## FOREWORD

Ground Water is of fundamental importance to meet the rapidly expanding drinking, agricultural and industrial water requirement of the country. Periodic monitoring of the ground water regime is an essential prerequisite for effective planning, management and sustenance of quantity as well quality of this precious resource. To keep track of the changes in ground water regime, Central Ground Water Board monitors ground water level four times in a year, i.e. during May, August, November and January, through a network of Ground Water monitoring Wells scattered throughout the length and breadth of the country. The present report gives an overview of the status of ground water level monitored during the water year 2015-16 by the officers of Central Ground Water Board in the State of Madhya Pradesh. Presently there are 1482 as on 31.03.2015 and 1487 as on 31.03.2016, Ground Water monitoring Wells under this programme in entire Madhya Pradesh.

Water samples are collected once in a year during May and are subjected to detailed chemical analysis to monitor the changes in chemical quality of ground water. Water samples are also collected for selected stations for every year in May for analysis of heavy metals. The water level and water quality data so generated are updated and stored in computer and subjected to rigorous analyses using the latest software. The results of the analyses are reflected in the periodic reports on Status of Ground Water Level, which are usually issued within a month of completion of each monitoring. As such, four reports are issued every year beside the Ground Water Year Book, which is published annually. The presents report deals with the cumulative action of the work done during the water year 2015-16. During this water year, the existing network stations were monitored during May 2015, August 2015, November 2015 and January 2016.

The ground water regime monitoring work is a joint endeavor of all the officers and staff of this Region, and their contribution in this important activity is highly appreciated. Preparation of this report has been an arduous task which has been successfully completed by *Shri R. M. Verma, Scientist D (Hydrogeology) and Shri Tej Singh, Assistant Chemist*. I hope that the State Government and other user agencies would utilize the data incorporated in the report for proper planning of the ground water development and management activities in the State.

(Parvinder Singh)  
Regional Director

## **EXECUTIVE SUMMARY**

Central Ground Water Board, North Central Region, monitors ground water levels in entire State of Madhya Pradesh through 1487 Ground Water Monitoring Wells, four times in a hydrological year in order to bring out the spatial and temporal changes in the ground water regime. This continuous monitoring provides a valuable tool to decipher the seasonal and long-term changes in ground water levels and quality, and in turn helps in managing the ground water resources in a more scientific and effective manner. The present report incorporates the overall behavior of the ground water regime including the quality aspects in the State of Madhya Pradesh on the basis of the detailed analyses of the field data collected from observation wells during the water year 2015-16.

Total geographical area of Madhya Pradesh State is 3, 08,252 km<sup>2</sup>, which comprises fifty one districts. The State exhibits six distinct physiographic units namely the Malwa plateau, the Satpura range, The Vindhyan range, the Mahakoshal range, the Bundelkhand region and the river valleys. There are six river basins in Madhya Pradesh as six major rivers originate from the State namely Ganga basin (Yamuna sub basin - Chambal sub-sub basin, Kunwari sindh sub-sub basin, Jamni sub-sub basin, Betwa sub-sub basin, Dhasan sub-sub basin, Ken sub-sub basin, Paisuni and Waidhan sub sub basin, Tons sub basin, Sone sub basin), Narmada basin, Godavari basin, Tapti basin, Mahi basin and Mahanadi basin.

Central Ground Water Board, North Central Region has set up a network of monitoring wells spread over the State in different hydrogeological conditions, consisting of 1161 Dugwells and 326 Piezometers, which are being monitored four times in a year. The periods of monitoring are – January 1<sup>st</sup> to 10<sup>th</sup>, May 20<sup>th</sup> to 30<sup>th</sup>, August 20<sup>th</sup> to 30<sup>th</sup> and November 1<sup>st</sup> to 10<sup>th</sup>. Water samples are being collected for analysis during the month of May, when concentrations of different chemical constituents are expected to be highest.

The State has varied hydrogeological set-up due to which ground water potential differs from place to place. The area is underlain by various geological formations ranging in age from Archaean to Recent. Hard rock areas cover more than 80% of total land area of the State. These hard rock areas show wide variations and complexities in nature and composition of rocks, geological structures, geomorphological set up and hydrometeorological conditions. The crystalline rocks of Archaean age like granite, gneiss, granulites, schist, quartzite and granitoids occupy about 14.7% of geographical area of the State. The basaltic rocks of Deccan lava flows are the predominant formations and occupy nearly 44.5% of total geographical area. The consolidated sedimentary rocks of Vindhyan Super Group and Mahakoshal (Cuddapah) Super Group of Proterozoic age occupy about 19.1% of total geographical area and the semi consolidated (Gondwana Formation) occupies about 6.7%. Recent unconsolidated alluvial sediments occupy about 14.4% of total geographical area.

Monsoon rainfall is the sole source of natural recharge to ground water regime and rainfall pattern has an important impact on groundwater levels in the phreatic aquifer. Rainfall in the State occurs during south-west monsoon season (mid June to September) and sometimes during winter (November to February). Most of the rainfall (more than 90%) occurs during the south-west monsoon season, August being the雨iest month.

Monsoon rainfall within  $\pm 19\%$  of the normal monsoon rainfall is considered normal. Monsoon rainfall above 19% of the normal monsoon rainfall is considered excess and monsoon rainfall less than -19%

and more than -59% of the normal monsoon rainfall is considered deficit and if the monsoon rainfall is lesser than -59% of the normal monsoon rainfall, it is considered scanty.

The normal rainfall of the Madhya Pradesh State is 938 mm. About 829 mm rainfall as an average of state rainfall was received during 2015 monsoon period. About 10.0% less rainfall has occurred during the year with respect to normal rainfall. The percent departures of the monsoon rainfall from the normal rainfall worked outs, which shows that all most entire state has received less rainfall than normal rainfall except in Khandwa, Betul, Chhindwara, Indore, Rajgarh, Shajapur, Ratlam, Mandsaur and part of Dhar districts. Shajapur rain gauge station has received the highest rainfall of 1473.1 mm and Bhind rain gauge station has received the least rainfall of 399.9 mm. North, north-east, central and south-eastern parts of the state have received deficit rainfall. Shajapur, Dewas, Ujjain, Ratlam, Indore and Rajgarh rain gauge has received excess rainfall. Anuppur rain gauge station has received highest deficit rainfall in the state.

The groundwater level monitored in May is the pre-monsoon water level and the water level as it stands at the end of the ground water year after all the inputs and outputs have taken place. It is the resultant ultimate/deepest water level. Depth to water level during May 2015 ranged from 1.05 to 49.57 metres below ground level (mbgl) in Madhya Pradesh. About 1.47% percent of the wells in the State recorded a water level up to 2 m bgl, 14.70% between 2-5 m bgl, 46.29% between 5-10 m bgl, 32.11% between 10-20 m bgl, 4.48% between 20-40 m bgl and 0.96% in more than 40 m bgl. Depth to water levels between 5-10 m bgl is the most prominent over the entire State.

The groundwater level monitored in November is the post-monsoon water level and the water level as it stands after the major portion of rainfall recharge has taken place. Depth to Water levels ranges from 0.30m bgl to 35.97 m bgl in Madhya Pradesh state. Depth to water level during November 2015 ranged from 0.30 m bgl to 35.97 m bgl in Madhya Pradesh. 6.42% percent of the wells in the State recorded a water level up to 2 m bgl, 32.92% between 2-5 m bgl, 40.37% between 5-10 m bgl, 17.93% between 10-20 m bgl, and 2.36% between 20-40 m bgl and there is no well comes under more than 40 m bgl. Water levels between 5-10 m bgl are most prominent over the entire state.

Ground water is a dynamic system. The ground water level or head is subject to change both due to natural and man made causes. The water level data of May 2015 was compared with that of November 2015. Comparison of November 2015 water levels with that of May 2015 shows that there is a rise in the ground water level in about 84.54% of the wells due to monsoon recharge and 15.46% of wells show decline in water level. Rise in the order of 0-2 m is seen in about 37.33% of wells in the state. 26.47% of wells show a rise in the order of 2-4 m. 20.74% wells recorded a rise of water level by more than 4 m. About 13.05% of the wells show a decline in water level up to 2 m, 1.81% of the wells show a decline in water level between 2 to 4 m and 0.60% of the wells shows decline more than 4 m. Such a rise is a natural phenomenon in the hydrological cycle since the monsoon rainfall recharges the ground water regime.

Long term behaviour of water levels of the phreatic zone have been analysed by comparing the average water level data of last ten years with the current water level of different measurements during the year. The groundwater levels were influenced by monsoon rainfall received in the area during the year 2015. The ground water levels of May 2015 were compared with the 10 years May (2005-2014) average ground water levels to decipher the long-term changes in the ground water regime. It is observed that about 58.76% of the wells show rise and about 41.24% wells show decline

in water levels in the state. The rise in water level is in the order of 0-2 m in 38.33% of the wells, 2-4 m in 12.52% of the wells and more than 4 m in about 7.91% of the wells. The decline in water levels in the order of 0-2 m is about 29.65% of the wells, between 2-4 m in 6.61% of the wells and more than 4 m in 4.99% of the wells.

Ground water levels trend map of pre-monsoon period (May 2006 to May 2015) in Madhya Pradesh state shows that there is a general rising trend up to (0.10 m/year) of ground water levels during the past decade in the almost all the districts of the State. The rising trend at higher rate (0.10 to 0.2 m/year) is found in sporadic patches of smaller areal extent in Dewas, Sheopur, Gwalior, Panna, Satna and Shajapur district. The rising trend more than 0.20 m/year has been observed in Sheopur, Dewas districts of the State. Declining trend at a rate up to (-0.10 m/year) is observed in patches mainly in central and southern parts of the state. The declining trend at higher rate (-0.10 to -0.20 m/year) has been observed only at few districts, namely, Chhindwara, and Narsinghpur districts. About 33.6 % of monitoring wells are showing declining water levels trend while 66.4 % monitoring wells are showing rising ground water level trend.

Ground water levels trend map of post-monsoon period (Nov 2006 to Nov 2015) in Madhya Pradesh state Map shows that there is a general rising trend up to 0.10 m/year of ground water levels during the past decade in all most all the districts of the State. Rising trend at a rate 0.10 to 0.20 m/year is observed only in small patches in Shivpuri, Gwalior, Ujjain and Rewa districts. The rising trend at rate more than 0.20 m/year) is found only in Gwalior. The declining trend up to 0.10 m/year has been observed in patches mainly in Southern and central parts of state. The declining trend at rate (-0.10 to -.20 m/year) is found in patches mainly in Morena, Sheopur, Narsinghpur and Betul districts. Declining water levels trend more than (-0.20 m/year) has been observed only in Narsinghgarh and Sheopur districts. About 36.8 % of monitoring wells are showing declining water levels trend while 63.2 % monitoring wells are showing rising ground water level trend.

1050 number of ground water samples were collected from the ground water monitoring wells during May 2014 in entire Madhya Pradesh State. The analyses of ground water samples indicate that ground water in state of Madhya Pradesh state is generally good. In most part of the State the ground water has low to medium salinity ( $EC \approx 1000 \mu\text{s}/\text{cm}$ ) except in few pockets. In some parts of the State very high electrical conductivity i.e. more than  $3000 \mu\text{s}/\text{cm}$  at  $25^\circ\text{C}$  (1.52%) has been recorded specially in Ashoknagar, Bhind, Damoh, Datia, Dewas, Gwalior, Khargone, Mandla, Neemuch, Sehore, Shajapur, Shivpuri and Ujjain districts.

Fluoride concentration more than permissible limit i.e. 1.5 mg/l is observed in Agar Malwa, Anuppur, Betul, Chhindwara, Katni, Mandla, Narsinghpur, Sehore, Seoni, Shahdol, Shajapur, Ujjain And Umaria districts. The maximum fluoride concentration has been observed at Rehgaon (3.85mg/l), Mandla district. In Madhya Pradesh, 91.71% wells have been recorded fluoride concentration within the desirable limit of 1.0 mg/l where as 1.81% wells show fluoride concentration more than the maximum permissible limit of 1.5 mg/l.

The analyses of ground water samples indicate that 66.48% wells have nitrate concentration within the permissible limit of 45mg/l, while 33.52% wells have nitrate concentration above permissible limit. Nitrate concentration more than permissible limits have been observed in Agar Malwa, Alirajpur, Anuppur, Ashoknagar, Balaghat, Barwani, Betul, Bhind, Bhopal, Burhanpur, Chhatarpur, Chhindwara, Damoh, Datia, Dewas, Dhar, Guna, Gwalior, Harda, Hoshangabad, Indore, Jabalpur, Jhabua, Katni, Khandwa, Khargone, Mandla, Mandsaur, Morena, Narsinghpur, Neemuch, Panna, Raisen, Rajgarh, Ratlam, Rewa, Sagar, Satna, Sehore, Seoni, Shahdol, Shajapur, Sheopur, Shivpuri,

Sidhi, Singrauli, Tikamgarh, Ujjain and Vidisha districts. Very high Nitrate concentration more than 500 mg/l has been observed at Sirsod Chouraha (765 mg/l), Shivpuri district observation wells.

Total Hardness in ground water samples ranges between 20 to 1805 mg/l. Most of the waters are calcium bicarbonate type attributing to temporary hardness of water. The analyses reveal that 7.05% of wells show hardness more than the permissible limit of 600 mg/l. In general the ground water is good for drinking purposes and suitable for irrigation.

# **GROUND WATER YEAR BOOK - MADHYA PRADESH**

## **(2015- 16)**

### **1. INTRODUCTION**

Madhya Pradesh is located in the central part of India and is a land-locked State, bordered on the west by Gujarat, on the northwest by Rajasthan, on the northeast by Uttar Pradesh, on the east by Chhattisgarh, and on the south by Maharashtra. It has a geographical area of 3,08,252 km<sup>2</sup> and is situated between north latitudes 21° 04' and 26° 54' and east longitudes 74° 00' and 82° 50'. There are 51 districts and 313 Community Development blocks in Madhya Pradesh. The population of State as per census 2011 is 7,25,97,565 with a population density of 236 persons per Km<sup>2</sup> area. Out of total population, 75% lives in the villages and their main occupation is agriculture. The important urban areas in the State are Bhopal, Indore, Jabalpur, Ujjain and Gwalior. Dhupgarh in Pachmarhi is the highest point in the State.

Madhya Pradesh comprises several linguistically and culturally distinct regions, of which the major regions are:

**Malwa plateau** region is located in the northwest of the State and north of the Vindhya Range, with its distinct language and culture. Indore is the major city of the region, while Ujjain is a town of historical importance. Bhopal, the capital city lies on the extension of Malwa Region and on the edge of Bundelkhand region.

**Nimar region** is located in the western portion of the Narmada River valley, lying south of the Vindhya in the southwest portion of the State. Khandwa, Khargone, Burhanpur and Barwani are the major district of the Nimar region.

**Bundelkhand** is a region of rolling hills and fertile valleys in the northern part of the State, which slopes down toward the Indo-Gangetic plain to the north. Gwalior is an historic center of the region. This region encompasses Gwalior, Sagar, Damoh, Panna, Chhatarpur and Tikamgarh Districts.

**Chambal region** is located in the north-western parts of the State. The climate is harsh, and the area is known for murderous pirates who were active in hundreds in the late 1900s. This region is comprised of Sheopur, Morena and Bhind districts.

**Baghelkhand** is a hilly region in the northeast parts of the State, which includes the eastern end of the Vindhya Range. Satna, Rewa and Sidhi districts lie in this region.

**Mahakoshal (Mahakaushal)** is the southeastern portion of the State, which includes the eastern end of the Narmada river valley and the eastern Satpuras. Jabalpur is the most important city in the region. Katni and Jabalpur districts lie in this region.

**Central Vindhyan and Satpura region** is occupying most parts of the central Narmada river valley. Hoshangabad, Harda, Narsimhapur districts lies in this region.

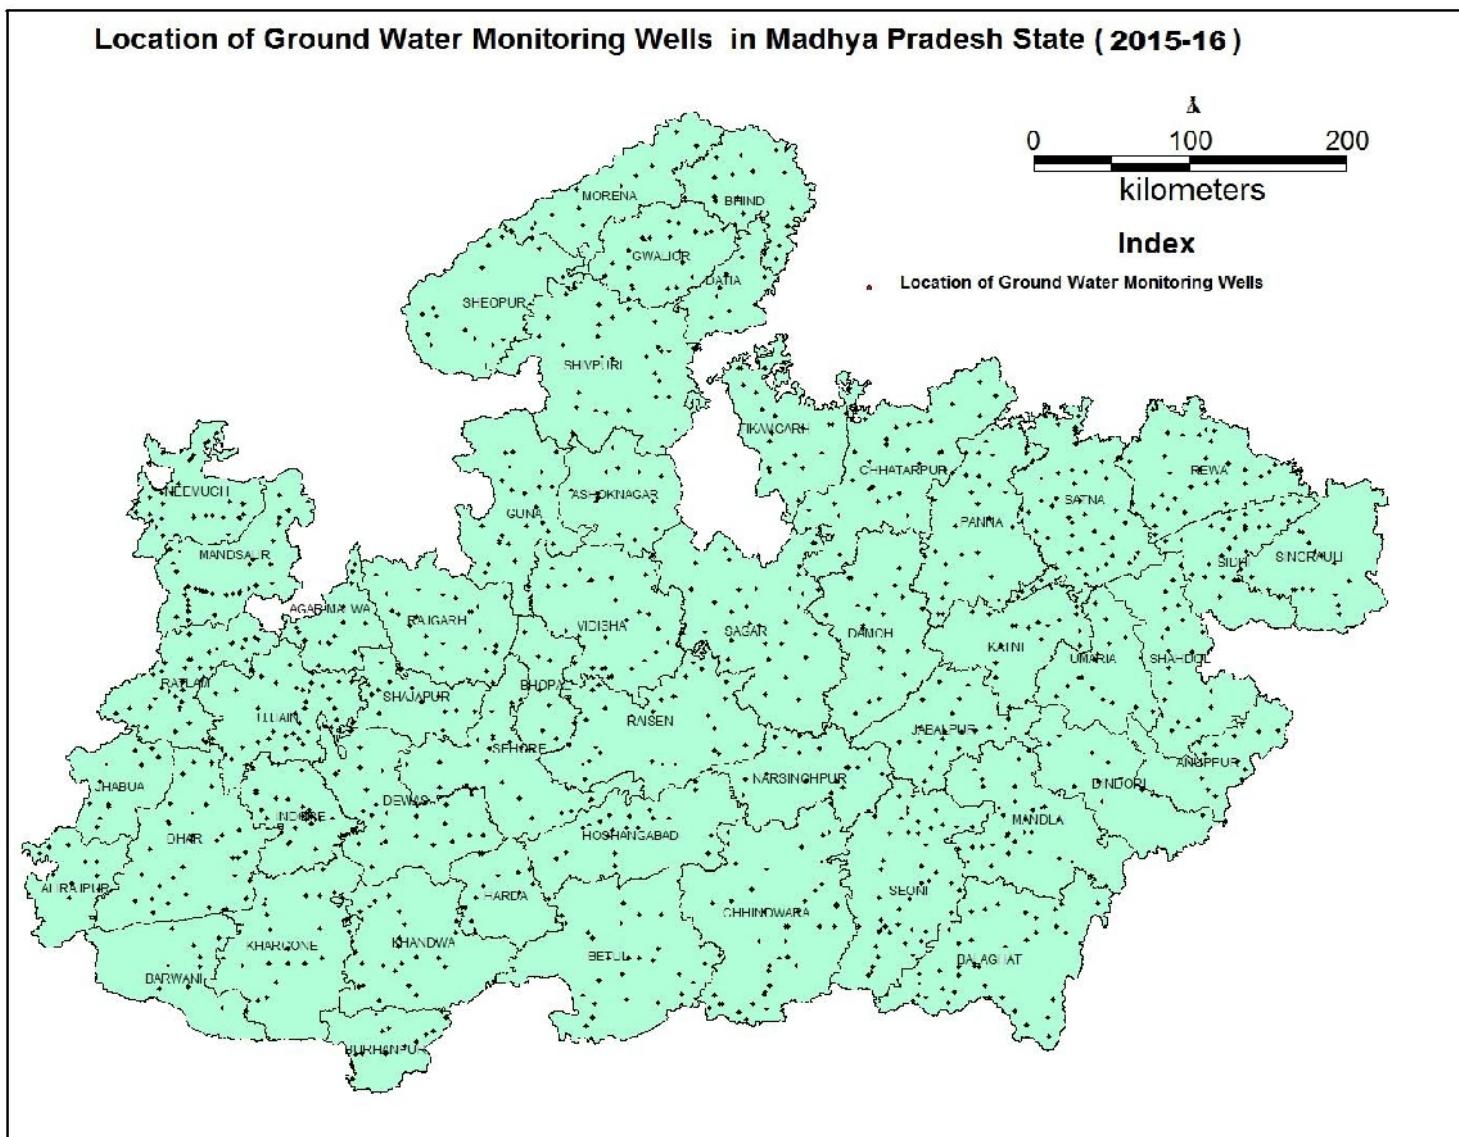

Agriculture is the main stay of the people of Madhya Pradesh State. Water is essential for irrigation purposes, but its indiscriminate use can lead not only to shortages, but also to the deterioration of crop yields and soils. Ground water resource of a region is one of the building blocks for balanced economic development of the area, especially in an agriculture based society. Dependence on ground water for irrigation and increasing water requirements in urban areas in Madhya Pradesh has necessitated judicious and planned uses of ground water resources in order to reach sustainability. For proper planning and management of ground water development in a judicious and socio-economically equitable manner, assessment of ground water scenario is one of the most important prerequisites.

Central Ground Water Board monitors ground water levels all over the country four times in a year in order to bring out the spatial and temporal changes in the ground water regime. This continuous monitoring provides a valuable tool to decipher the annuals, seasonal and long-term changes in ground water regime, and in turn helps in managing the ground water resources in a scientific manner.

The North Central Region office of Central Ground Water Board, based at Bhopal, monitor the ground water wells spared all over the state. As on start of the year i.e. 31-03-2015, the number of ground water monitoring well is 1482 which includes 1134 dugwells and 348 piezometers. During the year some new additional dug wells were established. Few of the exiting dugwells and Piezometers were declared as abandoned. At the close of the Year i.e 31-03-2016, the number of ground water monitoring well is 1487 which includes 1161 dugwells and 326 piezometers. District-Wise Distribution of Ground Water Monitoring Wells in Madhya Pradesh 2015-16 is given in Table 1. The locations of these stations are shown in Figure 1. All stations are monitored four times in a given hydrological year in the months of August (20<sup>st</sup> to 30<sup>th</sup> day), November (postmonsoon) (1<sup>st</sup> to 10<sup>th</sup> day), January (1<sup>st</sup> to 10<sup>th</sup> day) and May (premonsoon) (20<sup>th</sup> to 30<sup>th</sup> day). The long-term data generated during these monitoring seasons are important for computation, comparison and analysis of ground water utilization and its availability.

Reports on the status of ground water levels are produced within one month from each monitoring period and contain analysis of ground water levels in that particular season, and compare these water levels with those of the same season previous year, premonsoon period and previous seasons of the same hydrological year and decadal mean (10 years of average) of the same season.

## 1.1 PHYSIOGRAPHY

The State of Madhya Pradesh exhibits six distinct physiographic units as follows:

The Malwa Plateau

The Satpura Range

The Vindhyan Range

The Mahakoshal Range

The Bundelkhand Region

The River valleys

The Malwa Plateau marks the northern span of the Deccan Plateau and this region forms a part of the vast Deccan plateau of Central India. The hill ranges run across the plateau. The Satpura range located in the southern part of the State is E-W trending. It has an average elevation of 600 m amsl and highest elevation of 1350 m amsl. The Vindhyan range occupies in the northern and central part of the region and has ENE-WSW trend. The Mahakoshal Range also has a similar trend. The Vindhyan range extends into the Malwa plateau and Bundelkhand region. The Vindhyan range and Mahakoshal range are separated from the Satpura range by the Narmada River and vast tract of its basin area. The river valleys, other than the Narmada alluvial plain and Chambal alluvial plain, are very limited and form narrow belts along the rivers.

## 1.2 DRAINAGE

Madhya Pradesh State represents great river basins and the watershed of a number of rivers. Catchments of many rivers of India lie in Madhya Pradesh. There are six river basins in Madhya Pradesh as six major rivers originate from the State- 1 Ganga basin (1.1 Yamuna sub basin - Chambal sub-sub basin, Kunwari sindh sub-sub basin, Jamni sub-sub basin, Betwa sub-sub basin, Dhasan sub-sub basin, Ken sub-sub basin, Paisuni and Baidhan sub sub basin 1.2 Tons sub basin, 1.3 Sone sub basin), 2 Narmada basin, 3 Godavari basin, 4 Tapti basin, 5 Mahi basin and 6 Mahanadi basin. As Madhya Pradesh is located in the center of India, most of the rivers are interState rivers. The rivers namely, Chambal, Sindh, Betwa, Ken flows northward and meet with Yamuna, whereas the river

Sone falls directly into Ganga. Narmada, Tapti and Mahi rivers flow westward and meet Arabian Sea whereas Wainganga and Pench rivers meet Godavari in the south. The Narmada (originating from Amarkantak) and Tapti (originating from Multai in Betul District) rivers and their basins divide the State in two, with the northern part draining largely into the Ganga basin and the southern part into the Godavari and Mahanadi systems. The Vindhya range forms the southern boundary of the Ganga basin, with the western part of the Ganga basin draining into the Yamuna and the eastern part directly into the Ganga itself. All the rivers, which drain into the Ganga, flow from south to north, with the Chambal, Kshipra, Kalisindh, Parbati, Kuno, Sind, Betwa, Dhasan and Ken rivers being the main tributaries of the Yamuna. The land drained by these rivers is agriculturally rich, with the natural vegetation largely consisting of grass and dry deciduous forest types. The eastern part of the Ganga basin consists of the Son, the Tons and the Rihand Rivers, with the Son being the major tributary. This is also the junction point of the Satpura and the Vindhya ranges, with the Maikal and Kaimur Hills being the fulcrum. The forests here are much richer than the thorn forests of the northwestern part of Madhya Pradesh. The Son River is of great significance in that it is the largest tributary going into the Ganga on the south bank and arising out of the hills of Madhya Pradesh rather than from the Himalayas. This river and its tributaries contribute the bulk of the monsoon flow into Ganga, because the north bank tributaries are all snow fed.

