used for most of the ground water calculations.

In general water level ranges mostly from 2 to 20 m bgl, however parts of the state show variation 20 m bgl or above. The water levels in the range of 0 to 2 m bgl (i.e., water logged condition) is observed only in 22 wells.

Water level in the range of 2 - 5 mbgl is observed in 391 Monitoring Wells (about 37.6%). Along the Terai belt, extending from parts of Saharnapur to Siddarhnagar and upto Ballia in eastern U.P. through major parts of Lakhimpur Kheri, Bahrach, Shrawasti, Balrampur, Deoria, Kushinagar, Sitapur, Basti, Gonda, Faizabad, Maharajganj and Pilibhit districts, the water level ranges from 2 - 5 m bgl. There are patches in Aligarh, Allahabad, Auraiya, Barabanki, Bareilly, Chandauli, Jalaun, Hardoi, Hathras, Kanpur Nagar, Kanpur Dehat, Lalitpur, Mainpuri, Jhansi, Mathura, Moradabad, Rae Bareli, Rampur, Shahjahanpur and Unnao districts showing depth to water levels from 2 to 5 m bgl.

About 38.9 % of wells (404 nos.) show water level between 5 and 10 m bgl. This area is observed in almost all parts of U.P. The water level of 5 to 10 mbgl is observed in major parts of districts of Aligarh, Auraiya, Allahabad, Ambedkar Nagar, Azamgarh, Ballia, Barabanki, Bareilly, Banda, Badaun, Chandauli, Deoria, Faizabad, Bulandsahar, Etah, Etawah, Farrukhabad, Ghazipur, Ghaziabad, Gorakhpur, Hardoi, Jaunpur, Jhansi, Jalaun, Kheri, Kannauj, Kanpur Dehat, Lalitpur, Lucknow, Mahoba, Mau, Meerut, Mirzapur, Pratapgarh, Rae Bareli, Shahjahanpur, Sitapur, Sonbhadra , Sultanpur and Unnao.

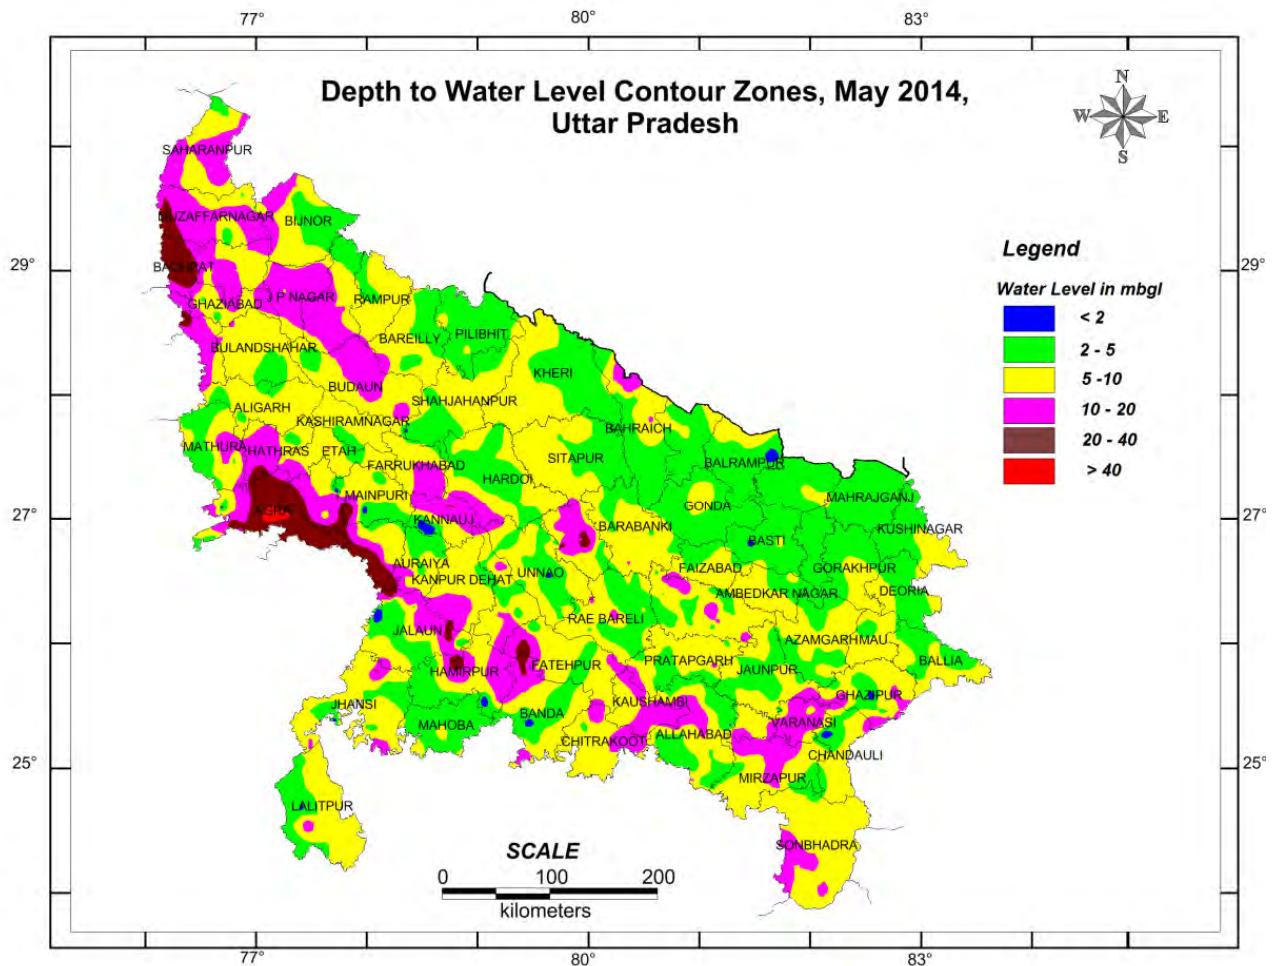

180 wells (about 17.3%), show water levels between 10 and 20 m bgl. Along the Ganga river, the water levels are generally 10-20 m bgl in Kanpur, Mirzapur, Kaushambi, Fatehpur, Kaushambi and Allahabad districts. Similarly, all along river Yamuna right from Mathura to Allahabad district, a narrow strip shows deeper water levels in the range of 10 - 20 m bgl. This strip widens at Agra, Fatehpur, Hamirpur, Chitrakoot and Banda districts.

Along the Betwa river, a tributary of Yamuna river, the deeper water levels are encountered. Few patches falling in this range are observed in western U.P. in Muzzafarnagar, Meerut, Gaziabad, Gautam Buddha Nagar, J.P. Nagar, Budayun, Hathras, districts .This range is generally observed in almost all parts of Lucknow city. In major parts of Varanasi, and Pratapgarh districts depth to water level have been observed in this range.

Only 39 (about 3.7%) Monitoring Wells fall in the range of more than 20 m bgl water level. The water levels in this range are observed along a narrow strip along Yamuna river, from parts of Agra upto Kaushambi through Etawah, Banda, Fatehpur, Jalaun, and along Betwa river in Hamirpur district. Deeper levels owe to the ravenous tract along these rivers. In parts of Lucknow city, water level in this range is observed.

The district wise categorization table of water level during May 2014 is presented in table-3 and the pictorial view is shown in Plate –IV.

Plate IV

## **August 2014:**

The water level during August indicates the immediate impact of rain fall on ground water storage. This is the month of peak monsoon rainfall hence this measurement is carried out to get the peak of the water level hydrograph. The water level rises in response to rainfall.

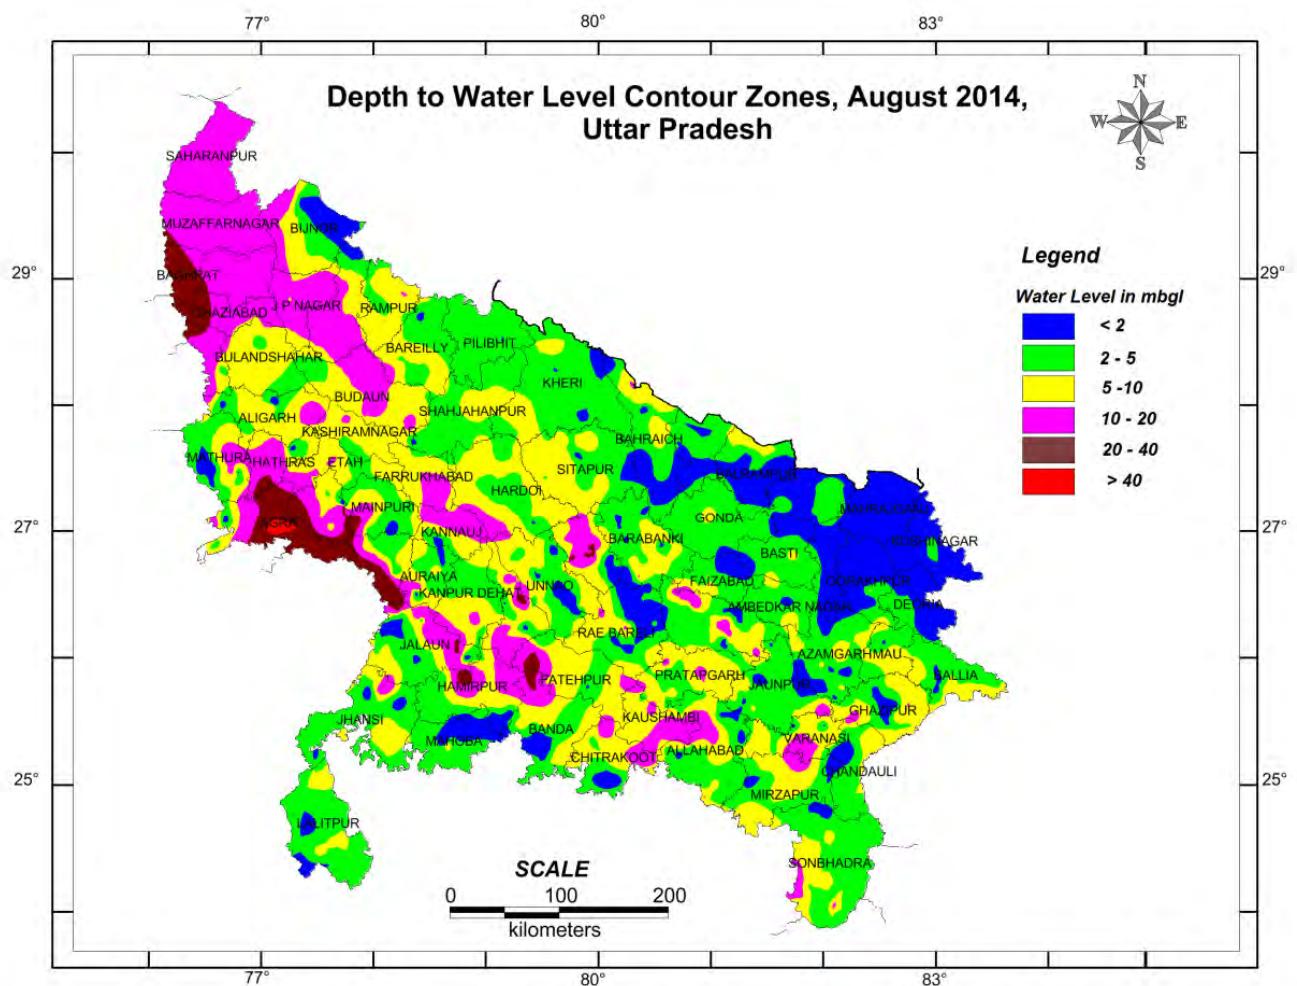

Water level has become shallower in large part of the state, with more impact of rainfall seen in areas where the water level was less than 5 mbgl. The water logged areas increased and the deeper water level areas had shrunk. The distribution of water level from less than 2 m bgl to 10 mbgl shows the three ranges of 0–2, 2–5, and 5–10 mbgl occurring in 19.3%, 34.6%, and 27.2% wells respectively. Deeper water level areas of 10 – 20 mbgl have reduced to 14.8% but occur in the same areas along the River Yamuna.

The water logged area has increased. The depth to water levels from 0 to 2 m bgl is found in 189 wells (19.3%) mainly in Saryu and parts of Gandak canal command areas. Water level in the range of 2 - 5 m bgl is observed in 333 wells (34.6%) in most districts of the state except in western U.P. The depth to water levels from 5 to 10 m bgl occurs all along the Ganga, Yamuna and Ganga-Yamuna interfluvial area in patches right from Saharanpur upto Sonbhadra district. Along RamGanga and Betwa rivers water level falls in this range. A total no. of 262 wells

( 27. 2%) fall in this category. The water levels between 10 and 20m bgl. are observed at 143 wells (14.2%). This range is encountered mostly along the Yamuna river from Mathura upto Allahabad and upto part of Varanasi along Ganga river. Parts of districts of western U.P. show this range. In Lucknow city water level in the range of 10 to 20 m bgl is observed. The deeper water levels along Yamuna River are mainly due to higher elevation of natural levee formed on either side of the river. The depth range of 20 m bgl. and more is found only along the Yamuna river between Agra and Hamirpur and Bagpat districts. Only 38 wells (4%) show depth to water levels greater than 20m. These areas showing deeper water levels are due to presence of ravenous tract along the river Yamuna. Many wells in Lucknow city show this range.

The district wise categorization table of water level during August 2014 is presented in table-4 and the pictorial view is shown in Plate-V.

**Plate V**

### November 2014:

The water level starts receding gradually after August with lateral flow of ground water due to change hydraulic conditions with recession of monsoon and ground water storage. The water level stabilizes by November and there after natural out flow reduces considerably. This is the post monsoon water level which reflects the change in ground water storage which is the dynamic ground water resource. The volume of water available in storage may be safely used during the remaining year. This water level is an important parameter for resource estimation, planning etc.

Water logged area showing DWL 0-2 mbgl reduced from August'14 and shown by 12.9% of wells. The depth to water level was shallow, falling in the range of 2 – 5 mbgl over a larger area and observed at 37.8% of the wells monitored, followed by water level in the

range of 5 – 10 mbgl as observed at 28.8% of wells. The moderate (DWL 10 –20 mbgl) and deep water level areas (DWL> 20 mbgl) were noticed at 16.1% and 4% wells respectively.

The depth to water level from 0 to 2 m bgl. is observed in 121( 12.9% of the monitored wells). Area falling under this category are located in patches in Allahabad, Auraiya, Ambedkar Nagar, Ballia, Banda, Bahraich, Basti, Bijnor, Balrampur, Chandauli, Deoria, Gonda, Gazipur, Faizabad, Jaunpur, Kushinagar, Maharajganj, Mathura, Mahoba, Rae Bareli, Sitapur, and Unnao districts.

A large number of wells i.e., 354 (about 37.8% of the monitored wells) show depth to water levels from 2 to 5 m bgl. Largest area of state is covered under this category. This range is observed in most parts of the districts in Terai, Eastern, Central U.P and few districts of Bundelkhand region. Along the Gomti, Ghaghra and Sharda rivers water level ranges from 2 to 5 mbgl. Most parts of districts of eastern U.P. and Terai region show DWL < 5mbgl.

The water levels between 5 and 10 m bgl. is observed at 270 wells(28.8%). This range is prominent in Western, Central & Southern U.P. A thin strip showing this range runs along the Ganga river, and extends over the Ganga - Ramganga interfluve area. This range is also seen along the Ganga-Yamuna doab from Aligarh up to Allahabad through Mathura, Kanpur Dehat, Kanpur Nagar, Jalaun, Hamirpur and Banda. On both the sides of Betwa river in Jhansi and Jalaun water level are observed to vary from 5 to 10 mbgl.

