## **FOREWORD**

Central Ground Water Board has been monitoring ground water levels and ground water quality of the country since 1968 to depict the spatial and temporal variation of ground water regime. The changes in water levels and quality are result of the development pattern of the ground water resources for irrigation and drinking water needs. Analyses of water level fluctuations are aimed at observing seasonal, annual and decadal variations. Therefore, the accurate monitoring of the ground water levels and its quality both in time and space are the main pre-requisites for assessment, scientific development and planning of this vital resource.

Central Ground Water Board, North Western Region, Chandigarh has established Ground Water Observation Wells (GOW) in Haryana State for monitoring the water levels. As on 31.03.2015, there were 964 Ground Water Observation Wells which included 481 dug wells and 488 piezometers for monitoring phreatic and deeper aquifers. In order to strengthen the ground water monitoring mechanism for better insight into ground water development scenario, additional ground water observation wells were established and integrated with ground water monitoring database. As a result, total number of ground water observation wells as on 31.03.2016, has reached 1176 ground water observation wells which include 517 dug wells and 659 piezometers for monitoring phreatic aquifers including 45 deep piezometers for monitoring confined/ semi- confined aquifers. These observation wells are being monitored four times a year in the months of May, August, November and January, undertaken throughout the country. This report presents the observations and findings for the period from May 2015 to January 2016.

Shri M. L. Angurala, Scientist 'D' has put concerted efforts to compile and analyse the data and prepare the report. Chapter on Chemical Quality of ground water has been compiled by Mrs Balinder. P. Singh, Scientist 'D' & Shri Rishi Raj, Asstt.Chemist. The editing and processing, to bring the report, to its present form has been carried out by Shri Tejdeep Singh, Sc D.

This report incorporates all the analytical data on ground water monitoring done in Haryana State and provides valuable information on prevailing ground water regime to the user agencies and other stakeholders as well.

# **GROUND WATER YEAR BOOK**

## **HARYANA STATE**

### **2015 – 2016**

#### **1 INTRODUCTION**

The State of Haryana is in North India with its capital at Chandigarh. The Haryana State is located between North Haryana is a landlocked state in northern India. It is between 27°39' to 30°35' N latitude and between 74°28' and 77°36' E longitude covering an area of 44,212 sq. km. The state is sub-divided into nine physiographic units and is drained by two major rivers Ghaggar and Yamuna. It was carved out of the former state of Punjab on 1 November 1966 on the basis of language distribution. The name Haryana is found in the works of the 12th century AD Apabhramsha writer Vibudh Shridhar (VS 1189–1230). It is bordered by Punjab and Pradesh to the north and by Rajasthan to the west and south. The river Yamuna defines its eastern border with Uttar Pradesh. Haryana surrounds the country's capital Delhi on three sides, forming the northern, western and southern borders of Delhi. Consequently, a large area of south Haryana is included in the National Capital Region for purposes of planning for development.

The state was home to prominent sites of the Indus Valley and Vedic Civilizations. Several decisive battles were also fought in the area, which shaped much of the history of India. These include the epic battle of Mahabharata at Kurukshetra mentioned in Hindu mythology (including the recital of the Bhagavad Gita by Lord Krishna), Banganga or the Bhishma Kund, a legend attached to this water tank says that, when Bhishma lay on his bed of arrows, he felt thirsty and asked for water. To fulfill his desire, Arjuna immediately shot an arrow into the ground and let loose a stream of gushing water. This is how the BhishmaKund is believed to come into existence and the three battles of Panipat. Haryana was administered as part of the Punjab province of British India, and was carved out on linguistic lines as India's 17th state in 1966. Haryana is now a leading contributor to the country's production of food grains and milk. Agriculture is the leading occupation for residents of the state with the flat arable land irrigated by submersible pumps and an extensive canal system. There are four irrigation systems in the state namely

- |                          |                   |
|--------------------------|-------------------|
| 1. Western Yamuna canal, | 3. Agra canal and |
| 2. Bhakra canal,         | 4. Ghaggar canal  |

Haryana contributed heavily to the Green Revolution that made India self-sufficient in food production in the 1960s.

### **1.1 Physiography**

The altitude of Haryana varies between 700 and 3600 ft (200 meters to 1200 meters) above sea level. An area of 1,553 km<sup>2</sup> is covered by forest. Haryana has four main geographical features.

- The Yamuna-Ghaggar plain forming the largest part of the state
- The Shivalik Hills to the northeast
- Semi-desert sandy plain to the southwest
- The Aravalli Range in the south

### **1.2 Geohydrological Conditions**

On the basis of Geohydrological conditions as well as groundwater movement and surface drainage pattern, the entire state is divided into the following basins:-

1. Yamuna basin; (a) Upper, (b) Lower
2. Ghaggar Basin; (a) Upper, (b) Lower
3. Inland Alluvial Basin
4. Krishnawati Basin
5. Sahibi Basin
6. Landoha Nala Basin
7. Kanti Sub Basin (Loharu Satnali area)

Ground water occurs both under confined and unconfined conditions in the alluvial formation whereas it is mostly under un-confined conditions in Siwaliks and piedmont deposits and semi-confined conditions in hard rocks.

### **1.3 Rivers of Haryana**

The Yamuna flows along the state's eastern boundary while the ancient Sarasvati River is said to have flowed from Yamuna Nagar, but has now disappeared. Haryana's main seasonal river, the Ghaggar rises in the outer Himalayas, between the Yamuna and the Sutlej and enters the state near Pinjore in the Panchkula district. Passing through Ambala and Hissar, it reaches Bikaner in Rajasthan and runs for 460 km before disappearing into the deserts of Rajasthan. Important tributaries include the Chautang and Tangri. The seasonal Markanda River is a stream, which in ancient times

was known as the Aruna. It originates from the lower Siwaliks Hills and enters Haryana west of Ambala. During monsoons, this stream swells into a raging torrent notorious for its devastating power. The surplus water is carried on to the Sanisar Lake where the Markanda joins the Sarasvati and later the Ghaggar. Shahbad Markanda town is situated on its bank. Mentioned in the epic Shatapatha Brahmana as the Drishadwati, the Sahibi River originates in the Jaipur district in Rajasthan. However, before seismic activities some 7,500 years ago in the Aravalli Hills, the river brought water from as far as the Ajmer district. Gathering volume from about a hundred tributaries in Rajasthan and the Mewat areas, it reaches voluminous proportions, forming a broad stream around Alwar and Patan. Further flowing via Rewari District and Dharuhera, it reaches Jhajjar then splits into two smaller streams, finally reaching the outskirts of Delhi and flowing into the Najafgarh Lake that flows into the Yamuna through the Najafgarh drain. Recently hardly any water flows in Sahibi as most of the water is impounded in small check dams upstream in the Alwar district of Rajasthan and the Masani barrage in Rewari district, built on this river on NH 8 (Delhi-Jaipur highway). Three other rivulets in and around the Mewat hills, the Indori, Dohan and Kasavati all flow from East to West.

#### **1.4 Hydrometeorology**

The state receives its rainfall primarily through southwestern monsoon. Winter showers are also quite common. The average annual rainfall varies forms little as 313 mm in areas bordering Rajasthan in South-western parts of the state over 862 mm in the North-Eastern parts near Siwalik Hills bordering Himachal Pradesh. In more than 50% of total area average rainfall is less than 500 mm. Rainfall progressively decreases towards South and southwest districts. Drought conditions are common in Mahendragarh, Rewari, Bhiwani, Hissar and Sirsa. The state experiences extreme winter and summer. The minimum and maximum temperatures recorded in the state are 2.0 c (Narnaul Dec. 2000 and 45.6C Hissar May, 2000) respectively. Winter frost is quite common during the months of December and January. Minimum and maximum wind speeds recorded are 0.4 Km per hour and 5.3 Km per hour. The mean wind speed of the state is reported to be 2.9 Km per hour. The mean relative humidity on an average varies from 30% in April to 90% in August, the annual average being 60%. As a whole the climate of the state is semi-arid to sub tropical. Aridity is more in South Western parts of the state bordering Rajasthan.

## 2.0 HYDROGEOLOGICAL SETUP

Three geological groups are represented in the state viz. Pre-Cambrian, Tertiary and Quaternary. The Quaternary group comprises of Alluvium which occupies 98% of the area of the state. The tertiary group is represented by the outermost zone of the Siwalik system composed mainly of sandstones, clay and boulders. The rocks of Pre-Cambrian age which form part of the Aravalli hill ranges are exposed in Gurgaon, Mewat and Faridabad districts and as small outcrops in other Southern districts. The thickness of alluvium deposits decreases from North to South. All the three major physiographic units viz. Peninsula, Extra-Peninsula and Indo-Gangetic areas, terminating in the hard rock formations of Delhi systems (Pre-Cambrian age) towards South, Siwaliks system (Tertiary age) in the North and in between the alluvial formations (Recent to sub recent age) are observed in the state. The general geological succession of the various units of the Peninsula and Indo-Gangetic plains traversing the Haryana state are given below (table-1).

Table:-1 Generalized Stratigraphy of Haryana State (after GSI, 2012)

Age	Super Group	Group/Formation	Lithology
Quaternary		Older and Newer Alluvium and Aeolian Deposits	Grey and brown sand, silt, silt-clay, clay with calcrete, limestone and gypsum.
Tertiary	Siwalik Super Group	Upper Siwalik	Boulder conglomerate, sandstones, clay/mudstone and pebble beds.
		Middle Siwalik	Sandstone with variegated clay/mudstone.
		Lower Siwalik	Sandstone, mudstone/shale
		Sabathu	Fine-grained sandstone, clay and limestone.
Pre-Tertiary (?)		Tundapathar 'Series' Lower (Paleozoic Unconformity)	Stromalitic limestone, Tosham rhyolite, Granite (Erinpura), migmatite, ultramafic and pegmatite.
Proterozoic	Delhi Group	Ajabgarh Group (Divided into 5 Formations)	Quartzite and basic flows, mica-schist, carbonaceous phyllites and slates, calc-schist, dolomite, marble, calc-silicate, amphibolite, hornblende-schist, phyllite.
		Alwar Group	Quartzite, conglomerate, amphibolite, mica-schist and arkosic quartzite.