The major tributary of the Ganga, the Son, arises in one of the most important watersheds in India, the Maikal hills around Amarkantak. Three of the great rivers of India, Narmada, Mahanadi and Son, are given birth to by these hills. This is also one of the few ranges in the State having a north-south configuration. The Mahanadi itself, together with its tributaries such as Hasdeo, Mand and Kharun flows southeast into Orissa and converts that State into a green rice bowl. The upper Mahanadi catchment contains some of the finest forests in the State, ranging from mixed deciduous to teak, bamboo and sal. Just as the Mahanadi flows east from the Maikal hills and the Son flows north, the mighty Narmada charts a westerly course from these very hills. The Narmada flows through a rift valley, with the Vindhya range marching along its northern bank and the Satpuras along the southern. Its tributaries include Banjar, Tawa, Machna, Denwa and Sonbhadra rivers. Taken in combination with its parallel sister river, the Tapti, which also flows through a rift valley, the Narmada - Tapti systems carry an enormous volume of water and provide drainage for almost a quarter of the land area of Madhya Pradesh.

The Satpuras, in the Gawligarh and Mahadeo Hills, also contain a watershed, which is south facing. The Indrawati, Wainganga, Wardha, Pench, Kanhan and Penganga rivers, discharge an enormous volume of water into the Godavari system. The Godavari is the lifeline of Andhra Pradesh, but the water which feeds it is a gift of the central India watershed.

### **1.3 HYDROGEOLOGY**

The State of Madhya Pradesh has varied hydrogeological characteristics due to which ground water potential differs from place to place. The area is underlain by various geological formations ranging in age from the Archaean to the Recent. Hard rock areas cover more than 80% of total land area of the State. These hard-rock areas show wide variations and complexities in nature and composition of rocks, geological structures, geomorphological set up and hydrometeorological conditions. The crystalline rocks of Archaean age like granite, gneiss, granulites, schist, quartzite and granitoids occupy about 14.7% of geographical area of the State. The basaltic rocks of Deccan lava flows are the predominant formations and occupy nearly 44.5% of total geographical area. The consolidated sedimentary rocks of Vindhyan Super Group and Mahakoshal (Cuddapah) Super Group of Proterozoic age occupy about 19.1% of total geographical area and the semi consolidated (Gondwana Formation) occupies about 6.7%. Recent unconsolidated alluvial sediments occupy about 14.4% of total geographical area. Hydrogeological units of Madhya Pradesh State are given in Table 2 and Hydrogeological map of Madhya Pradesh State has been given in Fig 2A and Fig 2B.

#### **Archeans**

Archaeans comprise of old metamorphics, granites, gneisses and schists. They are hard and compact formations with low primary permeability, forming poor aquifers. Ground water occurs in these only in the weathered mantle and underlying fractured zone. Dug wells in this formation have depths of 5-30 m with water levels between 3-17 mbgl. Where thickness of aquifer is considerable, specific capacity ranges from 20-200 lpm/m of draw down. Hydraulic conductivity is generally less than 1 m/d and specific yield less than 5%. The yield of open wells ranges between 40-135 m<sup>3</sup>/d.

#### **Vindhyan**

Vindhyan Group of rocks comprise of sandstone, shale and limestone. The sandstone and shale are hard and compact and form poor aquifers. Ground water occurs in these in the weathered mantle and fractured zone or bedding plane fissures. The limestone is different in its hydrogeological properties having large solution cavities, which give rise to immense secondary permeability. The wells in limestone formations yield 100-500 m<sup>3</sup>/day for less than 5m draw down. Specific capacity ranges from 100-300 lpm/m of draw down, hydraulic conductivity varies between 5-15 m/d and specific yield ranges from 5-15% in good karstic zones.

#### **Gondwanas**

The Gondwanas are sedimentary formations rich in granular zones and form good aquifers. They support both dugwells and tubewells, capable of yielding 100-500 m<sup>3</sup>/d for the drawdown of 6-10 m. the specific capacity ranges between 75-250 lpm/m of drawdown, hydraulic conductivity varies

between 10-25 m/d and specific yield is from 10-15%. However, the clayey and silty formations (shales/claystone/siltstone) of Denwas are poor aquifers.

### **Infra Trappeans**

The Bagh and Lameta beds and Nimar Sandstone are also sedimentary formations but have a limited extent and poor to moderate permeability. The limestone and calcareous clays when karstified form productive aquifers. The coralling limestone, the marls and nodular limestone are hard and compact having poor permeability. The Nimar sandstone has intergranular porosity, joints, fracture, bedding planes, which give moderate scope for ground water movement. The depth of wells varies from 3 to 13 m and depth to water level between 2 to 12 mbgl.

### **Deccan Traps**

These form the most important aquifers in the region. The weathered, fractured, jointed and vesicular units of basalts form moderate to good aquifers. These formations have highly variable yields ranging from 10 to 750 m<sup>3</sup>/d. Dugwells range in depth from 4 to 20 m with water levels varying between 2 and 14 mbgl. The specific capacity ranges from 50 to 150 lpm/m of drawdown, hydraulic conductivity varies between 5 and 15 m/d and the specific yield is 5-10%. The Deccan Traps formations can be tapped by dug-cum-bore and drilled wells. It is observed that the yield increases by 5-10 times when 10-15 m bores extending down to the lower vesicular zone are drilled at the base of dugwells. Yields of 400-600 m<sup>3</sup>/d can be obtained in this way. In some areas the control of doleritic dykes on occurrence of ground water was observed. Wells located on the upstream side of these dykes gave better yields. Also wells located on tectonic lineaments gave better yields.

### **Alluvium**

It comprises of unconsolidated gravel, sand, silt, clay in various proportions and has primary intergranular porosity and permeability. Hence it is the most promising formation for ground water development. The thickness of alluvium varies from 10 to 318 m with aquifer thickness from 10 to 160 m being more in the Ganga basin than in the Narmada basin. The depth to water ranges from 5 to 30 mbgl. The transmissivity is high in the Ganga basin being up to 300 m<sup>2</sup>/d. In the Narmada basin transmissivity ranges between 83-283 m<sup>2</sup>/d. the yields vary from 30 to 50 m<sup>3</sup>/hr in shallow well and 30-200 m<sup>3</sup>/hr for deep wells in the Ganga basin. In the Narmada basin the yields are of the order of 15-30 m<sup>3</sup>/hr in the phreatic zone and 70-200 m<sup>3</sup>/hr in the deeper zone. In the Wainganga sub basin the wells yield 60-600 m<sup>3</sup>/d. In the Tapi basin, the yields are 25-95 m<sup>3</sup>/d.

Fig 2A

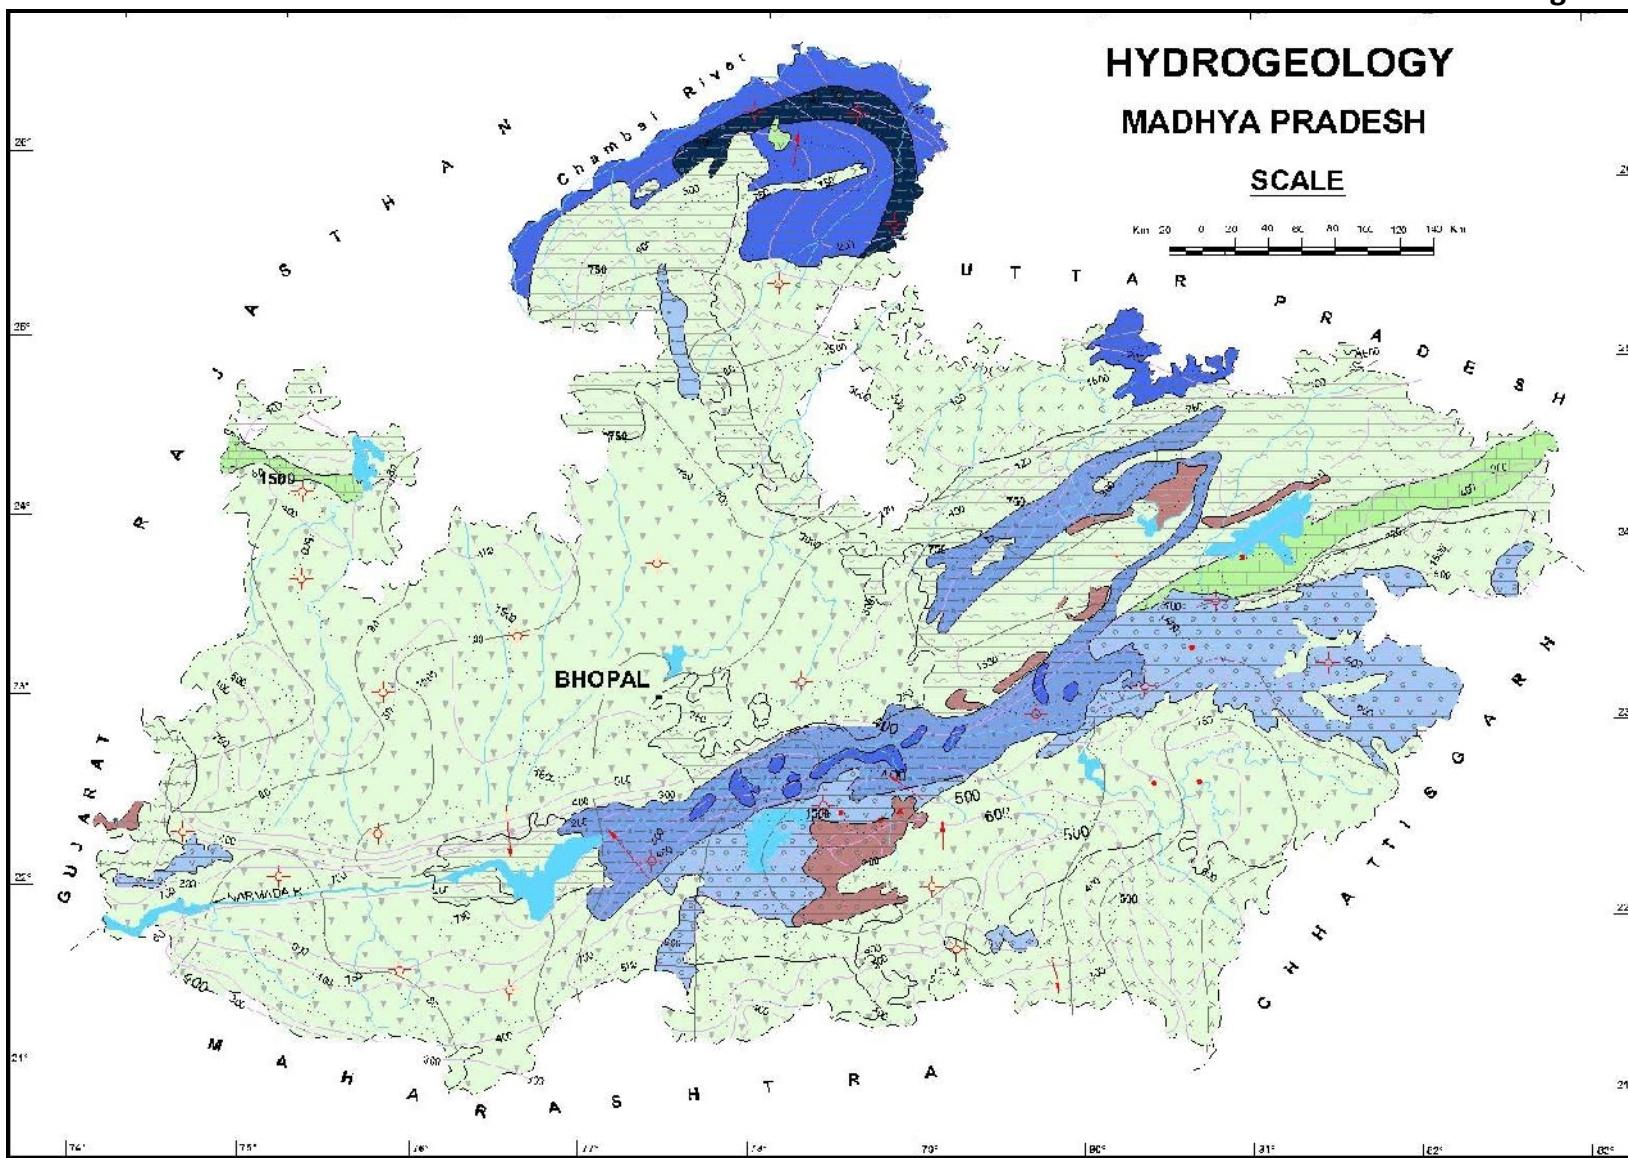

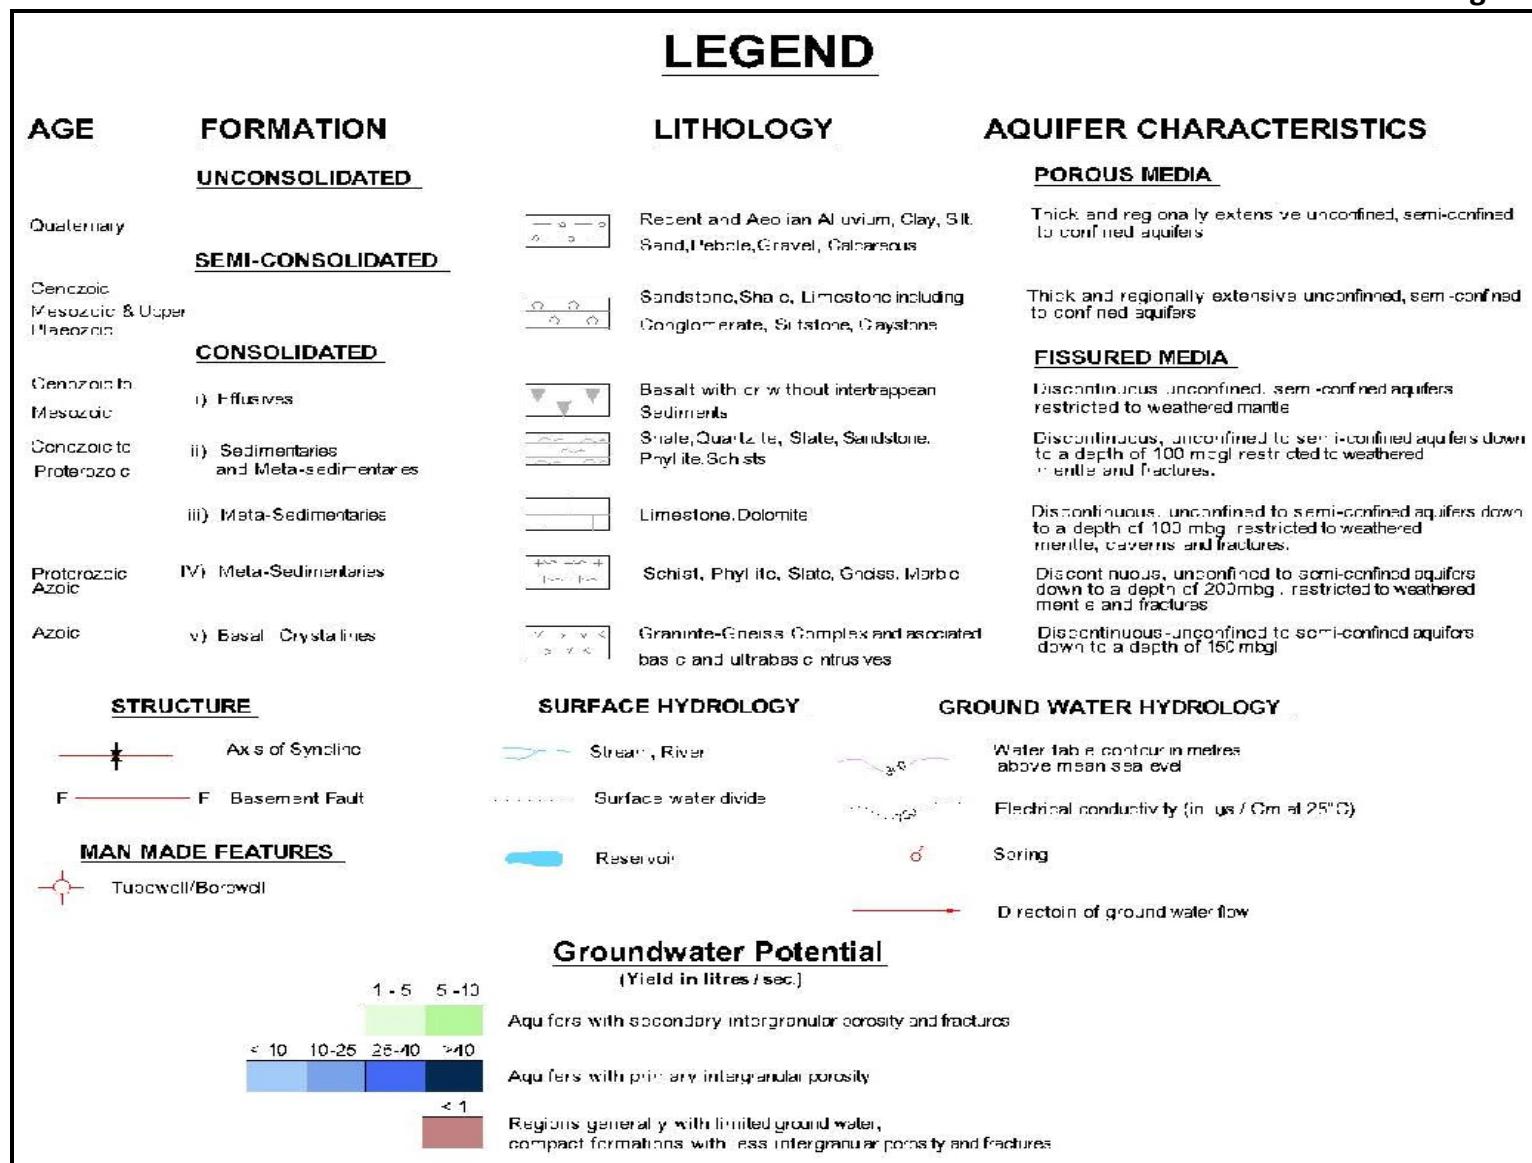

Fig 2B

**Table 2 Hydrogeological Units in Madhya Pradesh, their Potential and Ground Water Scenario**

<b>Geological Age</b>	<b>Group</b>	<b>Rock Formation</b>	<b>Surface Exposure Area (Approx.)</b>	<b>Occurrence and Hydrogeological Characters.</b>
Pleistocene to Recent	Alluvial plains (older and Newer Alluvium)	Unconsolidated clays and silts, gravels and sands of different mix. Lenses of Peat and organic matter carbonate and siliceous concretions (Kankars)	38,000 Sq.Km.	Occur widespread in Bhind (Chambal basin), Hoshangabad and Narsimhapur districts (Narmada basin) and also in Sheopur, Morena, Datia, Chhatarpur, Jabalpur, Katni, Khandwa, Burhanpur, Raisen, Sidhi and Balaghat districts and along rivers in some other districts. Form very potential ground water reservoirs with a thick sequence of sandy aquifers down to great depths (>300 m.bgl). The aquifers are unconfined, semi-confined (leaky confined) or confined.
Creataceous to Eocene	Deccan Trap	Basalts	1,43,300 Sq.Km.	Occupy the Malwa plateau covering Nimuch, Mandsaur, Indore, Dhar, Ratlam, Shajapur, Sagar, Rajgarh, Sehore, Badwani, Khargone, Khandwa and Burhanpur districts and parts of Jhabua, Raisen, Guna, Ashoknagar, Vidisha, Bhopal, Sehore, Betul, Jabalpur, Katni, Hoshangabad, Harda, Narsimhapur, Chhindwara, Seoni, Dindori, Mandla, Shahdol and Anuppur districts.
	Bagh and Lameta Groups	Sandstones cherty limestones	8,500 Sq.Km.	Infra Trappean formation of Bagh & Lameta occurs in Dhar, Jhabua & Jabalpur districts and small patches in Sagar, Hoshangabad and Narsimhapur districts. Weathered, Fractured and vesicular basaltic layers of Traps, inter-trappeans and infratrappeans form productive unconfined hallow aquifers and leaky confined/confined deeper aquifers and yield upto 5 lps. (Infra trappeans are less productive). Storativity 1 to 4% Hydraulic conductivity 5-15 m/day.

<b>Geological Age</b>	<b>Group</b>	<b>Rock Formation</b>	<b>Surface Exposure Area (Approx.)</b>	<b>Occurrence and Hydrogeological Characters.</b>
Palaeozoic to Cretaceous	Gondwana super Group. Jabalpur, Mahadeva, Panchet, Raniganj, Barakars and Talchir Groups	Boulder beds Sand-stones, shales, clays, limestone, coal seams	28,000 Sq.Km.	Occur in Betul, Chhindwara, Narsimhapur, Hoshangabad, Jabalpur, Katni, Sidhi, Umaria, Shahdol and Anuppur districts. Possess moderate primary porosity. Groundwater occurs under phreatic as well as semi-confined to confined conditions. Free flowing conditions with free flow discharge of 150 to 200 lpm have been recorded in North-eastern part of Jabalpur district.
Precambrian (Proteozoic)	Vindhyan Super Group. Bhander, Rewa, Kaimur and Semri Groups. Mahakoshal (Cuddaph) Super Group Bijawar and Gwalior Groups.	Shales, Sandstones limestones	58,700 Sq.Km.	Occur in Gwalior, Morena, Sheopur, Shivpuri, Guna, Ashoknagar, Rewa, Panna, Satna, Jabalpur, Katni, Damoh, Sagar, Chhatarpur, Raisen, Bhopal, Vidisha, Nimuch, Mandsaur and Dewas districts. Generally, devoid of any primary porosity. Weathering and denudation, structurally weak planes and fractures impart porosity and permeability in the rock mass. Solution cavities (Cavernous) in carbonate rocks, at places give rise to large groundwater storage/circulation. Sp. Yield value of unconfined aquifer is generally low (0.2% to 3%). Hydraulic conductivity varies widely depending upon fracture incidence (2 to 10 m/day.)
Archaeans	Older Metamorphics Sausar, Sakoli and Chilpi Groups. & Bundelkhand Granites.	Granitoid gneisses, schists, gneisses, quartzites and granites	31,500 Sq.Km.	Occur in Seoni, Balaghat, Shahdol, Anuppur, Mandla, Dindori, Sidhi, Rewa, Panna, Datia, Tikamgarh, Gwalior, Chhatarpur, Jabalpur, Katni, Jhabua and Shivpuri districts, as also parts of Chhindwara, Harda, Hoshangabad, Narsimhapur and Dewas districts. Do not posses primary porosity. Weathering, fracturing, jointing impart secondary porosity. Groundwater mostly occurs under phreatic conditions and at some places also under confined/semi confined conditions.

#### **1.4 MONSOON RAINFALL DISTRIBUTION DURING THE YEAR 2015**

Monsoon rainfall is the sole source of natural recharge to ground water and rainfall pattern has an important impact on groundwater levels in the phreatic aquifer. Rainfall in the State of Madhya Pradesh occurs during south-west monsoon season (mid June to September) and sometimes during winter season (November to February). Most of the rainfall (more than 90%) occurs during the south-west monsoon season, August being the雨iest month.

The rainfall data for the period 1<sup>st</sup> June 2015 to 30<sup>th</sup> September 2015 (monsoon period) of 50 rain gauge stations located in Madhya Pradesh State, collected from IMD website is given in Table 3. The isohyetal map of monsoon rainfall 2015, prepared on the basis of this data is given in Fig 3. Monsoon rainfall within  $\pm 19\%$  of the normal monsoon rainfall is considered as normal rainfall. Monsoon rainfall above 19% of the normal monsoon rainfall is considered excess rainfall. Monsoon rainfall less than -19% and more than -59% of the normal monsoon rainfall is considered deficit and if the monsoon rainfall is even lesser than -59% of the normal monsoon rainfall, it is considered scanty rainfall.

The normal rainfall of the Madhya Pradesh State is 938 mm. About 829 mm rainfall as an average of state rainfall was received during 2015 monsoon period. About 10.0% less rainfall has occurred during the year with respect to normal rainfall. The percent departures of the monsoon rainfall from the normal rainfall worked out, which shows that all most entire state has received less rainfall than normal rainfall except in Khandwa, Betul, Chhindwara, Indore, Rajgarh, Shajapur, Ratlam, Mandsaur and part of Dhar districts. Shajapur rain gauge station has received the highest rainfall of 1473.1 mm and Bhind rain gauge station has received the least rainfall of 399.9 mm. North, north-east, central and south-eastern parts of the state have received deficit rainfall. Shajapur, Dewas, Ujjain, Ratlam, Indore and Rajgarh rain gauge has received excess rainfall. Anuppur rain gauge station has received highest deficit rainfall in the state. The percent monsoon rainfall departure from normal rainfall of Madhya Pradesh State for the year 2015 is presented in Fig 4.