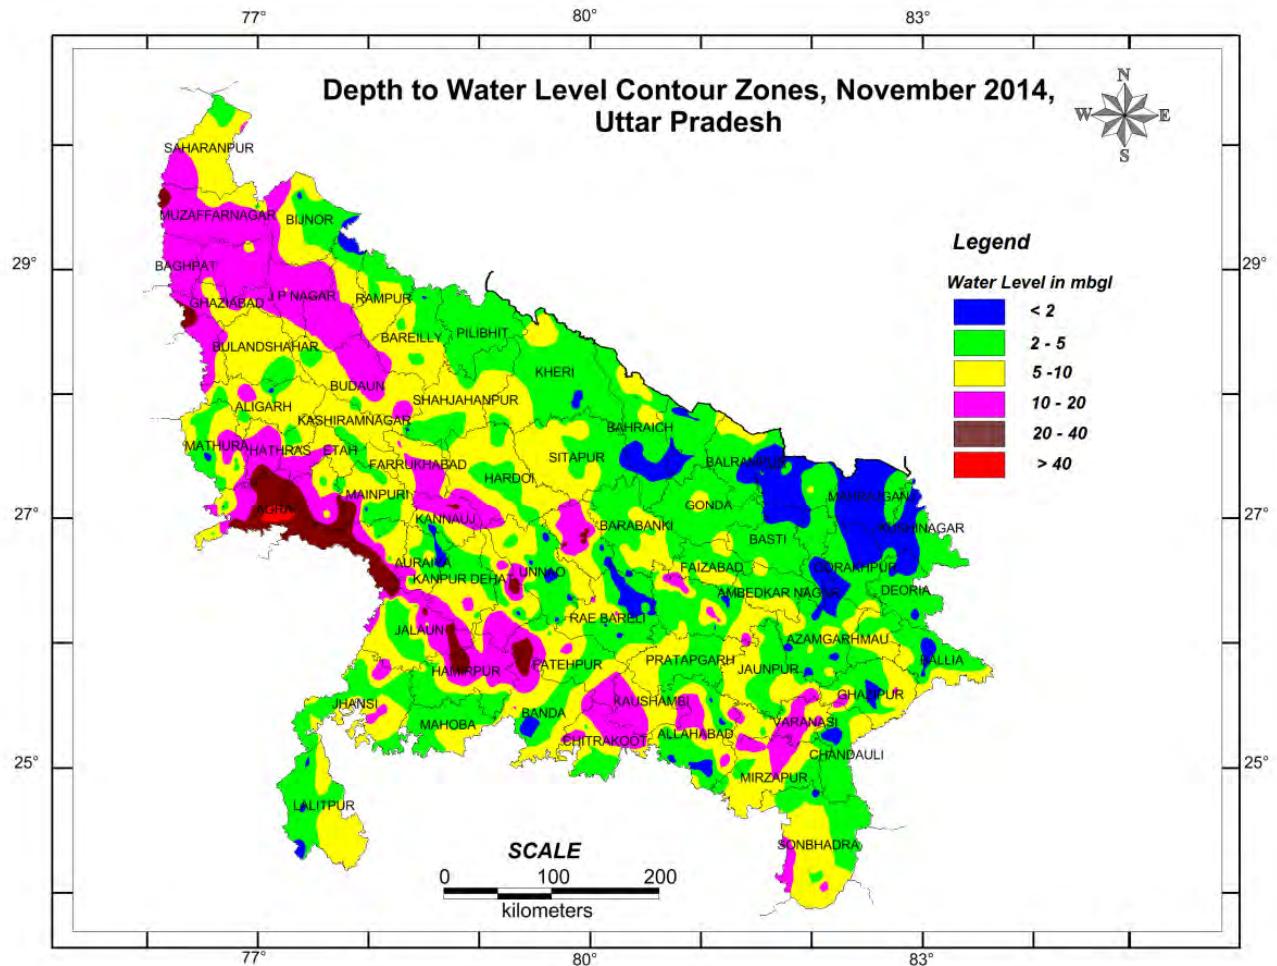

The water levels of 10 to 20 m bgl. is noticed in 151 wells(16.1%), mostly along the Yamuna river upto Varanasi, through Mathura, Agra, Kanpur, Jalaun, Fatehpur,Hamirpur ,Chitrakoot and Banda districts. This is mainly due to higher elevation of natural levee formed on either side of the Yamuna river. Most parts of districts of western U.P. - Muzaffarnagar, Meerut, Ghaziabad, G.B.Nagar, J.P.Nagar, Moradabad, show water level in this range. Few patches are seen in Agra, Allahabad, Bijnor, Chitrakoot, Fatehpur, Ghazipur, Hamirpur, Hathras, Kaushambi, Pratapgarh, Sultanpur and Unnao districts. Along the Ganga river a wide patch shows water level in the range. In Lucknow city water level in this range is observed.

The depth range of 20 m bgl. and more are found along the Yamuna river in Agra, Bagpat, Etawah, Fatehpur, Jalaun, Hamirpur and Kaushambi districts. In Lucknow city DWL in this range is found .Only 38 wells show depth to water levels greater than 20m. These

areas showing deeper water levels are due to bearing of geomorphology as presence of ravenous tract along the Yamuna and Betwa rivers.

The district wise status of water level during the month has been shown in table -5 and pictorial view is shown in Plate-VI.

**Plate VI**

### **January 2015:**

Winter season is the peak season of ground water abstraction for Rabi cultivation. Consequently bulk of ground water storage is depleted during this season which is well reflected in the water level measurement during January 2015.

The depth to water level shows a large variation. The distribution pattern of the various depth ranges is the same only a general deepening in the water level is seen. The water logged area showing depth to water level in the range of 0-2 mbgl has reduced to 8.6%. Water levels in the range of 2-5 and 5-10 mbgl are predominant during this period as

reflected at 40.6% and 32.46% of monitored wells respectively. The moderate water level zone remains at 14.47%. The very deep water level occurs in 3.5% wells. Thus there seems to be a balance between the input and output in these areas. The water level in the range of 0 - 2 mbgl is observed as isolated patches in Ambedkarnagar, Balrampur, Chandauli, Faizabad, Kushinagar, Sitapur, Bahraich, Mahoba, Maharajganj, Jalaun and Lalitpur districts.

The water level in the range of 2 – 5 mbgl is seen in almost all the districts except in western part; being predominantly concentrated along the northern border (Terai region) eastern and North eastern parts of the state and as scattered patches in central and southern part of the State. The depth to water level of 5 - 10 m.bgl is observed predominantly in the central , western, southern and lower eastern parts of U.P from Saharanpur to Sonbhadra districts.

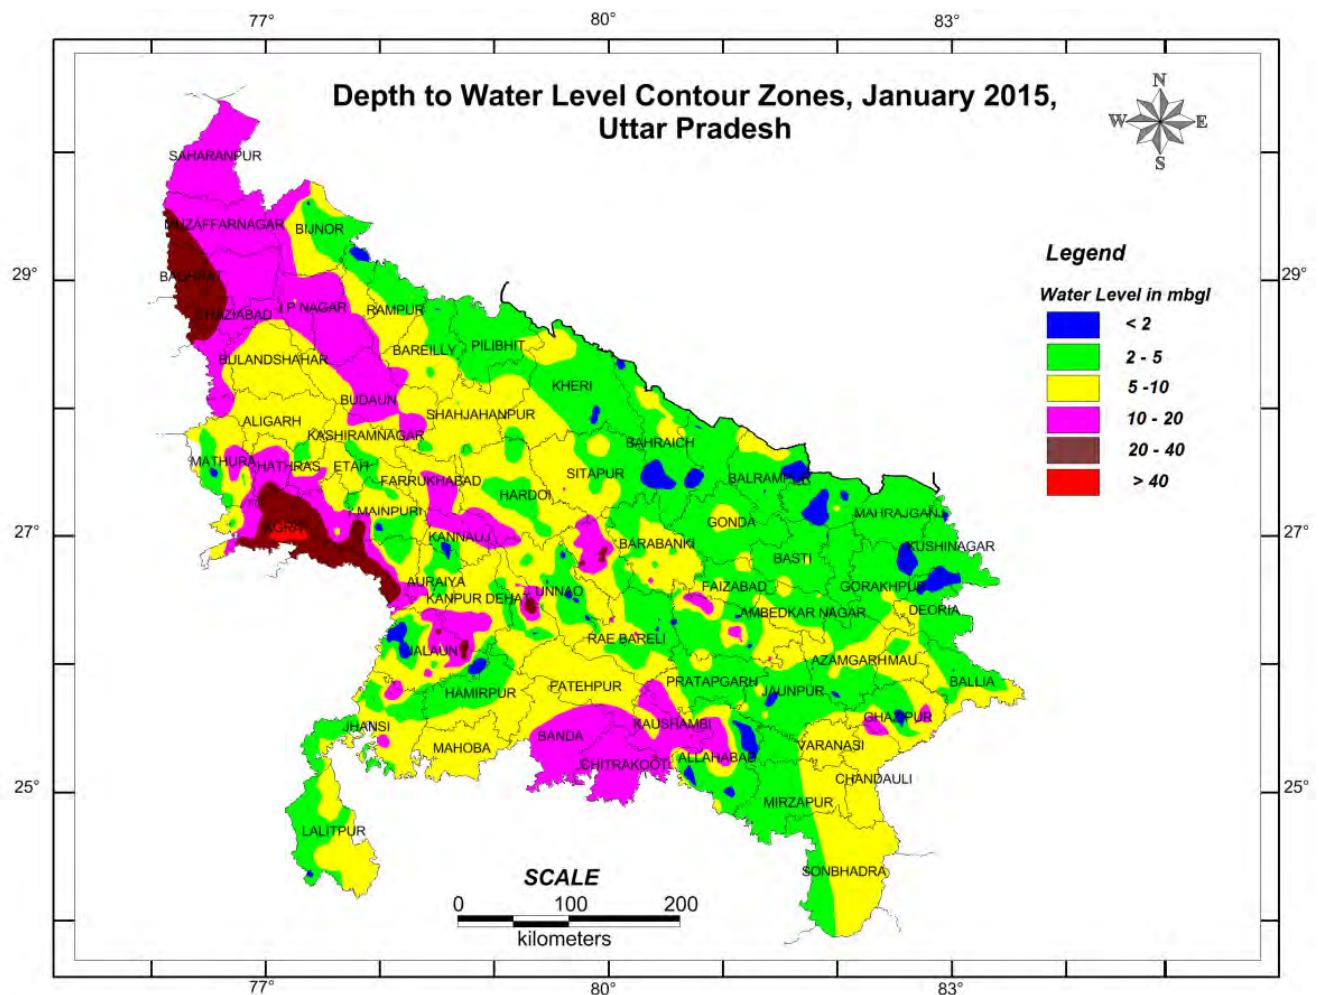

The water level in range of 10-20 m.bgl is observed all along Yamuna river and parts of western U.P.. This range is observed as patches in Agra, Allahabad, Baghpat, Banda, Bijnor ,Chitrakoot, Fatehpur, Gautam Buddha Nagar, Ghaziabad, Ghazipur, Hathras, Hamirpur, Jalaun, Kaushambi, Lucknow, Meerut, Mirzapur, Muzaffar Nagar, Pratapgarh , St.Ravidas Nagar, Sultanpur and Varanasi districts.

The water level of 20 m bgl and more is present only along Yamuna river in isolated patches in Bagpat, Etawah, Fatehpur, Hamirpur, Muzaffarnagar districts. This is due to effluent nature of river Yamuna and also due to higher elevations in the area. In major parts of city area of Lucknow, more than 20 mbgl dwl is observed.

In Gandak and Saryu canal commands water level predominately ranges from 2 to 5 mbgl. Sharda Sahayak canal command shows predominance of DWL between 2 and 10 m.bgl while Ram Ganga canal command shows predominance of 5 - 10 m.bgl water level range.

The district wise status of water level during the month has been shown in Table-6 and the same has been depicted in Plate-VII.

**Plate VII**

A summarized status of water level over the state during different seasons of the year 2014–15 is as follows:

DEPTH RANGE (m)	No. and Percentage of wells			
	May'14	Aug'14	Nov'14	Jan'15
0-2	22(2.1%)	189(19.6%)	121(12.9%)	66(8.6%)
2-5	391(37.6%)	333(34.6%)	354(37.8%)	312(40.6%)
5-10	404(38.9%)	262(27.2%)	270 (28.8%)	249(32.4%)
10-20	180(17.3%)	143(14.8%)	151(16.1%)	111(14.5%)
>20	39(3.7%)	32(3.3%)	38(4%)	27(3.5%)

From the table it is seen that:-

- There is a large variation in water logged area, water logging being maximum during August'14, reducing in Nov'14 and in Jan'15.

2. Shallow water level condition (2-5 m bgl) keeps fluctuating in response to the factors such as rainfall recharge and ground water draft.
3. The area having moderate depth to water level between 5-10 m is maximum in May'14, reducing considerably in August'14 and again increasing in November'14 and January'15.
4. The deep water level conditions (above 10 m bgl) being maximum in May'14 reduces afterward and remain almost same in August'14, November'14 & January'2015.
5. The spatial and temporal distribution of deeper water level zones is more or less constant.

The well-wise Depth to Water level of Ground Water Monitoring Wells of the state for May'14, Aug'14, Nov'14 & Jan'15 is given in **Annexure-I**.

## **Chapter 6**

### **WATER LEVEL FLUCTUATIONS**

Ground water is a dynamic resource and its storage changes in response to many factors such as monsoon rainfall, ground water draft for various purposes, hydrogeological conditions, topography, landuse, cropping pattern, irrigation status – surface and ground water etc. These changes in storage are reflected in form of water level fluctuations. The periodic monitoring of water levels gives an insight into these changes through study of spatial and temporal variations of water level throughout the year. The seasonal, annual and decadal comparisons of the water level data monitored at stations have been done and is analyzed as follows.

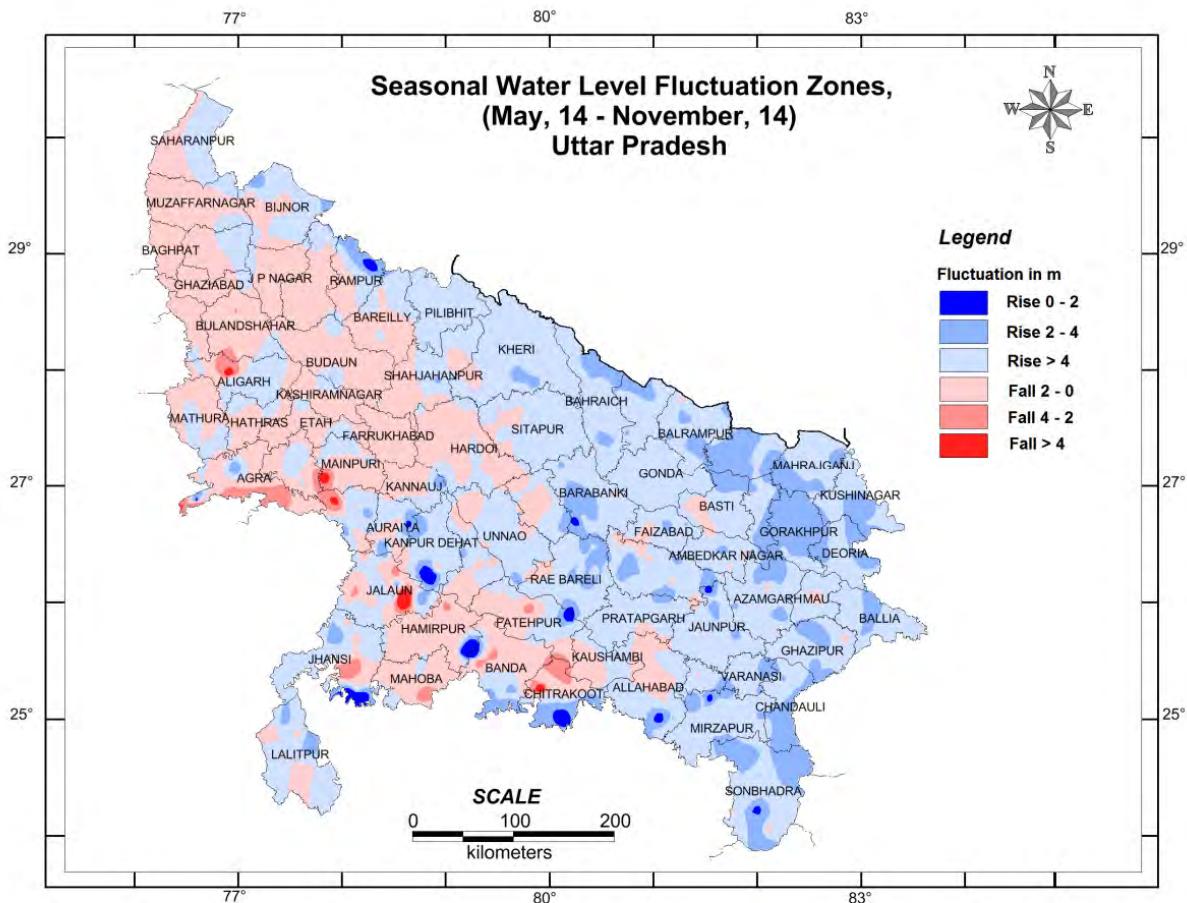

#### **6.1 Seasonal Fluctuation during 2014 -15**

The fluctuation of the water level in a particular year gives a picture of the response to rainfall and ground water extraction. The water level of May, the pre-monsoon water level, which is the lowest water level after all the inputs and outputs during one year, has been compared with that of Post-monsoon water level i.e. November'2014 and January'2015.