In the extra peninsular region (northern part of Panchkula district) Siwalik System (Upper Tertiary) and Sabathu Series (Lower Tertiary) are exposed. Sabathu comprises of greenish grey and red gypseous shales with thin bands of sand stones and limestone. Shales and limestone are richly fossiliferous. Siwaliks system comprises of mainly

greywacke, sandstones, grits, clays, siltstones, conglomerates and pseudo-conglomerates. These are fluviatile deposits and are rich in mammalian fossils.

The area in Panchkula, Ambala & Yamunanagar is underlain by the 'Kandi, Sirowal and the Alluvium. The Kandi belt which forms the upper higher portions of the composite fan deposits is 2 to 4 kms wide running more or less parallel to the Shivalik foothills. The sediments comprise boulders, pebbles, gravel and sand with clays mixed in varying proportions. Sirowal belt and the adjoining Gangetic plain on the south of the Kandi belt are underlain by silt, fine to medium sand and clays. Gravel and pebbles also occur occasionally. The area in Gurgaon district is underlain by the rocks of Delhi system and by Quaternary alluvium. The Ajabgarh shales and quartzite form the basement in the western part of the area where the thickness of alluvium is very less. In Hissar and Bhiwani districts area is underlain by unconsolidated sediments of Quaternary age. The sediments comprise sand, silt clay and kankar. In Sonipat, Jind, Karnal and Kurukshetra districts the area is underlain by alluvium deposits of Quaternary age. Alluvium comprises clay, silt, sands of various grades, kankar, gravel and pebbles. The alluvium deposits are generally lenticular in shape. In Mohindergarh and part of Bhiwani districts the following geological succession is met. Recent to sub Recent- Alluvium and windblown sands etc, Post Delhi intrusive- Pegmatite, quartz veins, granites etc. Algonquian Delhi system-Ajabgarh Series Kushalgarh Limestone, Alwar Series. The alluvium in the area belonging to the Older Alluvium comprises of sand, silt, clay loam and kankar. Newer alluvium is mainly confined to the sides of the river natural water courses. The alluvium is the fresh water deposit of the Indo-Gangetic river system. The sub-aerial deposits are represented by the talus material on the hill slopes and windblown sands. Rohtak district is underlain by alluvium deposits of Quaternary age. The alluvium overlies the rocks of Algonquians system outcrops of which are seen outside the district. The alluvium consists of clay, silt and various grades of sand. Windblown sand occurring as sand dunes is often seen overlaying the alluvium in various parts of the district.

The unconsolidated alluvial sediments cover around 98% of the state while hard rock's cover just around 2% area of the state. Alluvial deposits are of older and newer types and consist chiefly of clay, silt and fine to medium sand. Other deposits are piedmont deposits, which are confined to a narrow zone, about 2 to 4 kms wide, between Siwalik Hills and alluvial plains. Sand-dunes are found in the districts of Bhiwani, Mohindergarh, Hissar and

Sirsa Coarse sand, gravels and boulders are found to occur in piedmont areas and in the adjacent alluvial tracts. These deposits have developed in the north part of Ambala district. The thickness of alluvial sediments is more than 600 m. and along Yamunanagar-Karnal stretch it is reported to be more than 3000 m. However, the thickness of sediments progressively decreases towards Delhi and hard rock areas of Bhiwani, Gurgaon, Faridabad and Mohindergarh districts.

### **3.0 GROUND WATER REGIME MONITORING**

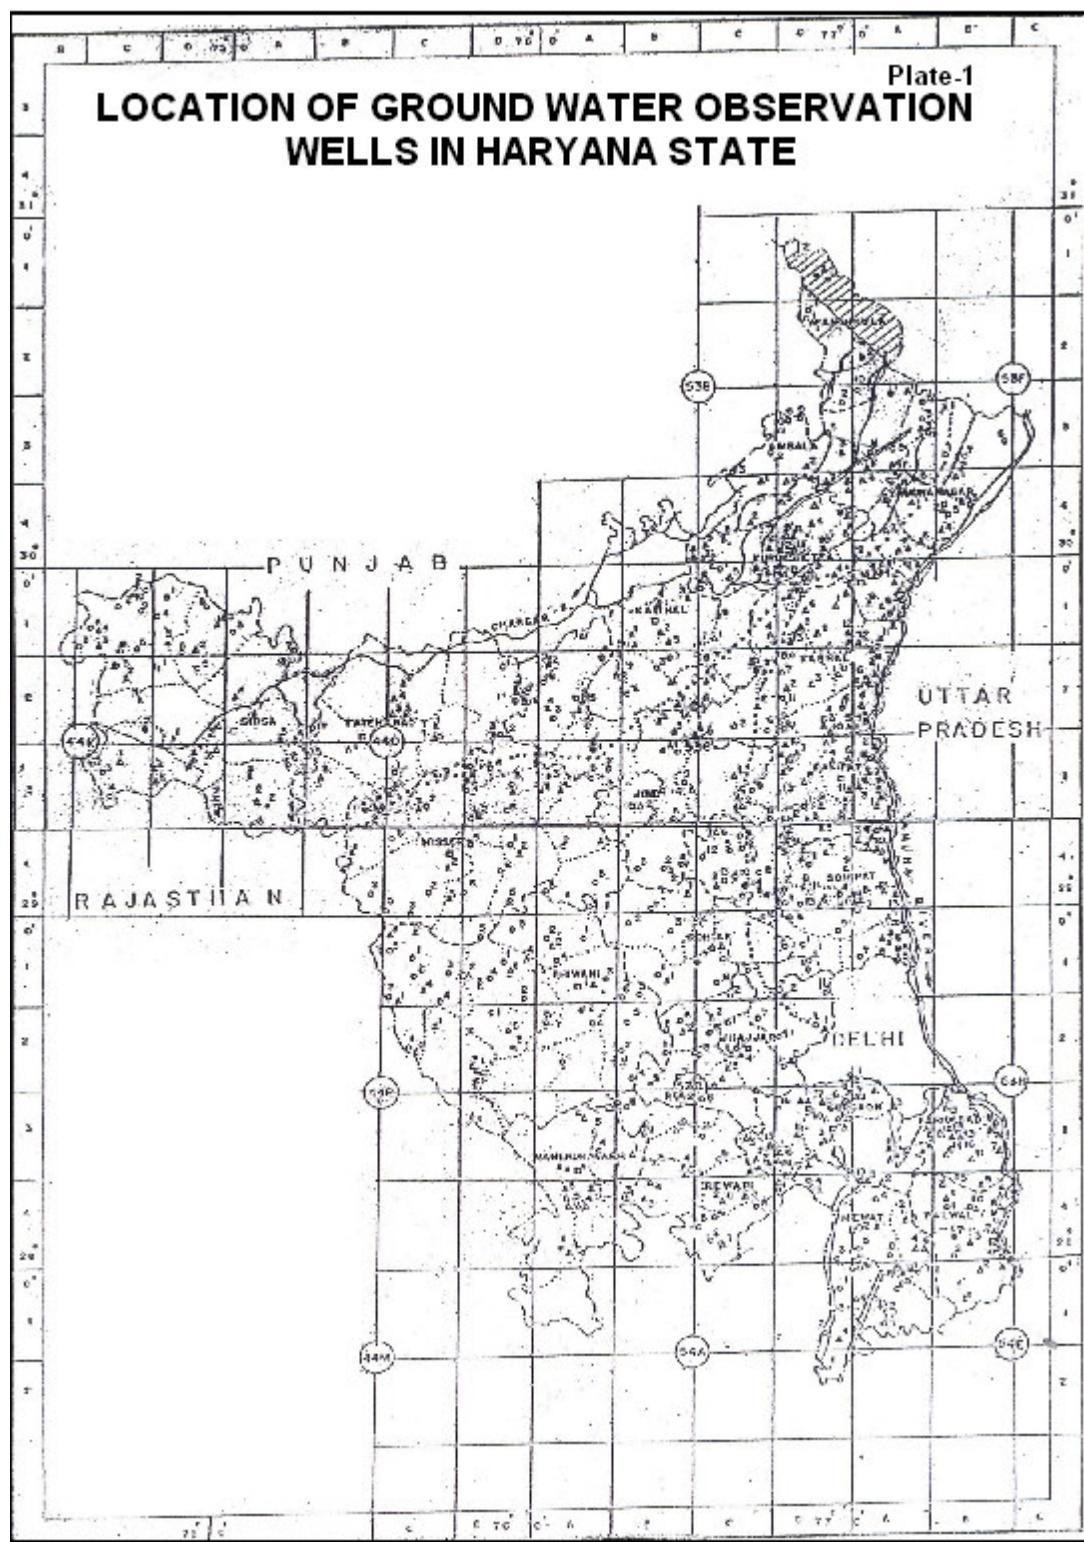

Central Ground Water Board, North Western Region, Chandigarh has established Ground Water Observation Wells (G WOW) in Haryana State for monitoring the water levels. As on 31.03.2014, there were 964 Ground Water Observation Wells which included 481 dug wells and 488 piezometers for monitoring phreatic and deeper aquifers. However, with establishment of new ground water observation wells including dug wells and piezometers, and reconciliation of ground water observation wells, total number of ground water observation wells as on 31.03.2016, has reached 1176 ground water observation wells which include 517 dug wells and 659 piezometers for monitoring phreatic aquifers including 45 deep piezometers for monitoring confined/ semi- confined aquifers.