**Table 3 Rainfall in Madhya Pradesh**

Sr. No.	Name of Station	Normal rainfall Monsoon (1 <sup>st</sup> June- 30 <sup>th</sup> Sept)	Actual rainfall (01.06.2015 to 30.09.2015)	Departure% wrt Monsoon Rainfall-2015

## **2.1 DEPTH TO WATER LEVELS**

During this water year, the existing monitoring wells were monitored four times, i.e., during May 2015, August 2015, November 2015 and January 2016. With the field data, maps were prepared for visual interpretation of the behaviours of the ground water levels. Depth to ground water levels were demarcated into various zones in the ranges of less than 2 m, 2-5 m, 5-10 m, 10-20 m, 20-40 m and more than 40 m. The description of the depth to water levels during different monitoring seasons is as follows:

### **DEPTH TO WATER LEVEL MAY 2015**

Depth to Water levels ranges from 1.05 to 49.57 m bgl in Madhya Pradesh. Very shallow water levels up to 2 m bgl are very few and seen only in part of Chhindwara, Hoshangabad and Damoh district of the state. Only 1.47% of wells in Madhya Pradesh State fall in this category. About 14.70% of wells spreading all over Madhya Pradesh State has recorded a water level in depth range of 2-5 m bgl occurring mainly in south-east and in sporadic patches in entire state. Depth to water levels ranging 5-10 m bgl is prominently spreading all parts of the State. About 46.29% of wells fall under this category. Deeper ground water levels ranging 10-20 m bgl are seen mostly in Northern and western parts of the state and in isolated patches in many parts of the state. About 32.11% of wells in the State fall in this category. Ground water levels of 20-40 m bgl are found in about 4.48% of the wells and occur mainly in few parts of north and west districts of the state. Depth to water level more than 40 m bgl is very few and has been recorded in Bhind. About 0.96% of wells fall under this category.

### **DEPTH TO WATER LEVEL AUGUST 2015**

Depth to Water levels ranges from ground level to 32.45 m bgl in Madhya Pradesh state. Very shallow water levels up to 2 m bgl are seen in almost entire state except north, in Bhind Morena and Gwalior and in north eastern part in Rewa, Sidhi, Singrauli Shahdol and Satna districts. About 20.42% of monitoring wells recorded water level less than 2 m bgl category. About 40.46% of monitoring wells spreading all over Madhya Pradesh state has recorded a water level in the depth range of 2-5 m bgl. Depth to water levels ranging 5-10 m bgl is noticed prominently in northern, north eastern western parts of the state. About 29.06% of wells fall in this category. Deeper ground water levels ranging 10-20 m bgl are seen in northern part and in isolated patches in northern, western and north eastern and central parts of the state. About 8.87% of wells in the state fall in this category. Ground water levels of more than 20 m are found in about 1.19% of the wells and are seen in Bhind, Morena, Gwalior and Burhanpur districts.

## **DEPTH TO WATER LEVEL NOVEMBER 2015**

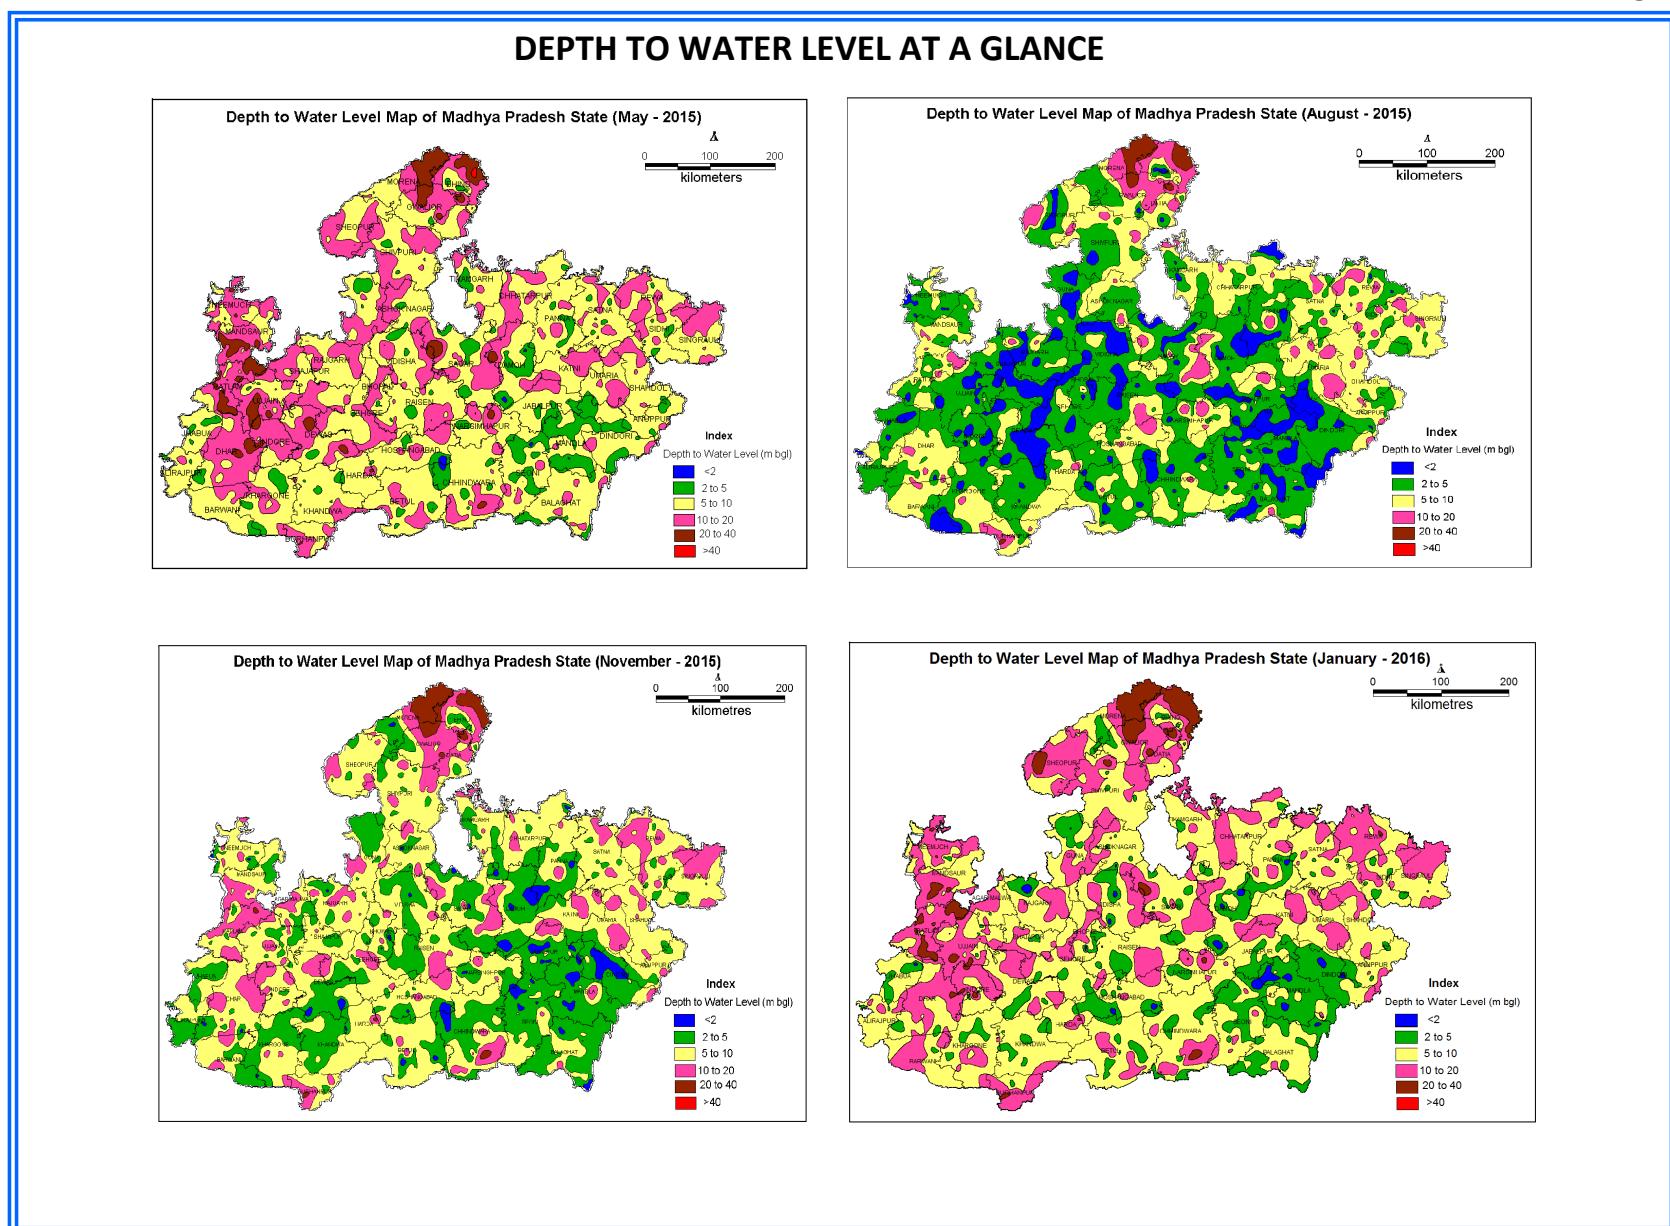

Depth to Water levels ranges from 0.30m bgl to 35.97 m bgl in Madhya Pradesh state. Very shallow water levels up to 2 m bgl are seen mainly in Morena, Dewas, Chhindwara, Panna, Damoh, Mandla, Dindori, Balaghat and Seoni districts. About 6.42% of monitoring wells recorded water level less than 2 m bgl category. About 32.92% of monitoring wells spreading all over Madhya Pradesh state has recorded a water level in the depth range of 2-5 m bgl. Depth to water levels ranging 5-10 m bgl is noticed prominently in northern, north eastern western parts of the state. About 40.37% of wells fall in this category. Deeper ground water levels ranging 10-20 m bgl are seen in northern part and in isolated patches in northern, western and north eastern and central parts of the state. About 17.93% of wells in the state fall in this category. Ground water levels of more than 20 m are found in about 2.36% of the wells and are seen in Bhind, Morena, Gwalior, Datia, Ratlam Chhindwara and Burhanpur districts.

## **DEPTH TO WATER LEVEL JANUARY 2016**

Depth to Water levels ranges from 0.57 m bgl to 39.40 m bgl in Madhya Pradesh state. Very shallow water levels up to 2 m bgl are seen mainly in Hoshangabad, Panna, Damoh, Mandla, Dindori, Vidisha, and Rajgarh districts. About 2.81 % of monitoring wells recorded water level less than 2 m bgl category. About 19.62 % of monitoring wells spreading all over Madhya Pradesh state has recorded a water level in the depth range of 2-5 m bgl especially in Mandla, Dindori, Balaghat, and Damoh and in many districts of the state. Depth to water levels ranging 5-10 m bgl is noticed in entire parts of the state. About 43.60% of wells fall in this category. Deeper ground water levels ranging 10-20 m bgl are seen in northern part and in isolated patches in northern, western and north eastern and central parts of the state. About 28.72% of wells in the state fall in this category. Ground water levels of more than 20 m bgl are found in about 5.26% of the wells and are seen in Bhind, Morena, Gwalior, Datia, Ratlam, Ujjain, Indore, Chhindwara and Burhanpur districts.

Depth to ground water level at a glance is shown in Fig 5. The depth to water level maps of different period has been depicted in Fig (6 to 9). The district wise frequency distribution of wells under different water level/fluctuation ranges for different monitoring period is given in Annexures (I to IV).

**Fig 5**

**Fig 6**

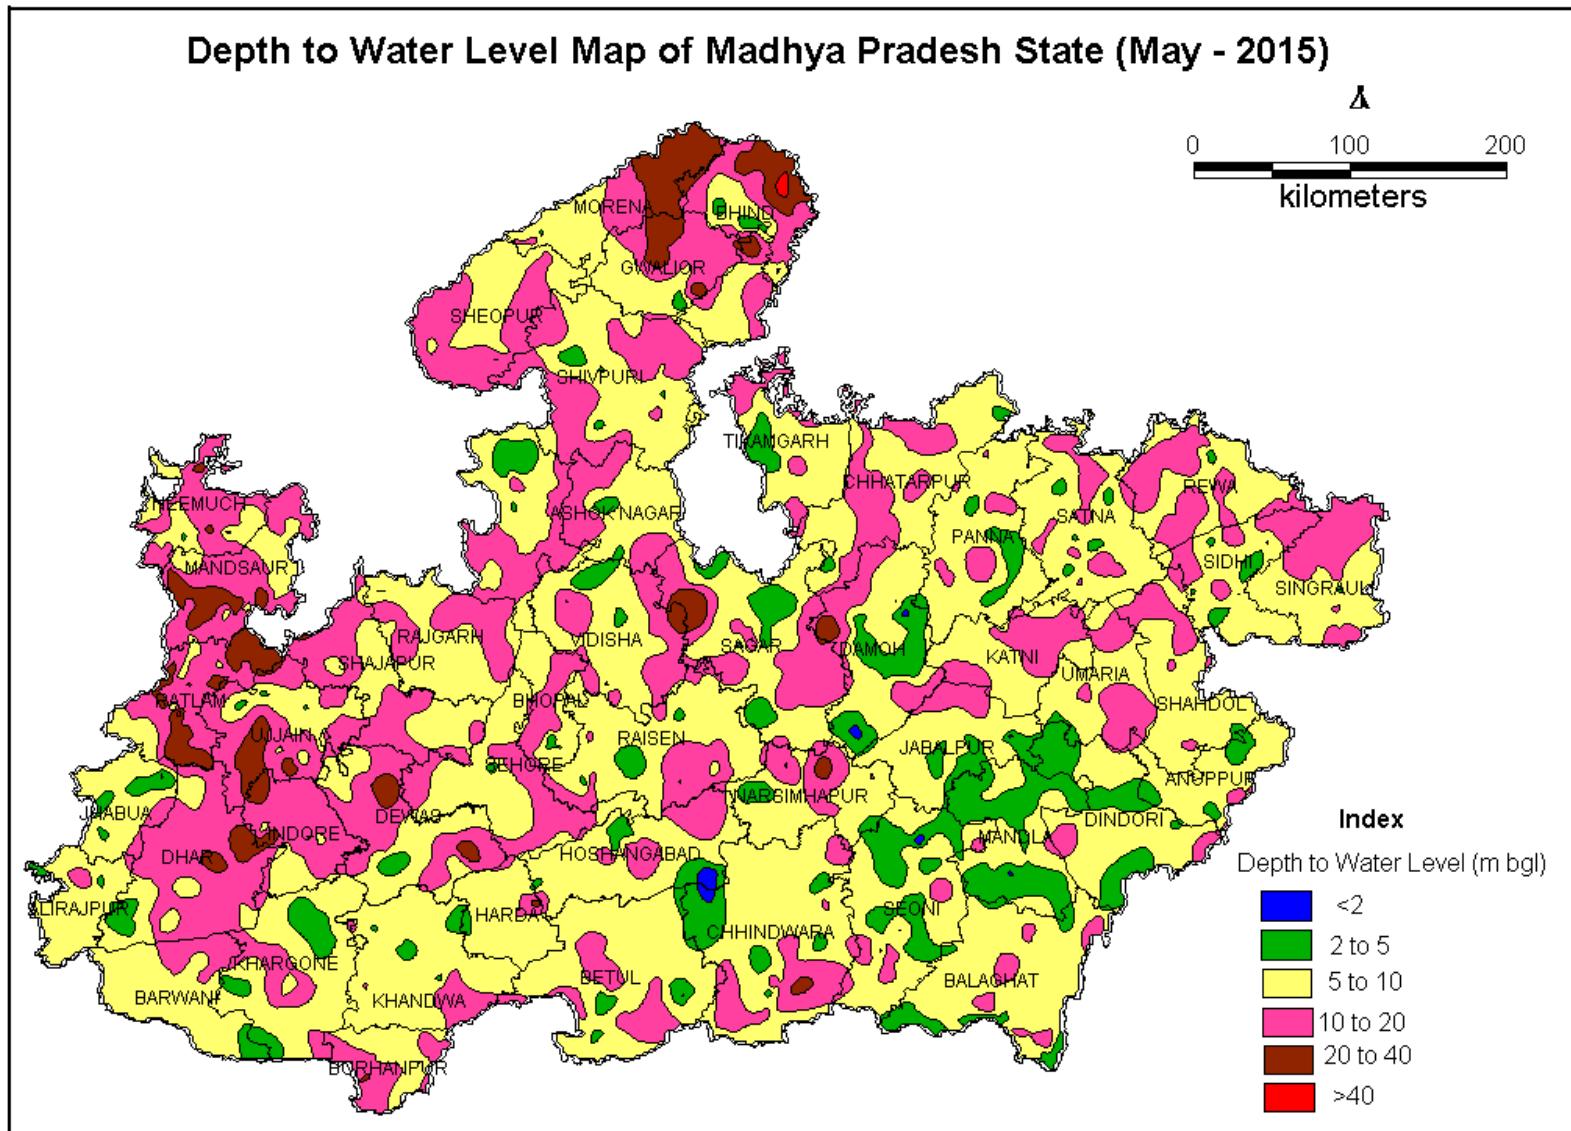

Fig 7

**Fig 9**

## **2.2 WATER LEVEL FLUCTUATIONS**

Water level fluctuations were analysed and maps were prepared after every water level measurement comparing the current water levels with that of the same season of the previous year, preceding season, pre-monsoon season and the decadal seasonal mean. These fluctuations were carefully examined to decipher the ground water situation with respect to time.

### **2.2a ANNUAL WATER LEVEL LUCTUATIONS**

#### **WATER LEVEL FLUCTUATION MAY 2014 TO MAY 2015**

The ground water levels of monitoring wells during May 2015 were compared with those of May 2014 to decipher the changes that took place in the ground water regime. In Madhya Pradesh, 29.85% of the wells show a rise and the rest 70.15% wells show a decline in water levels. About 22.25% of the wells show a rise in water level up to 2 m spreading in sporadic patches in all part of the state. 3.80% of the wells show a rise in water level between 2 to 4 m and the same no. of wells i.e., 3.80% of the wells shows rise more than 4 m. The rises in water in the range Of 2-4 m and more than 4 m are few and mainly seen in the patches of Chhindwara, Bhind and Satna. About 47.19% of the wells show a decline in water level up to 2 m in almost all district of the state. 12.43% of the wells show a decline in water level between 2 to 4 m and occur in sporadic patches of the state. About 10.53% of the wells shows decline more than 4 m, under this category fall in water level is less and seen mostly in western and north-central parts of state. In general this year there is a decline of water level in the state as compared to last year.

#### **WATER LEVEL FLUCTUATION AUGUST 2014 TO AUGUST 2015**

About 37.40% of wells show rise and 62.60% decline in water levels in August 2015 compared to those in August 2014. About 26.54% of wells in Madhya Pradesh state, show rise in water levels up to 2 m and seen mainly in Rajgarh, Shajapur, Ujjain, Dhar, Indore, Vidisha, Guna and Ashoknagar districts. Rise of 2-4 m has occurred in 7.17% of wells mostly in Rajgarh, Shajapur, Dhar, and Indore and in many districts of the state. About 3.70% of wells spread in Rajgarh, Shajapur, Ujjain, Indore, Bhind and Morena districts of state show rise in water levels more than 4 m.

Ground water levels decline is recorded in about 60.60% of the wells, mostly spread in entire state except in Malwa region. Decline in water levels up to 2 m are seen in about 44.65% of wells, and are spread in entire state except in Malwa region. Decline in water level between 2-4 m is observed in 11.73% of wells spread in central, northern south and eastern parts of the state. Decline in water in more than 4 m is observed by 6.22% monitoring wells spread in Barwani, Narsinghpur,

Hoshangabad, and in many districts of the state.

### **WATER LEVEL FLUCTUATION NOVEMBER 2014 TO NOVEMBER 2015**

About 38.19% of wells show rise and 61.81% decline in water levels in November 2015 compared to those in November 2014. About 27.90% of wells in Madhya Pradesh state, show rise in water levels up to 2 m and seen mainly in Rajgarh, Shajapur, Ujjain, Dhar, Indore, Vidisha, Guna and Ashoknagar, Morena, Sheopur, Gwalior and southeast parts of the state districts. Rise of 2-4 m has occurred in 6.63% of wells mostly in Rajgarh, Shajapur, Dhar, Dewas, Damoh Chhatarpur and northern districts of the state. About 3.66% of wells spread in Ujjain, Dewas, Indore, Vidisha, Shivpuri, Bhind, Morena and Sheopur districts of state show rise in water levels more than 4 m.

Ground water levels decline is recorded in about 61.81% of the wells, mostly spread in entire state except in Malwa region. Decline in water levels up to 2 m are seen in about 42.79% of wells, and are spread in entire state except in Malwa region. Decline in water level between 2-4 m is observed in 12.94% of wells spread in central, northern south and eastern parts of the state. Decline in water in more than 4 m is observed by 6.08% monitoring wells spread in Barwani, Dhar, Indore, Satna, Rewa, Bhind, Morena, Shivpuri, and Gwalior and in many districts of the state.

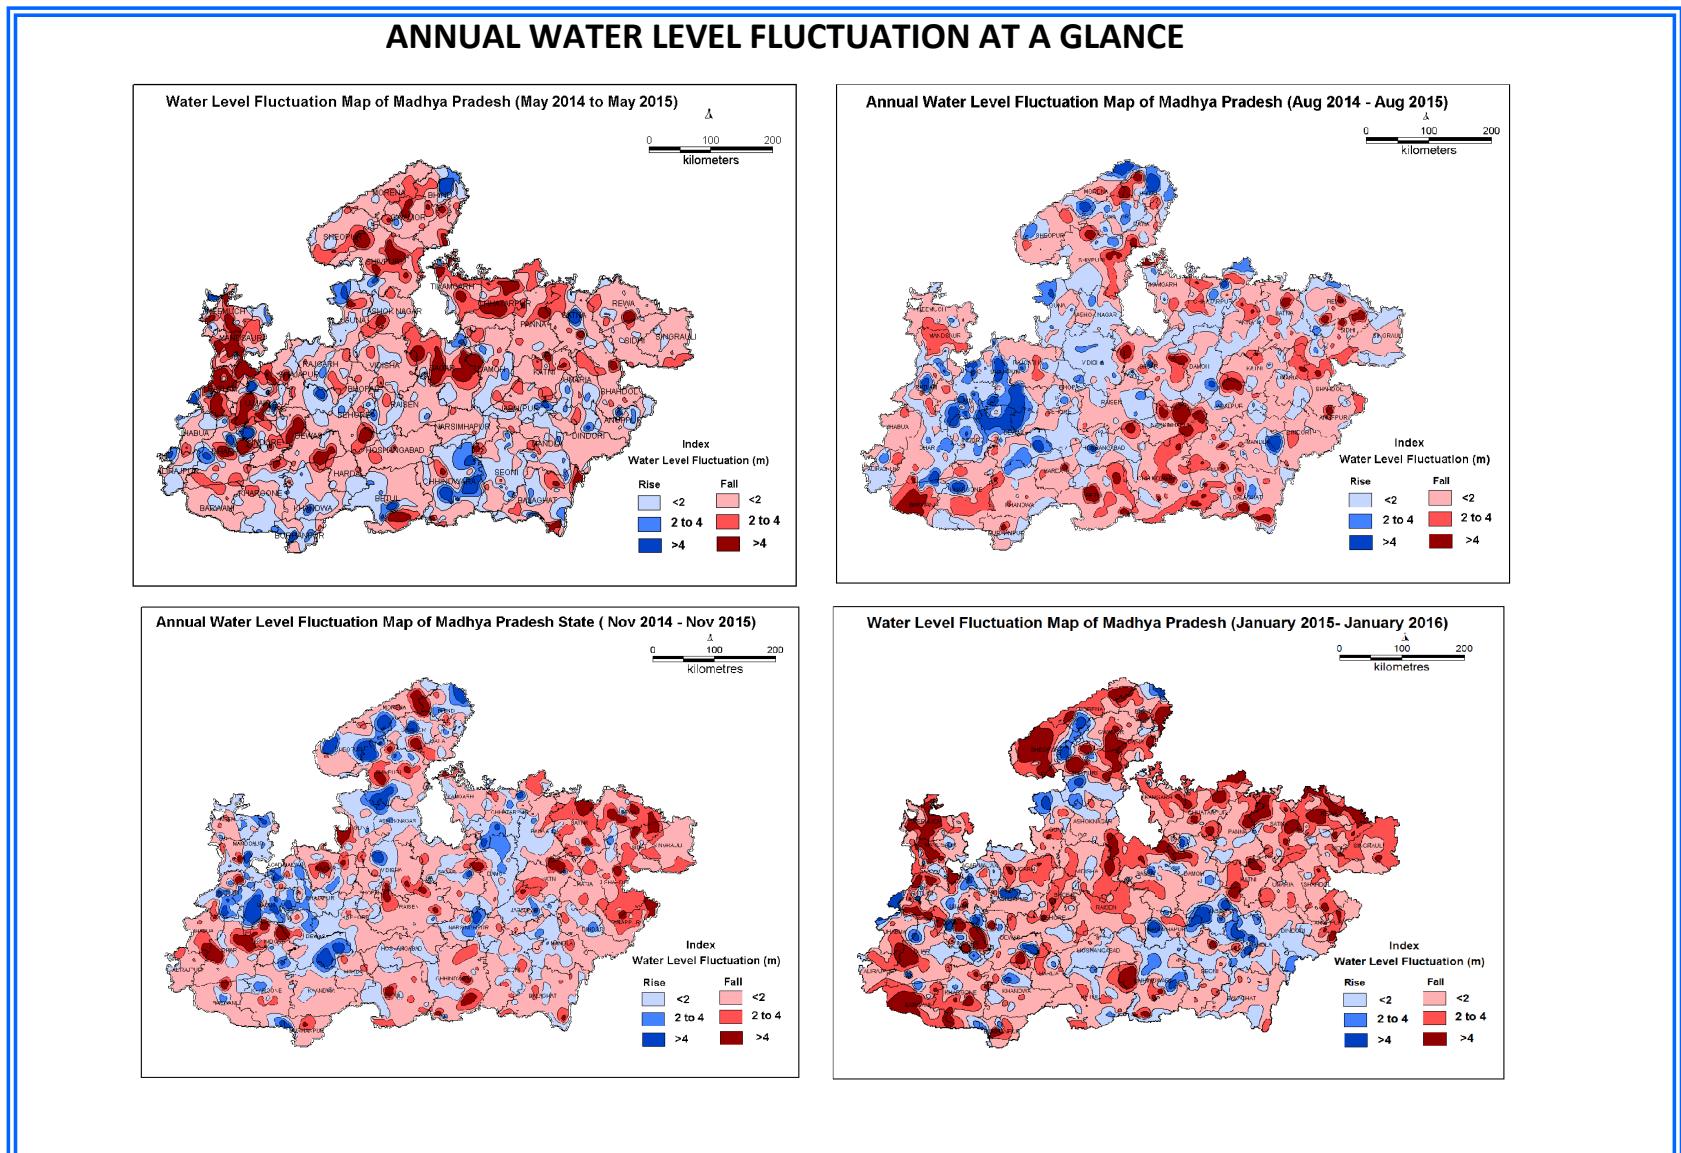

### **WATER LEVEL FLUCTUATION JANUARY 2015 TO JANUARY 2016**

About 25.83% of wells show rise and 74.17% decline in water levels in January 2016 compared to those in January 2015. About 18.84% of wells in Madhya Pradesh state, show rise in water levels up to 2 m and seen mainly in Rajgarh, Shajapur, Ujjain, Dhar, Indore, Vidisha, Guna and Ashoknagar, Morena, Sheopur, Gwalior and southeast parts of the state districts. Rise of 2-4 m has occurred in 3.74% of wells mostly in Rajgarh, Shajapur, Dhar, Dewas, Damoh Chhatarpur and northern districts of the state. About 3.26% of wells spread in Ujjain, Dewas, Indore, Vidisha, Shivpuri, Bhind, Morena and Sheopur districts of state show rise in water levels more than 4 m.