#### **May2014 – November 2014**

The difference between the pre and post-monsoon water level of the year, is the most important seasonal fluctuation which gives a clear picture of groundwater potential which could be fruitfully utilized for various uses over the succeeding year. This fluctuation is used to evaluate the dynamic ground water resource through the change in ground water storage. The depth to water level data during pre and post monsoon seasons of the year 2014 has been compiled and computed to estimate the seasonal change in water level. The same has been presented on district level in Table-7 and depicted in Plate-VIII.

Plate-VIII

The district wise data indicate a rise in water level in almost 59.45% of the wells indicating monsoon recharge to ground water. There is a general rise in water levels from 0 to 2 m as noticed at 406 (46.2%) wells. This rise is seen in almost all the districts of the state except north Central part of the state. The rise in water levels in the range of 2 - 4 m is observed in 130 wells (14.8%). This range is observed mostly in eastern and parts of central and southern U.P. But their spatial extent is limited to patches and are confined in Jalaun, Hamirpur, Banda, Chitrakoot of Bundelkhand region and Ballia, Faizabad, Ghaziabad, Mau and Pratapgarh districts of Poorvanchal. The rise of more than 4 m is observed in 98 wells (13%), covering few parts of hard rock areas of Allahabad, Chandauli, Chitrakoot, Fatehpur, Hamirpur, Jalaun, Jhansi, Mirzapur, Pratapgarh, Sonbhadra and Varanasi districts.

During premonsoon period, there are 319 wells (36.33%) shows declining in water level. Fall of 0 to 2 m in water level is observed in 296 wells no. (33.7%) in isolated patches. Fall of 2 to 4 m is noticed only in 16 wells and fall of > 4 m is observed only in 7 wells.

### **May 2014 – January 2015:**

By January the rainfall infiltration starts dissipating and ground water extraction which had come down during the monsoon also starts building up. But the rise in water level continues though at a lower scale. The water level data during pre monsoon period i.e. May'14 and that of January'2015 have been analysed to estimate the change in water levels. The same has been presented on district level in table-8.

There is a rise in water level in 429 no. of analysed wells (59.7%) and a fall in 286 no. (39.83%) of analysed wells. The rise in water levels in the range of 0–2 m is seen in 52% wells covering almost all the districts of the state. Rise of 2 – 4 m is observed at 6.9% wells spread throughout the state. Rise of more than 4 m is observed at 5 analysed wells . About 37.4% of wells (269 no.) of analysed wells show fall of 0-2 m in patches in few districts. 12 no. wells show fall of 2-4m and 5 well show fall of >4m.

The overall picture of change of ground water storage over the entire state during 2014 which emerged from the analysis of pre and post monsoon water level observation and water level fluctuation during May'14 and January'15 has been summarized as follows.

#### **Fluctuation Change of Groundwater Storage in U.P. (2014-15)**

Magnitude of Change (m)	May'14 – Nov'14		May'14 – Jan'15	
	Rise (%)	Fall (%)	Rise (%)	Fall (%)
0-2	46.2	33.7	52	37.4
2-4	14.8	1	6.9	1.67
>4	1.4	0.79	0.69	0.69

It is evident from analyses that ground water has been recharged in most parts of the state and the quantum of recharge is reflected through a rise in water level to a tune of 0-4 m. Number of wells showing rise of 0-2 m in water level from May'2014 to November'2014 and from May'2014 to January'2015 increased from 46.2 to 52% respectively. Percentage of analysed wells showing rise of water level in the range of 2-4 m has decreased from 14.8 - 6.8 in May'2014 to November'2014 and to January'2015 respectively and number of wells showing rise of water level of more than 4 m has remained same of 0.69%.

## **6.2 Annual Fluctuation**

Whereas the seasonal fluctuation in the water level occurs due to rainfall and irrigation as the two main factors during different periods of the year it is the annual fluctuation which gives the net result of one whole cycle of recharge and discharge that has taken place during one year. An annual decline indicates that ground water extraction has been in excess of the rainfall recharge in broad terms.

To evaluate the annual change in groundwater levels during 2014-15 as a resultant of different variables and to develop a strategy for future development, the water level of different seasons over the state was compared to that of the same season in the previous year. The outcome is discussed subsequently in brief.

### **May 2013 –14:**

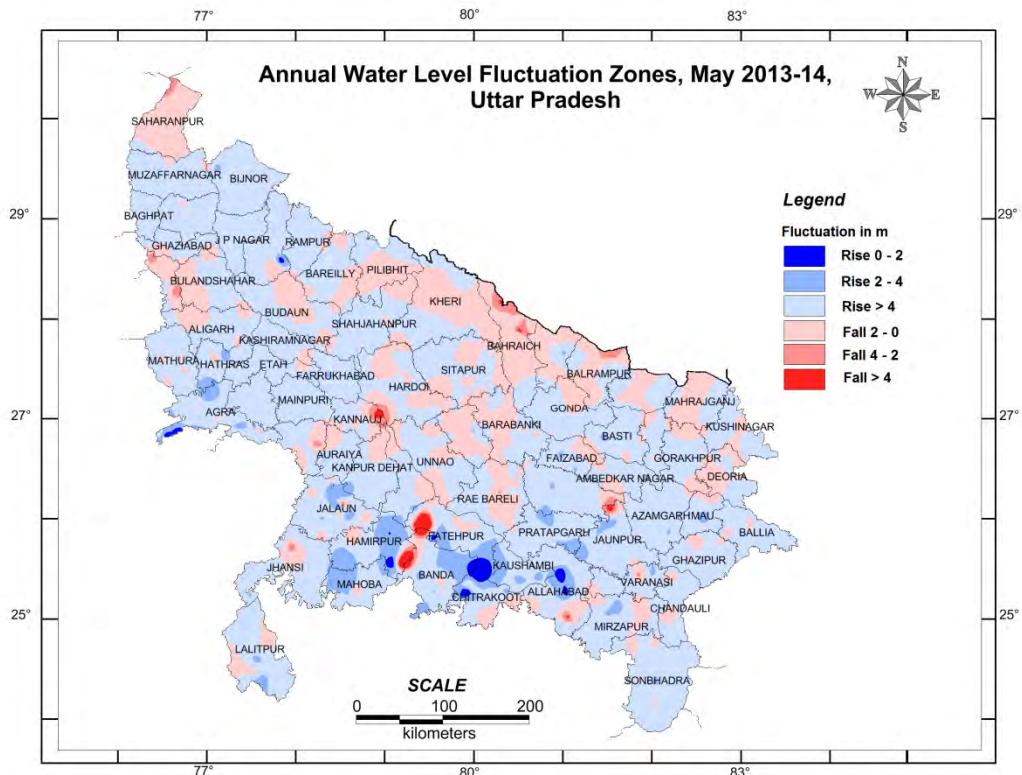

The water level data collected during May'2014 has been compared with May'2013 data to evaluate the rise and fall in water levels since last one year. The wells have been categorised depending on rise and fall in water levels.

It is analysed that 245 no. (30.7%) monitoring wells show fall and 545 no.(68.2%) show rise in water level. The fall of 0 - 2 m is observed in 224 ( 28%) monitoring wells in almost all parts of the state. This fall is prominent in Agra, Aligarh, Ambedkar Nagar, Auraiya, Bahraich, Balrampur, Banda, Barabanki, Bareilly, Bijnor, Budaun, Deoria, Etawah, Faizabad, Firozabad, Ghazipur, Gonda, Gorakhpur, Hathras ,Jhansi, Kanpur Nagar, Kannauj, G.B.Nagar, Kheri, Kushinagar, Maharajganj, Mau, Mathura, Pilibhit, Meerut, Raebareli, St.Kabir Nagar, Shahjahanpur, Siddhartha Nagar, Shrawasti, Sitapur, Sultanpur and Unnao districts. Fall of higher magnitude (2 to 4 m in water level) as compared to May'2014 is observed in 14 monitoring wells and only 7 wells shows fall more than 4 m.

A rise of 0 - 2 m in water level is observed as patches in 470 monitoring wells (58.8%) in Allahabad, Auraiya, Azamgarh, Ballia, Basti, Bulandsahar, Chandauli, Chitrakoot, Etah, ,Faizabad, Farrukhabad, Fatehpur, Ghazipur, G.B.Nagar, Ghaziabad, Gorakhpur, Hardoi, Jalaun, Jaunpur, Jhansi, Kaushambi, Lalitpur, Lucknow, Mahoba, Mirzapur, Meerut, Pratapgarh, Raebareli, St.Ravidas Nagar, Sitapur, Sonbhadra, Sultanpur Shrawasti, Siddhartha Nagar Unnao and Varanasi districts. Rise of 2-4 m in water level is observed in 65 Monitoring wells (8.1%) and rise of more than 4 m is seen in Monitoring wells in small patches in Agra, Hamirpur, Fatehpur, Chitrakoot, Mirzapur, Unnao, Raebareli districts.

The district wise changes have been shown in Table-9 and the same is depicted in Plate-IX.

**Plate - IX**

#### **August 2013-14:**

The water level data collected during August'2014 has been compared with Aug'2013 data to evaluate the rise and fall in water levels since last one year. The wells have been categorized depending on rise and fall in water levels.

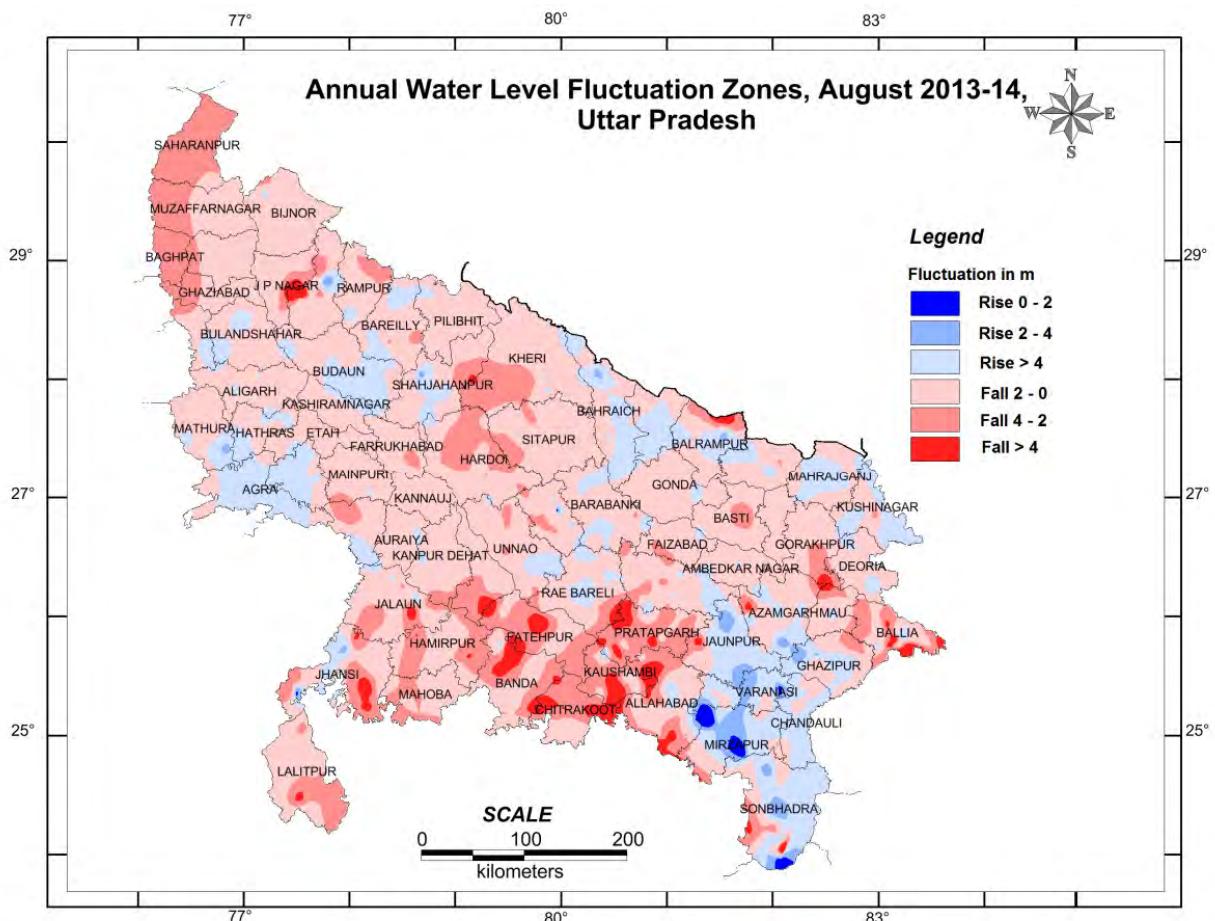

There is fall in water level in 565 wells (74.8%) and rise in 184 wells (24.37%). The fall in water level is because 97% of the state has received deficient to scanty monsoonal rainfall. A rise of 0 -2 m is observed at 154 monitoring stations (20.39% of the monitored wells) in few eastern and southern districts of the state. A rise of 2-4 m is seen in 22 wells (2.9%) and rise of more than 4 m in 8 wells as scattered patches but largely concentrated in South Central parts of the State.

The fall of 0 -2 m in levels is observed in 392 wells ( 51.9% of the monitored wells) covering all the districts of western U.P. and most of the districts of central U.P. A fall of 2 - 4m is observed in 130 wells (17.2%) in small parts of districts of

Allahabad, Ballia, Chitrakoot, Jhansi, Pratapgarh, Moradabad and fall of more than 4 m is observed only at 43 wells.

The district wise changes have been shown in Table-10 and the same is depicted in Plate-X.

**Plate- X.**

#### **November 2013 – 14:**

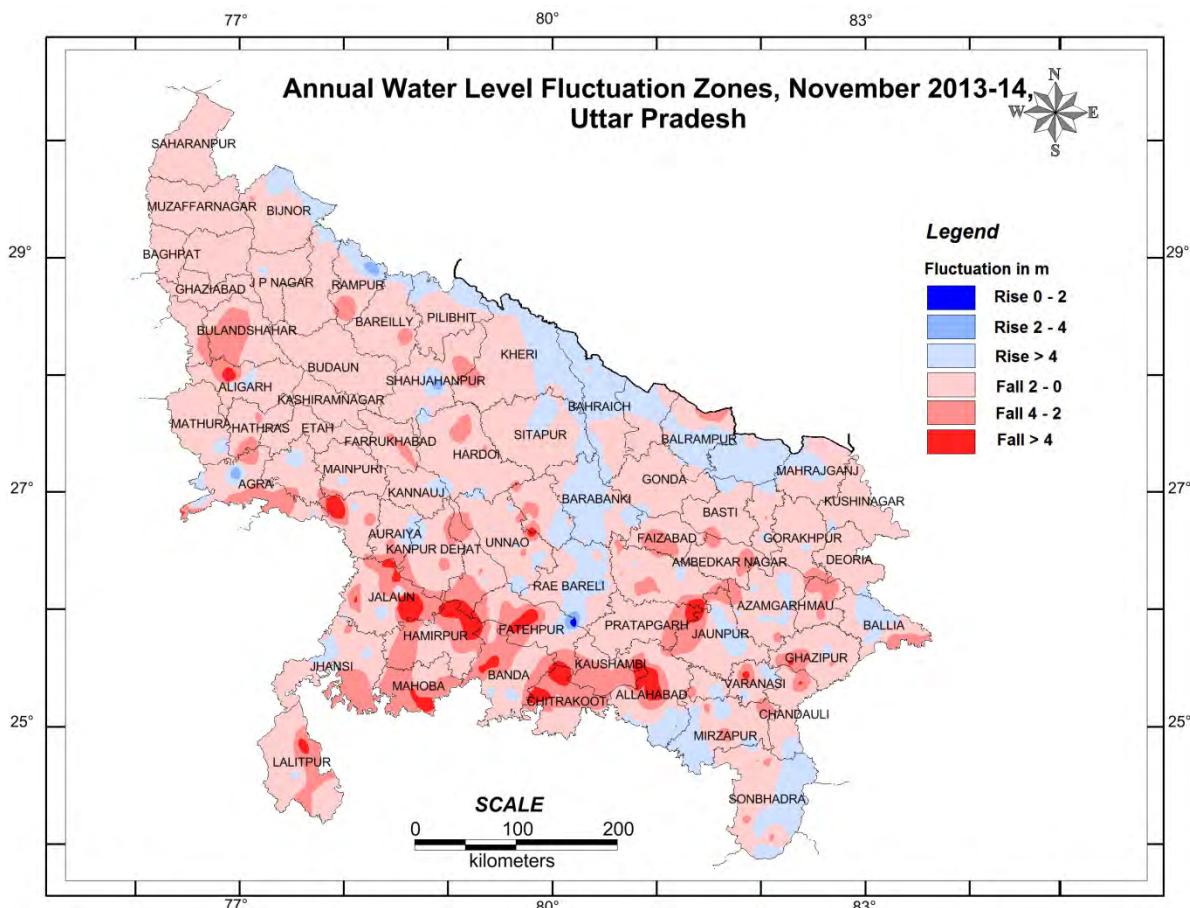

The water level data collected during November'2014 has been compared with November'2013 data to evaluate the rise and fall in water levels since last one year. It is observed that 176 wells (22.1%) show rise and 614 no. (77.1%) wells show fall in water level. Since the state has received 97% deficient to scanty monsoonal rainfall resulting in to decline of groundwater level.