The Ground Water Observation Wells are shown in Plate-1 and district wise split is given in Table 1. The density of the observation wells being monitored in the state of Haryana is given in Table 2 and depicted in Plate 2.

### **3.0 BEHAVIOUR OF GROUND WATER LEVEL**

In order to assess the quantitative change in ground water resources, water levels as a routine were monitored four times May 2015, August 2015, November 2015 and January 2016 and compared with previous water level records to ascertain the change in ground water level scenario.

#### **3.1 DEPTH TO WATER LEVEL**

The behaviour of water level in all four seasons May 2015, August 2015, November 2015 and January 2016 along with maps is discussed in following paragraphs and data is presented in annexure I. The maximum and minimum water levels recorded in four seasons is given below Table 3.

Table 3 Range of depth to water levels during the period

Range	May 2014	August 2014	November 2014	January 2015
Minimum	0. 28m bgl Gulaltha (Mewat district)	0.48 m bgl Rukhi (Sonipat district)	0.15 m bgl Bhal Anadhpur (Rohtak district)	0.45m bgl Kulasi (Jhajjar district)
Maximum	71.78 m bgl Khodma (Mahendragarh)	68.6 m bgl Mangala (Sirsa)	92.60m bgl Khodma (Mahendragarh)	99 m bgl Kultajpur-DW (Mahendragarh)

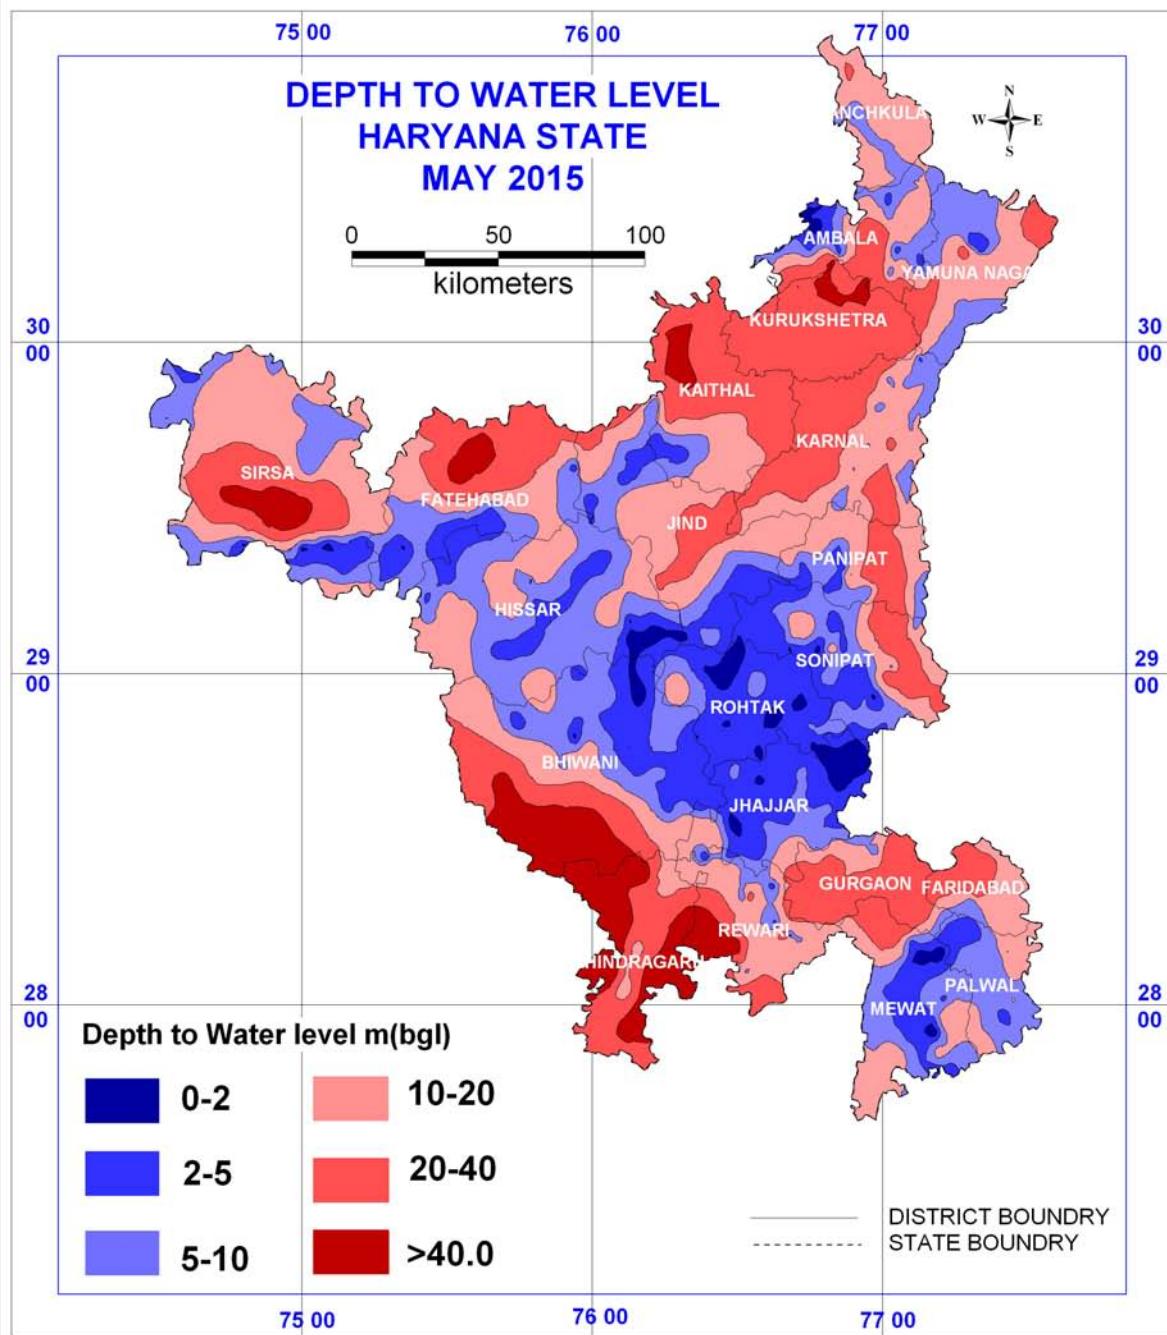

### **3.1.1 MAY 2015**

The behavioral pattern of depth to water level data of May 2015 is discussed below along with depth to water level map (Fig.1) and data are presented in Annexure-1 (Col-4).

The depth to water level during May 2015 varies from 0.28m bgl at Gulaltha in Mewat district to 92.50m bgl at Khodma in Mahendragarh district. Very shallow (0-2m) water levels conditions are observed in central part of the state comprising of major portion of Jhajjar, Sonipat and Rohtak districts. More than 5% wells and 2% area of state fall in this group which indicates water logging conditions. Shallow water levels (2-5m) observed in 17% wells and 15% area mainly in the central part and in few isolated patches in Fatehabad, Palwal, Mewat districts. Moderate water levels (5-10m) occur in 22% wells covering 23% of area of the state. Moderately deep water levels of 10-20m are observed in nearly 26% wells and 30% of the area falling in Karnal, Kurukshetra, Jind, Fatehabad, Sirsa Hissar, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. Deep water levels of 20-40m have been registered in 26% of wells and about 25% area reported from Ambala, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. Very Deep water levels (>40m) also occur in less than 4% of the wells and 6% area falling in Bhiwani and Mahendragarh districts & isolated patches in Kaithal, Kurukshetra, Fatehabad and Sirsa districts.

Summarized details of behaviour of depth to water level						
	Depth to water level(m) ranges

### **3.1.2 AUGUST 2015**

The behavioral pattern of depth to water level data of August 2015 discussed below along with depth to water level map (Fig.2) and data are presented in Annexure-1 (Col-5).

The depth to water level during August 2015 varies from 0.48m bgl at Rukhi in Sonipat district to 68.6m bgl at Mangala in Sirsa district. Very shallow (0-2m) water levels conditions are observed in small pockets in the central part of the state comprising Sonipat and Rohtak districts. More than 14% wells and 2% area of state fall in this group which indicates water logging conditions. Shallow water levels (2-5m) observed in 22% wells and 25% area mainly in the central part and in few isolated patches in Fatehabad, Palwal Mewat districts. Moderate water levels (5-10m) occur in 21% wells covering 22% of area covering south central parts of the state. Moderately deep water levels of 10-20m are observed in nearly 25% wells and 28% of the area falling in Sonipat, Panipat, Karnal, Kurukshetra, Jind, Fatehabad, Sirsa Hissar, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. Deep water levels of 20-40m have been registered in 14% of wells and about 20% area reported from Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Bhiwani, Rewari, Mahendragarh and Gurgaon districts. Very Deep water levels (>40m) also occur in less than 4% of the wells and 4% area falling in Sirsa district.