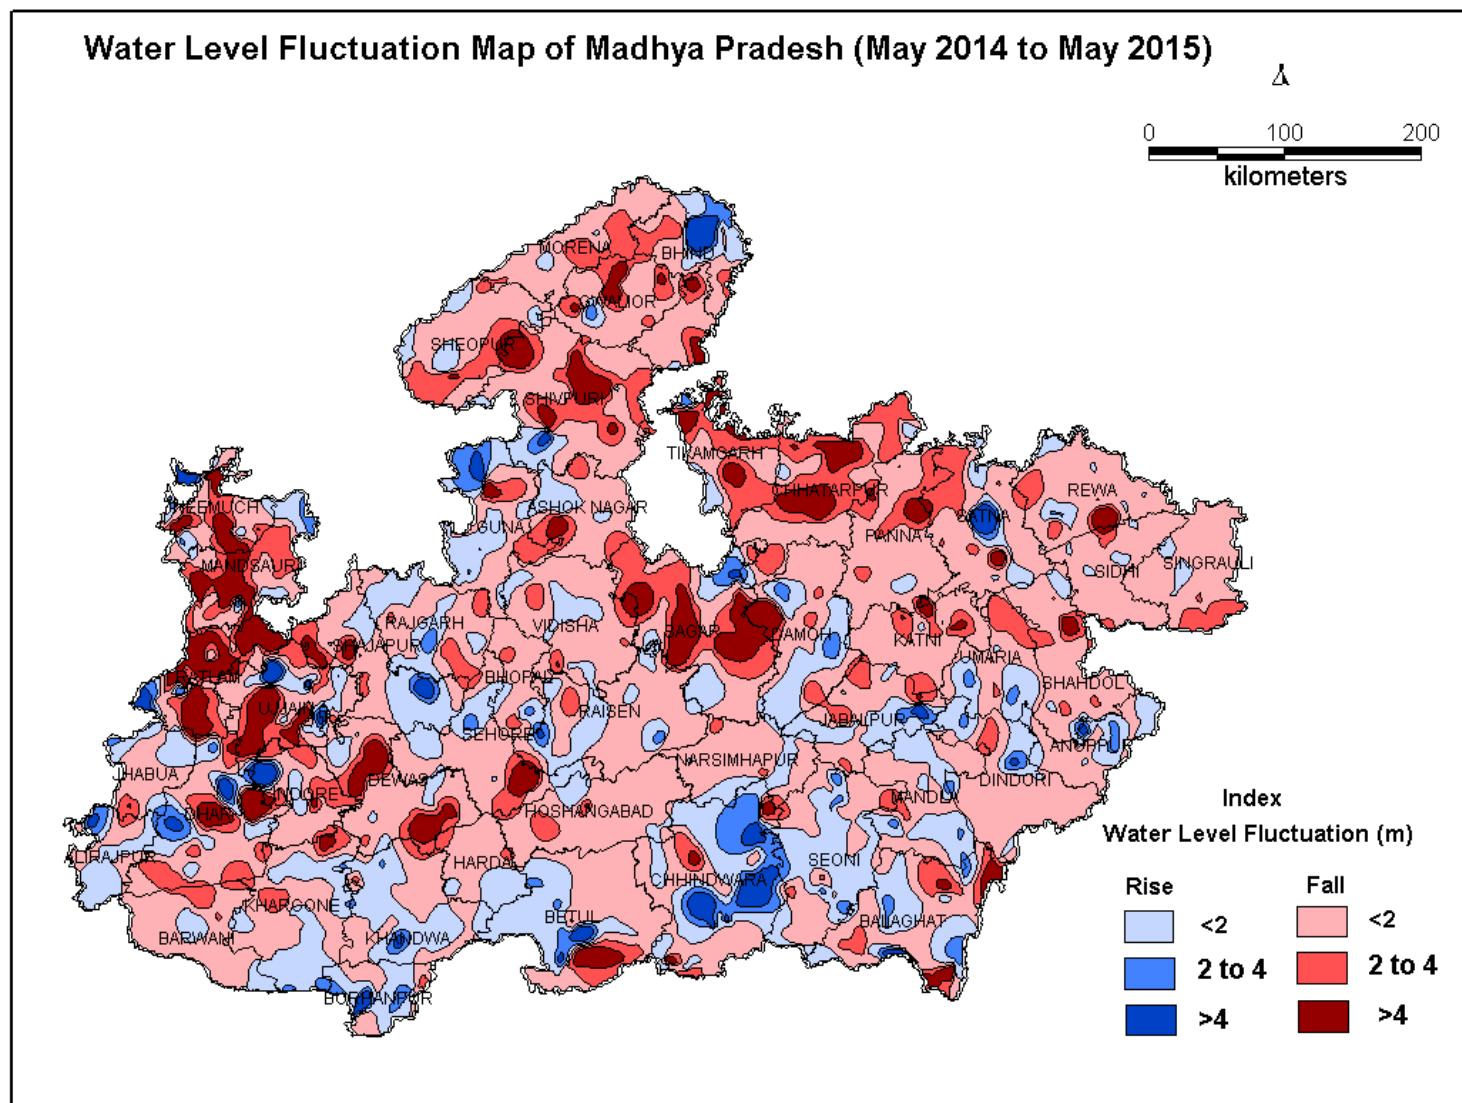

Ground water levels decline is recorded in about 74.17% of the wells, mostly spread in entire state. Decline in water levels up to 2 m are seen in about 43.08% of wells, and are spread in entire state. Decline in water level between 2-4 m is observed in 18.12% of wells spread in central, northern south and eastern parts of the state. Decline in water in more than 4 m is observed by 12.96% monitoring wells spread in Barwani, Dhar, Indore, Satna, Rewa, Bhind, Morena, Shivpuri, Mandsaur, Neemuch, Ujjain, Gwalior and in many districts of the state.

Annual water level fluctuation at a glance is shown in Fig 10. The annual water level fluctuation maps of different period have been depicted in Fig (11 to 14). The district wise annual water level fluctuation and frequency distribution of wells in different ranges is given in Annexures (V to VIII).

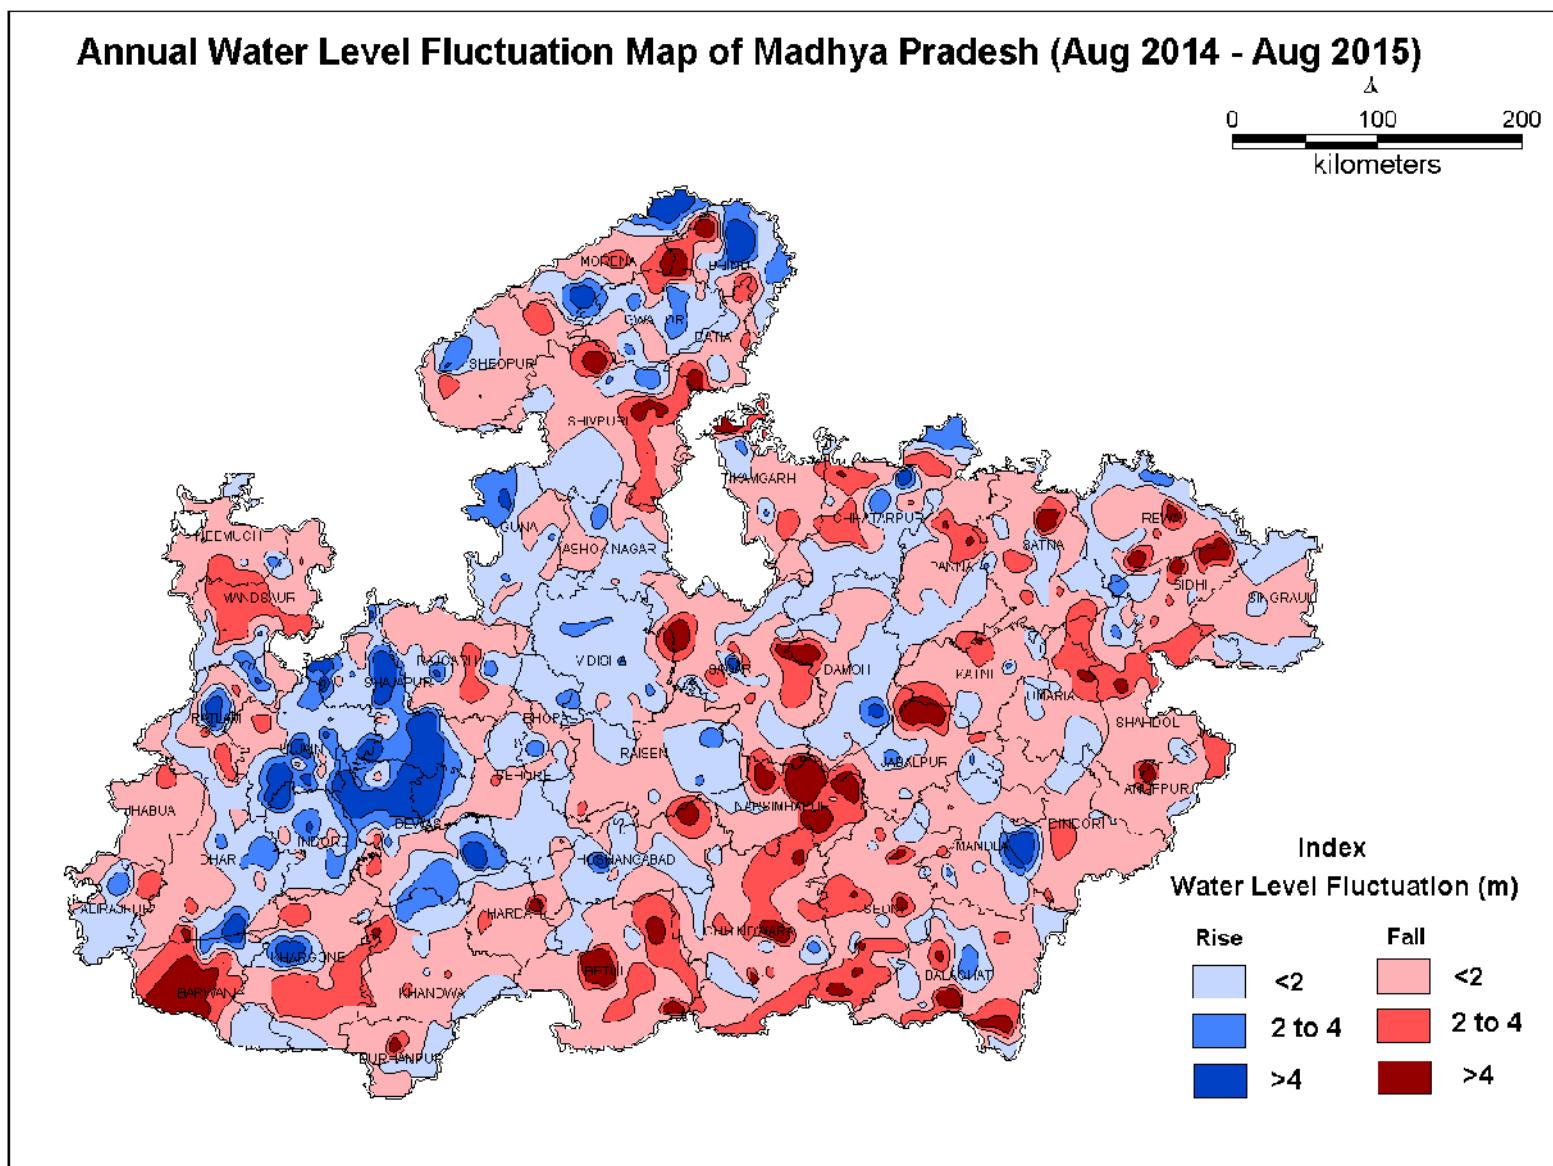

**Fig 10**

**Fig 11**

**Fig 12**

**Fig 13**

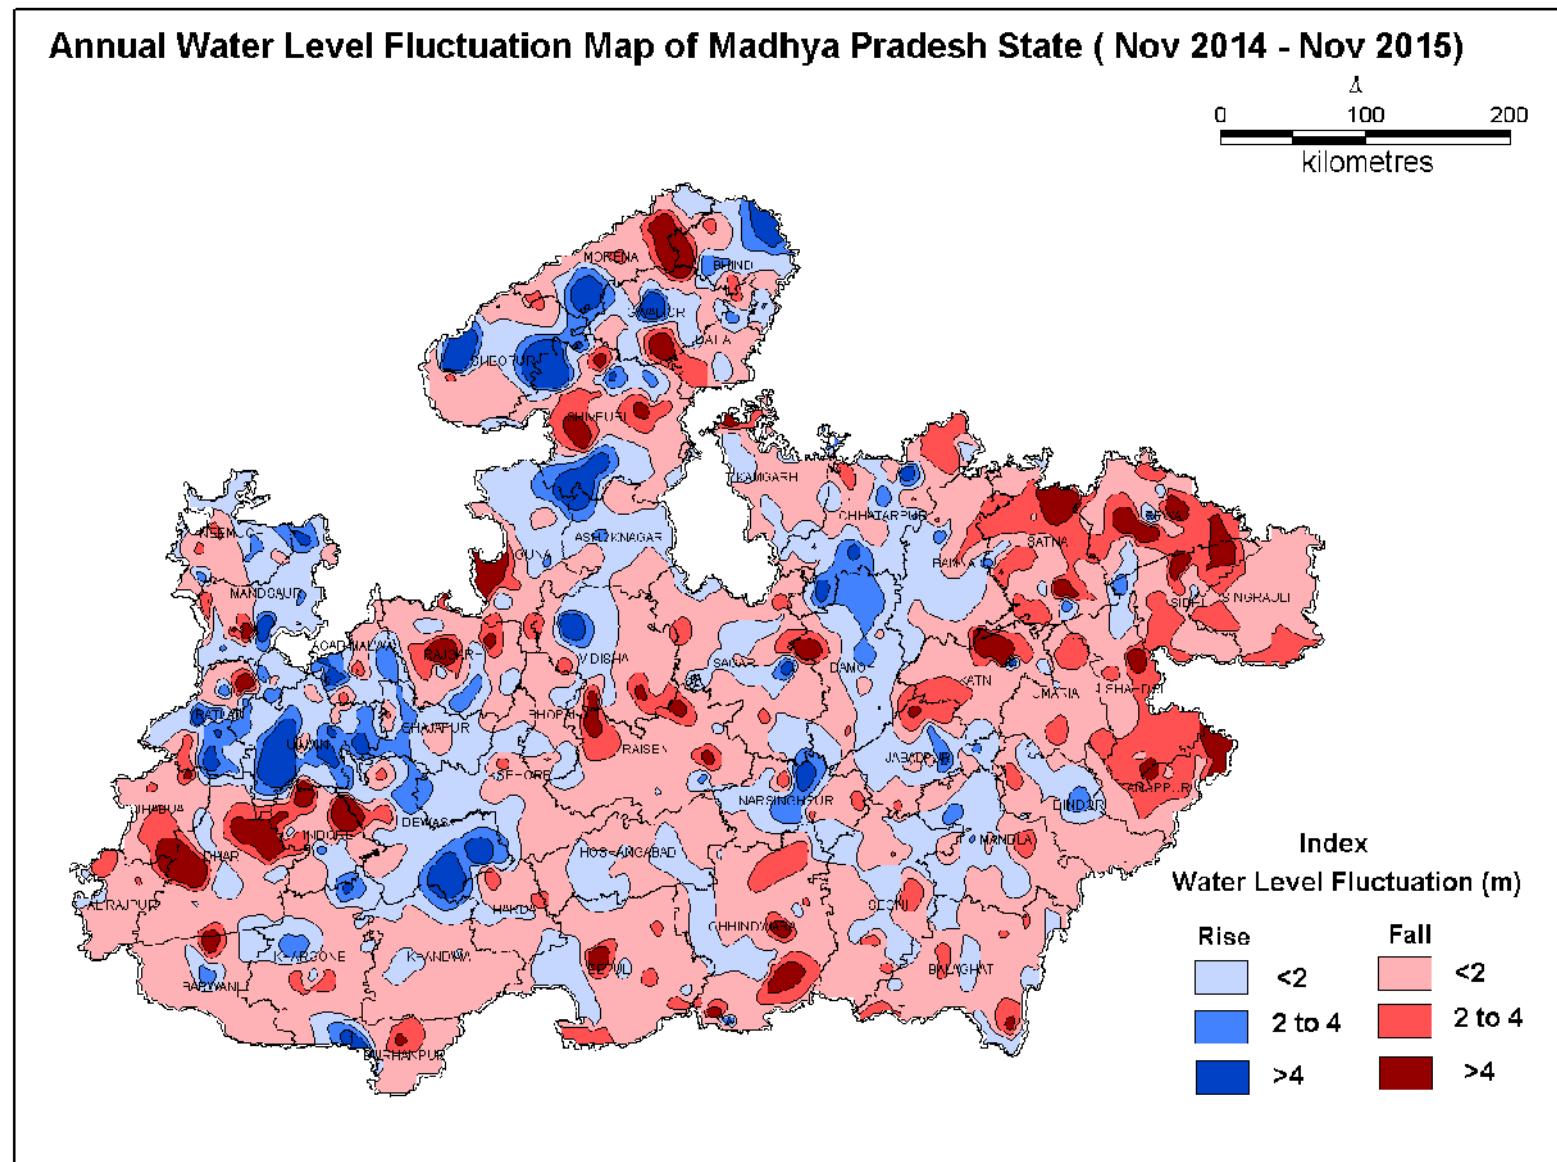

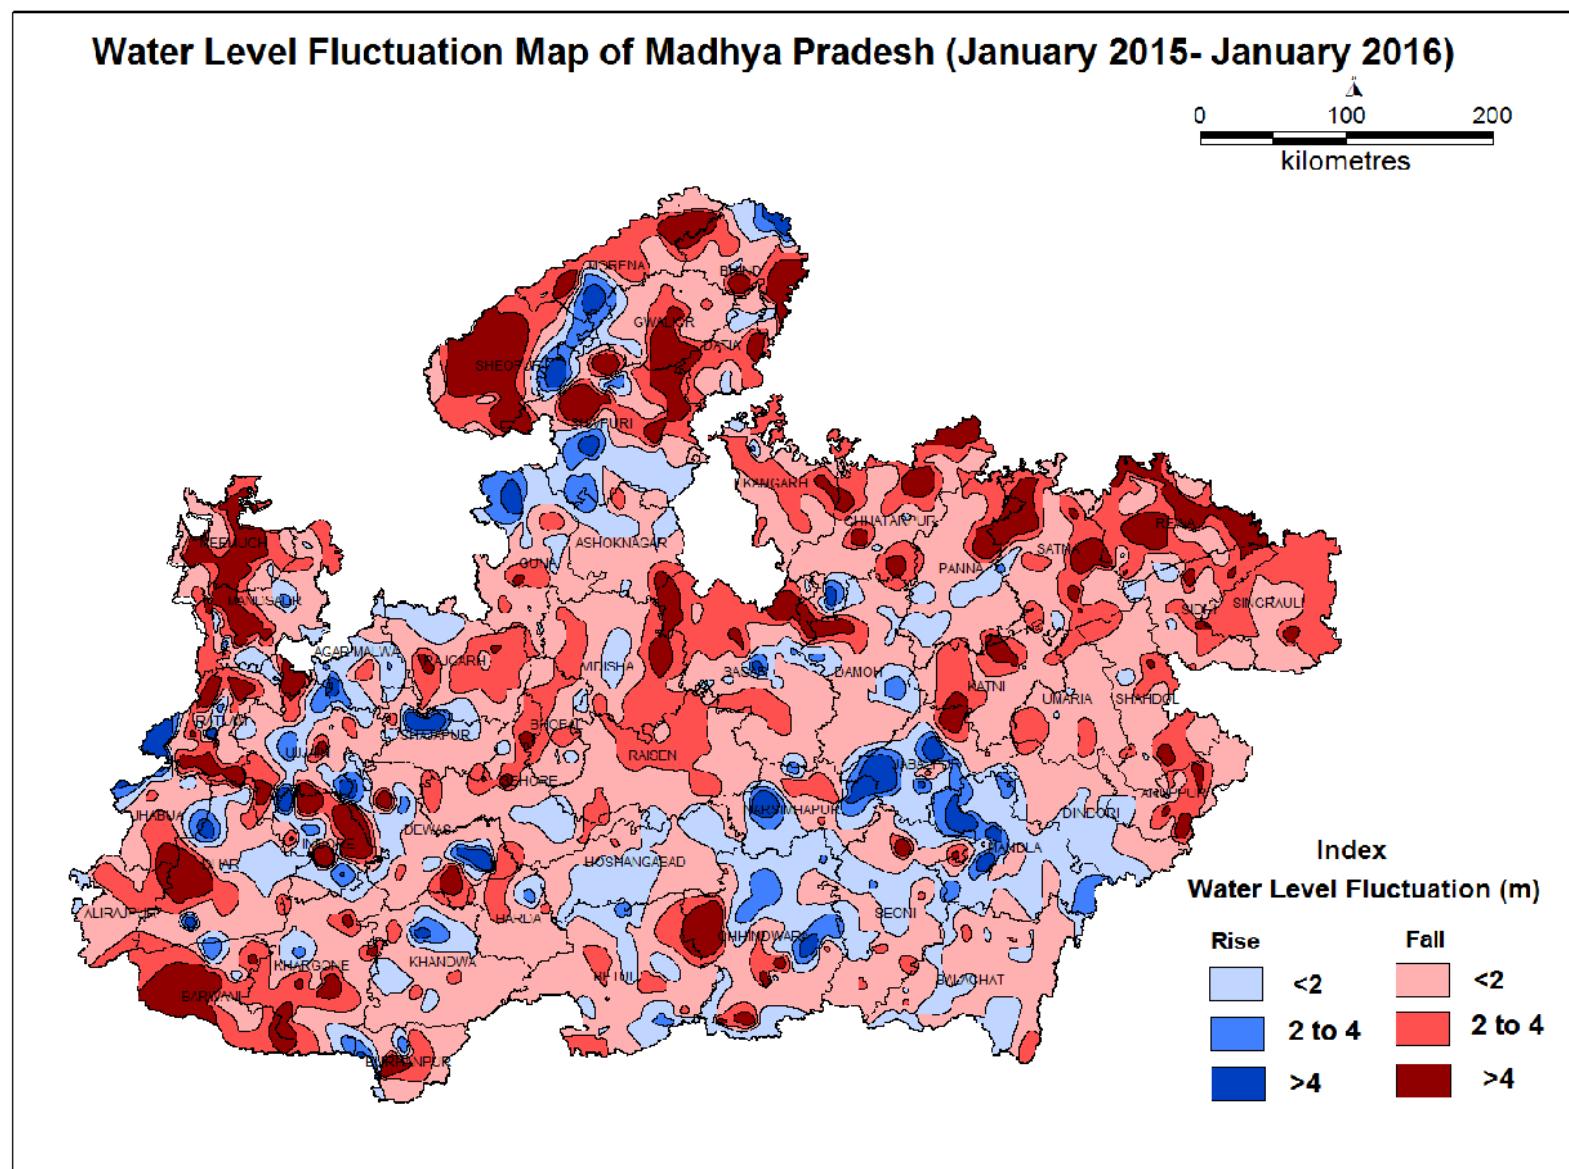

Fig 14

## **2.2b SEASONAL WATER LEVEL FLUCTUATIONS**

### **WATER LEVEL FLUCTUATION MAY 2015 TO AUGUST 2015**

Water levels have shown a general rise in 94.70% of the wells. Such a rise is a normal phenomenon in the hydrological cycle since the monsoon rainfall forms the sole source of natural recharge to ground water regime in the state. Rise in the order of 0 to 2 m is seen in 24.89% of wells and are seen in Tikamgarh, Chhatarpur, Sidhi, Singrauli, Shahdol and in patches in some of the districts of the state. About 27.0% of the wells have shown a rise of 2-4 m and are seen in entire state except in patches in districts of Malwa region of the state. Significant rise of >4 m is found in 42.81% of wells, in districts of Malwa region and north western parts of the state

About 4.61% of the wells in Madhya Pradesh state show a marginal decline in water level up to 2 m and 0.38% wells more than 2 m. The Marginal decline in water level is mainly due to pumping wells and is observed mainly in Bhind Morena, Datia, Tikamgarh, Chhatarpur and Shahdol districts of the state.