A rise of 0 -2 m, in water levels, is observed at 167 wells (20.9%). Rise of 0 to 2 m is observed in parts of Agra, Aligarh, Allahabad, Ambedkar nagar, Auraiya, Azamgarh, Ballia, Banda, , Barabanki , Chandauli, Chitrakoot, Etah, Faizabad, Fatehpur, Firozabad, Ghaziabad, Gorakhpur, Hamirpur, Hathras, Jalaun, Jaunpur, Jhansi, Kannauj, Kanpur Nagar,Kanpur Dehat, Kaushambi, Lucknow, Mahoba, Mathura, Mau, Mirzapur, Meerut, Moradabad, Pratapgarh, Raebareli, Saharanpur, St.Ravidas nagar, Sonbhadra,Sultanpur and Varanasi districts. Rise of 2 -4 m is observed at only 8 wells (1%) and rise of more than 4m is observed only at Fatehpur .

The fall of 0 -2 m in levels is observed in 476 wells ( 59.7%) mostly in districts of Terai region and few parts of western U.P. Most parts of districts- Aligarh, Ambedkar Nagar, Behraich, Ballia, Balrampur, Barabanki, Basti, Bareilly, Bijnor, Budaun, Bulandsahar, Deoria, Etawah, Farrukhabad, Faizabad, Ghaziabad, G.B.Nagar, Ghazipur, Gonda, Gorakhpur, Hardoi, Jhansi, Kannauj, Kanpur Nagar, Kheri, Kushinagar, Lucknow, Maharajganj, Mainpuri, Mathura, Muzaffar Nagar, Pilibhit, Raebareli, St.Kabir Nagar, Shrawasti, Siddhartha Nagar, Shahjahanpur, Sitapur, and Unnao . A fall of 2 - 4m is observed at 110wells. Fall in water level > 4 m is found in 28 wells (3.5).

The district wise changes have been shown in Table-11 and the same is depicted in Plate-XI

## Plate-XI

### January 2014 –15

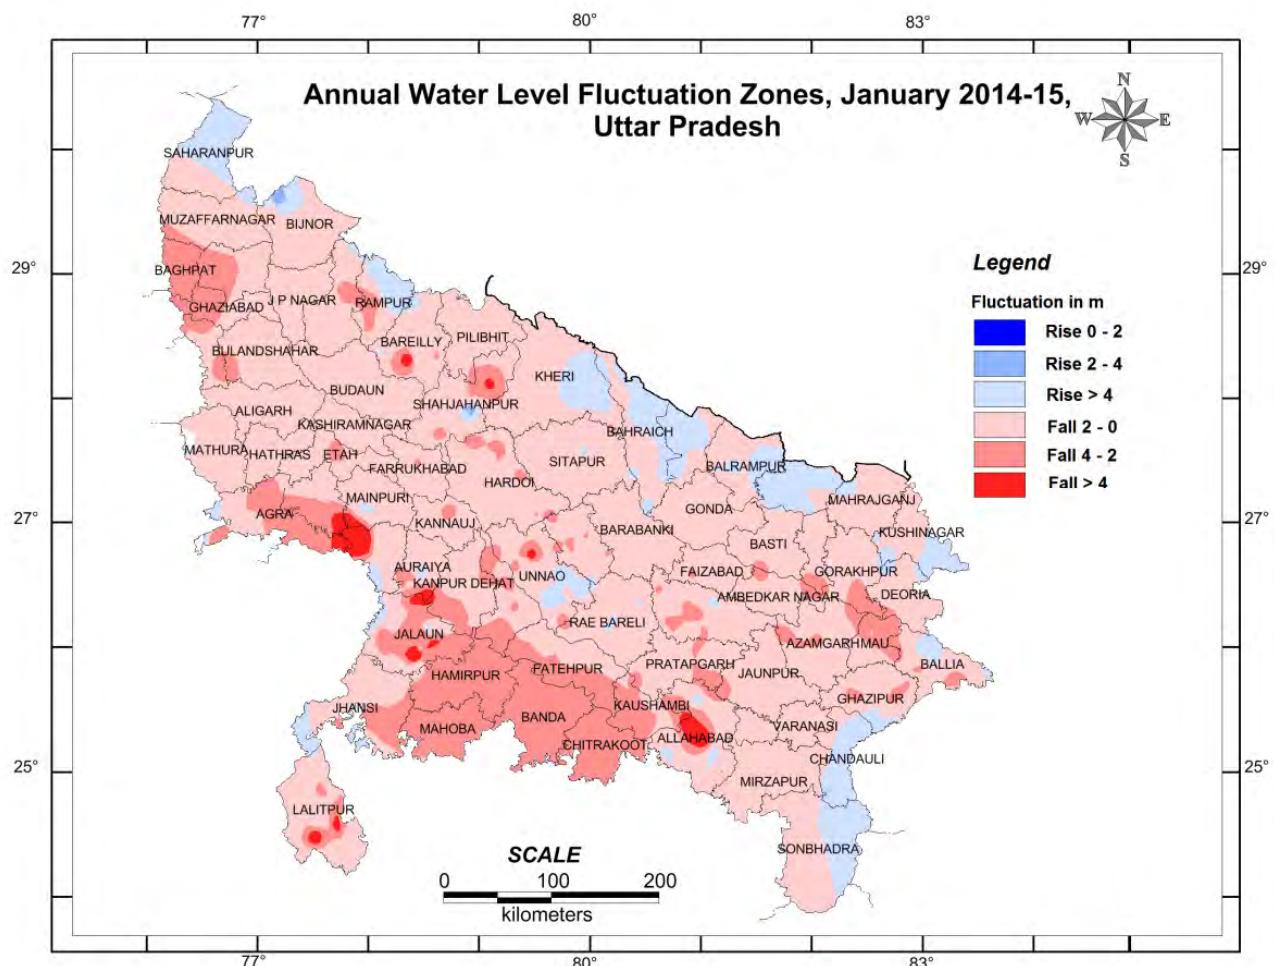

To evaluate the rise and fall in water level in January'2014 with respect to January'2015, water level data of wells have been analysed. The fluctuation data shows rise of water level in 80 Nos (12.2%) and fall in 569 Nos (87.4%) of the analysed wells. There is annual fall in water level in January'2015 as compared to January'2014 in all parts of the state. Since the state has received 97% deficient to scanty rainfall.

The fluctuation data of the state shows a rise of 0 to 2 m in 76 no. of analysed wells (11.6%) in few parts of Allahabad, Bahrach, Ballia, Balrampur, Gazipur, Shrawasti and Siddharth Nagar districts.

A rise of 2 to 4m is observed only in 3 no. wells and rise of > 4 m in only one well.

A fall of 0-2 m in water level is noticed in 465 no. of analysed wells (71.4%) . Districts showing major parts of Aligarh, Allahabad, Auraiya, Ambedkar Nagar ,Azamgarh, Bijnor, Bahraich, Banda, Barabanki, Basti, Bulandsahar, Chandauli, Etah, Etawah, Faizabad,

**Plate -XII**

Farrukhabad, Fatehpur, Ghazipur, Gonda, Firozabad, Hamirpur, Hathras, Jalaun, Jaunpur, Jhansi,, Kannauj, Kanpur Nagar, Lalitpur, Lucknow, Mahoba, Mainpuri, Mau, Mirzapur, Meerut, Moradabad, Muzaffarnagar, Raebareli, Saharanpur, St. Ravidas Nagar, Shravasti, Siddharthanagar, Sultanpur and Unnao districts.Fall of 2 to 4 m is seen only in 89 nos. (13.6%) well and fall of > 4 m is seen only in 15 wells. The district wise changes has been shown in Table-12 and depicted in the Plate-XII.

The over all status of annual fluctuation in the state is summarized in following table.

#### **Annual Fluctuation in Water Level During 2014 –15, U.P.**

<b>FLUCTUATION RANGE</b>	<b>May 13 - 14</b>		<b>August 13 - 14</b>		<b>November 13 -14</b>		<b>January 14 - 15</b>	
	<b>Rise (%)</b>	<b>Fall (%)</b>	<b>Rise (%)</b>	<b>Fall (%)</b>	<b>Rise (%)</b>	<b>Fall (%)</b>	<b>Rise (%)</b>	<b>Fall (%)</b>
0-2	470 (58.8%)	224 (28%)	154 (20.39%)	392 (51.9%)	167 (20.9%)	476 (59.7%)	76 (11.6%)	465 (71.4%)
2-4	65 (8.1%)	14 (1.7%)	22 (2.9%)	130 (17.2%)	8 (1%)	110 (13.8%)	3 (0.46%)	89 (13.6%)
>4	10 (1.2%)	7 (0.87)	8 (1%)	5 (5.6%)	1 (0.12%)	28 (3.5%)	1 (0.15%)	15
<b>TOTAL</b>	<b>545</b> <b>(68.2%)</b>	<b>245</b> <b>(30.7%)</b>	<b>184</b> <b>(24.3%)</b>	<b>565</b> <b>(74.8%)</b>	<b>176</b> <b>(22.1%)</b>	<b>614</b> <b>(77.13%)</b>	<b>80</b> <b>(12.2%)</b>	<b>569</b> <b>(87.4%)</b>

From the analysis of table it is evident that the water level has shown a fall in more than half of the wells in August'14, November'14 and January'15 as compared to previous years. This is due to less monsoon rainfall experienced in almost all parts of the state in 2014.

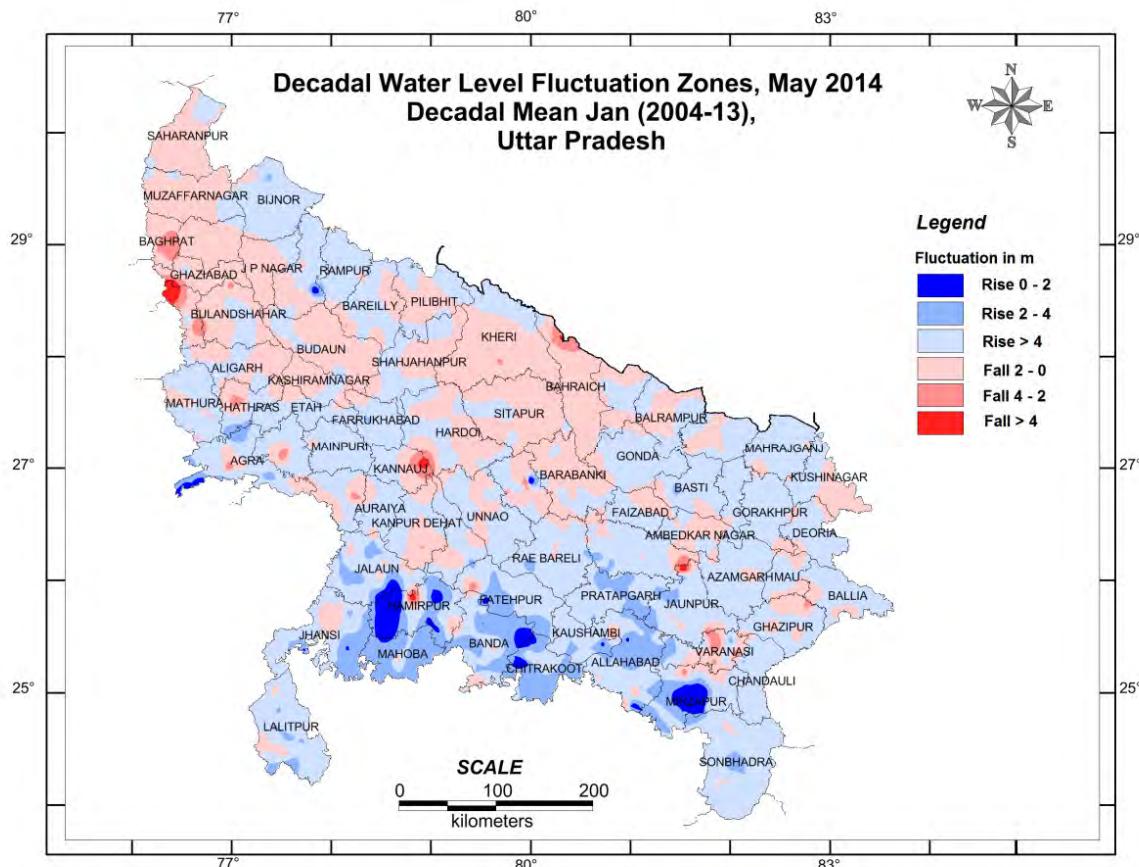

#### **6.3 Fluctuation from the Decadal Mean during 2014 – 15**

The fluctuations in water level described earlier are very much dependant on the rainfall and give a very short term picture. In order to remove the rainfall anomalies the long term water level is considered as this would normalize the erratic highs and lows. For this the water level of each season has been compared to the mean water level of past 10 years. This has been done to evaluate the status of water level during the year 2014-15 with respect to long term mean. The out come of the analysis has been compiled on district level and the same has been discussed subsequently for the four seasons of observation.

##### **Mean May (2004- 13) – May 2014**

The pre-monsoon water level data for 2014 has been compared to decadal mean (2004-2013) for pre-monsoon periods, and district-wise analysis of Ground Water Monitoring wells has been compiled in Table-13 and fluctuation map has been prepared and given in Plate –XIII. The analysed data show total of 562 no.(62.5%) wells show rise and 332 no.(36.9%) show fall in water level.

**Plate –XIII**

It is observed that 293 no. Monitoring wells (32.6 %) show a fall of 0-2 m. Fall of higher magnitude is found along Yamuna river. A fall in water levels between 2-4 m is observed in 31 (3.4%) Monitoring wells in major parts of Agra, Allahabad, Banda, Chitrakoot, Fatehpur, Hamirpur, Jaunpur, Lucknow, Mathura, Mau, St. Ravidas Nagar, Sonbhadra, Sultanpur, Ghazipur, Hathras, Jalaun, Kaushami, Mirzapur, and Varanasi districts. Few patches showing a fall of more than 4m in the water levels, with respect to decadal mean of May, are seen in 8 Monitoring wells.

There is a rise in water level from 0 to 2 m with respect to decadal mean of May in 447(49.7%) Monitoring wells.Rise of 2 - 4 m is observed at only 95 Monitoring wells and rise of more than 4 m is observed in 20 Monitoring wells.

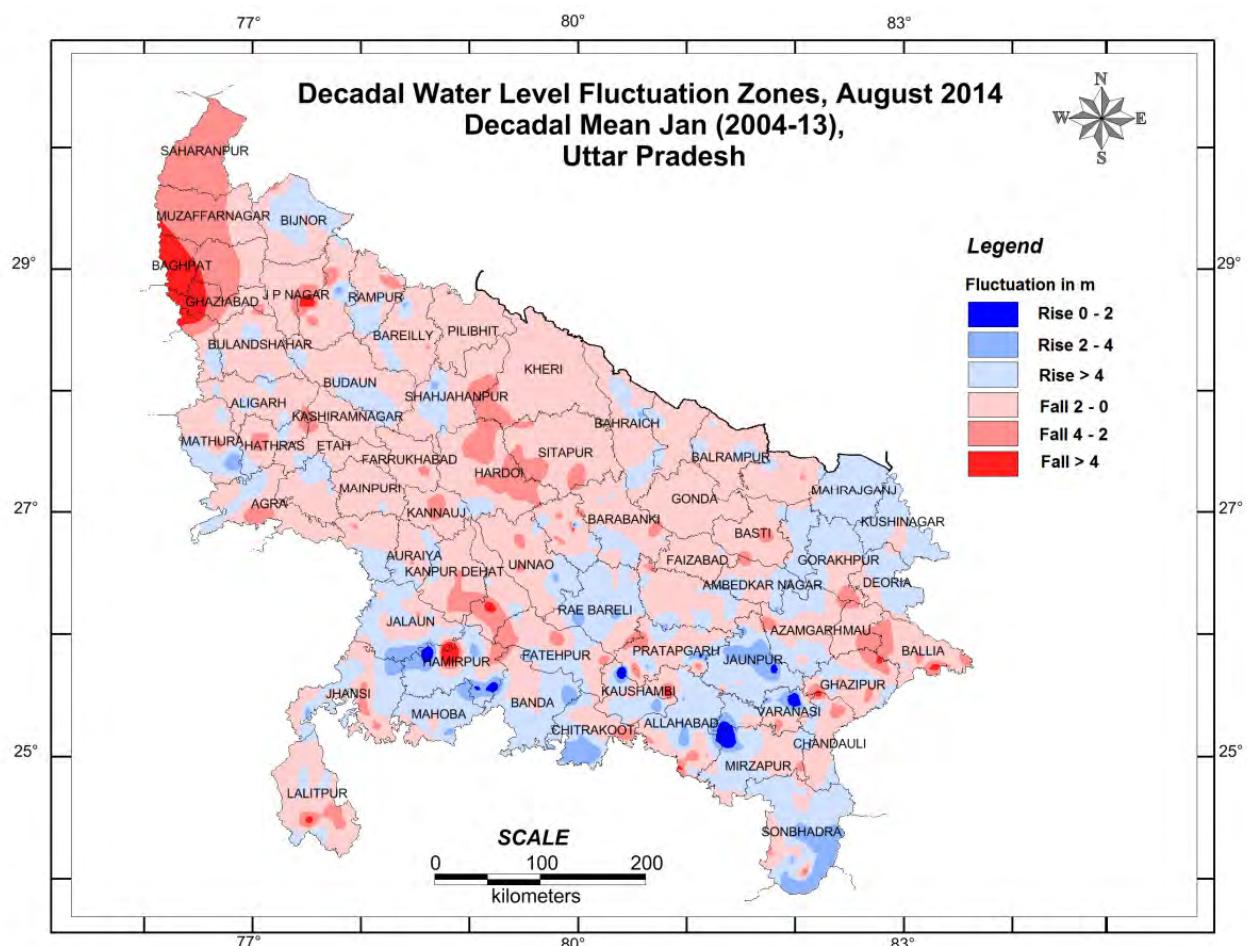

#### **Mean August (2004- 2013) – August 2014**

The average water level of last 10 years (2004 to 2013) for each well for the month of August has been evaluated and compared with water level data for August'2014. The wells

have been categorized depending on rise and fall in water levels and shown in Table-14 and fluctuation map has been given in Plate-XIV.