Summarized details of behaviour of depth to water level

Area covered	2	25	22	28	20	4

**FIG. 2**

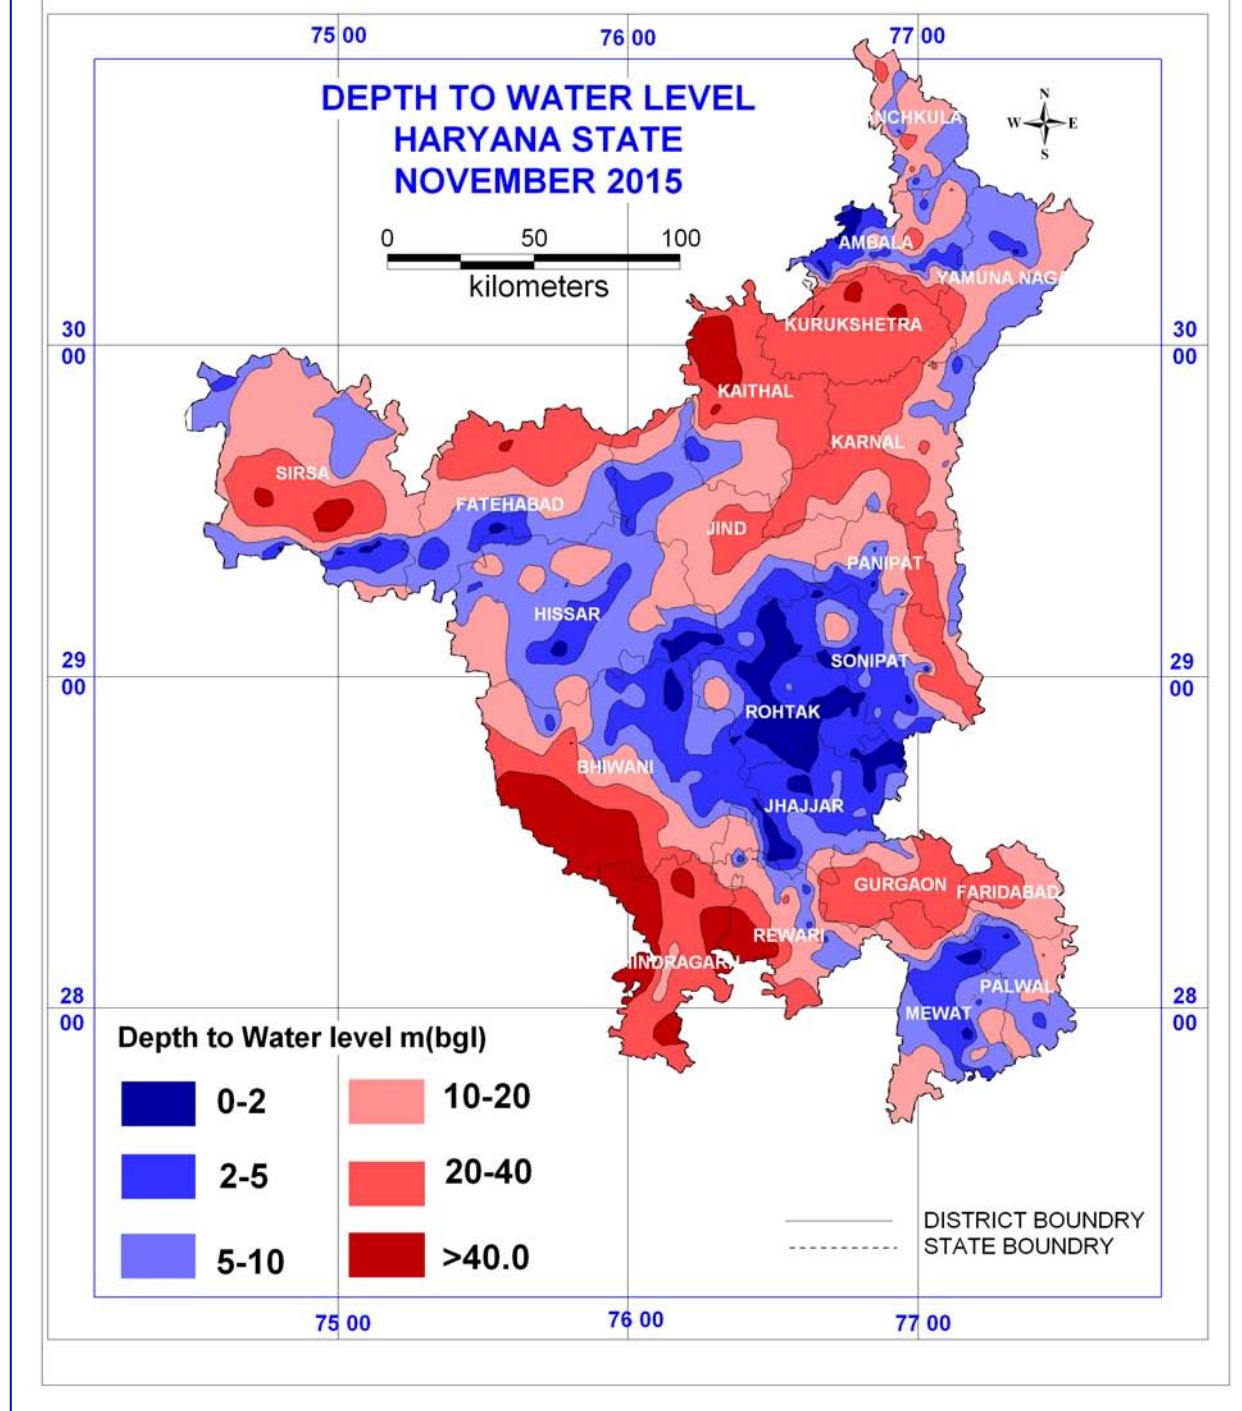

### **3.1.3 NOVEMBER 2015**

The depth to water level during November 2015 varies from 0.15m bgl at Bhal Anandpur in Rohtak district to 92.60m bgl at Khodma in Mahendragarh district. The distribution of water level in various ranges is discussed below along with depth water level map for November 2015 (Fig.3). The water level data are presented in Annexure-1 (Col-6).

Very shallow (0-2m) water levels conditions are observed in small pockets in the central part of the state comprising Sonipat, Rohtak and Mewat districts. 11% wells and 3% area of state fall in this group which indicates water logging conditions. Shallow water levels (2-5m) observed in 19% wells and 15% area mainly in the central part and in few isolated patches in Fatehabad, Palwal Mewat, Jind and Fatehabad districts. Moderate water levels (5-10m) occur in 22% wells covering 23% of area covering parts of Sonipat, Panipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Mewat, Palwal, Ambala and Yamuna Nagar districts of the state. Moderately deep water levels of 10-20m are observed in nearly 24% wells and 29% of the area falling in Panipat, Karnal, Kurukshetra, Yamuna Nagar, Ambala, Panchkula, Kaithal, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad Districts. Deep water levels of 20-40m have been registered in 21% of wells and about 25% area reported from Ambala, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. Very Deep water levels (>40m) also occur in less than 3% of the wells and 6% area falling in Bhiwani and Mahendragarh districts & isolated patches in Kurukshetra, Kaithal, Fatehabad and Sirsa districts.