### **WATER LEVEL FLUCTUATION MAY 2015 TO NOVEMMBER 2015**

Water levels have shown a general rise in 84.54% of the wells. Such a rise is a normal phenomenon in the hydrological cycle since the monsoon rainfall forms the sole source of natural recharge to ground water regime in the state. Rise in the order of 0 to 2 m is seen in 37.33% of wells and are seen in Tikamgarh, Chhatarpur, Sidhi, Singrauli, Shahdol and in patches in some of the districts of the state. About 26.47% of the wells have shown a rise of 2-4 m and are seen in entire state except in patches in districts of Malwa region of the state. Significant rise of >4 m is found in 20.74% of wells, in districts of Malwa region and many districts of the state

About 13.05% of the wells in Madhya Pradesh state show a marginal decline in water level up to 2 m and 2.41% wells more than 2 m. The Marginal decline in water level is mainly due to pumping wells and is observed mainly in Bhind Morena, Datia, Rewa, and Anuppur districts of the state.

### **WATER LEVEL FLUCTUATION MAY 2015 TO JANUARY 2016**

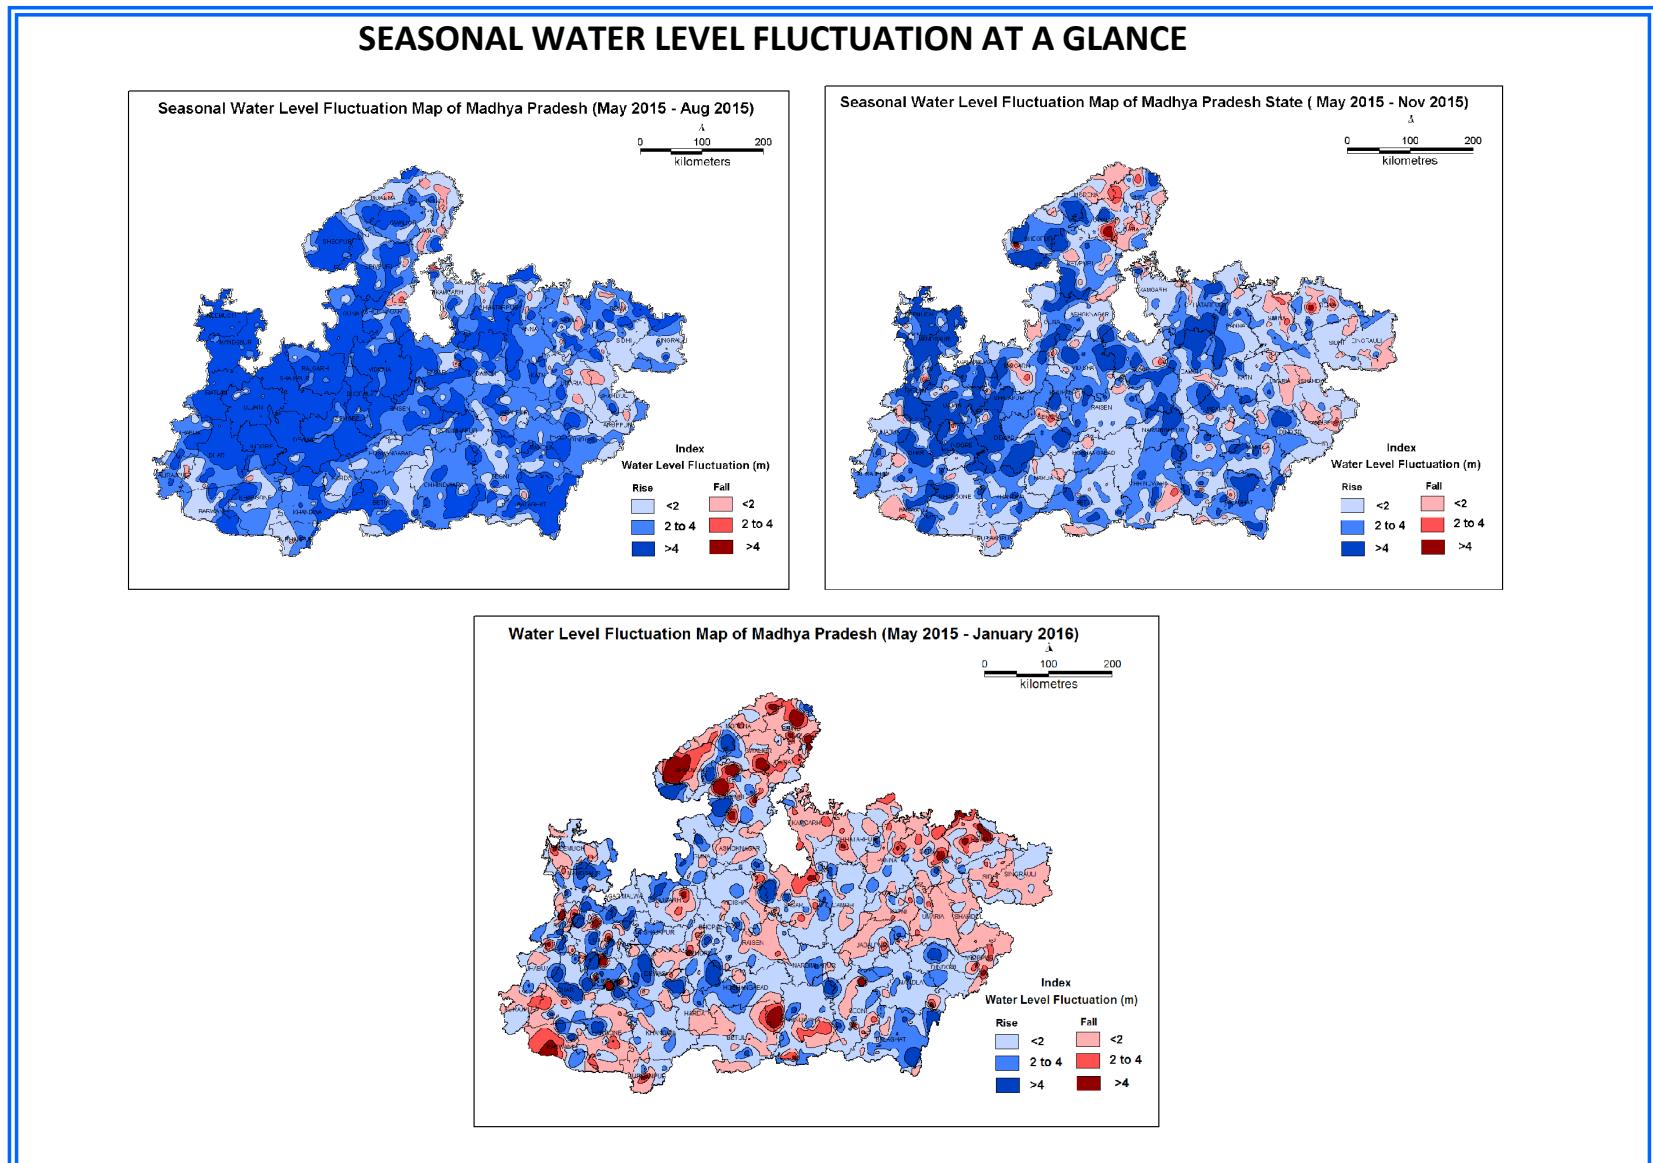

Water levels have shown a general rise in 61.02% of the wells. Such a rise is a normal phenomenon in the hydrological cycle since the monsoon rainfall forms the sole source of natural recharge to ground water regime in the state. Rise in the order of 0 to 2 m is seen in 40.99% of wells and are seen in Tikamgarh, Chhatarpur, Sidhi, Singrauli, Shahdol and in Malwa region and in patches in many of the districts of the state. About 11.71% of the wells have shown a rise of 2-4 m and are seen in

entire state. Significant rise of >4 m is found in 8.32% of wells, in districts of Malwa region and many districts of the state.

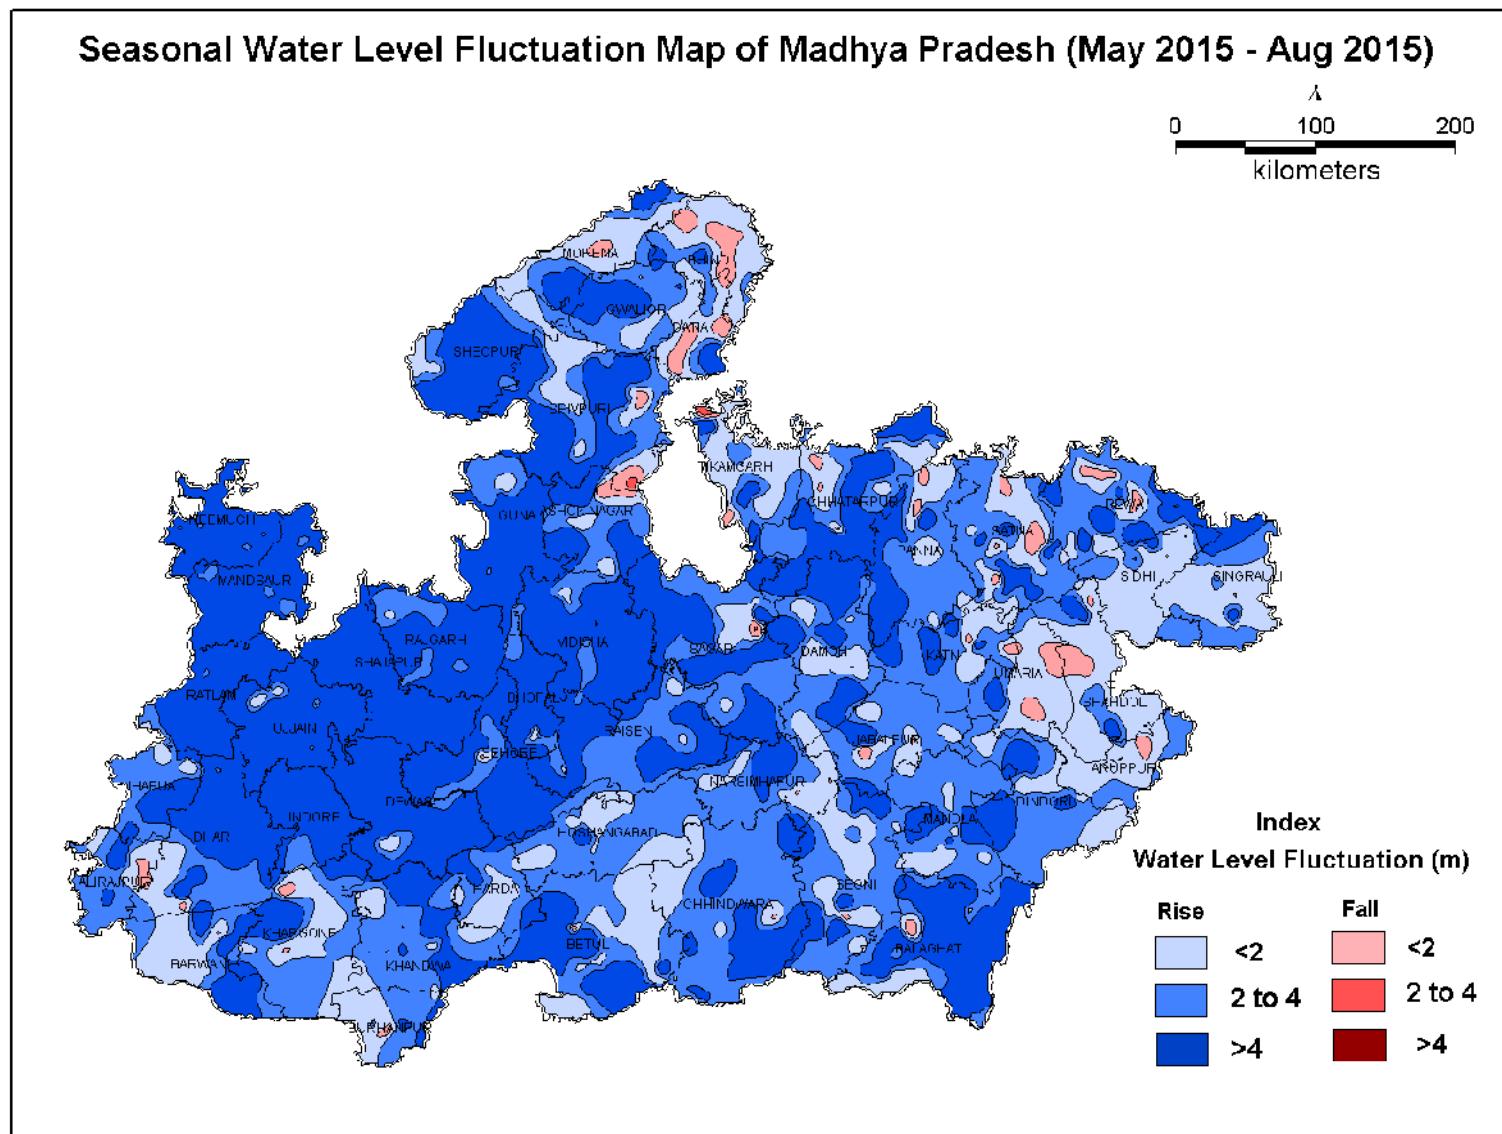

About 27.81% of the wells in Madhya Pradesh state show a marginal decline in water level up to 2 m and 11.17% wells more than 2 m. The Marginal decline in water level is mainly due to pumping wells and is observed mainly in Bhind Morena, Datia, Gwalior, and Shivpuri and in patches in many districts of the state.

Seasonal water level fluctuations at a glance are shown in Fig 15. The seasonal water level fluctuation maps of different period have been depicted in Fig (16 to 18). The district wise seasonal water level fluctuation and frequency distribution of wells in different ranges is given in Annexures (IX to XI).

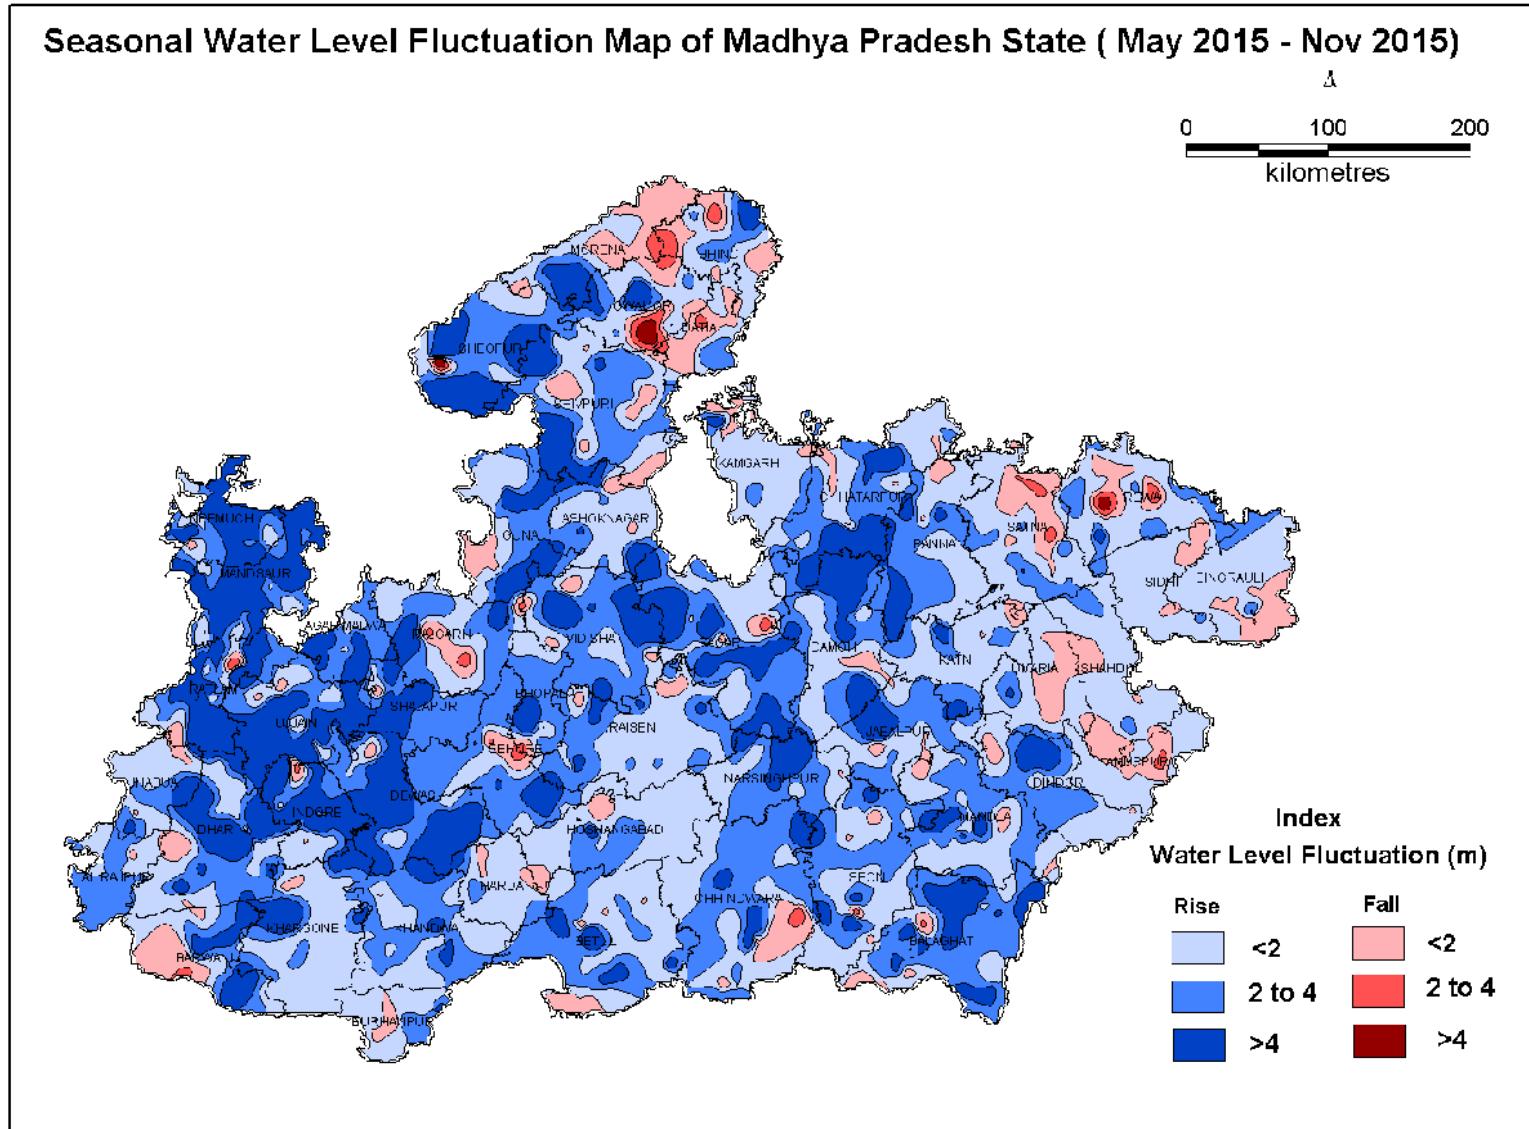

**Fig 15**

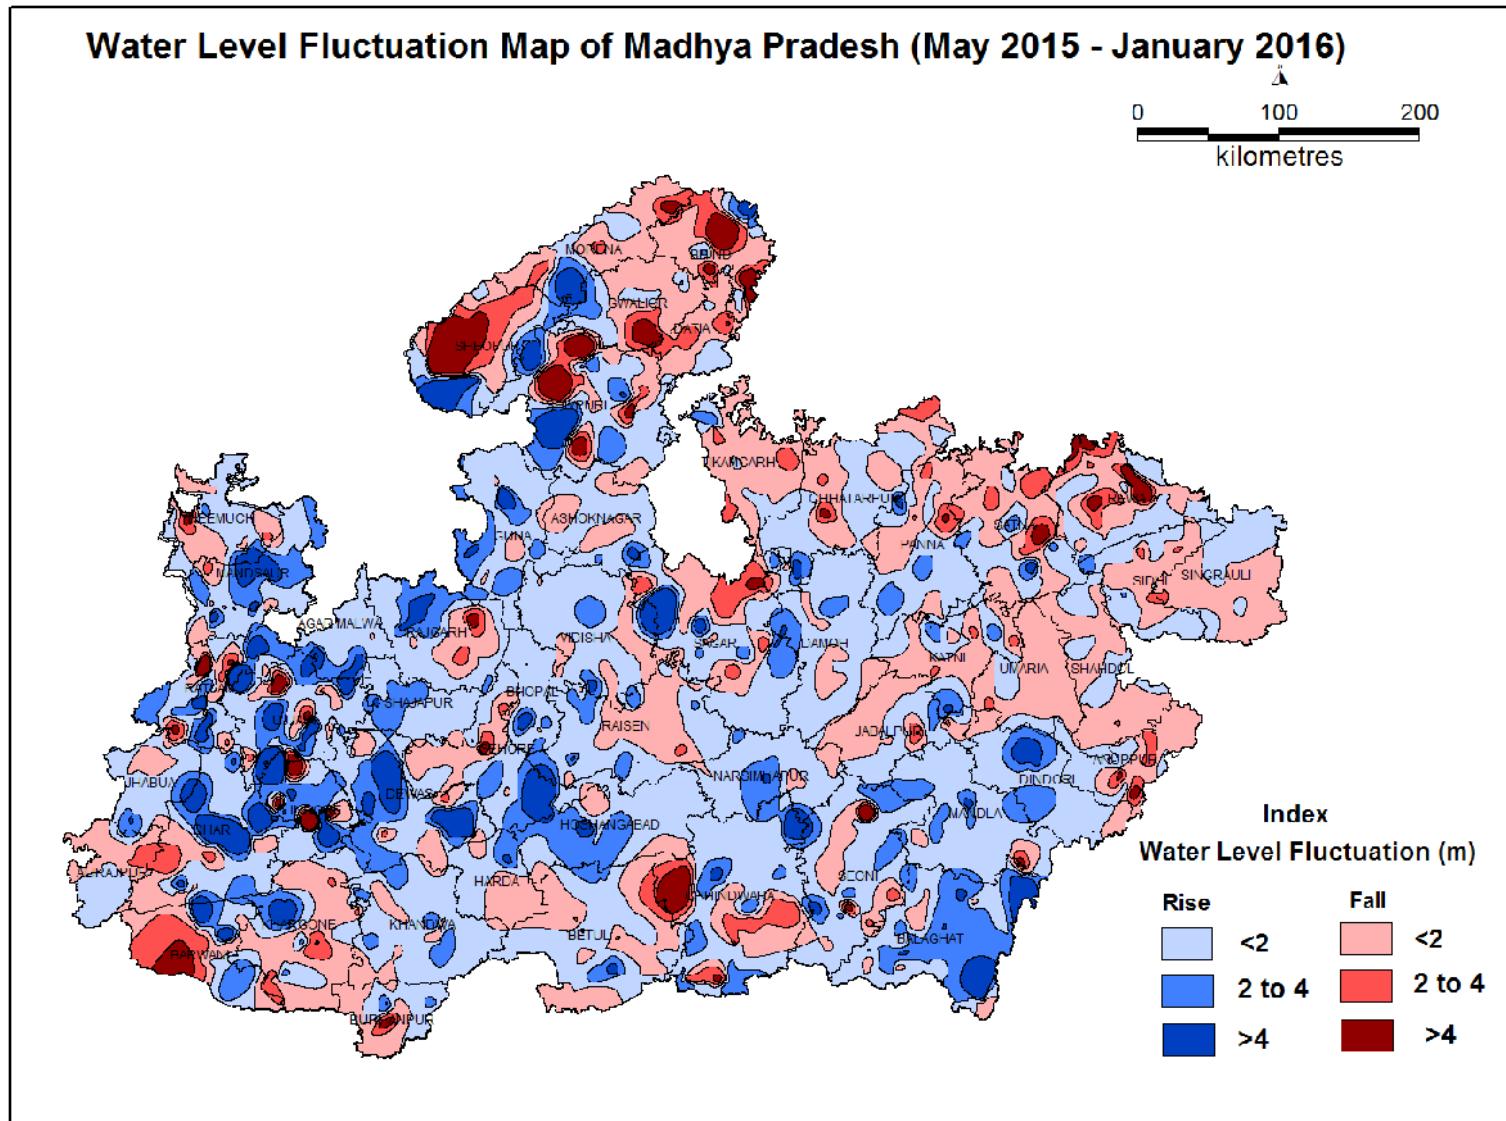

**Fig 16**

**Fig 17**

**Fig 18**

## **2.2c DECADAL WATER LEVEL FLUCTUATIONS**

Depth to ground water level of a particular monitoring season is compared with its 10 years of mean data, i.e., decadal mean of water levels, to get an idea about the water level conditions of that particular season with respect to the decadal mean. Such a comparison helps in the assessment of drought situations or otherwise of the abundance of ground water resources in a particular monitoring season.