There is rise in water level in 313 wells (37.8%) and fall in 513 (62.1%) wells. There is a rise of 0 to 2 m in water level in patches in 260 wells (31.4% of the monitored wells) in most districts of the state except in western U.P. and few patches in eastern U.P. Rise of 2 -4 m and more than 4 m is observed in 42 (5%) and 11 wells (1.3%) wells respectively

**Plate-XIV**

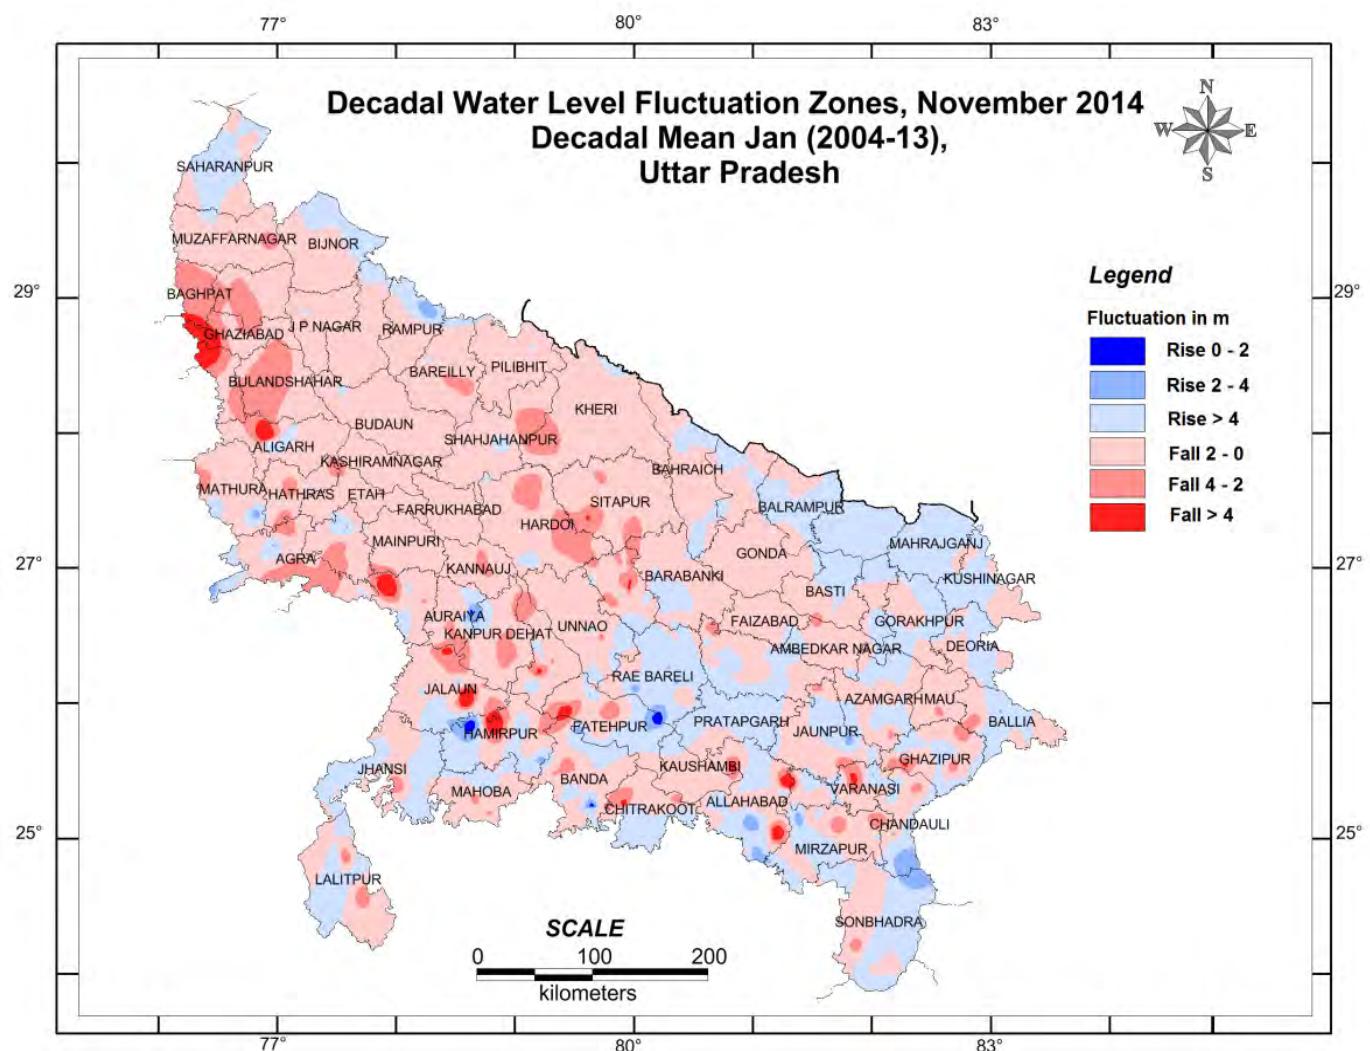

The fall in water level are noticed in 513 wells (62.1% of the monitored wells). Most of the districts of western parts of the state and few in south eastern U.P. show a fall in the range of 0 - 2 m . 406 wells (49.1%) show fall in this range. Districts showing major parts under fall in water level of 0-2 m are Muzzafarnagar, Bagpat, Meerut, Gaziabad, Buladshahr, Hathras, Etawa. Budaun, Farrukhabad, Kannauj, Hamirpur, Hardoi, Kanpur Dehat, Bahraich, Shrawasti, Balrampur, Azamgarh, Gazipur, Chandauli Mirzapur and Sonbhadra district. The fall of 2 - 4 m is observed in 92 wells (11.13%). Fall of >4m is observed only in 15 no.

wells. Districts showing major parts under fall of 2-4 m and also having areas showing fall more than 4 m are Ambedkar Nagar, Bulandsahar, G.B.Nagar, Harhras, Kanpur Nagar, Meerut, Varanasi .

#### Mean November (2004- 13) – November 2014:

The average water level of last 10 years (2004-13) for each hydrograph station for the month of November has been evaluated and compared with water level data for November'14. The wells have been categorized depending on rise and fall in water levels and shown in table-15 and fluctuation map has been given in Plate-XV.

**Plate-XV**

There is a rise in water level in 277 nos. wells (32.7%) and fall in DWL is observed in 568 Nos. of wells( 32.7%).Rise in DWL is predominant in parts of most districts of central, western and southern U.P. Fall is observed majority in most districts of Terai region, eastern, south eastern, southern ,western and parts of central U.P.

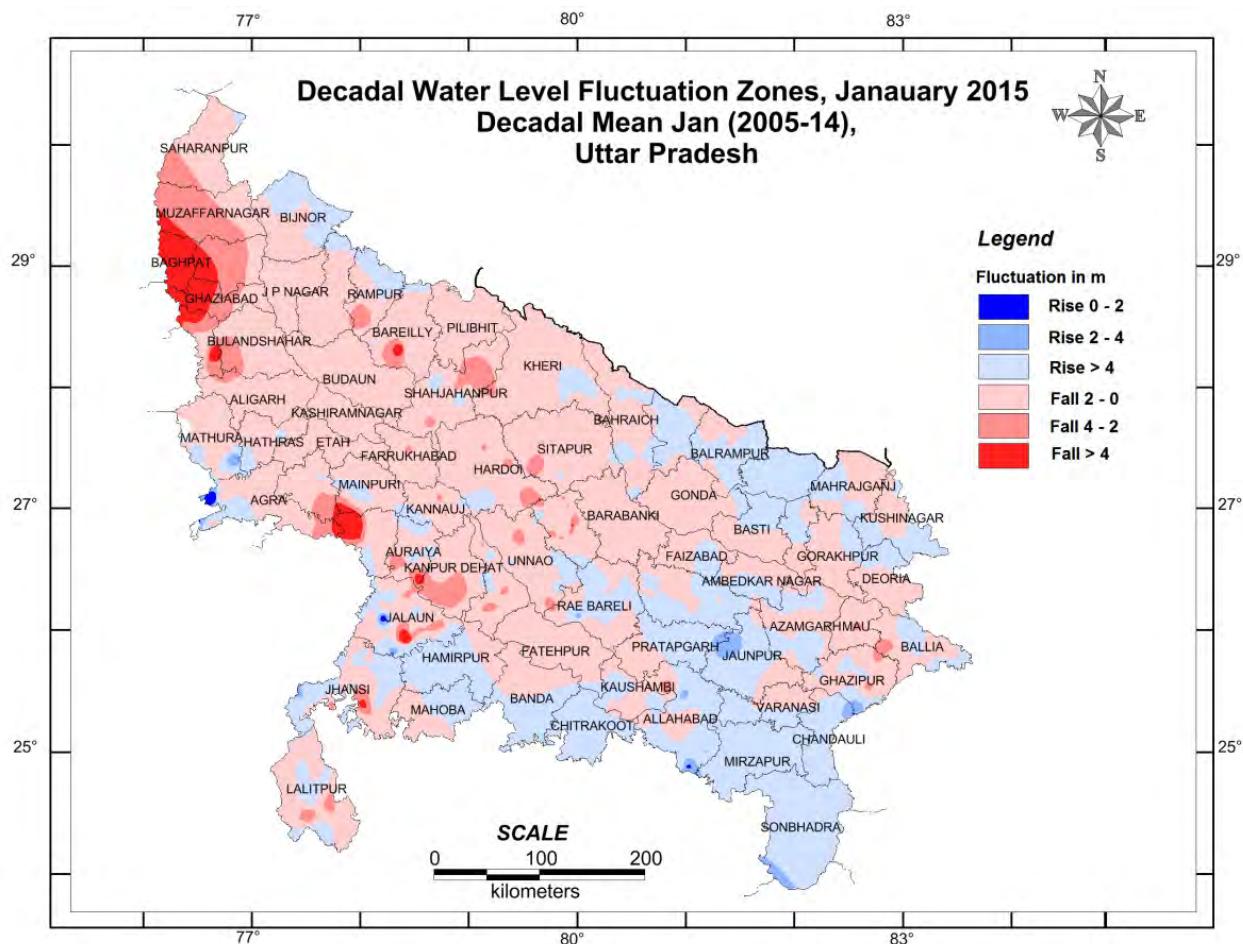

The rise between 0 and 2 m in water levels is observed in 251 wells (29.7%). This range is mostly observed in parts of Agra, Aligarh, Allahabad, Auraiya, Ambedkar Nagar, Budaun, Banda, Bareilly, Basti, Bijnor, Chandauli, Deoria, Etah, Etawah, Gonda, Farrukhabad, Fatehpur, Ghaziabad, Jhansi, J.P.nagar, Jalaun, Kannauj, Kanpur Dehat, Kushi Nagar, Maharajganj, Mathura, Mirzapur, Moradabad, Raebareli, Saharanpur, Shahjahanpur districts. Rise of 2 -4 m is observed only at 22 wells(2.6%) and rise of more than 4m is noticed only at 4 wells.

The fall of 0 - 2 m in water levels are noticed in 459 wells (54.3%). Districts showing major parts as decline of 0-2 m are Aligarh, Allahabad, Ambedkar Nagar, Azamgarh, Ballia, Bahraich, Balrampur, Barabanki, Basti, Bulandsahar, Chitrakoot, Deoria, Faizabad, Fatehpur, Firozabad, G.B.Nagar, Ghaziabad, Gonda, Gorakhpur, Ghazipur, Hamirpur, Hardoi, Jaunpur, Kannauj, Kheri,, Kaushambi, Kanpur Dehat, Kanpur Nagar, Lalitpur, Lucknow, Maharajganj, Mahoba, Mainpuri, Mau, Meerut, Muzaffarnagar, Pratapgarh, Pilibhit, Rae Bareli, St.Kabir Nagar, Sonbhadra, Sultanpur, Shrawasti, Sitapur, Unnao and Varanasi .The fall of 2 - 4 m is observed in 88 wells (10.4%) mainly in Agra, Allahabad, Ballia, Chitrakoot, G.B.nagar, Ghaziabad, Ghazipur, Hamirpur, Jaunpur, Lalitpur, Pratapgarh, St. Ravidas nagar, Sultanpur and Varanasi districts.Fall of > 4 m in water level is observed in 21no wells (2.4%) mainly in Mirzapur,Meerut, Jalaun and Lucknow districts.

#### **Mean January (2005- 14) – January 2015:**

The average water level of last 10 years (2004-13) for each hydrograph Monitoring station for the month of January has been evaluated and compared with water level data for January'2015. The wells have been categorised depending on rise and fall in water levels and shown in Table-16 and map showing this fluctuation is shown in Plate-XVI.

**Plate-XVI**

There is a rise in water level in 224 no. of analysed wells (32.5%) and a majority are showing fall in 464 no.(67.4%) of analysed wells. Due to less monsoonal rain fall in all the district resulting in to 32% of wells shows rise in water level. About 30.3% of analysed wells (209 no.) show rise of 0 to 2 m in water levels. This rise is observed mainly in major parts of districts of Auraiya, Azamgarh, Bahraich, Barabanki, Bareilly, Basti, Bijnor, Budaun, Bulandsahar, Chandauli, Deoria, Etah, Etawah, Gonda, Hardoi, Hathras, Jalaun, Jaunpur, Jhansi, Kannauj, Kanpur Nagar, Lalitpur, Mathura, Mau, Mirzapur, Moradabad, Pilibhit, Raebareli, Rampur, Saharanpur, Shahjahanpur, Shravasti, Siddharthanagar, Sonbhadra and Unnao. A rise of 2 to 4 m is noticed only in 108 (12%) wells and rise of > 4 mbgl is observed only in 38 wells.

A fall of 0 to 2 m is observed in 402 no. wells (about 58.4%) in major parts of the districts in eastern, central and few districts of western U.P. Districts with major parts showing decline of 0-2 m are Barabanki, Baghpat, Bareilly, Ballia, Chitrakoot, Faizabad, G.B.Nagar, Ghazipur, Gorakhpur, Kanpur Dehat, Unnao, Kaushambi, Kheri, Kushinagar, Maharajganj, Mainpuri, Meerut, Moradabad, Muzaffarnagar, St. Kabir Nagar, St.Ravidas Nagar, Siddharthanagar, Sitapur, Sultanpur and Varanasi. Fall of 2 to 4 m is observed in 53 no. wells (7.7%) in parts of Agra, Allahabad, Auraiya, Gazipur, Ghaziabad, Shahjahanpur, Kanpur Dehat, Ballia and Lucknow districts. Fall of more than 4 m fall is encountered in 9 Nos wells.