**FIG. 3**

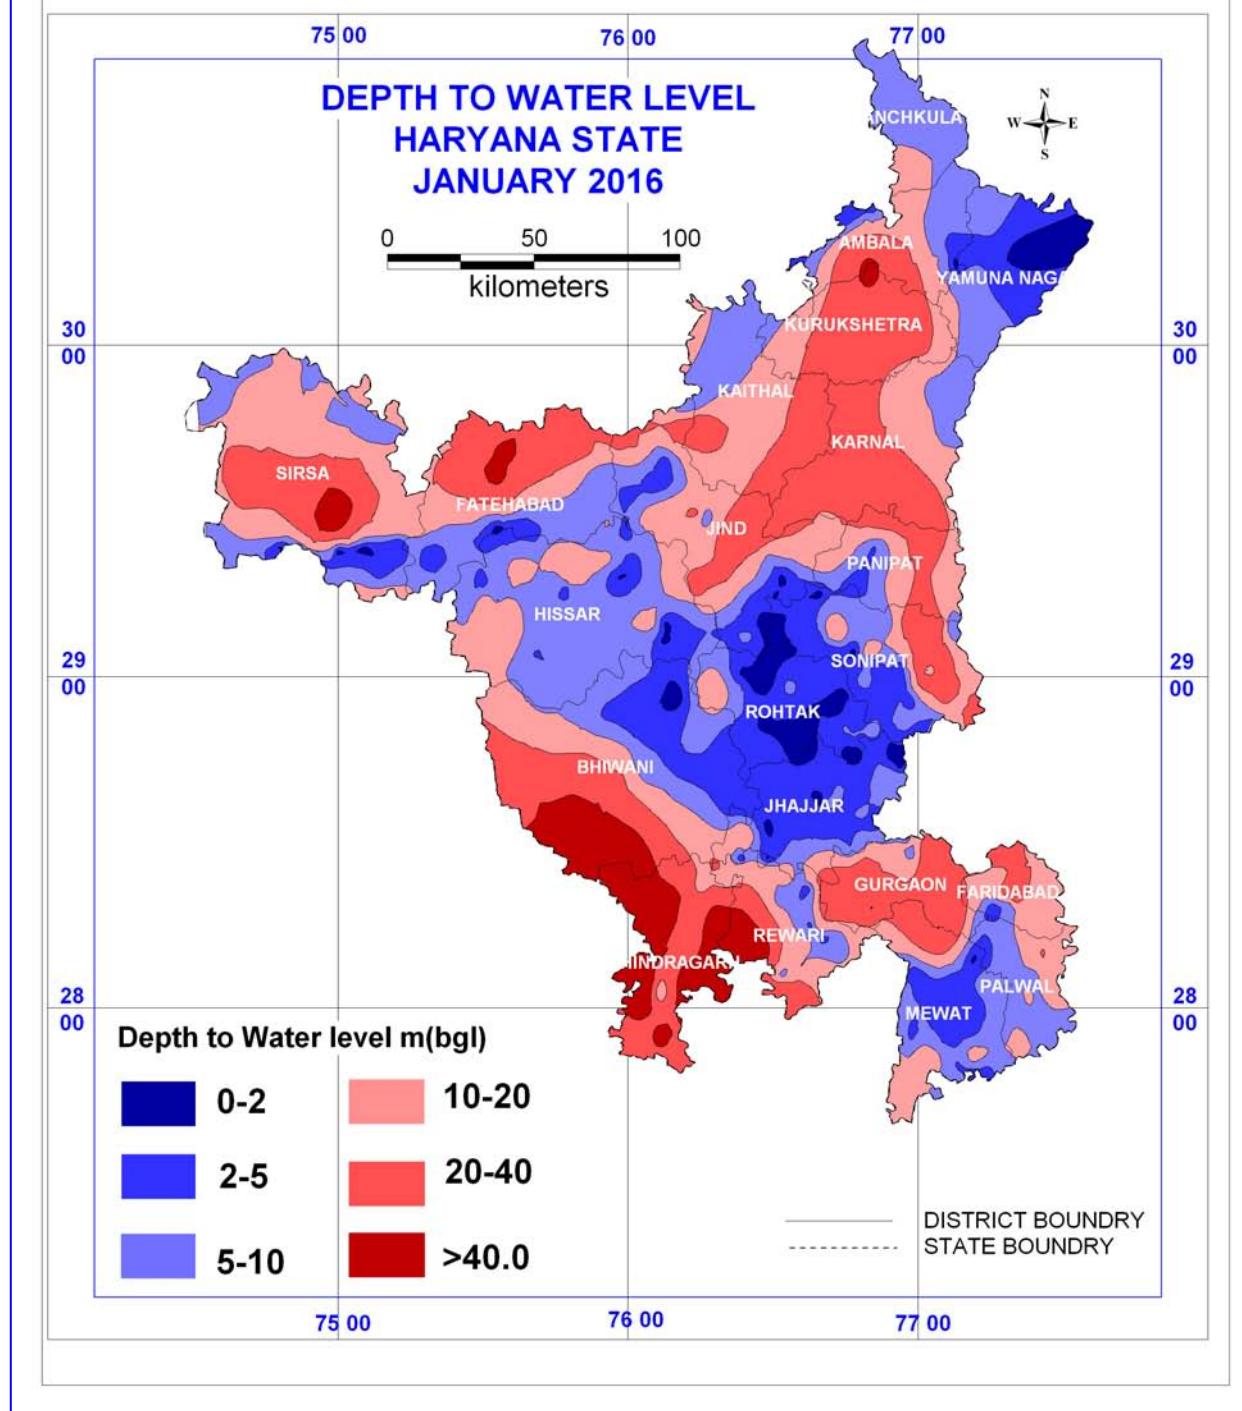

### **3.1.4 JANUARY 2016**

The behavioral pattern of depth to water level data of January 2016 discussed below along with depth to water level map (Fig.4) and data are presented in Annexure-1 (Col-7).

The depth to water level during January 2016 varies from 0.28m bgl at Kulasi in Mewat district to 99m bgl at Kultajpur in Mahendragarh district. Very shallow (0-2m) water levels conditions are observed in 9% wells and 2% area of state fall in this group which indicates water logging conditions. It is observed in central parts, Sonipat and Rohtak and in northeastern parts of Yamuna nagar district of the state. Shallow water levels (2-5m) observed in 21% wells and 12% area mainly in the central haryana covering parts of Sonipat, Rohtak and Jhajjar districts, western haryana in parts of Hisaar and sirsa districts Sirsa and Hissar and in the south, Faridabad, Palwal and Mewat districts. Moderate water levels (5-10m) occur in 24% wells covering 29% of area of the state covering parts of Sonipat, Jind, Jhajjar, Rohtak, Rewari, Bhiwani, Hissar, Fatehabad, Sirsa, Mohindergarh, Mewat and Palwal districts. Moderately deep water levels of 10-20m are observed in nearly 24% wells and 29% of the area falling in Sonipat, Panipat, Karnal, Kurukshetra, Jind, Fatehabad, Sirsa Hissar, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. Deep water levels of 20-40m have been registered in 18% of wells and about 22% area reported from Fatehabad, Sirsa, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Bhiwani, Rewari, Mahendragarh, Gurgaon districts. Very Deep water levels (>40m) also occur in less than 4% of the wells and 6% area falling in Bhiwani and Mahendragarh districts & isolated patches in Kurukshetra, of Fatehabad and Sirsa districts.

Area covered	2	12	29	29	22	6

**FIG. 4**

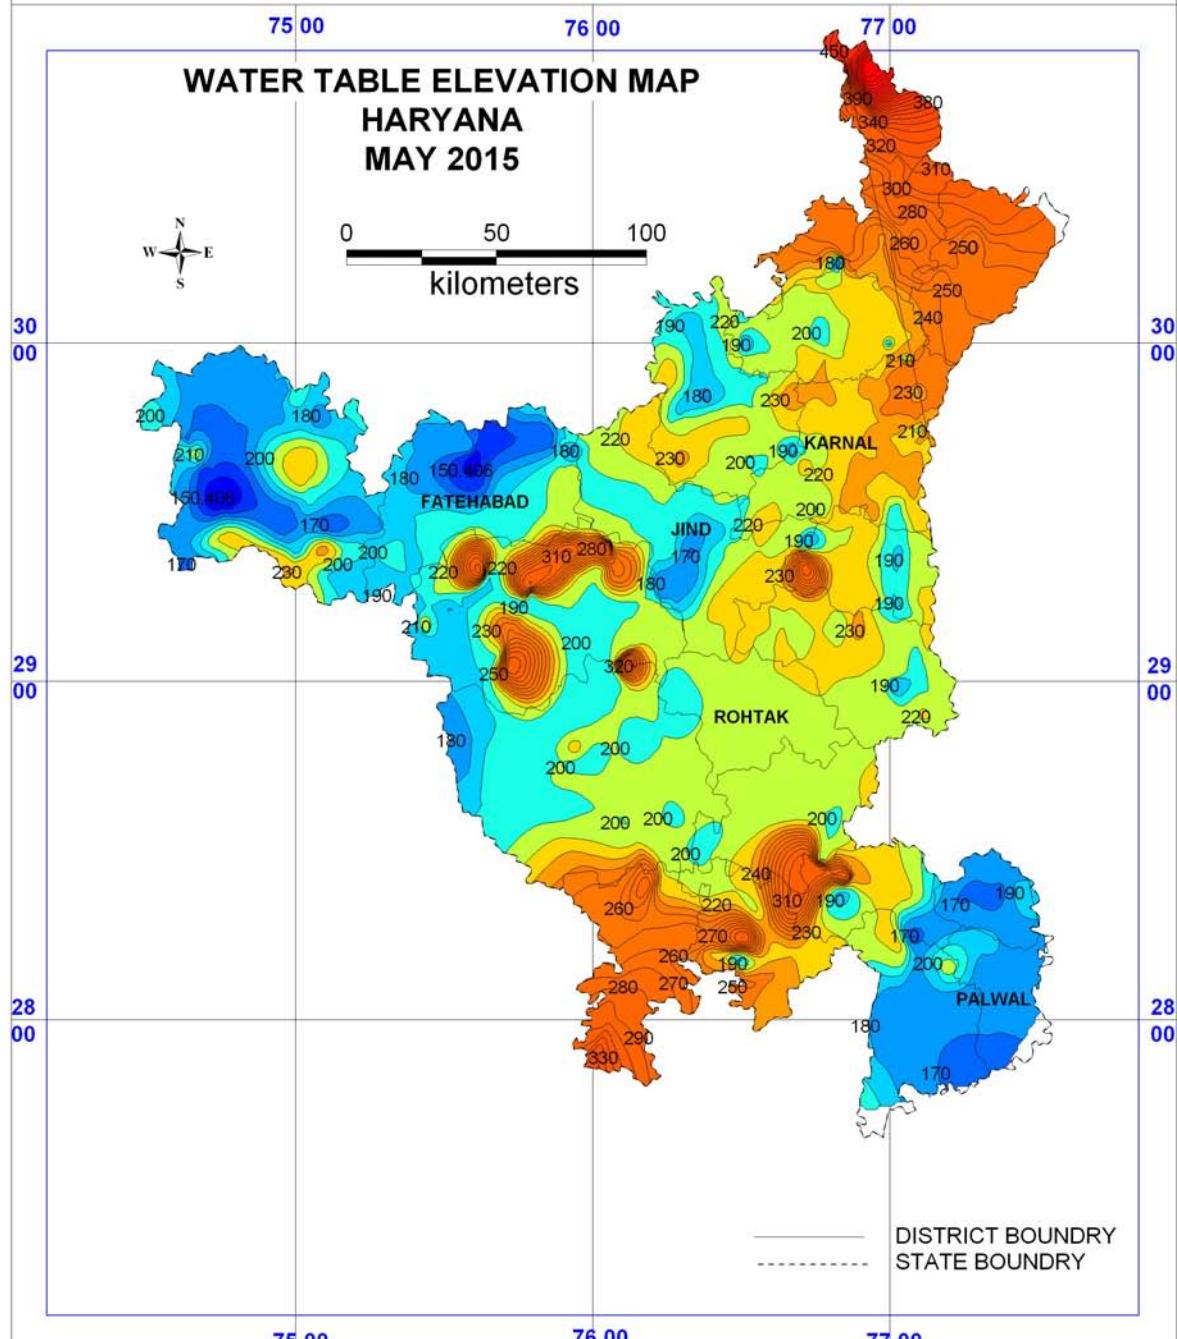

## **3.2 WATER TABLE ELEVATION**

### **3.2.1 MAY 2015**

The water table elevation map helps in determining the hydraulic gradient and ground water flow direction.