### **WATER LEVEL FLUCTUATIONS DECADAL MEAN (MAY 2005-2014) TO MAY 2015**

The ground water levels of May 2015 were compared with the 10 years May (2005-2014) average ground water levels to decipher the long-term changes in the ground water regime. It is observed that about 58.76% of the wells show rise and about 41.24% of wells show decline in water levels in the state. The rise in water level is in the order of 0-2 m in 38.33% of the wells, 2-4 m in 12.52% of the wells and more than 4 m in about 7.91% of the wells. The decline in water levels in the order of 0-2 m is about 29.65% of the wells, between 2-4 m in 6.61% of the wells and more than 4 m in 4.99% of the wells. Fall in water level more than 2 m are seen in sporadic patches only owing to pumping. In general by comparing mean of water level of previous 10 year and current year water level, it is inferred that there is a rise in water level in most parts of the state except north western parts of the state.

### **WATER LEVEL FLUCTUATION DECADAL MEAN (AUGUST 2005-2014) TO AUGUST 2015**

There is a rise in the water levels in about 38.15% of wells and fall in 61.85% wells. About 27.43% of wells spreading all over the north, north western parts and in many districts in patches shows a rise in water level up to 2 m. About 7.15% of the wells show a rise in the order of 2- 4 m and is spread in north and north western part of the state. Rise in water level of more than 4 m is found in about 3.57% of the wells and are seen in Bhind, Morena, Rajgarh, Shajapur, Ujjain, and dewas districts of the state.

Water level decline up to 2 m is recorded in about 42.50% of wells spread in south western and north eastern and eastern parts of the state. About 11.13% of the wells show a decline in the order of 2-4 m and 6.22% in the order of more than 4m, mostly spread in patches in many districts of the state especially in south, central, northern, and eastern parts of state.

## **WATER LEVEL FLUCTUATION MEAN (NOVEMBER 2005-2014) TO NOVEMBER 2015**

There is a rise in the water levels in about 34.78% of wells and fall in 65.22% wells. About 28.32% of wells spreading all over the north, north western parts and in many districts in patches shows a rise in water level up to 2 m. About 4.48% of the wells show a rise in the order of 2- 4 m and is spread in north and north western part of the state. Rise in water level of more than 4 m is found in about 1.97% of the wells and are seen in Bhind, Morena, Sheopur, Ujjain, Narsinghpur and Dewas districts of the state.

Water level decline up to 2 m is recorded in about 42.67% of wells spread in south western and north eastern and eastern parts of the state. About 15.03% of the wells show a decline in the order of 2-4 m and 7.52% in the order of more than 4m, mostly spread in patches in many districts of the state especially in south, central, northern, and eastern parts of state.

## **WATER LEVEL FLUCTUATION MEAN (JANUARY 2006-2015) TO JANUARY 2016**

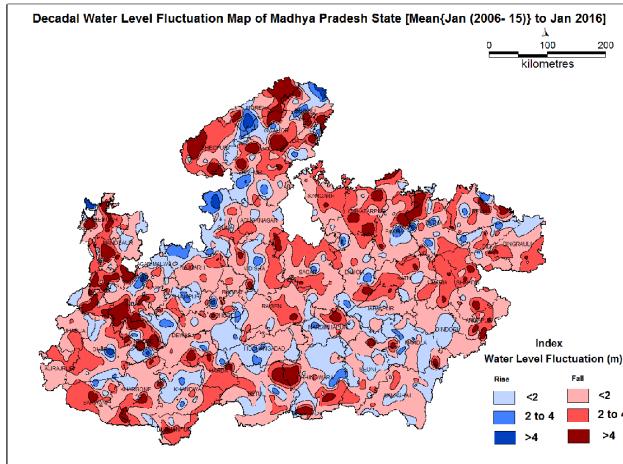

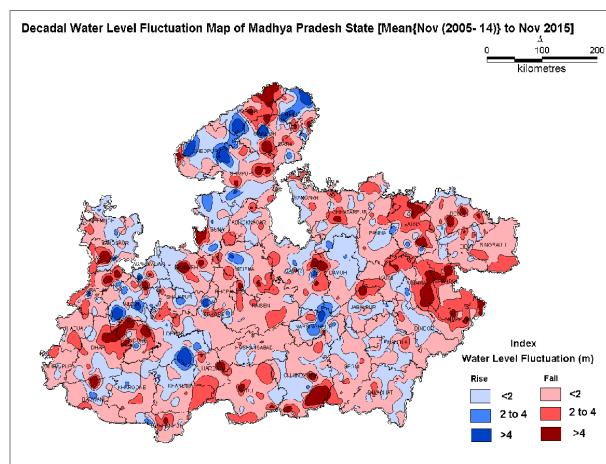

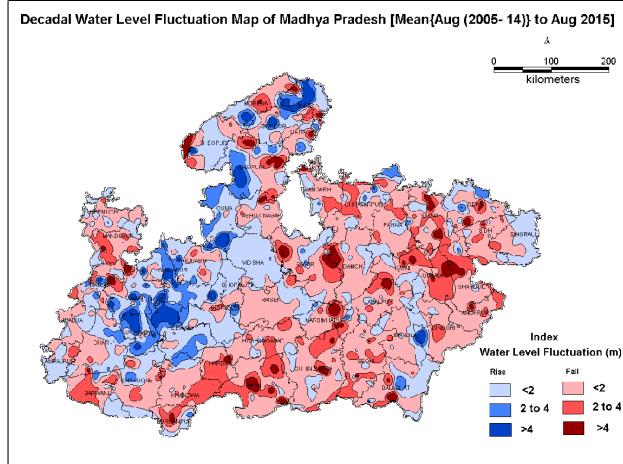

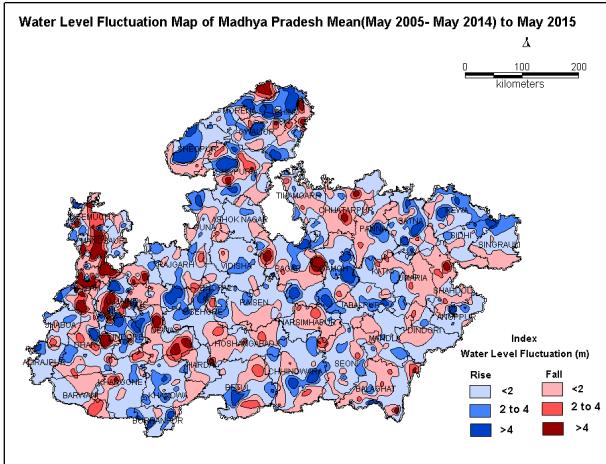

There is a rise in the water levels in about 28.98% of wells and decline in 71.02% wells. About 22.21% of wells spread in patches show a rise in water level up to 2 m. About 4.92% of the wells show a rise in the order of 2- 4 m and is spread in north and north western part of the state. Rise in water level of more than 4 m is found in about 1.84% of the wells and are seen in Bhind, Morena, Guna, Dhar and in patches in many districts of the state.

In general there is decline water level in entire state. Water level decline up to 2 m is recorded in about 39.66% of wells spread in entire parts of the state. About 19.29% of the wells show a decline in the order of 2-4 m and 12.07% in the order of more than 4m, mostly spread in patches in many districts of the state especially in south, central, northern, and eastern parts of state.

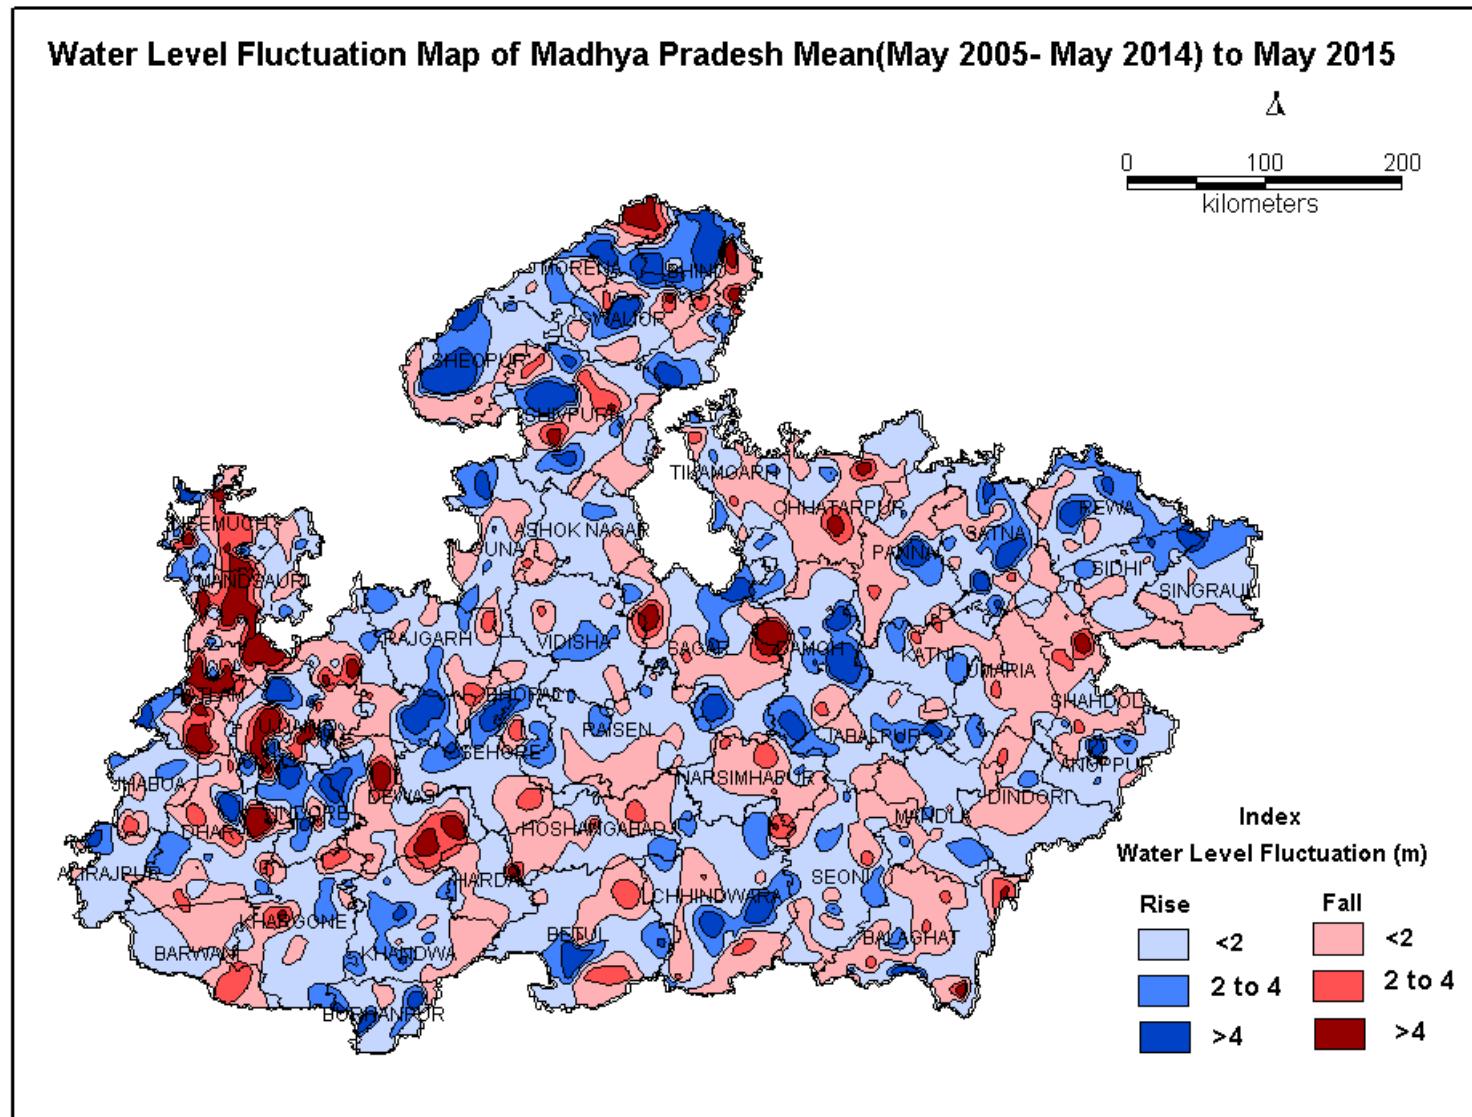

Decadal water level fluctuations at a glance are shown in Fig 19. The decadal water level fluctuation maps of different period have been depicted in Fig (20 to 23). The district wise decadal water level fluctuation and frequency distribution of wells in different ranges is given in Annexures (XII to XV).

**Fig 19**

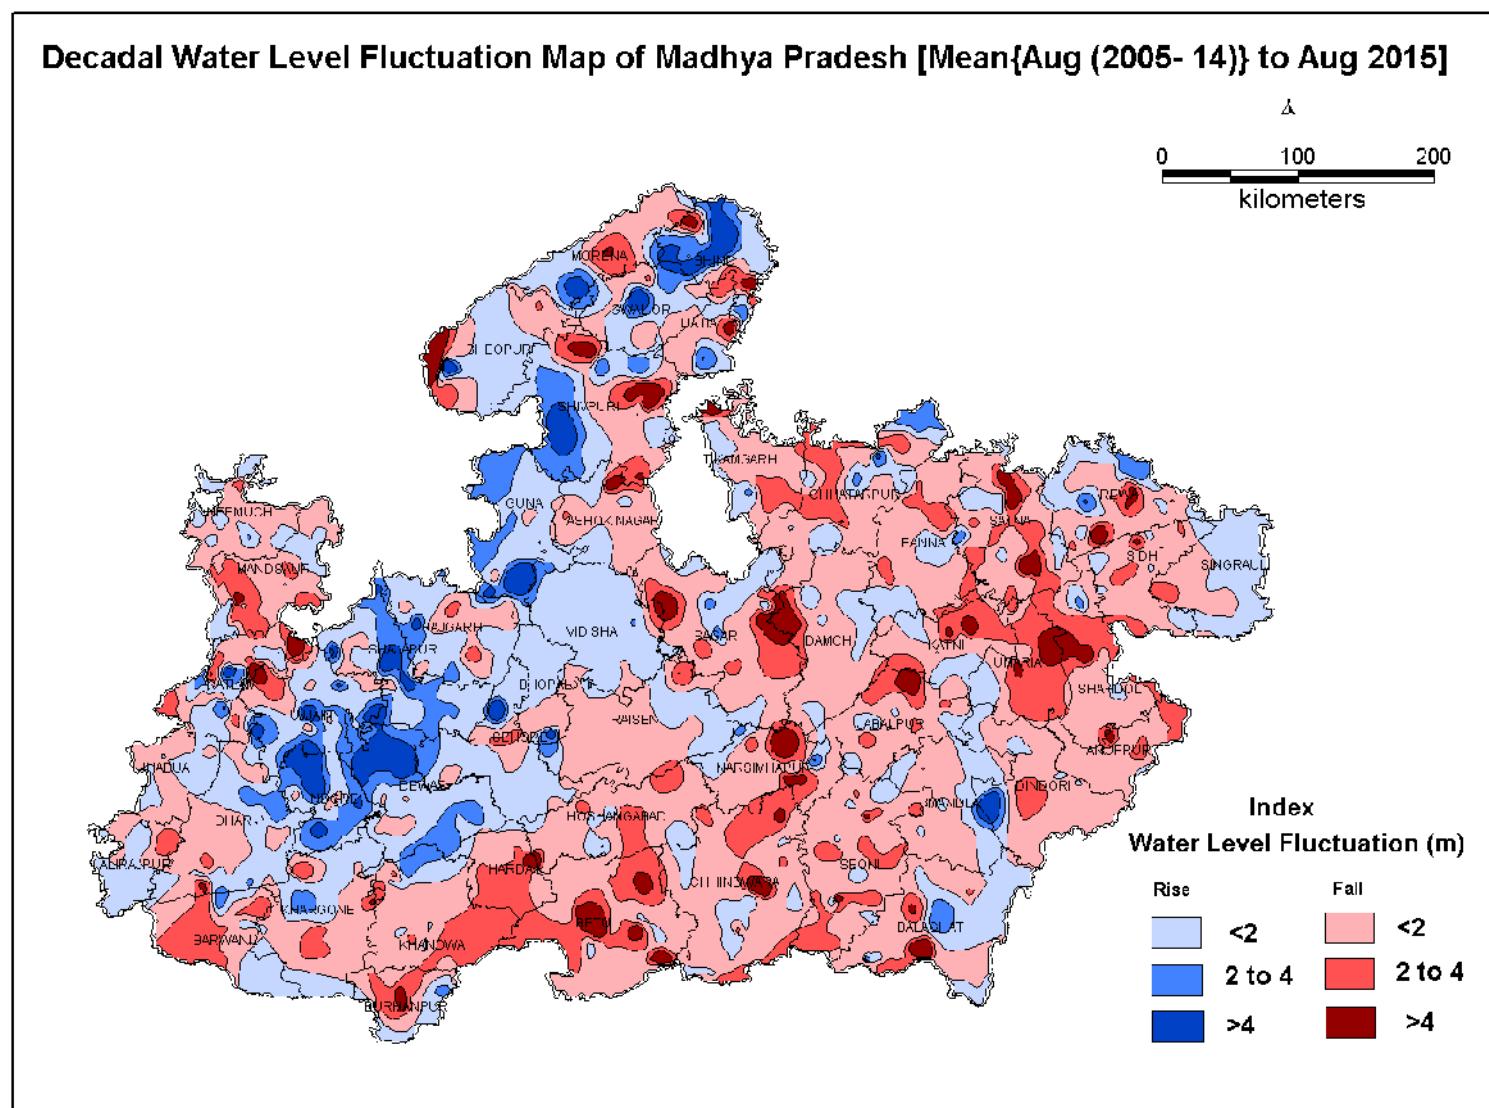

## DECADAL WATER LEVEL FLUCTUATION AT A GLANCE

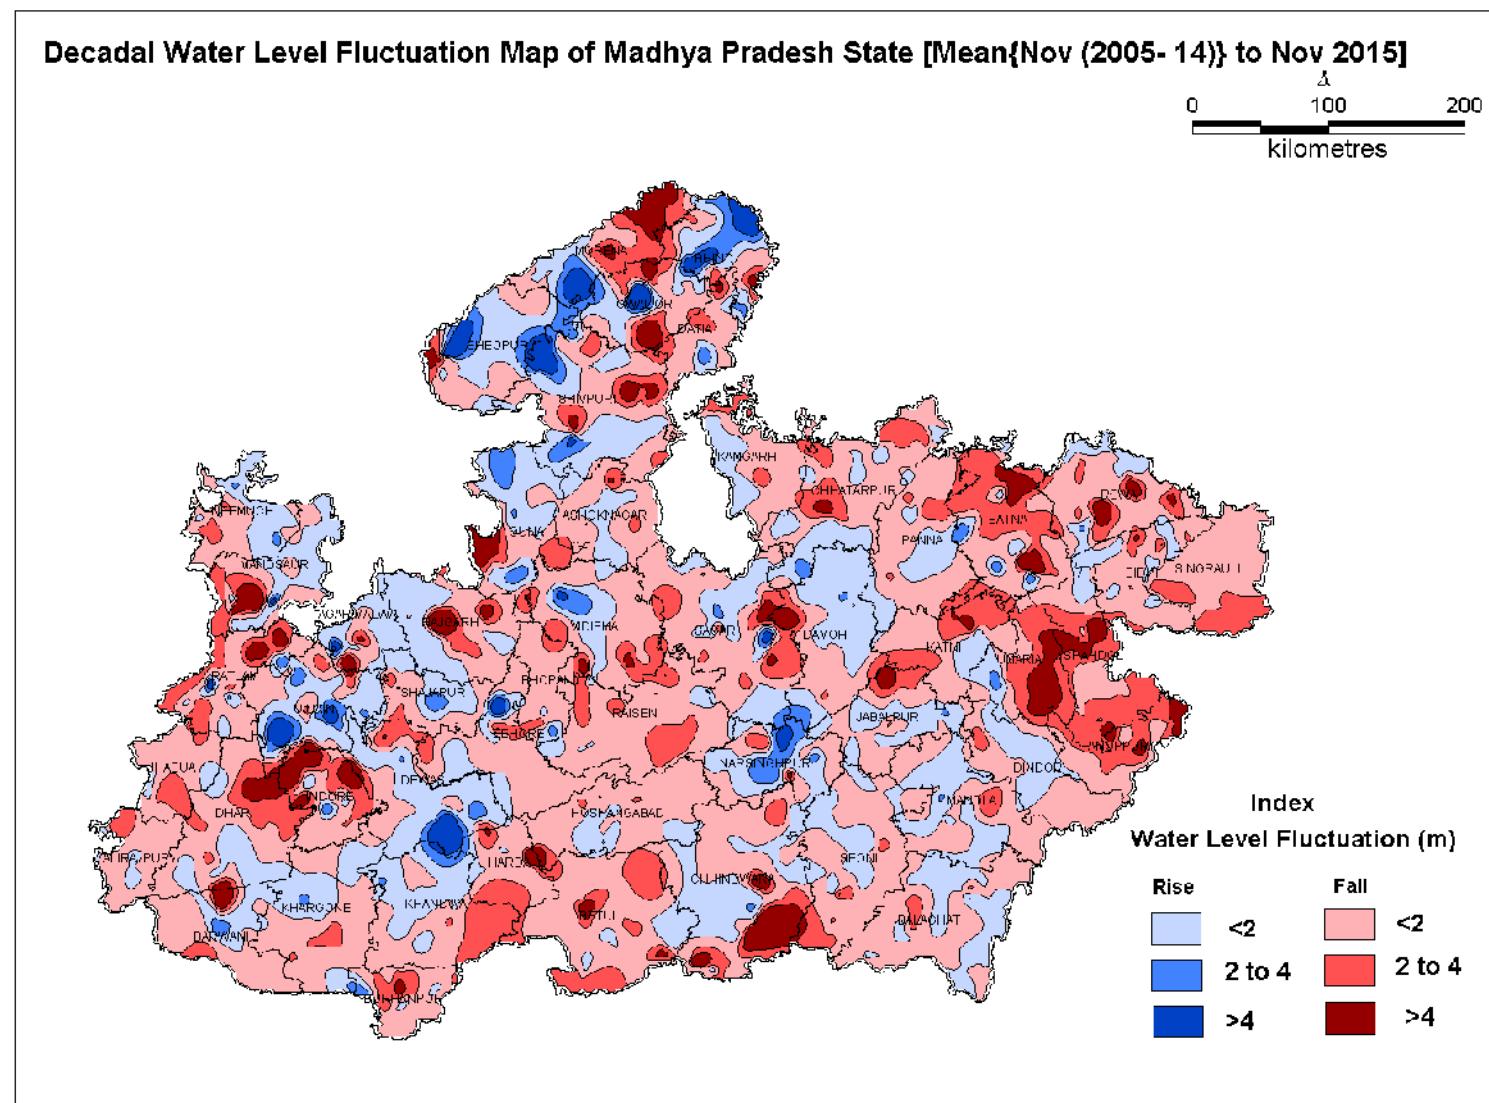

**Fig 20**

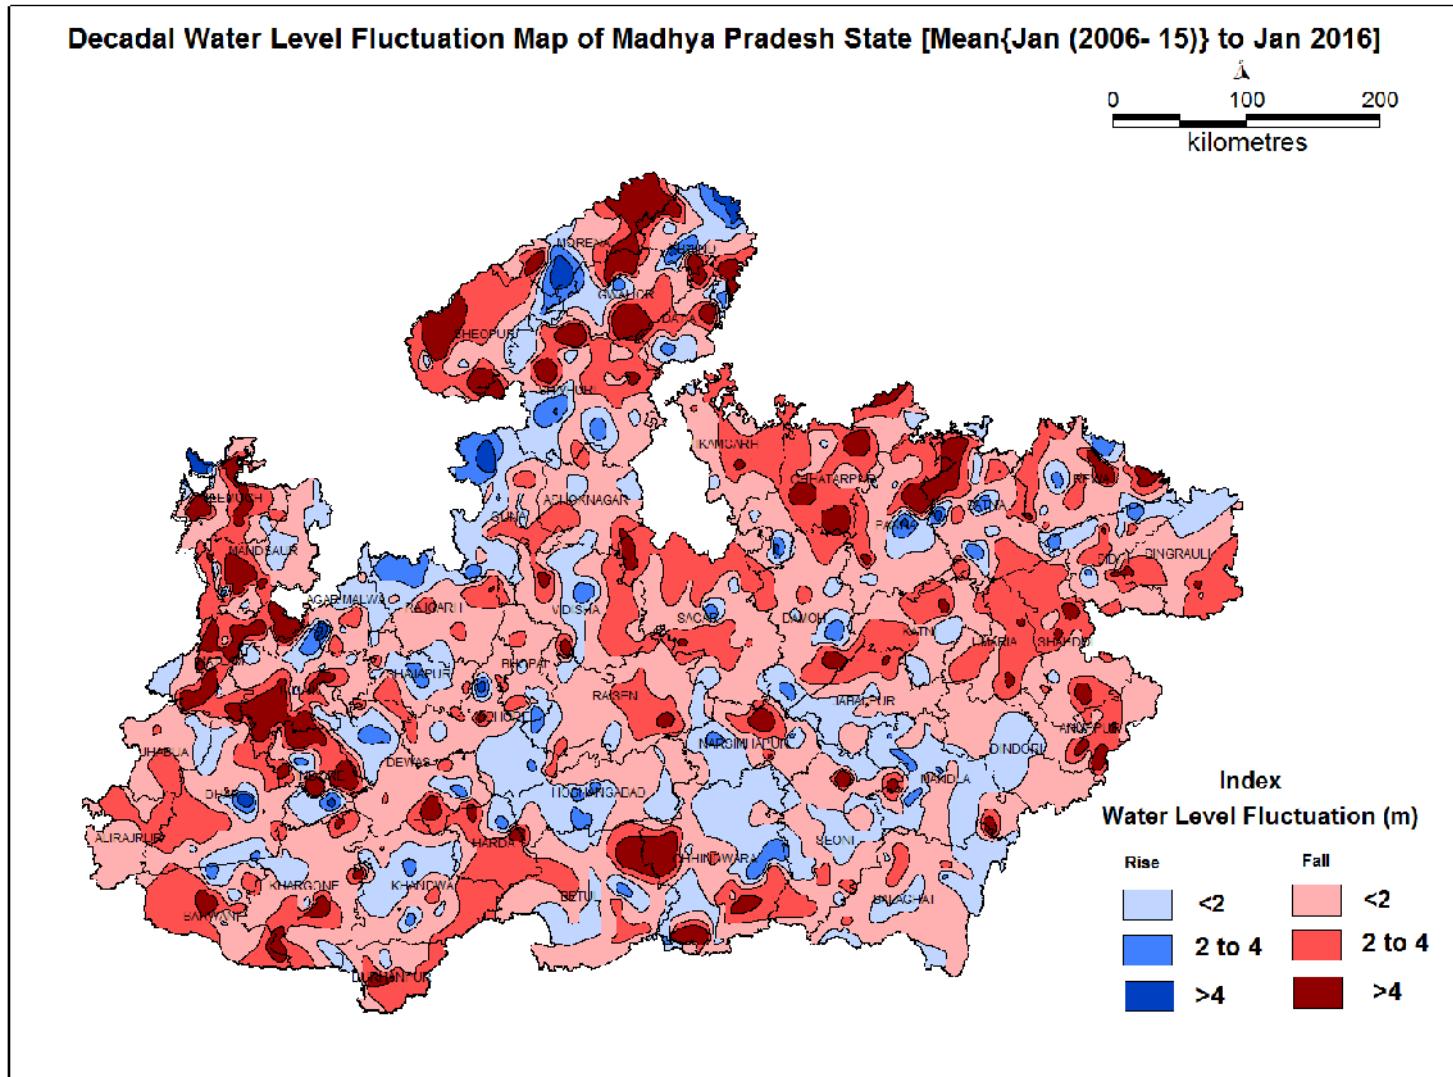

**Fig 21**

**Fig 22**

**Fig 23**

### **2.3 LONG-TERM TREND OF GROUND WATER LEVELS**

The trend analysis of depth to ground water levels (time series analysis) using the data from the hydrograph net work stations for the past one decade 2006-15 was carried out using the least square method. Based on this analysis, maps are prepared demarcating various zones of rising and declining trends for the decade 2006-15.