#### **DECADAL FLUCTUATION 2014 – 15, U.P.**

<b>FLUCTUATION RANGE</b>	<b>Mean May (2004-13) to May'14</b>		<b>Mean August(2004-13) to August'14</b>		<b>Mean Nov(2004-13) to November'14</b>		<b>Mean Jan(2005-14) to January'15</b>	
	<b>Rise (%)</b>	<b>Fall (%)</b>	<b>Rise (%)</b>	<b>Fall (%)</b>	<b>Rise (%)</b>	<b>Fall (%)</b>	<b>Rise (%)</b>	<b>Fall (%)</b>
0-2	447 (49.7%)	293 (32.6%)	260 (31.4%)	406 (49.1%)	251 (29.7%)	459 (54.3%)	209 (30.3%)	402 (58.4%)
2-4	95 (10.5%)	31 (3.4%)	42 (5.0%)	92 (11.1%)	22 (2.6%)	88 (10.4%)	11 (1.5%)	53 (7.7%)
>4	20 (2.2%)	8 (0.89%)	11 (1.33%)	15 (1.8%)	4 (0.47%)	21 (2.4%)	4 (0.58%)	9 (1.3%)
Total	562 (62.5%)	332 (36.9%)	313 (37.8%)	513 (62.1%)	277 (32.7%)	568 (67.2%)	224 (32.5%)	464 (67.4%)

From the analysis of table it is evident that the water level has shown a fall in more than half of the wells in Aug'14, Nov'14 and January'15 as compared to mean of last ten years. The changes in water level with respect to mean were confined to a magnitude of 0-2 m. The rise/fall of higher magnitude was limited and isolated in nature.

## **WATER LEVEL TREND**

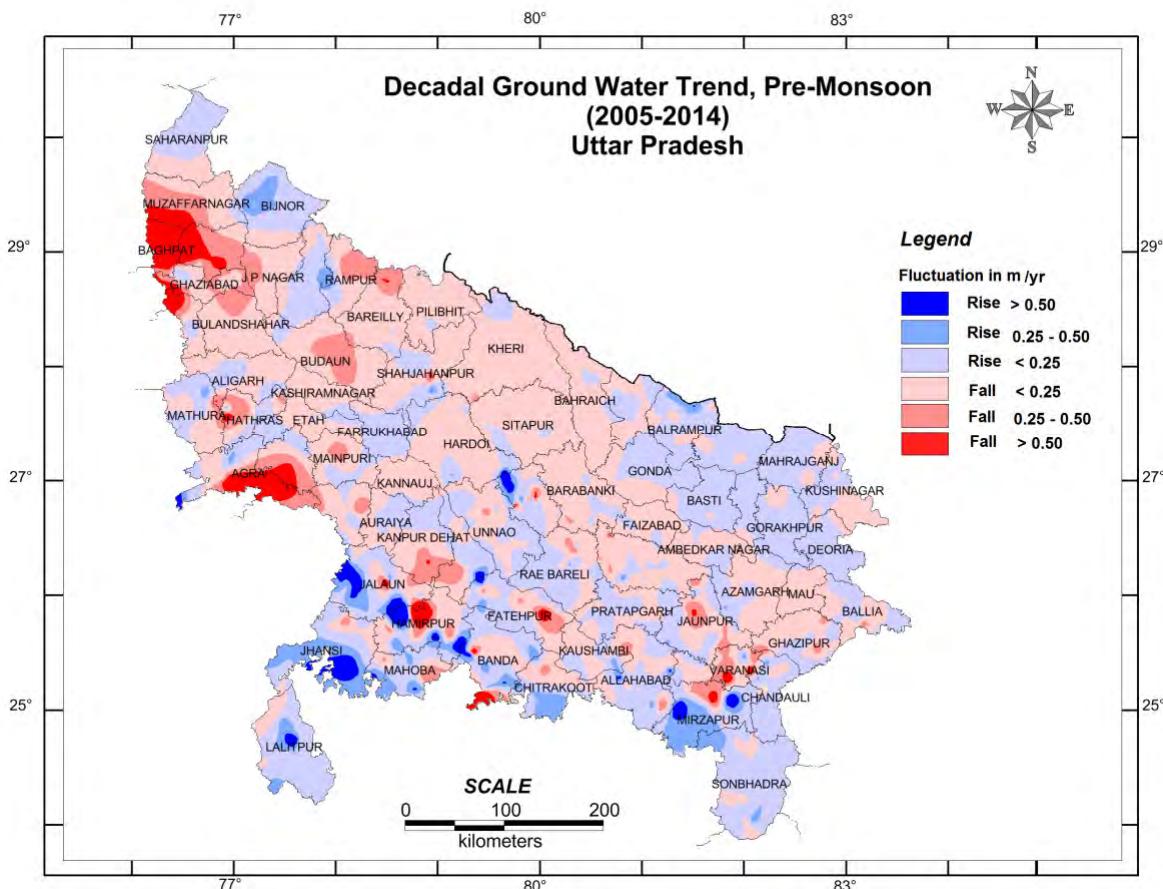

The seasonal, annual and decadal fluctuation gives an idea of the behavior of the water level but is subjected to many anomalous factors which give a short term picture. To have a true picture where highs and lows are balanced out, the long term trend for ten years 2005 to 2014 has been worked out and analysed on the basis of DWL data of Ground Water Monitoring Wells. The pre monsoon, post monsoon and annual trend for the said period is given in Annexure-II.

The declining trend data during Pre-monsoon for the period 2005-2014 are summarized as follows:

<b>Percentage of wells showing Decline in Pre-monsoon DWL (cm/year)</b>		
<b>0-20cm</b>	<b>20-40 cm</b>	<b>&gt;40 cm</b>
73.1 %	15.8%	10.7%

There is a declining trend in 51.4% of the monitoring wells covering over 10 years period. Decline of 0 – 20 cm/yr is most extensive covering 73% wells followed by 20 – 40 cm/yr in 15.8% wells and >40 cm/yr in 10.7%. The low decline is spread all over the state but dominant in eastern and central parts and along Terai belt of the state. Higher decline occurs in most of the districts of western and southern regions. There is a rise in trend in 44.1% of the monitoring wells over 10 years period. The Pre-monsoon DWL trend map of U.P. for the period 2005 to 2014 has been shown in the plate-XVII.

**Plate-XVII**

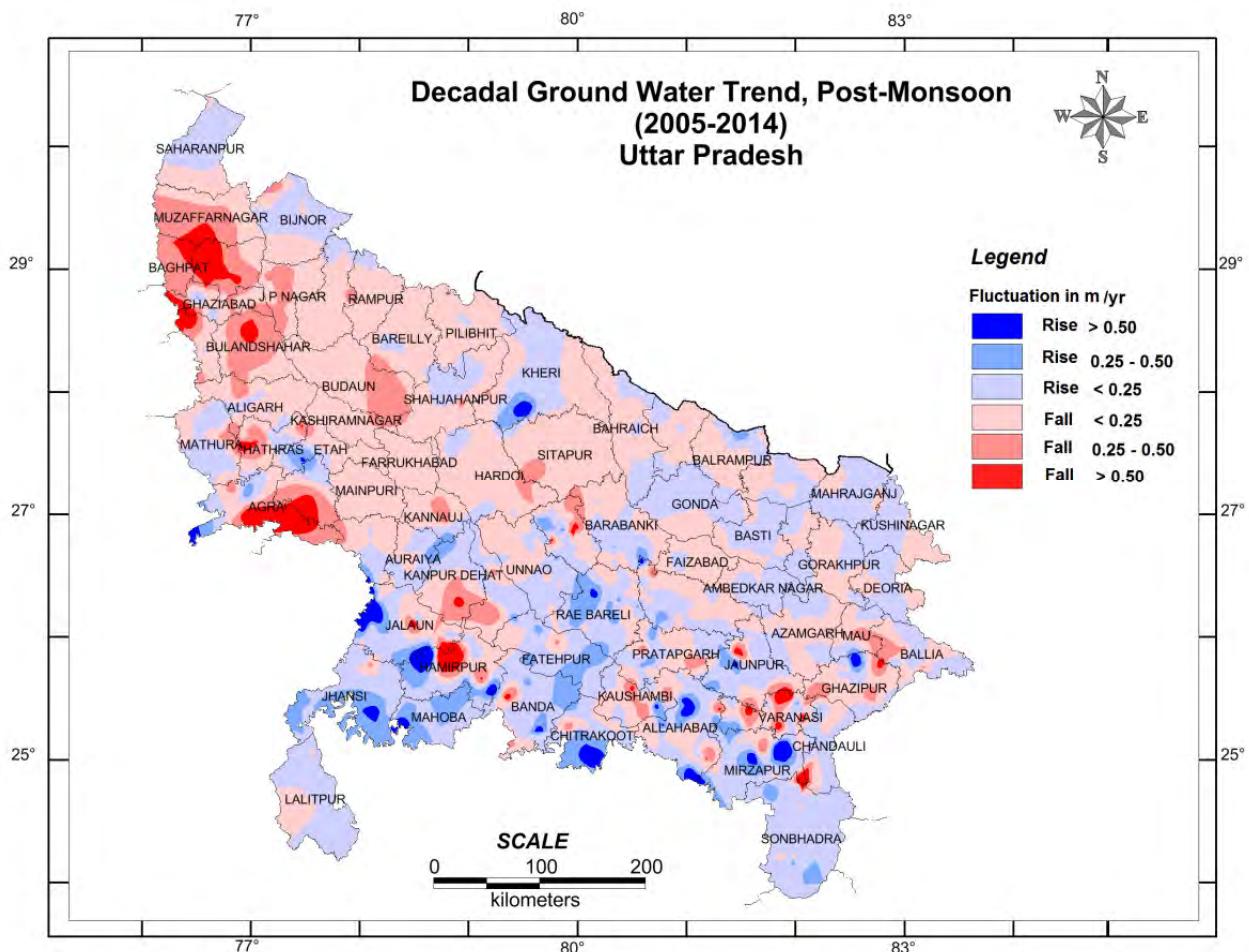

The declining trend data during Post-monsoon for the period 2005-2014 are summarized as follows:

Percentage of wells showing Decline in Post-monsoon DWL (cm/year)		
0-20cm	20-40 cm	>40 cm
71%	13.9 %	13.9%

There is a declining trend in 50.6% of the monitoring wells over 10 years period. Decline of 0 – 20 cm/yr is most extensive covering 71% wells followed by 20 – 40 cm/yr in 13.9% wells and >40 cm/yr also in 13.9% wells. The low decline is spread all over the state but dominant in central, eastern part and along Terai belt of the state. Higher decline occurs in most of the districts of western, north western and southern parts and along Yamuna River. There is a rise in trend in 44.3% of the monitoring wells over 10 years period. The Post-

monsoon DWL trend map of U.P. for the period 2005 to 2014 has been shown in the plate XVIII.

**Plate: XVIII**

## **Chapter 7**

### **GROUND WATER QUALITY (Based on NHS data 2014-15)**

#### **INTRODUCTION**

The availability of fresh water for human consumption, irrigation, agricultural development and other activities is associated with the growing needs of modern living conditions but is decreasing day by day due to increase in population, urbanization, industrialization and erratic behavior of rains. To meet the requirement of fresh water, the dependency on ground water is increasing in comparison to surface water because during summer season most of the surface water bodies do not have sufficient water, while ground water is easily accessible throughout the year.

The quality of groundwater is affected in three ways i.e. physical, chemical and bacteriological, although the procedure is very slow and complex to understand. The quality of ground water in the phreatic aquifer depends on the nature of rocks, contact time, circulation and temperature. It is also dependent on the solubility of the minerals present in the rocks. To some extent the atmospheric precipitation (rain water) is also contributory factor for affecting the quality of ground water as during the rain fall most of the gases such as CO<sub>2</sub>, SO<sub>2</sub> and NO<sub>2</sub> present in the atmosphere gets dissolved in the rain water during the course of downward travel and percolate down through the earth surface dissolving mainly calcium and magnesium present in the soil forming calcium bicarbonate. The pH plays an important role in the geochemical reactions as low pH tends to help faster dissolution of the minerals. The quality of ground water is also influenced by the excessive use of fertilizers and pesticides for agricultural production and also industrial activity.

Ground water due to its long standing with minerals and rocks is generally more mineralized than surface water. This was found to be confirmed largely for water in phreatic zones. The chemical quality of ground water in phreatic zones is also affected by anthropogenic sources at the ground surface, whether it is domestic, agriculture or industrial in nature.

#### **METHODOLOGY**

To evaluate the drinking water quality of ground water ,751 water samples were collected from Ground Water Monitoring Stations (GWMS) during the A.A.P. 2014-15. Generally the monitoring stations are open dug wells tapping phreatic aquifer. Ground water samples were collected from hand pumps where dug wells are not in use. All the samples

were analysed for the determination of pH, EC, CO<sub>3</sub>, HCO<sub>3</sub>, Cl, F, NO<sub>3</sub>, SO<sub>4</sub>, PO<sub>4</sub>, SiO<sub>2</sub>, T.H., Ca, Mg, Na & K. These water samples were analysed as per standard methods (APHA 2005). Following standard methods (Table-1) have been adopted for the chemical analysis of different constituents in water samples.

**TABLE – 1: Methods used for Chemical Analysis of Ground Water Samples**

Sl. No.	Constituents	Method Used
1.	pH	pH Meter
2.	EC	EC Meter
3.	Carbonate	Titrimetric method
4.	Bi-carbonate	-do-
5.	Chloride	Mohr's method
6.	Fluoride	Spectrophotometric method
7.	Nitrate	-do-
8.	Sulphate	-do-
9.	Phosphate	-do-
10.	Silica	-do-
11.	Total Hardness	Titrimetric method
12.	Calcium	-do-
13.	Magnesium	Evaluation from TH and Ca
14.	Sodium	Flame emission photometric method
15.	Potassium	-do-

### **WATER QUALITY NORMS & CRITERIA**

Water quality standards and guidelines have been laid down by WHO (1984), Govt. of India, National High Tech Mission (1986) and BIS (2012) and many other organizations. These guidelines are exhaustive and it becomes very difficult to analyse ground water samples for all the constituents. The water quality is judged by a common man mainly by ENT (Eyes, nose and tongue) tests before using it for domestic purposes. They are-

E (Eyes): Appearance - turbidity, particles, oily layer, color etc.

N (Nose): Odor - no smell, rotten egg smell, fishy smell etc.

T (Tongue): Taste - salinity, pH, temperature, soluble iron chloride etc.

The guidelines/standards laid down by BIS (2012) with regard to some constituents for domestic and potable purposes have been tabulated in the Table 2.

**TABLE- 2: Indian Standard for Drinking Water Specifications (BIS 2012)**

S. No.	Substance/ Characteristics	Desirable limit	Undesirable effect out side desirable limit	Permissible limit in absence of alternate source
1.	Colour (Hazen Units)	5	Above 5, consumer acceptance decreases	25
2.	Turbidity (NTU)	5	Above 5, consumer acceptance decreases	10
3.	pH value	6.5-8.5	Beyond this range water will effect mucous membrane.	No relaxation
4.	Dissolved solids mg/l max	500	Beyond this palatability decreases and may cause gastro intestinal irritation	2000
5.	Alkalinity mg/l max	200	Unpleasant taste	600
6.	Total hardness (as CaCO <sub>3</sub> ) mg/l max	300	Encrustation in water supply structure and adverse effect on domestic use.	600
7.	Chloride (as Cl) mg/l max	250	Beyond this limit taste corrosion and palatability are effected	1000
8.	Calcium (as Ca) mg/l max	75	Encrustation in water supply structure and adverse effect on domestic use.	200
9.	Magnesium (as Mg) mg/l max	30	Encrustation in water supply structure and adverse effect on domestic use.	100
10.	Sulphate (as SO <sub>4</sub> ) mg/l max	200	Beyond this limit gastrointestinal irritation occurs when Magnesium of sodium is present	400
11.	Nitrate (as NO <sub>3</sub> ) mg/l max	45	Beyond this methemoglobinæmia takes place	45
12.	Fluoride (as F) mg/l max	1.0	Fluoride may be kept as low as possible. High fluoride may cause fluorosis	1.5

## **CHEMICAL QUALITY OF GROUND WATER IN UTTAR PRADESH**

The chemical quality of ground water depends on various factors like source of water such as rainfall, erosion, dry fall out, weathering of rocks and as a result of chemical reactions taking place on and below the surface. Thus, the chemical quality of water is dependent on geological and hydrogeological conditions prevailing in the area, climate, and topography, nature of soil, physicochemical characteristics of rocks, nature of plantation and finally the activities of man resulting in environmental pollution. The pollution of ground water may lead to abandonment of wells, so in order to deal with this problem it becomes necessary to assess its suitability for drinking and irrigation purpose before corrective measures are undertaken.