The water table elevation contours in the area follows the topography and it varies from 556.98m AMSL in northeastern part in Panchkula district to 150.36m AMSL in southeastern part in Palwal district. The general ground water flow is from Northeast to Southwest direction. However, in the southern part it is towards central part thus creating a closed basin causing water logging conditions in the central Haryana in parts of Rohtak, Bhiwani and Hissar districts. The hydraulic gradient is steep in the northern, eastern and southwestern parts of the State, whereas, it is gentle in the southeastern part. The major part of the state has moderate water table gradients. The sluggish ground water movement (0.07 m/km) observed in central part results in water logging on regional scale as depicted in (Fig.5).

**FIG.5**

### **3.3 SEASONAL FLUCTUATIONS**

The water level data of current month or monitoring period is compared with water level data of monitoring period and seasonal water level fluctuation is determined.

#### **3.3.1 JANUARY 2015 - MAY 2015**

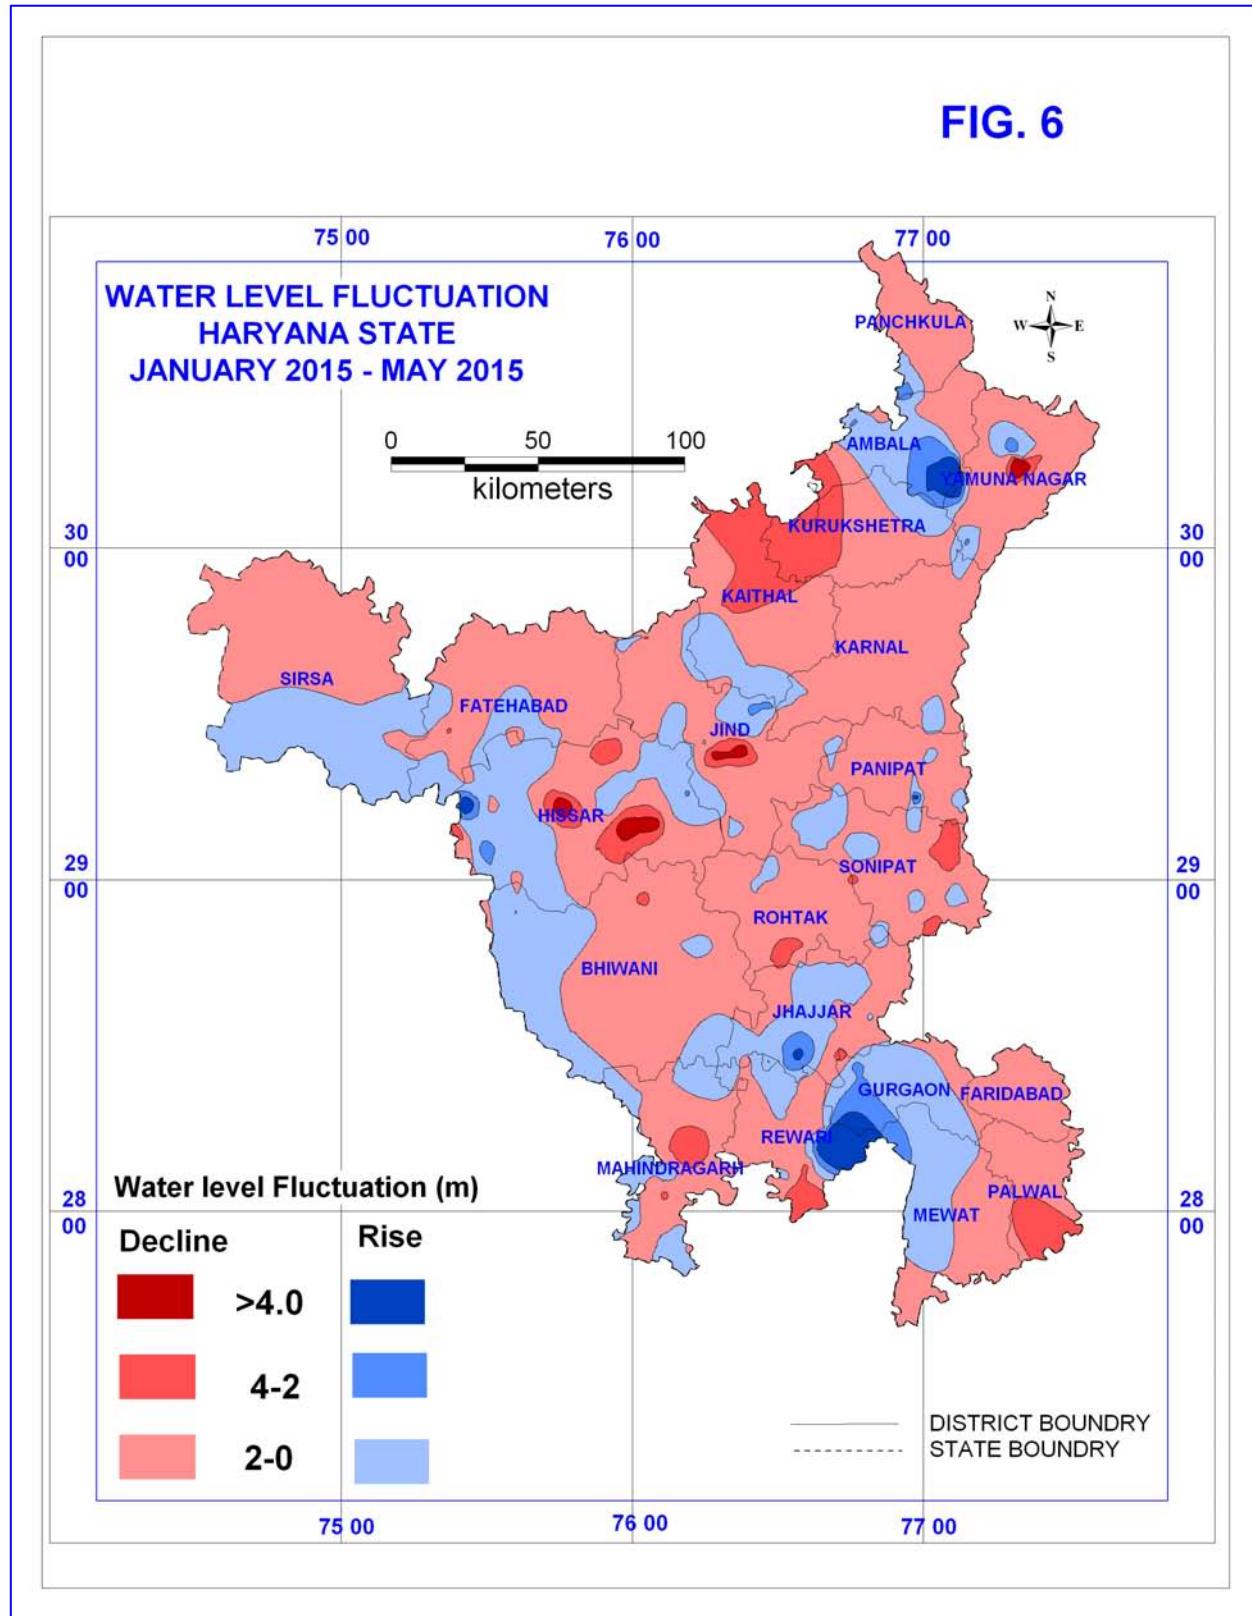

The behavioral pattern of seasonal water level fluctuation is discussed below along with map (Fig. 6) and data are presented in Annexure-2 (Col-4).

The interpretation of seasonal fluctuations indicates a general decline ranging from 0.01-8.88m in 66% of the wells monitored covering an area of 70% of the State. The water level decline in the range of 0-2m has been observed in 59% wells and 63% of the area in all districts. Water level decline in range of 2-4m has been observed in 5% wells and 7% of the area covering parts of Kaithal and Kurukshetra along with isolated patches in Hissar, Mahendragarh, Jind, Palwal and Rewari districts. Water level decline >4m is recorded in 2% wells and 1% of the area in hissar and Jind districts.

The water level Rise ranging from 0.18-2.16m has been observed in 34% of the wells and 30% of the area depict Rise in water levels. The water level Rise of 0-2m has been observed in 28% of wells and 27% of area declining in Sirsa, Hissar, Bhiwani, Fatehabad, Jind, Kaithal, Jhajjar, Rohtak and isolated patches in Sonipat, Panipat Yamuna nagar and Ambala districts. The water level Rise of 2-4m has been observed in 4% of wells and 2% of area of the state. Water level rise >4m is recorded in 2% wells and 1% of the area in Sonipat, Sirsa and Mahendragarh districts.