#### **GROUND WATER LEVELS TREND PRE MONSOON (May 2006 to May 2015)**

Ground water levels trend map of pre-monsoon period (May 2006 to May 2015) in Madhya Pradesh state has been depicted in **Fig 24**. The Map shows that there is a general rising trend up to (0.10 m/year) of ground water levels during the past decade in the almost all the districts of the State. The rising trend at higher rate (0.10 to 0.2 m/year) is found in sporadic patches of smaller areal extent in Dewas, Sheopur, Gwalior, Panna, Satna and Shahapur district. The rising trend more than 0.20 m/year has been observed in Sheopur, Dewas districts of the State. Declining trend at a rate up to (-0.10 m/year) is observed in patches mainly in central and southern parts of the state. The declining trend at higher rate (-0.10 to -0.20 m/year) has been observed only at few districts, namely, Chhindwara, and Narsinghpur districts. The declining trend of pre-monsoon water levels reflects the ground water developmental activities in an area, whereas the rising trend indicates that either the developmental activities have reduced, or that, recharge due to sources other than the rainfall, such as applied irrigation has increased. About 33.6 % of monitoring wells are showing declining water levels trend while 66.4 % monitoring wells are showing rising ground water level trend.

#### **GROUND WATER LEVELS TREND POST MONSOON (Nov 2006 to Nov 2015)**

Ground water levels trend map of post-monsoon period (Nov 2006 to Nov 2015) in Madhya Pradesh state has been depicted in **Fig 25**. The Map shows that there is a general rising trend up to 0.10 m/year of ground water levels during the past decade in all most all the districts of the State. Rising trend at a rate 0.10 to 0.20 m/year is observed only in small patches in Shivpuri, Gwalior, Ujjain and Rewa districts. The rising trend at rate more than 0.20 m/year is found only in Gwalior. The declining trend up to 0.10 m/year has been observed in patches mainly in Southern and central parts of state. The declining trend at rate (-0.10 to -0.20 m/year) is found in patches mainly in Morena, Sheopur, Narsinghpur and Betul districts. Declining water levels trend more than (-0.20 m/year) has been observed only in Narsinghpur and Sheopur districts. The declining trend in post-monsoon water levels suggests that a part of the aquifer is being dewatered every year, due either to deficient rainfall or to developmental activities. The rising post-monsoon trend, on the other hand, shows that

additional water is being stored in the aquifer, due either to increased rainfall or to seepage through applied irrigation. About 36.8 % of monitoring wells are showing declining water levels trend while 63.2 % monitoring wells are showing rising ground water level trend.

**Fig 24**

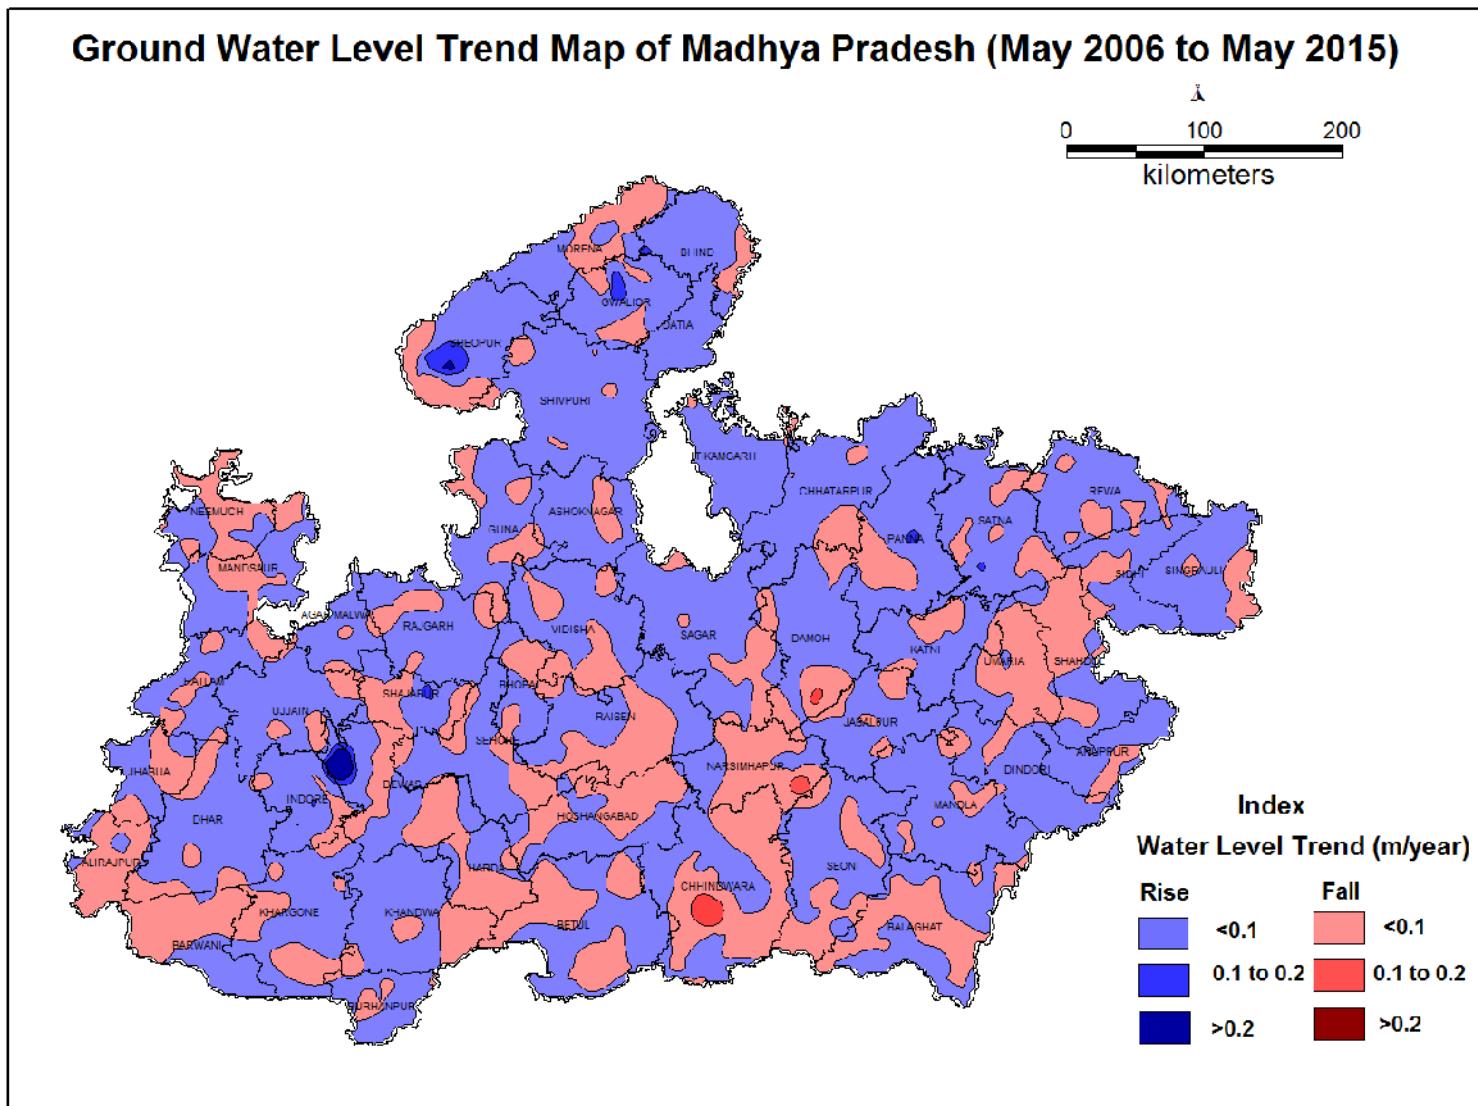

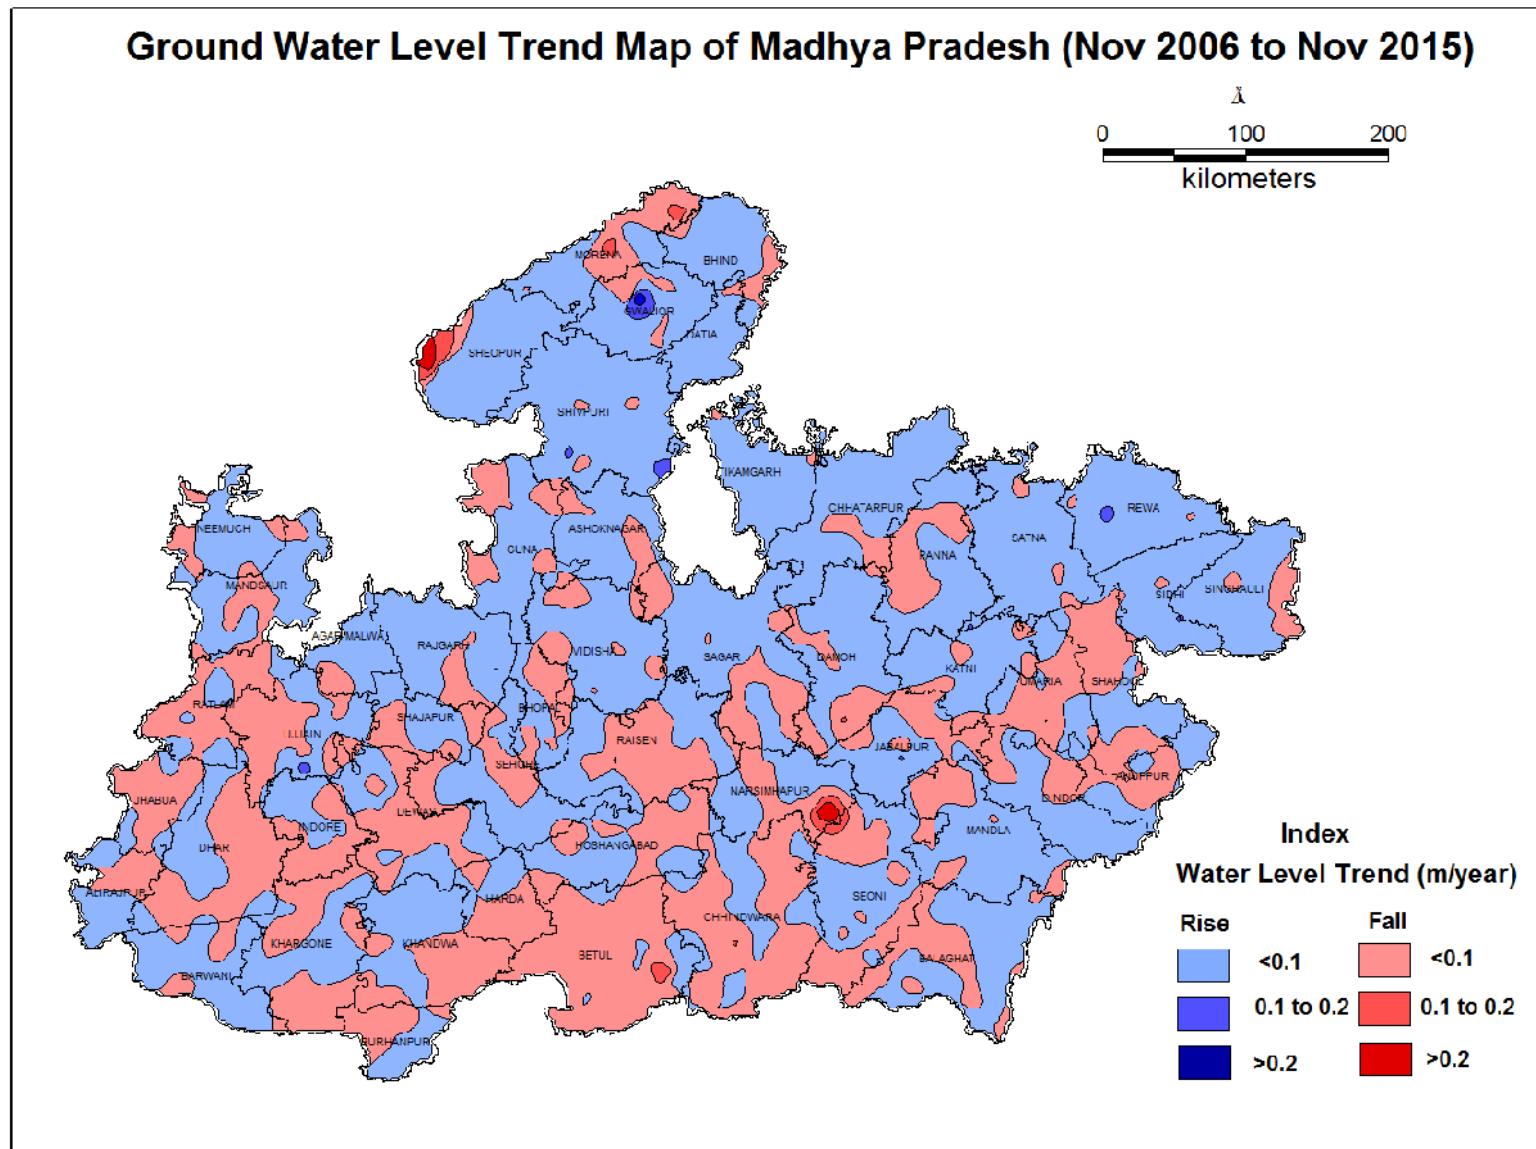

Fig 25

### **3. HYDROCHEMISTRY OF GROUND WATER (2014-15)**

Water samples were collected from 1050 Ground Water Monitoring Wells during May 2014 and monitored for chemical quality of ground water (phreatic aquifer) and their location is given in Fig 26. Detailed analysis of the chemical samples was carried out for 15 parameters. The results of chemical data observed are given in ANNEXURE - XVI.

#### **3.1 SALINITY**

The salinity of water is represented by electrical conductivity. Electrical conductivity is a numerical expression of the ability of water to conduct an electric current. It depends on the total concentration of the ionized substances dissolved in water and the temperature at which the measurement is made. Electrical conductivity increases by about 2% per degree Celsius rise in temperature. The mobility of the dissolved ions, their valencies and their concentration affect conductivity. As electrical conductivity is an index of salinity in water, high electrical conductivity means high salinity. High salinity not only imparts bad taste to drinking water but such water is not suitable for irrigation purposes as it leads to deposition of salt content in the soil and affects the fertility of soil in the absence of adequate soil management practices.

The water having electrical conductivity upto 1000  $\mu\text{S}/\text{cm}$  at  $25^\circ\text{C}$  may be considered fresh & suitable for drinking purpose. The Ground water quality of Madhya Pradesh is generally good as 65.24% wells have electrical conductivity below 1000  $\mu\text{S}/\text{cm}$  at  $25^\circ\text{C}$ . The salinity tolerant crop may be grown in the area where electrical conductivity is more than 2000  $\mu\text{S}/\text{cm}$   $25^\circ\text{C}$ .

The chemical quality of ground water of Madhya Pradesh is generally good as the perusal of the frequency distribution of electrical conductivity in phreatic aquifer. Table-4 shows that 86.86% wells fall in the range of 0-1500  $\mu\text{S}/\text{cm}$  at  $25^\circ\text{C}$  and only 1.52% wells have electrical conductivity more than 3000  $\mu\text{S}/\text{cm}$  at  $25^\circ\text{C}$ .

**Table 4 Frequency distribution of electrical conductivity in phreatic aquifer range**

Range ( $\mu\text{S}/\text{cm}$ at $25^\circ\text{C}$ )	No. of Samples	%
0-1500	912	86.86
1501-3000	122	11.62
>3001	16	1.52

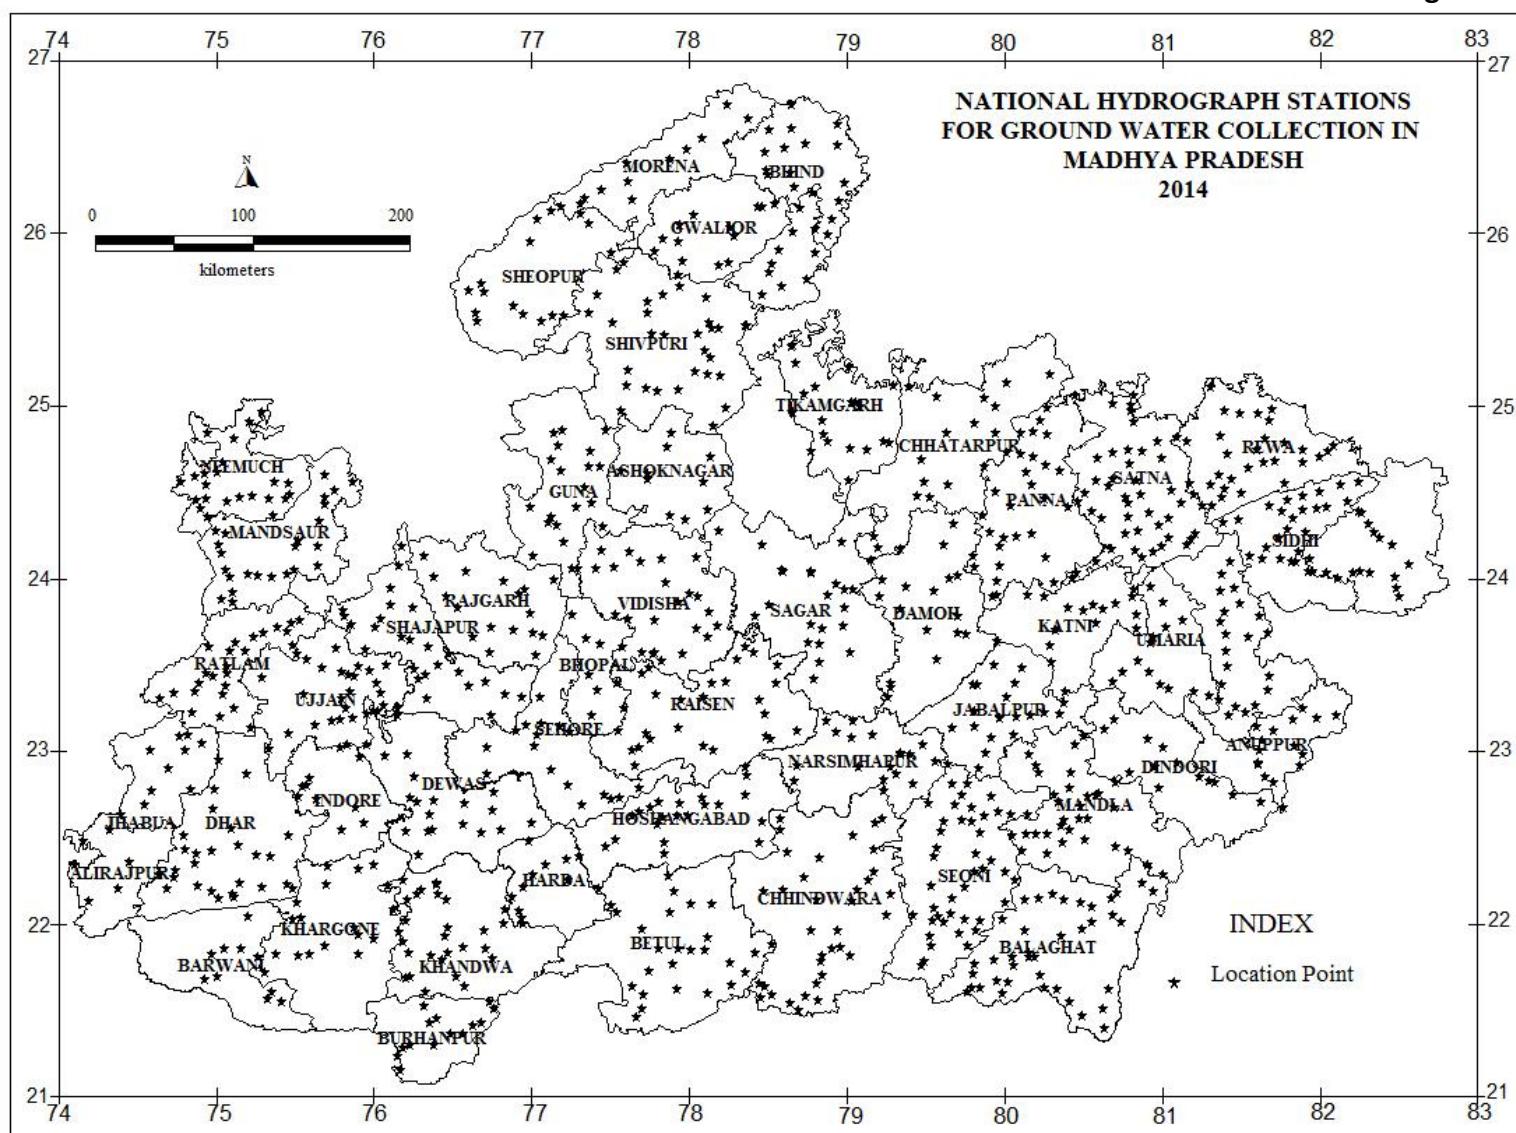

The distribution of major ions indicates that in Madhya Pradesh in ground water with low to medium salinity (EC  $\leq 1000 \mu\text{s}/\text{cm}$ ) bicarbonate is the predominant anion but there is conspicuous increase in Chloride, Sulphate and Nitrate ion concentration with increase in salinity which indicates that the leaching of minerals of these constituents or human

activity is contributing towards salinity in ground water of the area. Generally the ground water in Madhya Pradesh is alkaline earth bicarbonate type. The list of samples having electrical conductivity more than 3000  $\mu\text{s}/\text{cm}$  at  $25^\circ\text{C}$  is given in Table 5 and distribution of Electrical Conductivity in Madhya Pradesh is given in the Fig 27.