### **SUITABILITY OF GROUND WATER FOR POTABLE PURPOSES**

The suitability of ground water for drinking purposes has been assessed according to the guidelines laid down by BIS (2012). The chemical analysis results for 751 nos. of samples collected from GW monitoring Stations spread in entire Uttar Pradesh have been tabulated in Annexure A.

The changes in chemical quality of Groundwater from the year (2013-2014) have been shown in table 3 and table 4. The chemical analysis shows that there is not much variation in maximum, minimum, and average values of pH, Electrical conductivity, CO<sub>3</sub>, HCO<sub>3</sub>, Cl, F, NO<sub>3</sub>, SO<sub>4</sub>, SiO<sub>2</sub>, PO<sub>4</sub>, TH, Ca, Mg, Na and K.

**TABLE-3: Hydro-Chemical Data of Ground Water in Uttar Pradesh (2014 -2015)**

<b>S. No.</b>	<b>Constituents</b>	<b>Minimum</b>	<b>Maximum</b>	<b>Average</b>

14.	$\text{Na mg/l}$	1.7	4660	87
15.	$\text{K mg/l}$	Nd	2920	16

**Hydrogen Ion Concentration (pH) :**

The pH value of ground water in the state of U.P. varies from 7.0 to 9.1 and is generally well within the permissible limit and the water is slightly alkaline in nature. The average pH value has been found to be 8.04.

**Carbonate & Bicarbonate ( $\text{CO}_3$  &  $\text{HCO}_3$ ):**

The Carbonate has been observed to be nil in most of the case however it has been found upto 132 mg/l & Bicarbonate has been observed in the range of 85to 1244 mg/l with average value of 328 mg /l.

**Electrical Conductivity (EC):**

The Electrical Conductivity is a reflection of the concentration of various chemical constituents in ground water and gives the overall quality of ground water for its various uses like drinking, irrigation and other purposes. In the study area EC ranges from 149 to 33530  $\mu\text{Siemens}/\text{cm}$  at 25°C with average value of 987  $\mu\text{Siemens}/\text{cm}$  at 25°C. In 95.5% of water samples EC values upto a max. of 2250  $\mu\text{S}/\text{cm}$  at 25°C was observed. In 3.6% of samples EC ranges between 2251 to 5000  $\mu\text{S}/\text{cm}$  whereas only 0. 93% samples are found to have EC value more than 5000  $\mu\text{S}/\text{cm}$  at 25°C. The highest value of EC, 33530  $\mu\text{S}/\text{cm}$  at 25°C was observed in ground water from Nandgaon block (Mathura district). The range of Electrical

Conductivity in shallow ground water does not show much variation in the 2013 -14 and 2014 -15 as given in frequency distribution table 4 &5 and figure 1.

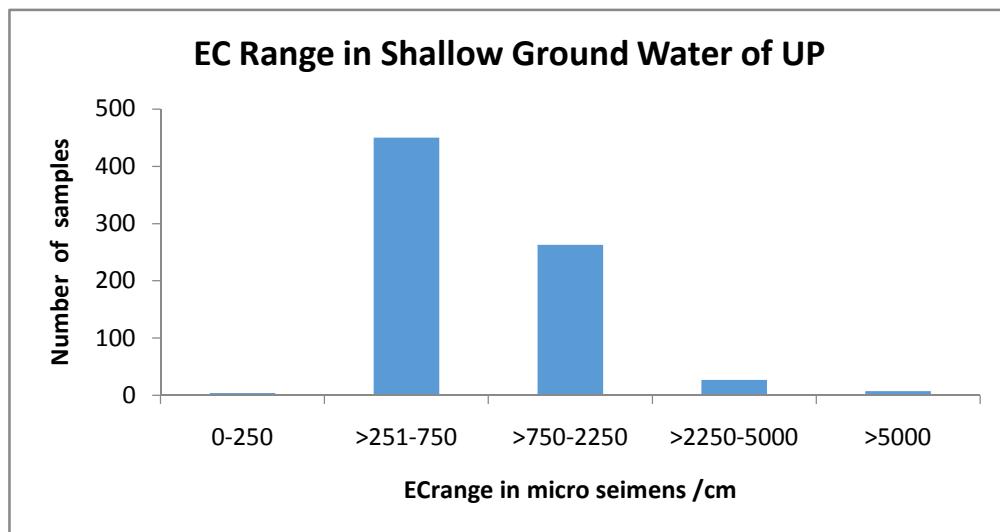

**TABLE -4: Frequency distribution of Electrical Conductivity (2014 -2015)**

EC ranges in $\mu\text{S}/\text{cm}$ at $25^\circ\text{C}$	0-250	251 - 750	751-2250	2251-5000	>5000

32	Mathura	Mathura	2368
33	Pratapgarh	Sangipur	2580
34	Unnao	Asoha	3132

The comparative statement of four years i.e. (2011-12), (2012-2013), (2013-14) & (2014-15) shows a very slight variation in the water quality as is evident from the following table 7:

**TABLE 7: Comparative Statement of Water Quality as per EC for four years**

EC $\mu\text{S}/\text{cm}$ at $25^\circ\text{C}$	Percentage of Water Samples			
	2011-12	2012-13	2013-14	2014-15
0-2250	96.3	97.2	95.4	95.5
2251-5000	2.8	2.0	3.6	3.6
>5000	0.9	0.8	1.0	0.90

#### **Chloride (Cl):**

The study reveals that concentration of chloride ion ranges from 3.5 to 9397 mg/l with an average value of 104 mg/l. The analysis results given in the table 8a and table 8b shows that there is not variation in Chloride concentration in the groundwater for the year 2013-14 and 2014-15. From the table 8a it is clear that a total of 94% water samples fall within the desirable limit while 99.1% contain chloride within the maximum permissible limit prescribed by BIS (2012). Only 0.9% samples exhibit Cl values > 1000 mg/l viz. 2840, 1015 & 1008 mg/l from Akola, Achhnera & Jagner blocks resp., distt. Agra; 2645 & 9397 mg/l from Farah block and Nandgaon blocks resp distt. Mathura and 1142mg/l & 1113mg/l from Maudaha and Sareela blocks resp; distt. Hamirpur.

6	Mathura	Farah	2645
7	Mathura	Nandgaon	9397

### Nitrate ( $\text{NO}_3$ ) :

The concentration of Nitrate has been found varying widely. It ranges between not detectable to 1269 mg/l with an average value of 22 mg/l. 88% of water samples fall within the permissible limit of 45 mg/l (BIS 2012) and 12% samples have higher level of Nitrate concentration with the highest value 1269 mg/l recorded at Naujheel block ( distt. Mathura). High Nitrate is found all over the state and does not follow any definite pattern of distribution. The distribution of samples in different concentration ranges are given in table 10a and 10b for the year 2014-15 and 2013-14. The result suggests that there is not much variation in the Nitrate concentration.

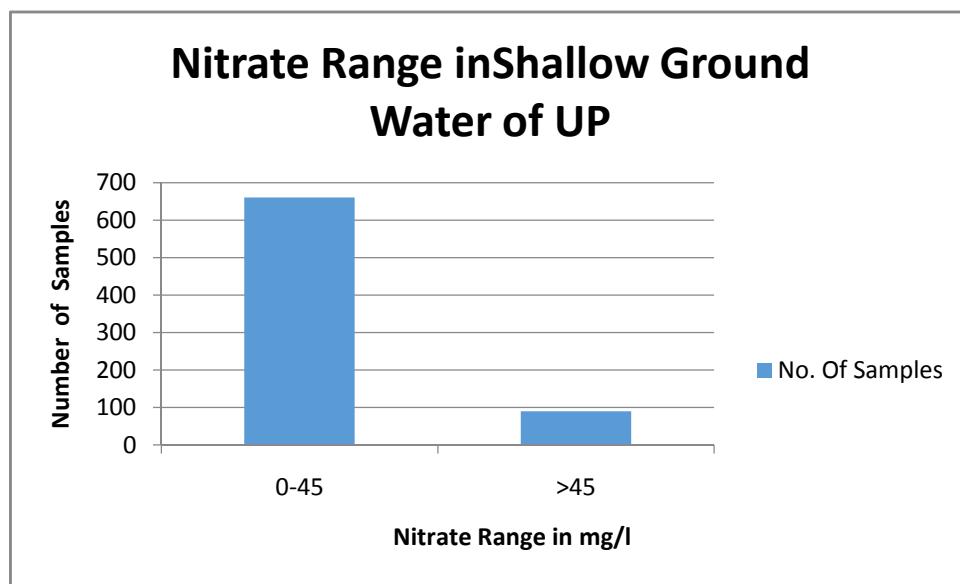

**TABLE-10a: Frequency Distribution of Nitrate (2014-15)**

Range of Nitrate in mg/l	0-45	>45

### Fluoride (F) :

Small quantities of Fluoride are beneficial in reducing tooth decay, whereas excess concentration (>1.5 mg/l) is harmful causing staining of tooth enamel and Fluorosis. The value of Fluoride concentration is found to range between not detectable to 5.0 mg/l with 94.9% samples falling within the permissible limit prescribed by BIS (2012). The highest value of 5.0 mg/l, has been recorded for well water in Bichpuri block (distt. Agra). The distribution of samples in different F ranges has been given in table 12a and 12b for the year

2014-15 and 2013-14. The result shows that there is not much variation in the Fluoride concentration.

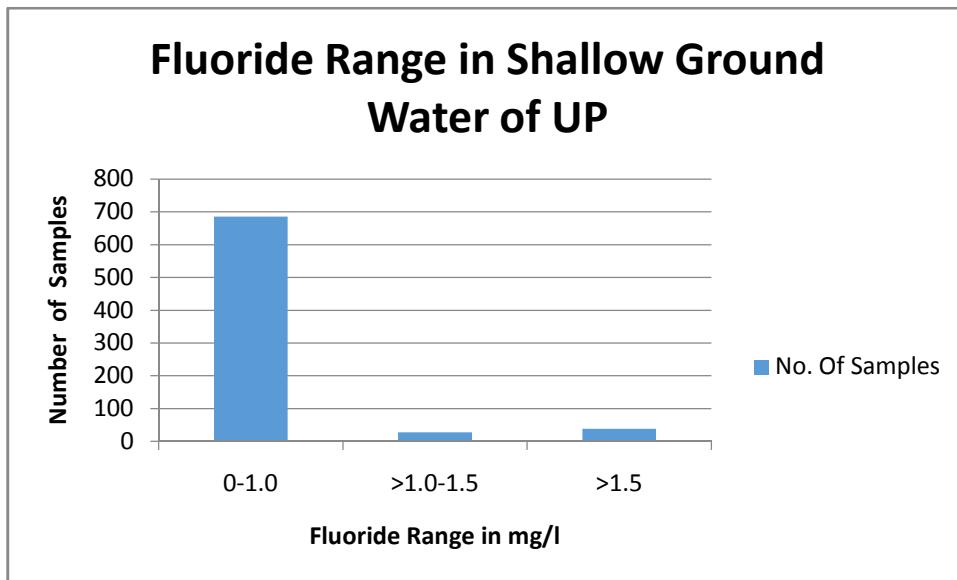

**TABLE – 12a: Frequency Distribution of Fluoride (2014 -15)**

**Total Hardness (T.H.) :**

The concentration of total hardness has been found to vary widely. It ranges between 50 to 6255 mg/l with 96.9% of water samples falling within the permissible limit of 600 mg/l (BIS-2012) and 3.1% samples have higher level of Total Hardness concentration with the highest value 6255 mg/l recorded at Nandgaon block (distt. Mathura). The distribution of samples in different concentration ranges are given in following table 14:

**TABLE -14 : Frequency Distribution of Total Hardness**

Range of T.H. in mg/l	0-200	201-600	>600
No. of Samples	257	471	23
%	34.2	62.7	3.1

#### **Calcium (Ca) :**

The concentration of Calcium has been found varying widely. It ranges between 4.0 mg/l to 737 mg/l with 93.2% of water samples falling within the desirable limit of 75 mg/l (BIS- 2012) and 6.3% samples have higher level of calcium concentration but within maximum permissible limit of 200 mg/l. Only 0.5% water samples exhibited calcium values >200 mg/l with a maximum value of 737 mg/l recorded at Nandgaon block (distt. Mathura). The distribution of samples in different concentration ranges are given in following table 16:

**TABLE-16 : Frequency Distribution of Calcium**

Range of Calcium in mg/l	0-75	>75-200	>200
No. of Samples	700	47	4
%	93.2	6.3	0.5

#### **Magnesium (Mg) :**

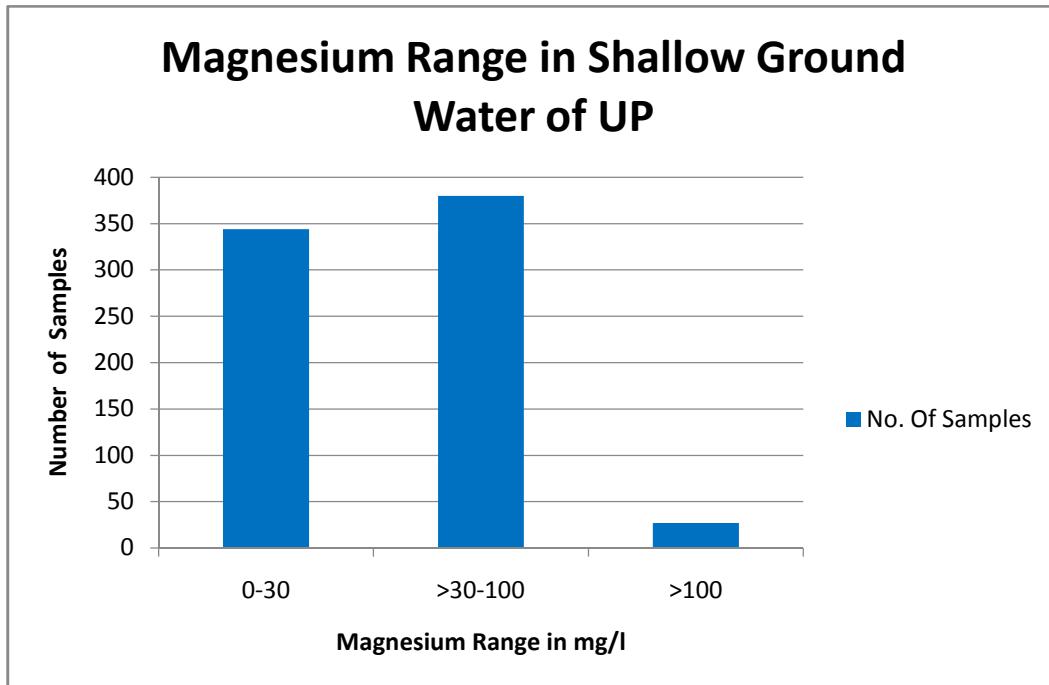

The main sources of magnesium in ground water are (i) rain water, (ii) evaporate deposits & (iii) weathering of magnesium silicate minerals. The source of magnesium in igneous rocks are olivine, pyroxenes, amphiboles, dark coloured micas etc. Among the sedimentary rocks, the sources are chlorite, serpentine biotite, amphiboles, staurolite etc. Mg is one of the constituents responsible for hardness of water. The lower concentration of Mg is not harmful but higher conc. is laxative. The concentration of Magnesium has been found varying widely. It ranges between 2.4 mg/l to 1073 mg/l with 45.8% of water samples falling within the desirable limit of 30 mg/l (BIS- 2012) and 50.6% samples have higher level of Mg

concentration but within maximum permissible limit of 100 mg/l. Only 3.6% water samples exhibited Mg values >100 mg/l with a maximum value of 1073 mg/l recorded at Nandgaon block (distt. Mathura). The distribution of samples in different concentration ranges are given in following table 18:

**TABLE - 18: Frequency Distribution of Magnesium**

Range of Magnesium in mg/l	0-30	>30-100	>100
No. of Samples	344	380	27
%	45.8	50.6	3.6

### Sodium (Na) :

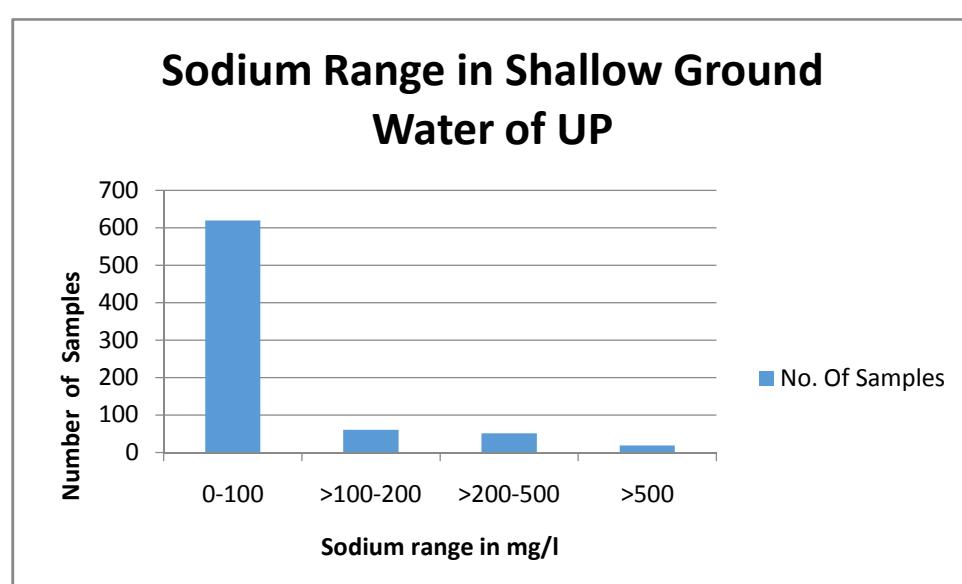

It is found in varying concentrations in all natural waters. It is found in evaporates and sea water in high concentration. It occurs among silicate minerals in feldspar, mica, amphiboles and pyroxenes. The main sources of sodium in ground water are (i) rain water, (ii) evaporate deposits, (iii) weathering of rock minerals present in the soil, (iv) disposal of sewage and industrial wastes containing sodium. The higher concentration of Na in drinking water is harmful especially to those suffering from cardiac, renal diseases pertaining to circulatory system of the human body.