Summarized details of behaviour of depth to water level								
Water level fluctuation(m)	Decline				Rise

Area covered	63	7	1	70	27	2	1	30

**FIG. 6**

### 3.3.2 MAY 2015 - AUGUST 2015

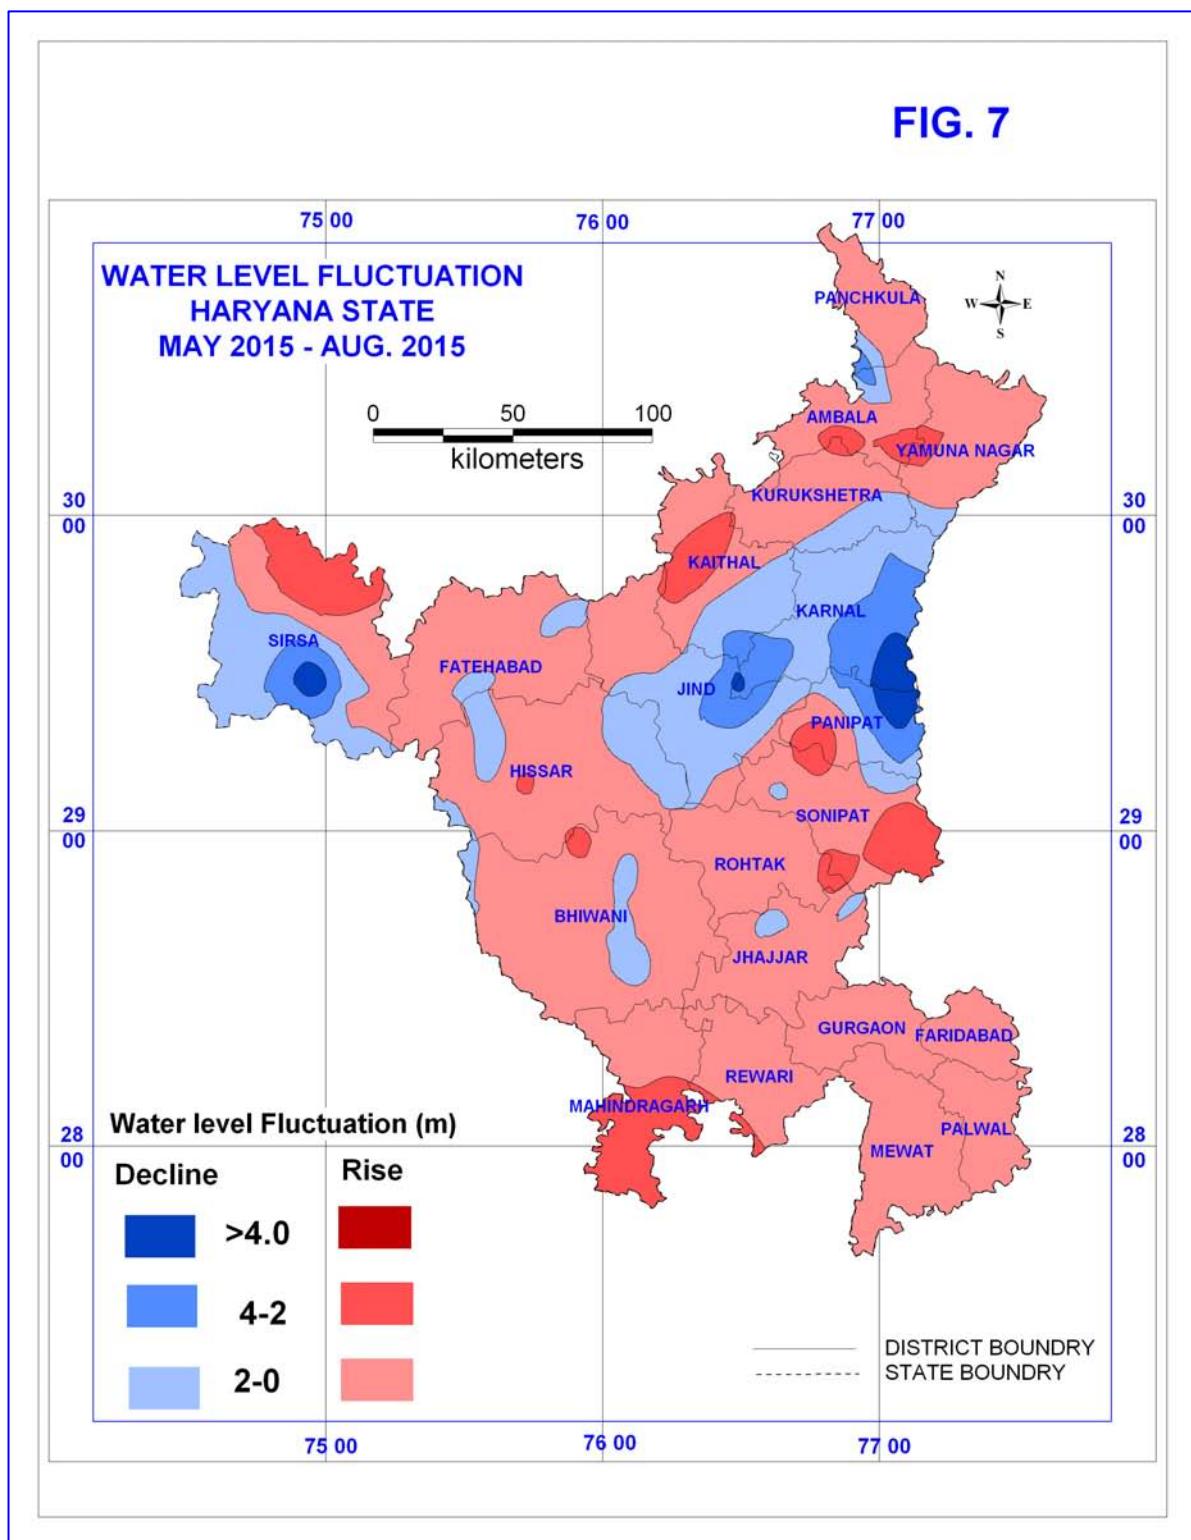

The behavioral pattern of seasonal fluctuations is discussed below along with seasonal water level fluctuation map (Fig. 7).and data are presented in Annexure-2 (Col-5).

The interpretation of seasonal fluctuations indicates a general decline ranging from 0.01-5.39m in 37% of the wells monitored covering an area of 24% of the State. The water level decline in the range of 0-2m has been observed in 31% wells and 17% of the area in all districts. Water level decline in range of 2-4m has been observed in 5% wells and 6% of the area covering parts of Sirsa, Panipat, Yamunanagar, Kurukshetra, Kaithal, Jind and Ambala districts. Water level decline >4m is recorded in 1% wells and 1% of the area in Karnal, Kurukshetra and Kaithal districts.

The water level Rise ranging from 0.58-3.35m has been observed in 63% of the wells and 76% of the area of the state. The water level Rise of 0-2m has been observed in 47% of wells and 68% of area rising in Panchkula, Ambala, Yamunanagar, Mewat, Gurgaon, Mahendragarh, Bhiwani, Sirsa, Fatehabad, Jind, Jhajjar, Rohtak and Sonipat districts. The water level Rise of 2-4m has been observed in 16% of wells and 8% of area rising in Panchkula and Ambala districts. The water level Rise of >4m has not been observed in the state during the period.

Summarized details of behaviour of depth to water level								
Water level fluctuation(m) %age	Decline				Rise			
	2-0	4-2	>4	subtotal	2-0	4-2	>4	subtotal