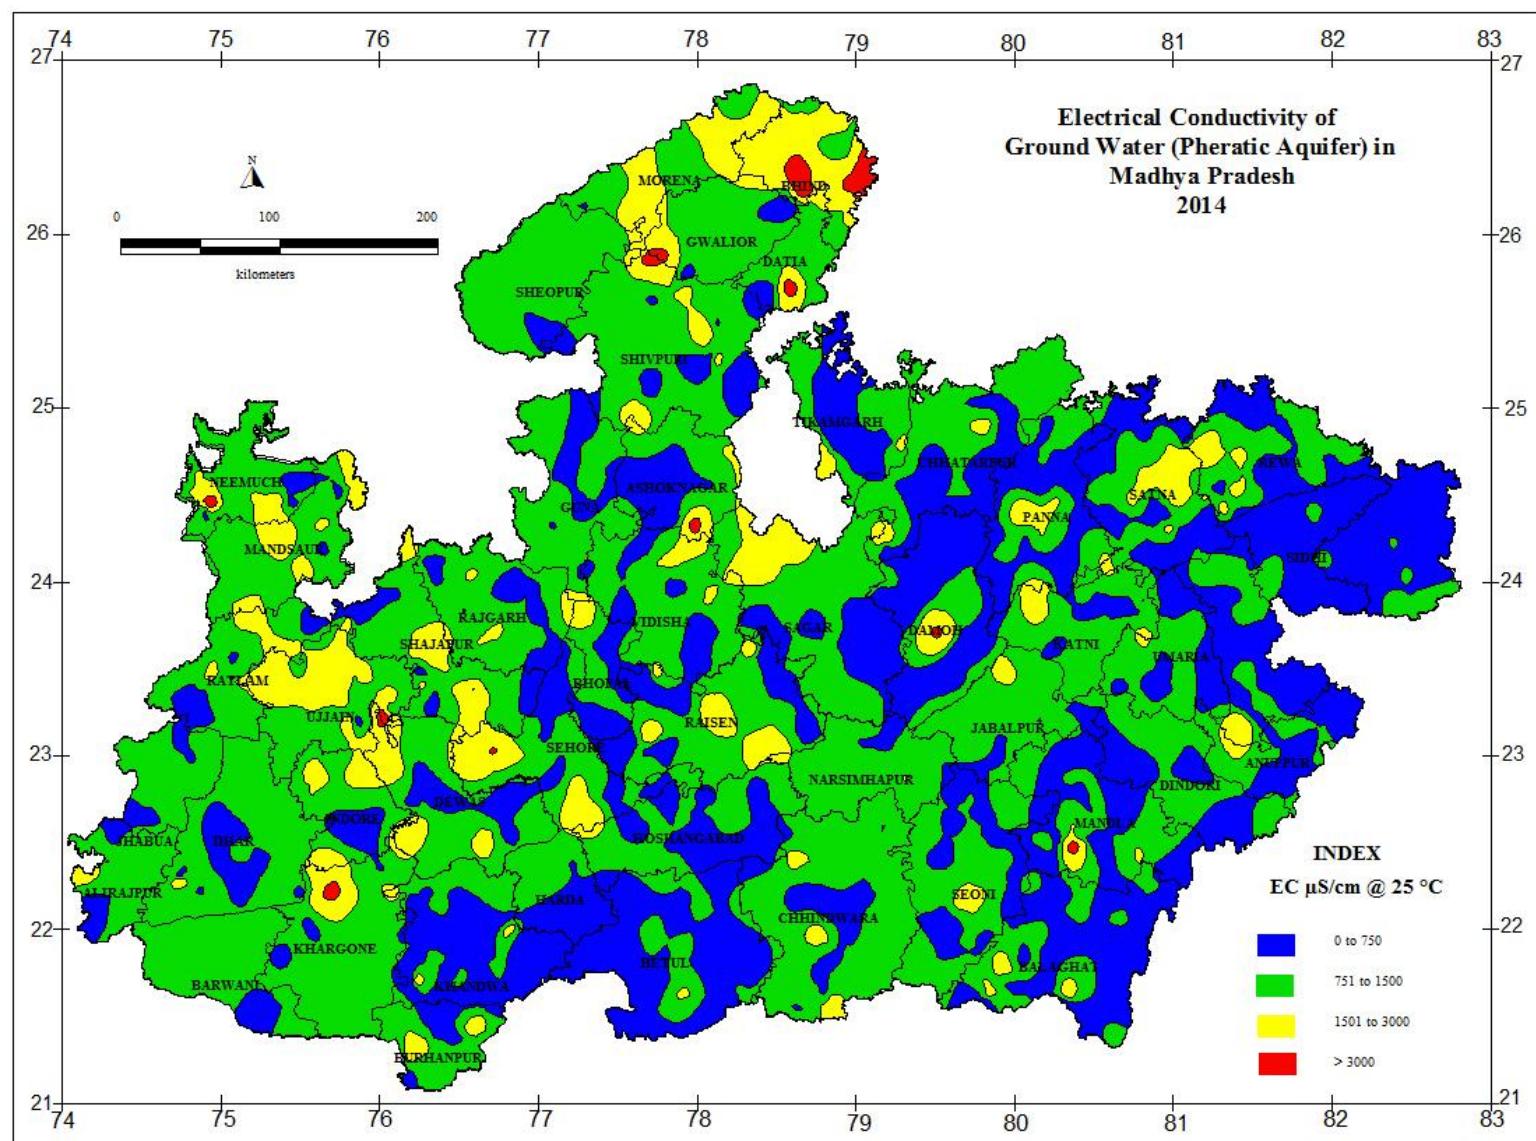

**Table 5: Locations showing electrical conductivity above 3000  $\mu\text{s}/\text{cm}$  at  $25^\circ\text{C}$ .**

S. No.	District	Block	Location	Latitude	Longitude	EC ( $\mu\text{s}/\text{cm}$ at $25^\circ\text{C}$ )
1	ASHOKNAGAR	MUNGAOLI	Bahadurpur	24.342	77.969	3313

**Fig 26**

**Fig 27**

### 3.2 FLUORIDE

Generally fluoride is present in low concentration in natural water. The presence of fluoride in ground water is very important from health point of view for human consumption as in low concentration; it prevents dental caries (upto 1.0 mg/l). However the high concentration of fluoride above the permissible limit of 1.5 mg/l in drinking water (IS: 10500 Drinking water standards) is harmful for human consumption as it causes mottling of teeth and skeletal fluorosis. Its accumulation leads not only to high skeletal concentration, but also has crippling ill effects.

In Madhya Pradesh fluoride rich water in shallow aquifer occurs in Agar Malwa, Anuppur, Betul, Chhindwara, Katni, Mandla, Narsinghpur, Sehore, Seoni, Shahdol, Shajapur, Ujjain And Umari districts. The distribution of fluoride in the State is shown in Fig 28. Fluoride analysis reveals that there is no specific trend observed for distribution of Fluoride in the State. The maximum fluoride concentration has been observed at Rehgaon (3.85mg/l) Mandla district.

**Table 6 Frequency Distribution of Fluoride in Phreatic Aquifer**

Range mg/l	No. of Samples	%
0-1	963	91.71
1-1.5	68	6.48
>1.5	19	1.81

The frequency distribution of Fluoride is give in the Table 6 shows that in 91.71% wells Fluoride concentration is within the desirable limit of 1.0 mg/l where as 1.81% wells show Fluoride concentration above the maximum permissible limit of 1.5 mg/l. The list of locations having Fluoride concentration more than 1.5mg/l is given in Table 7.

**Table 7 Locations showing fluoride exceeding 1.5 mg/l in ground water**

S. No.	District	Block	Location	Latitude	Longitude	F ( more than 1.50 mg/l)
1	AGAR MALWA	BADOD	Matkotra	23.739	75.853	1.84
2	AGAR MALWA	NALKHEDA	Nalkhera	23.836	76.244	1.75

### 3.3 NITRATE

Undesirable changes in the natural quality of ground water due to anthropogenic activities of man are a matter of great concern. The contribution of atmospheric and geological sources for Nitrate in ground water is small in comparison to the sources related to pollution as a result of activities of man. Sewage and animal waste contain considerable amount of Nitrate and its discharge on land & subsequent leaching by rainfall causes enrichment of Nitrate in ground water. Similarly agricultural sources such as excessive use of fertilizers, irrigation with wastewaters, legumes and farm yard wastes contribute nitrate to ground water.

Concentration of nitrate in excess of 45mg/l in water is harmful for human consumption, particularly for infants as it may cause blue baby disease. The highest desirable and maximum permissible limit of nitrate is 45mg/l (IS: 10500 Drinking water standards). The locations of wells in Madhya Pradesh, where concentration of nitrate ion was more than 45mg/l in ground water are shown in Fig 29. Perusal of frequency distribution of Nitrate in ground water reveals that 66.48% (698 nos.) wells have nitrate concentration within the permissible limit of 45mg/l while 33.52% (352 nos.) well water contain nitrate in excess of 45 mg/l (Table 8).

**Table 8 Frequency distribution of Nitrate in shallow aquifer**

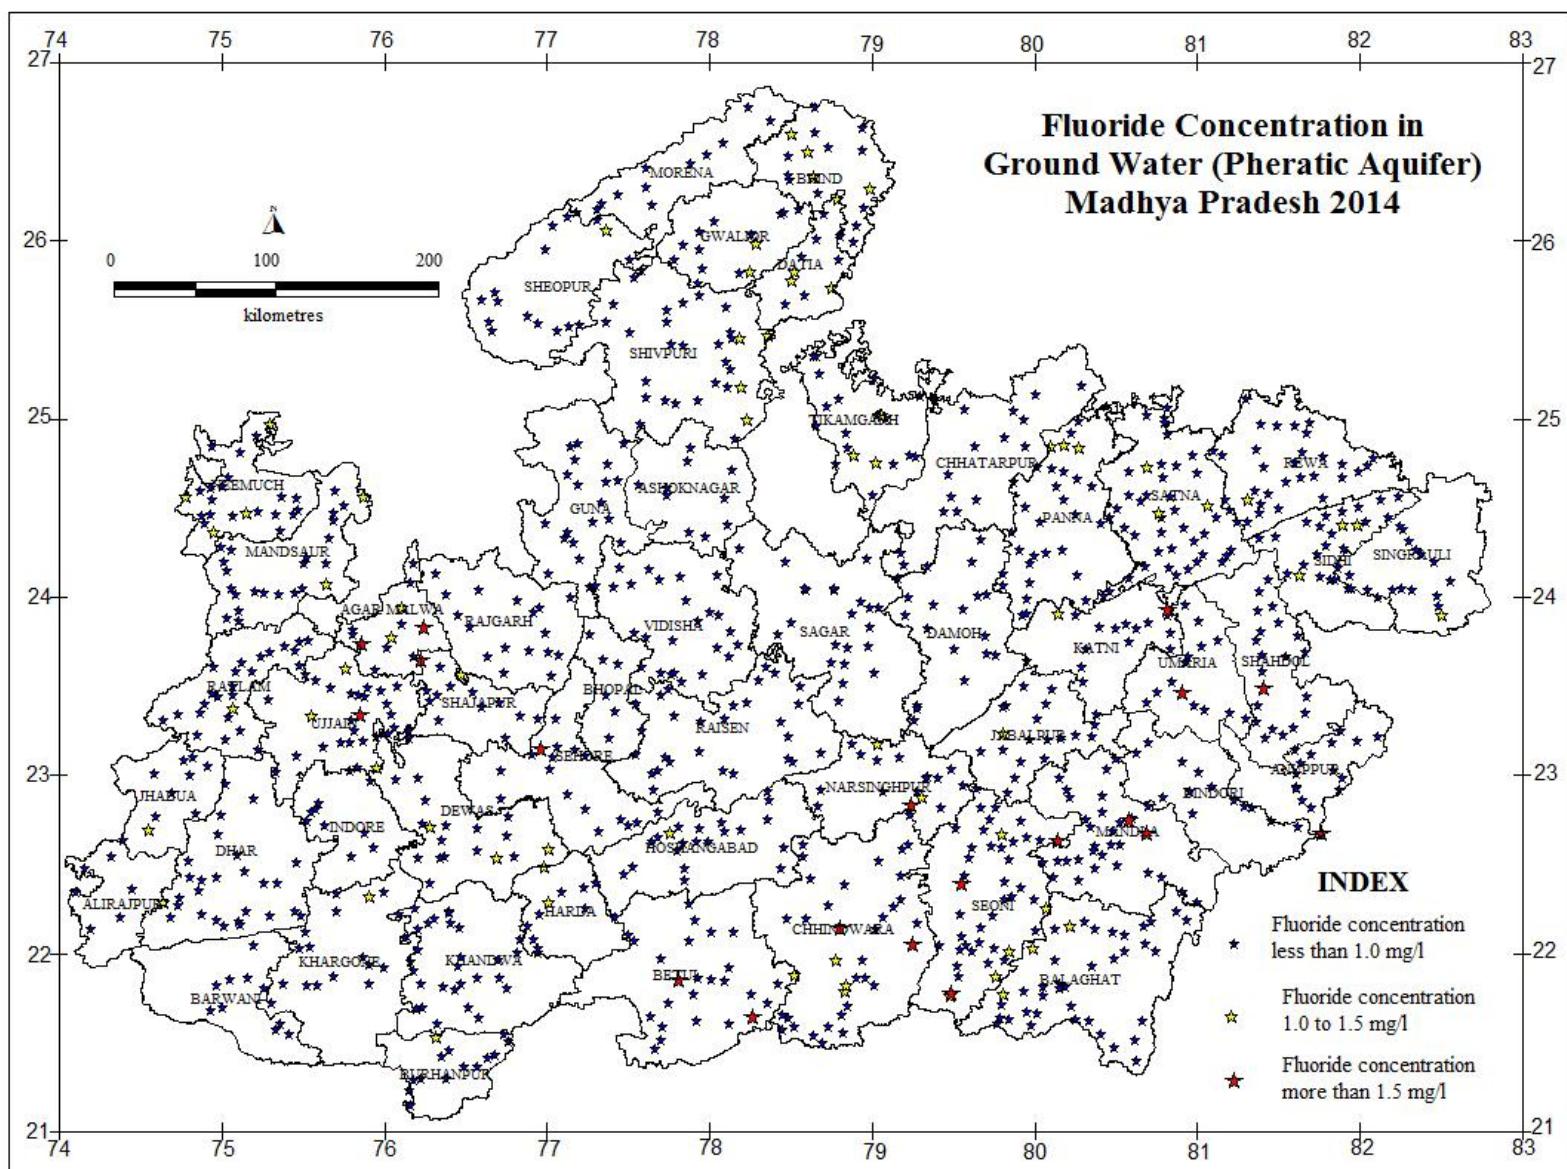

Range mg/l	No. of Samples	%
0-45	698	66.48
>45-100	222	21.14
>100	130	12.38

In Madhya Pradesh, nitrate concentration in shallow aquifer occurs in Agar Malwa, Alirajpur, Anuppur, Ashoknagar, Balaghat, Barwani, Betul, Bhind, Bhopal, Burhanpur, Chhatarpur, Chhindwara, Damoh, Datia, Dewas, Dhar, Guna, Gwalior, Harda, Hoshangabad, Indore, Jabalpur, Jhabua, Katni, Khandwa, Khargone, Mandla, Mandsaur, Morena, Narsinghpur, Neemuch, Panna, Raisen, Rajgarh, Ratlam, Rewa, Sagar, Satna, Sehore, Seoni, Shahdol, Shajapur, Sheopur, Shivpuri, Sidhi, Singrauli, Tikamgarh, Ujjain and Vidisha districts. The distribution of nitrate

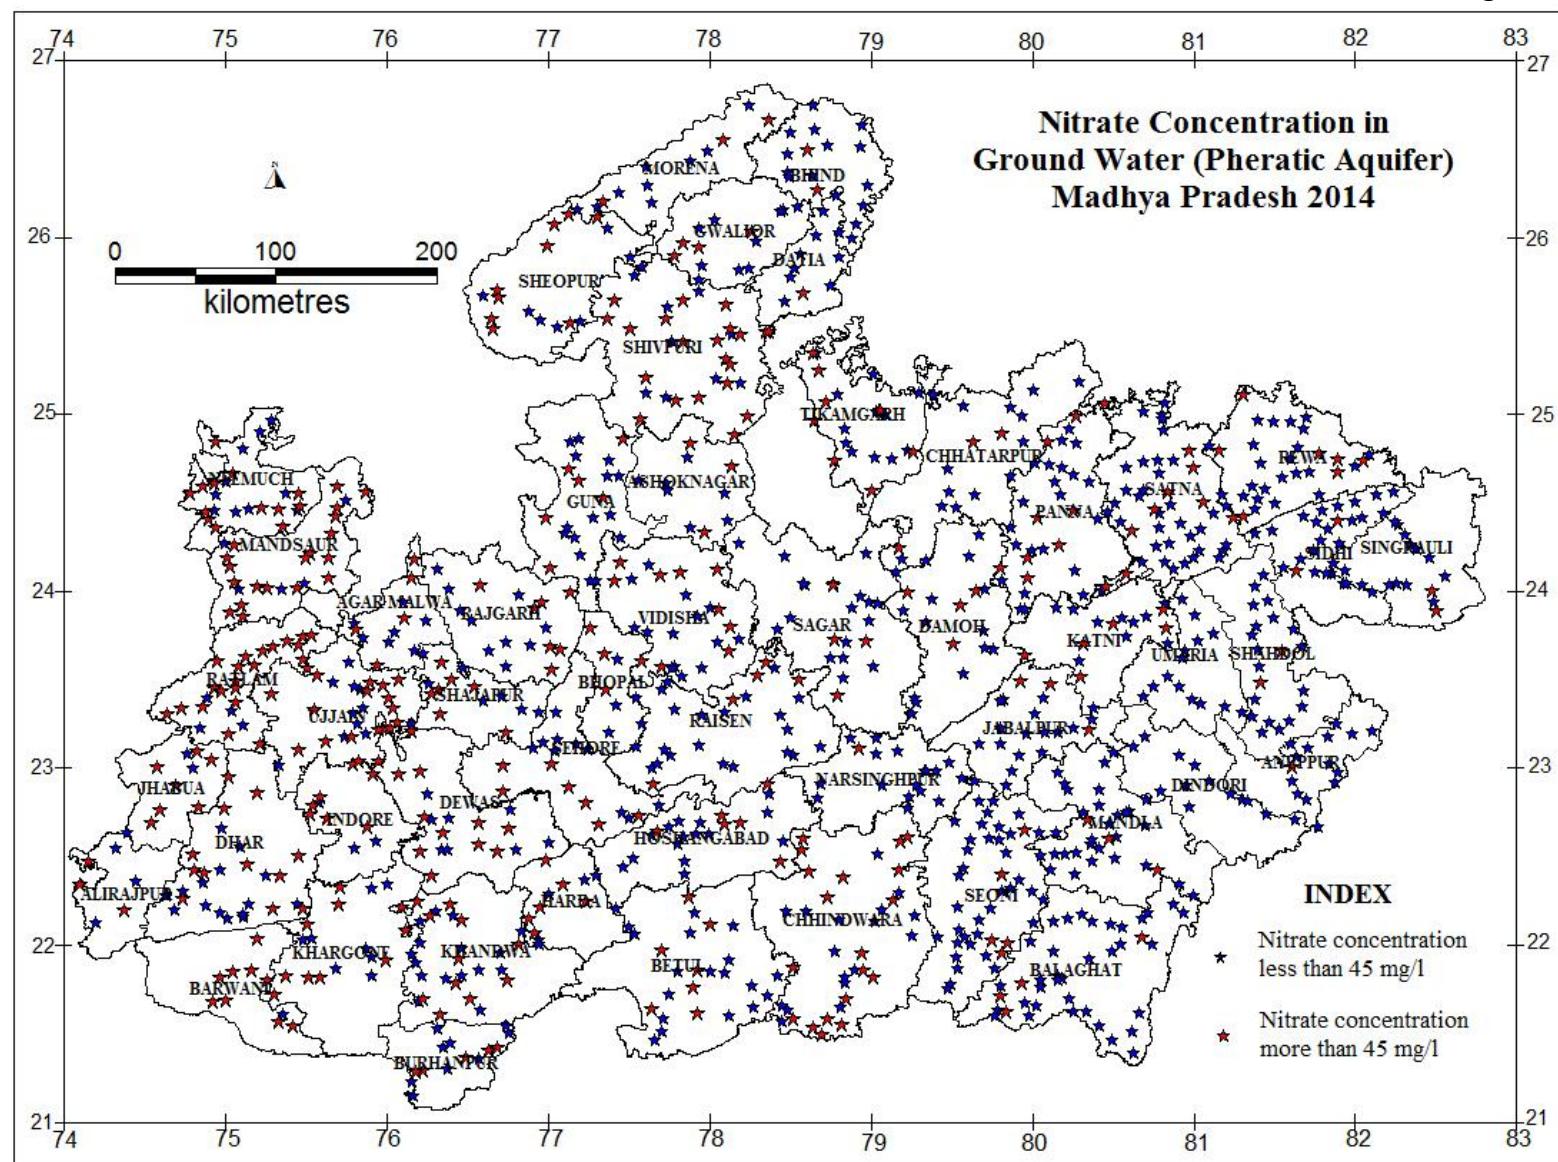

concentration in the State is shown in Fig 29.

Very high Nitrate concentration of 500 mg/l was found in the ground water sample from Sirsod Chouraha, Shivpuri district (765 mg/l). The locations having more than 45 mg/l nitrate in ground water of Madhya Pradesh are shown in Table 9.

**Fig 28**

**Fig 29**

**Table 9 Locations showing nitrate more than 45 mg/l in ground water**

### 3.4 TOTAL HARDNESS

Hardness is mainly caused by the presence of Calcium and Magnesium Bicarbonate, Sulphate and Chloride ions. As per Indian standard IS:10500 (Drinking water), the highest desirable limit of total hardness is 200 mg/l and maximum permissible limit is 600 mg/l. Total Hardness in the shallow ground water in Madhya Pradesh ranges between 20 to 1805 mg/l (1805 mg/l in Girdola, Neemuch district). Most of the waters are calcium bicarbonate type attributing to temporary hardness of water. Permanent hardness of water caused by Calcium and Magnesium, Sulphate and Chloride can be removed by ion exchange.

**Table 10 Frequency distribution of Total Hardness in shallow aquifer**

Range mg/l	No. of Samples	%
0-200	251	23.90
>200-600	725	69.05
>600	74	7.05

The study of Total Hardness in ground water reveals that 74 nos. (7.05%) of well waters contain hardness more than the maximum permissible limit of 600mg/l and 725 nos. (69.05%) of well waters has total hardness above the maximum desirable limit of 200 mg/l but below the maximum permissible limit of 600 mg/l (Table 10). The locations having Total Hardness more than 600 mg/l in ground water of Madhya Pradesh are shown in Table 11.

**Table 11 Locations showing Total Hardness exceeding 600 mg/l in ground water.**

### 3.5 SUITABILITY FOR IRRIGATION

The crop productivity depends on the quality of the water used for irrigation. Water suitability for irrigation needs to be evaluated on the basis of hazards it can create in the soil, affecting yield & quality of crops. The potential hazards to crop growth are salinity, sodicity, alkalinity and toxicity.

#### SODIUM ADSORPTION RATIO

Sodium Adsorption Ratio (SAR) is an estimate of the degree to which Sodium will be absorbed by soil from water. Sodium in irrigation waters adversely affects soil structure and permissibility by replacing Ca and Mg ions.

$$SAR = \frac{Na^+}{\sqrt{(Ca^{+2} + Mg^{+2})/2}}$$

Where: Na<sup>+</sup>, Ca<sup>+2</sup> and Mg<sup>+2</sup> are expressed in meq/l

**Table 12 Quality of Water on the basis of SAR values**

S.No.	Range of SAR	No. of Sample	% of Samples	Quality of Water
1.	<10	1042	99.24	Low Sodium hazard good quality
2.	10-18	7	0.67	Medium Sodium hazard medium quality
3.	18-26	1	0.10	High Sodium hazard bad quality
4.	>26	0	0.00	Very High Sodium hazard very bad quality

Table 12 shows that the quality of water samples as per SAR is good as 99.24% wells have SAR value below 10.

### **RESIDUAL SODIUM CARBONATE**

Residual Sodium Carbonate (RSC): Equals the sum of bicarbonate and Carbonate ion concentration minus the sum of Calcium & Magnesium ions, when all the ions are expressed in meq/l.

$$RSC = (\text{CO}_3^{--} + \text{HCO}_3^-) - (\text{Ca}^{++} + \text{Mg}^{++})$$

According to Eaton (1950) and USSL (1954), irrigation waters containing residual sodium carbonate (RSC) above 2.5 meq/l are not suitable for irrigation purpose. Water containing 1.25 to 2.5 meq/l of RSC is marginally suitable & those containing less than 1.25 meq/l of RSC are safe. The water quality of Madhya Pradesh has been evaluated on the basis of RSC in Table 13.

**Table 13 Number of wells falling in different RSC ranges**

S.No.	RSC Range in meq/l	No. of wells	% of wells	Suitability
1.	< 1.25	943	89.81	Suitable
2.	1.25 – 2.5	49	4.67	Marginally suitable
3.	>2.5	58	5.52	Unsuitable

Nearly 94.48% of dug well waters of Madhya Pradesh were found to have RSC values below 2.5meq/l, which infers that the water is free from alkalinity hazards. However 5.52% (58 Nos.) of wells have RSC more than 2.5 meq/l. Excessive use of these high RSC waters for irrigation can adversely affect fertility of the soil in the area by making it alkaline, resulting at times in hardening of the soil due to deposition of sodium carbonate. For safe use of such waters gypsum requirement for different soils needs to be evaluated.

**Table 14 Table showing maximum and minimum values and values exceeding desirable and permissible limit for drinking use of different parameters**