The analysis result of shallow ground water indicate that sodium ranges between 3.9 mg/l to 5060mg/l with an average value of 101 mg/l. 82.6% of water samples exhibit sodium concentration upto 100 mg/l and 2.5% samples were found to be associated with extremely high levels of Na concentration >500 mg/l with a maximum value of 5060 mg/l recorded at Nandgaon block (distt. Mathura). The distribution of samples in different concentration ranges are given in following table 20:

**TABLE-20 : Frequency Distribution of Sodium**

Range of Sodium in mg/l	0-100	>100-200	>200-500	>500
No. of Samples	620	61	51	19
%	82.6	8.1	6.8	2.5

**Figure-7** Showing the Sodium range in shallow ground water of U.P

### Potassium (K)

Although potassium is more abundant than sodium in sedimentary rocks, its concentration in natural waters is quite low due to greater resistance to weathering of potassium bearing minerals. The main sources of K in natural waters are (i) rain water, (ii) weathering of Potash silicate minerals, (iii) potash fertilizers. K enters into structure of clay and clay bearing minerals during weathering. In illite K ions are incorporated in spaces between crystal layers where these are not removable by further ion exchange reactions

(Buckman & Brady, 1960). Usually the concentration of K in water from natural source is small but high concentration of this ion if present, may be attributed to pollution.

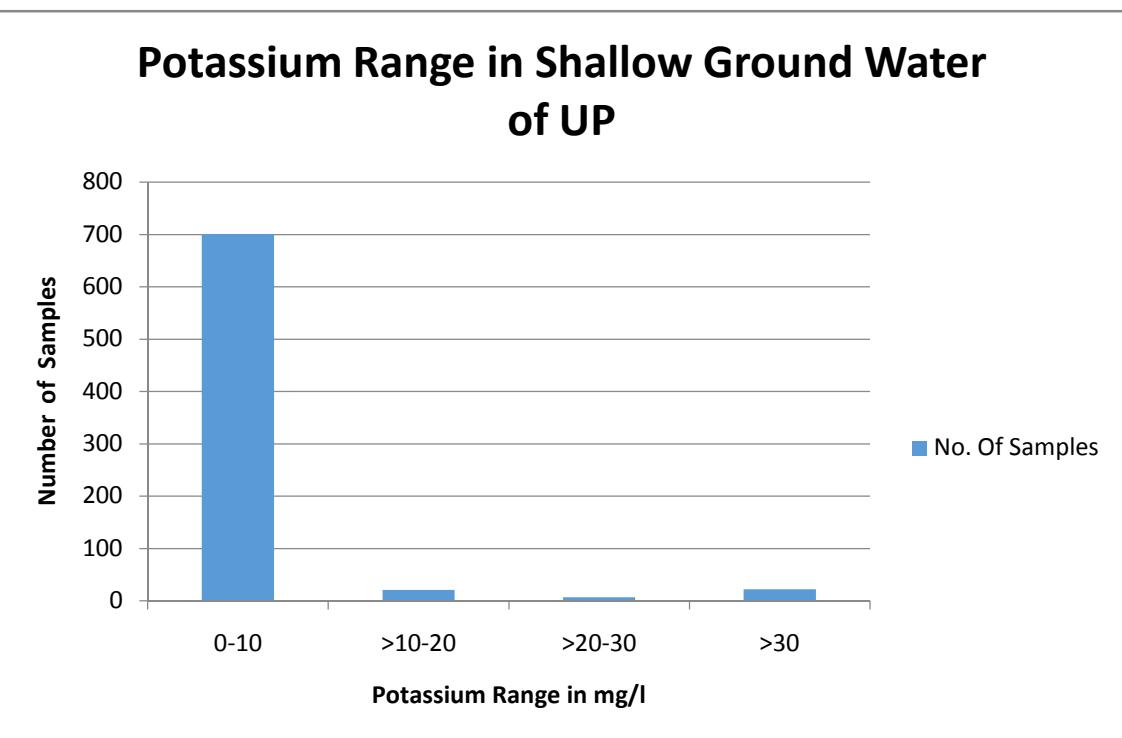

Potassium is an essential plant nutrient. It plays an important role in maintenance of cellular organization and in keeping the protoplasm in a proper degree of hydration by stabilizing the emulsions of highly colloidal particles. K deficiency causes water imbalance. The carbohydrate metabolism is also affected by inadequate supplies of potassium.

The analysis result of shallow ground water indicate that Potassium ranges between 0.13 to 709mg/l with an average value of 8.7 mg/l. 93.4% of water samples exhibit Potassium concentration upto 10 mg/l and 2.9% samples were found to be associated with extremely high levels of K concentration >30 mg/l with a maximum value of 709mg/l recorded at Nohjhil block (distt. Mathura). The distribution of samples in different concentration ranges are given in table 22:

**TABLE-22: Frequency Distribution of Potassium**

## SUITABILITY OF GROUND WATER FOR IRRIGATION PURPOSE

The chemical quality of water is an important factor to be considered in evaluating its usefulness for irrigation purposes. Plants grown by irrigation absorb and transpire the water but leave nearly all the salts behind in the soil, where they accumulate and eventually prevent plant growth. Excessive concentrations of solute interfere with the osmotic process by which plant root membranes are able to assimilate water and nutrients.  $\text{CaCO}_3$  has low solubility, it may precipitate harmlessly but the bulk of residual solutes present a disposal problem that must be solved effectively to maintain productivity of the irrigated soil. In areas where natural drainage is inadequate, the irrigation water infiltrating the root zone will cause water table to rise excessively. The crop productivity depends on the quality of the water used for irrigation. Water suitability for irrigation needs to be evaluated on the basis of hazards it can create in the soil, affecting yield & quality of crops.

In addition to problems caused by excessive concentration of dissolved solids (TDS), certain constituents in irrigation water are especially undesirable and some may be damaging even when present in small concentrations viz. Sodium Adsorption Ratio (SAR) & Residual Sodium Carbonate (RSC) (Annexure-A). The potential hazards to crop growth are salinity, sodicity, alkalinity & toxicity.

### **Electrical Conductivity (EC) :**

The Electrical Conductivity is a reflection of the concentration of various chemical constituents in ground water and gives the overall quality of ground water for its various uses like irrigation. The Electrical Conductivity data reveals that the majority of the samples belong to C1, C2 class as per USSL classification given in table 24

**TABLE 24: Frequency distribution of Electrical Conductivity**

<b>EC ranges in <math>\mu\text{S}/\text{cm}</math> at <math>25^\circ\text{C}</math></b>	<b>0-250 (C1)</b>	<b>251 – 750 (C2)</b>	<b>751-2250 (C3)</b>	<b>&gt;2250 (C4)</b>
No. of samples	4	450	263	34
Percentage	0.53	59.94	35.01	4.52

### **Total Dissolved Solids (TDS) :**

The total load of dissolved solids in water is determined theoretically by taking into account the EC of that particular water body.

Thus , 
$$\text{TDS} = \text{EC} * .67 \text{ mg/l}$$

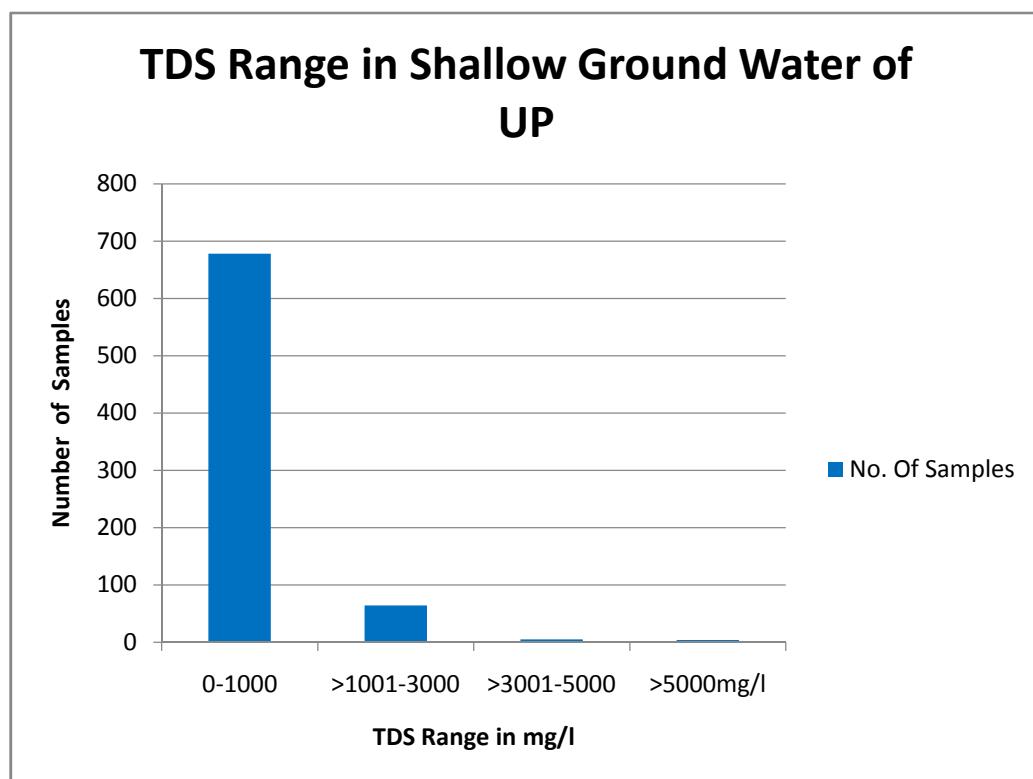

where EC is in  $\mu\text{S}/\text{cm}$  at  $25^\circ\text{C}$

TDS is responsible for the mineralization of water and gives its degree of salinity. The perusal of the analysis data of U.P. shows that the Total Dissolved Solids in the area ranges from a minimum of 100 mg/l to a maximum of 22465 mg/l at Nandgaon block (distt. Mathura) with an average value of 661 mg/l. Its frequency distribution is given in table 25.

**Table-25 : Frequency Distribution of T.D.S. in NH Stations of U.P.**

Salinity as per T.D.S range	No. of Samples	Percentage
Fresh, non saline (0-1000 mg/l)	678	90.3
Slightly saline (1001-3000 mg/l)	64	8.5
Moderately saline (3001-5000 mg/l)	5	0.7
Highly saline (>5000 mg/l)	4	0.5

Figure-9 depicts the T.D.S. range in shallow ground water of U.P

#### **Alkalinity Hazard or Residual Sodium Carbonate (RSC) :**

When carbonate or bicarbonate concentration in irrigation water is relatively higher than the alkaline earth metals, there is tendency for calcium and magnesium ions to precipitate as carbonates in the soil, thereby reducing the level of calcium and magnesium

ions and increasing the relative levels of sodium in the soil. The highly soluble sodium carbonate (black alkali) known as residual sodium carbonate (RSC) is defined as –

$$RSC = ( HCO_3 + CO_3 ) - ( Ca + Mg )$$

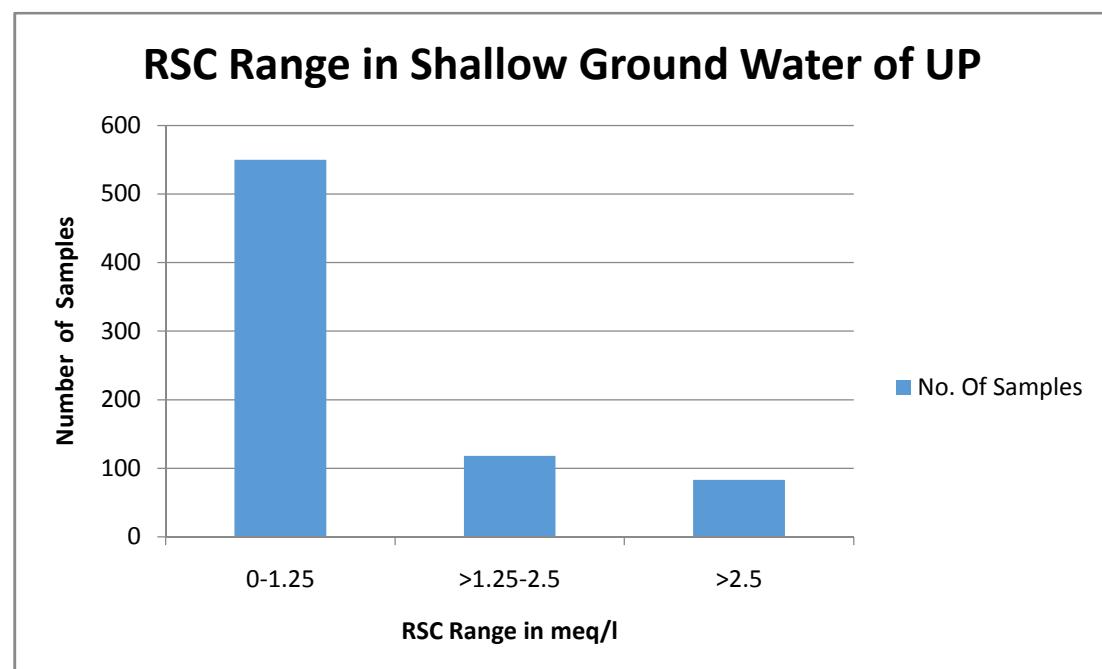

Where concentrations are expressed in meq/l.

The perusal of the analysed data of U.P. shows that the Residual Sodium Carbonate in the area ranges from a minimum of 119 meq /l to a maximum of 14 meq /l with an average value of 0.07 meq/l. The frequency distribution of RSC in National Hydrograph Station of UP is given in 26

**Table 26: Frequency Distribution of R.S.C. in NH Stations of U.P.**

RSC range (meq/l)	No. of samples	Percentage
<1.25 ( Very safe water )	550	73.2
1.25-2.5 ( Marginally safe water )	118	15.7
>2.5 ( Unsuitable water )	83	11.1

**Figure-11** depicts the R.S.C. range in shallow ground water of U.P

#### Sodium Adsorption Ratio:

Sodium Adsorption Ratio (SAR) is an estimate of the degree to which Sodium will be absorbed by soil from water. Sodium in irrigation, waters adversely affects soil structure and permissibility by replacing Ca and Mg ions. The analysis results are shown in table 27,

suggest that the quality of water samples as per SAR is good as 96.95% wells have SAR value below 10.

$$SAR = \frac{Na^+}{[Ca^{+2} + Mg^{+2}/2]^{1/2}}$$

Where:  $Na^+$ ,  $Ca^{+2}$  and  $Mg^{+2}$  are expressed in meq/l

Table – 27: Shows the quality of Water on the basis of SAR values

S. No.	Range of SAR	No. of Samples % of Samples	% of Samples	Quality of Water
1.	<10	728	96.95%	Low Na hazard good quality
2.	10-18	17	2.26%	Medium Na hazard medium quality
3.	>18-26	5	0.66%	High Na hazard bad quality
4.	<26	1	0.13%	V. High Na hazard V. bad quality

### Conclusion:

By and large, the chemical quality of ground water of phreatic zone in Uttar Pradesh is found to be suitable for drinking purposes as per available analysed chemical parameter data (as per BIS 2012). Presence of some constituents beyond the permissible limit at some locations renders the water unfit for public water supply.

Considering the parameters responsible for suitability of ground water of Uttar Pradesh it is observed that it is generally fit for irrigation purposes as per Electrical conductivity, Residual Sodium Carbonate, Sodium Adsorption Ratio except at few places where corrective measures are to be taken before agricultural usage.