Area covered	17	6	1	24	68	8	0	76

**FIG. 7**

### **3.3.3 MAY 2015 - NOVEMBER 2015**

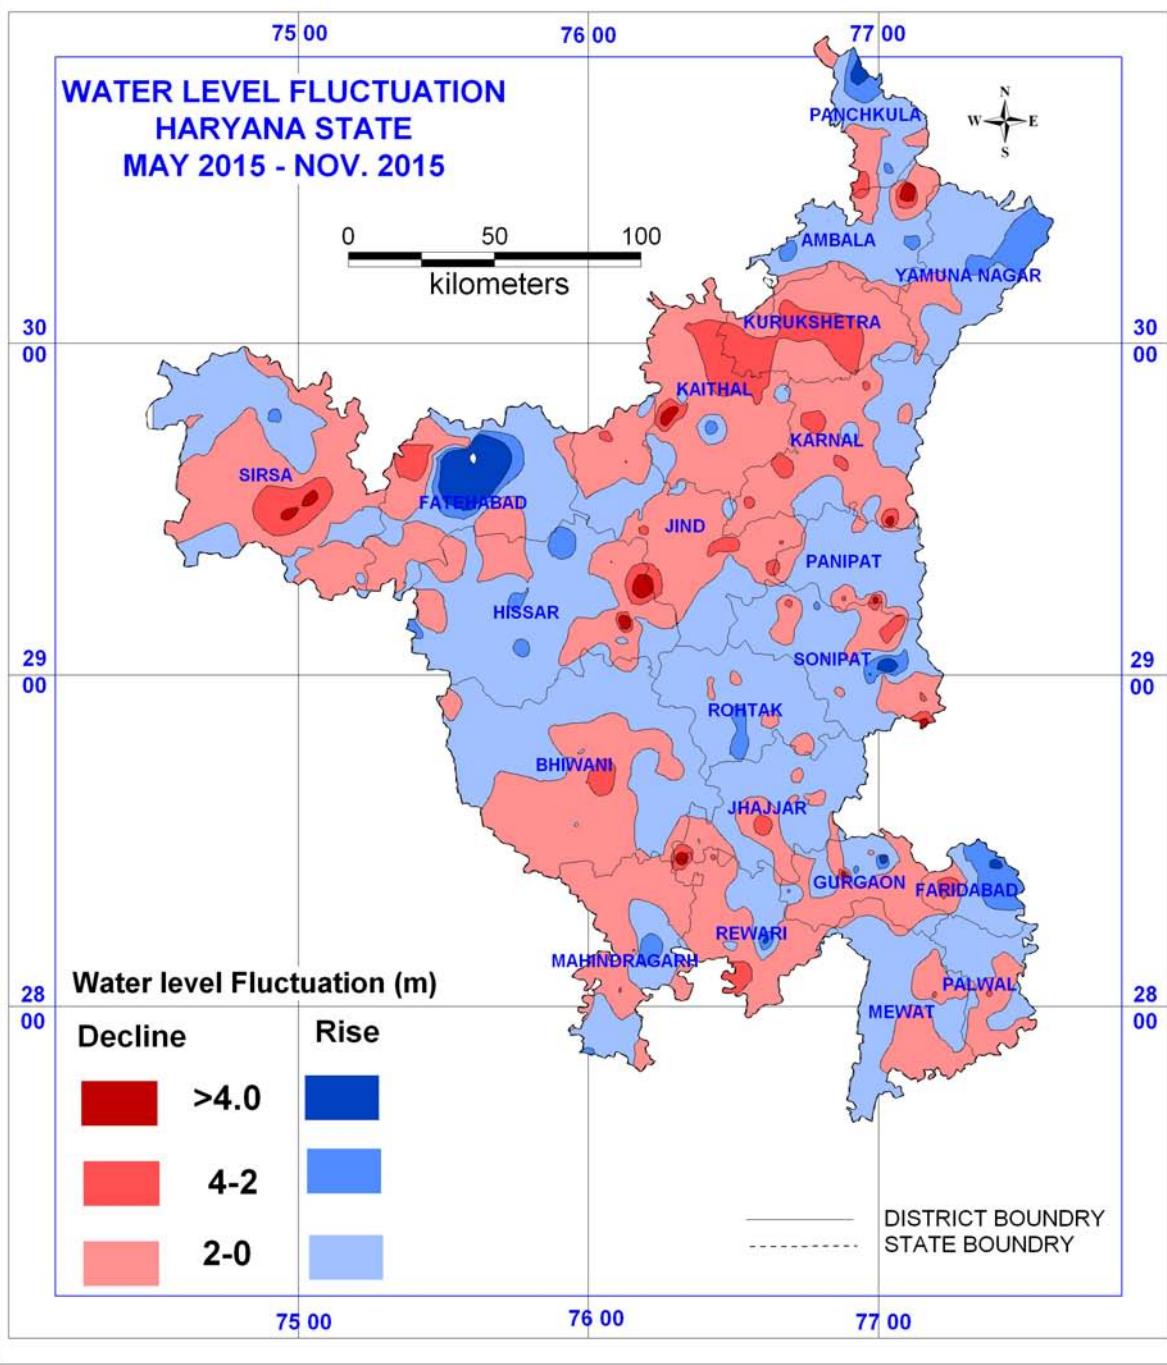

The behavioral pattern of seasonal fluctuations is discussed below along with seasonal water level fluctuation map (Fig. 8).and data are presented in Annexure-2 (Col-6).

The interpretation of seasonal fluctuations indicates a general decline ranging from 0.01-12.23m in 46% of the wells monitored covering an area of 49% of the State. The water level decline in the range of 0-2m has been observed in 37% wells and 43% of the area in all districts. Water level decline in range of 2-4m has been observed in 7% wells and 5% of the area covering parts of Sirsa, Jind, Kaithal, Karnal, Kurukshetra, Panipat, Sonipat Mahendragarh and Faridabad districts. Water level decline more than 4m is recorded in 2% wells and 1% of the area in isolated patches.

The water level Rise ranging from 0.01-0.82m has been observed in 53% of the wells and 51% of the area depict Rise in water levels. The water level Rise of 0-2m has been observed in 48% of wells and 47% of area rising Panchkula, Ambala, Yamuna Nagar, Kaithal, Jind, Fatehabad, Sirsa, Hissar, Jhajjar, Rohtak, Sonipat and Bhiwani districts. The water level Rise of 2-4m has been observed in 4% of wells and 3% of area. Water level decline more than 4m is recorded in 1% wells and 1% of the area in isolated patches.

Summarized details of behaviour of depth to water level

**FIG. 8**

### **3.3.4 MAY 2015 – JANUARY 2016**

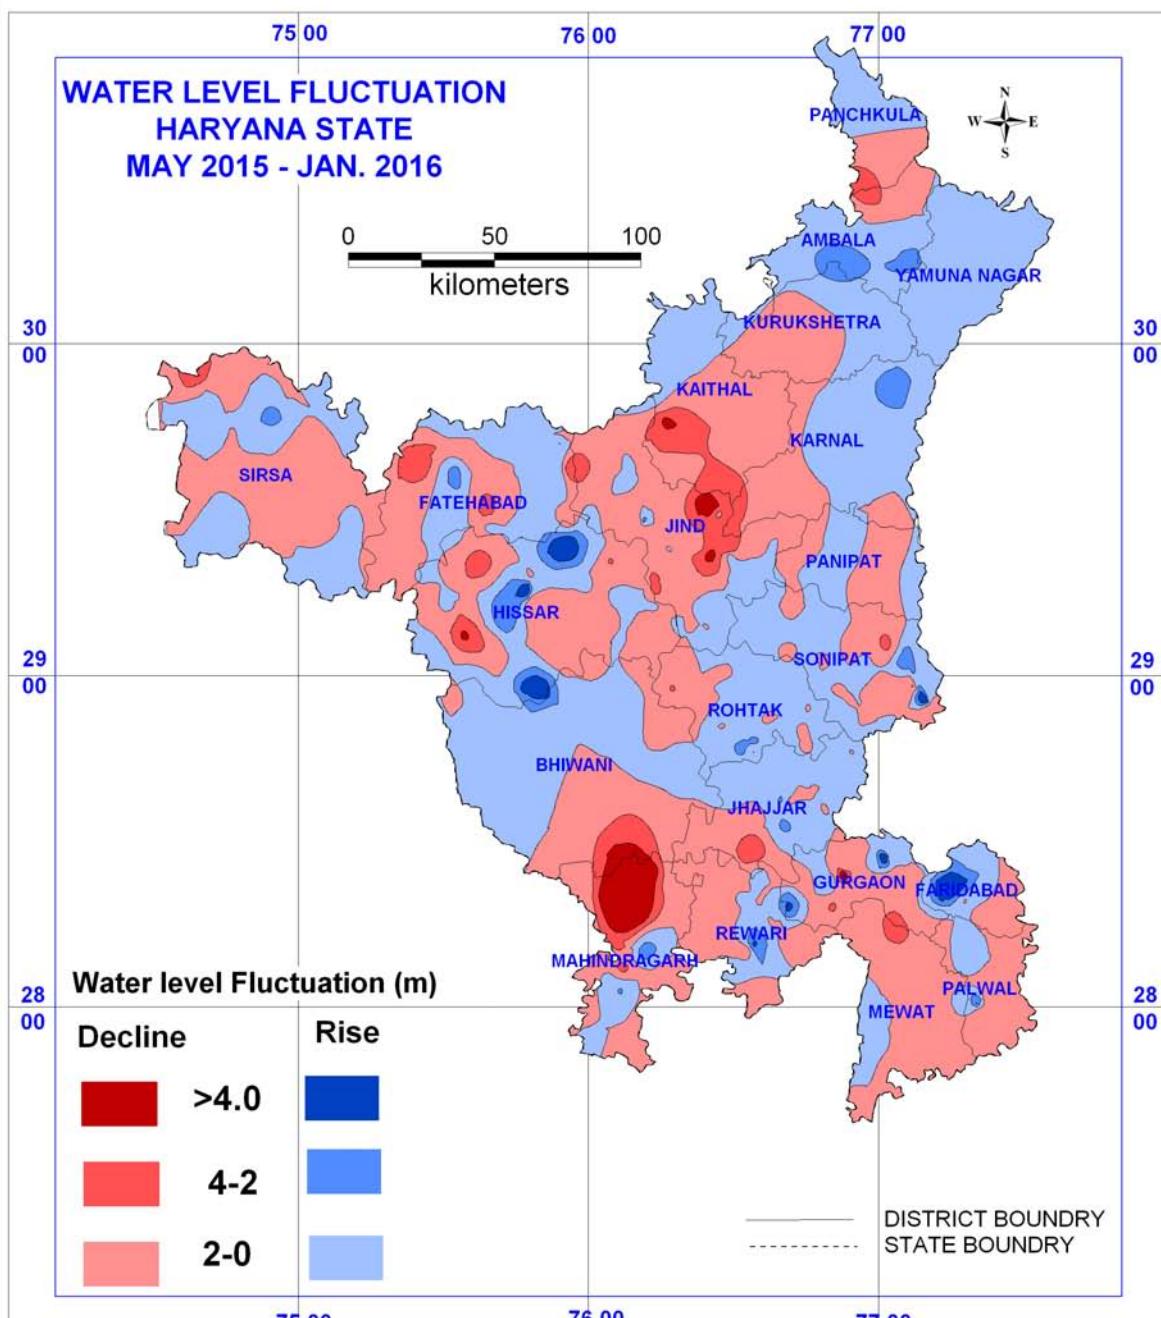

The behavioral pattern of seasonal fluctuations is discussed below along with seasonal water level fluctuation map (Fig. 9).and data are presented in Annexure-2 (Col-7).

The interpretation of seasonal fluctuations indicates a general decline ranging from 0.05-5.45m in 56% of the wells monitored covering an area of 48% of the State. The water level decline in the range of 0-2m has been observed in 47% wells and 40% of the area in all districts. Water level decline in range of 2-4m has been observed in 7% wells and 6% of the area covering parts of Sirsa, Kurukshetra, Karnal, Panipat and Sonipat districts. Water level decline more than 4m is recorded in 2% wells and 2% of the area in isolated patches.

The water level Rise ranging from 0.6-4.3m has been observed in 44% of the wells and 52% of the area depict rise in water levels. The water level Rise of 0-2m has been observed in 38% of wells and 46% of area rising in Sirsa, Hissar, Fatehabad, Jind, Kaithal, Kurukshetra Karnal Jhajjar, Rohtak, Sonipat and Bhiwani districts. The water level Rise of 2-4m has been observed in 4% of wells and 5% of area. Water level rise more than 4m is recorded in 2% wells and 1% of the area in isolated patches.

Summarized details of seasonal water level fluctuation

**FIG. 9**

### **3.4 ANNUAL WATER LEVEL FLUCTUATIONS**

The water level data of current season (i.e. May 2015) when compared with water level data of corresponding period of previous year (i.e. May 2014) annual water level fluctuations is determined.

#### **3.4.1 MAY 2014 – MAY 2015**

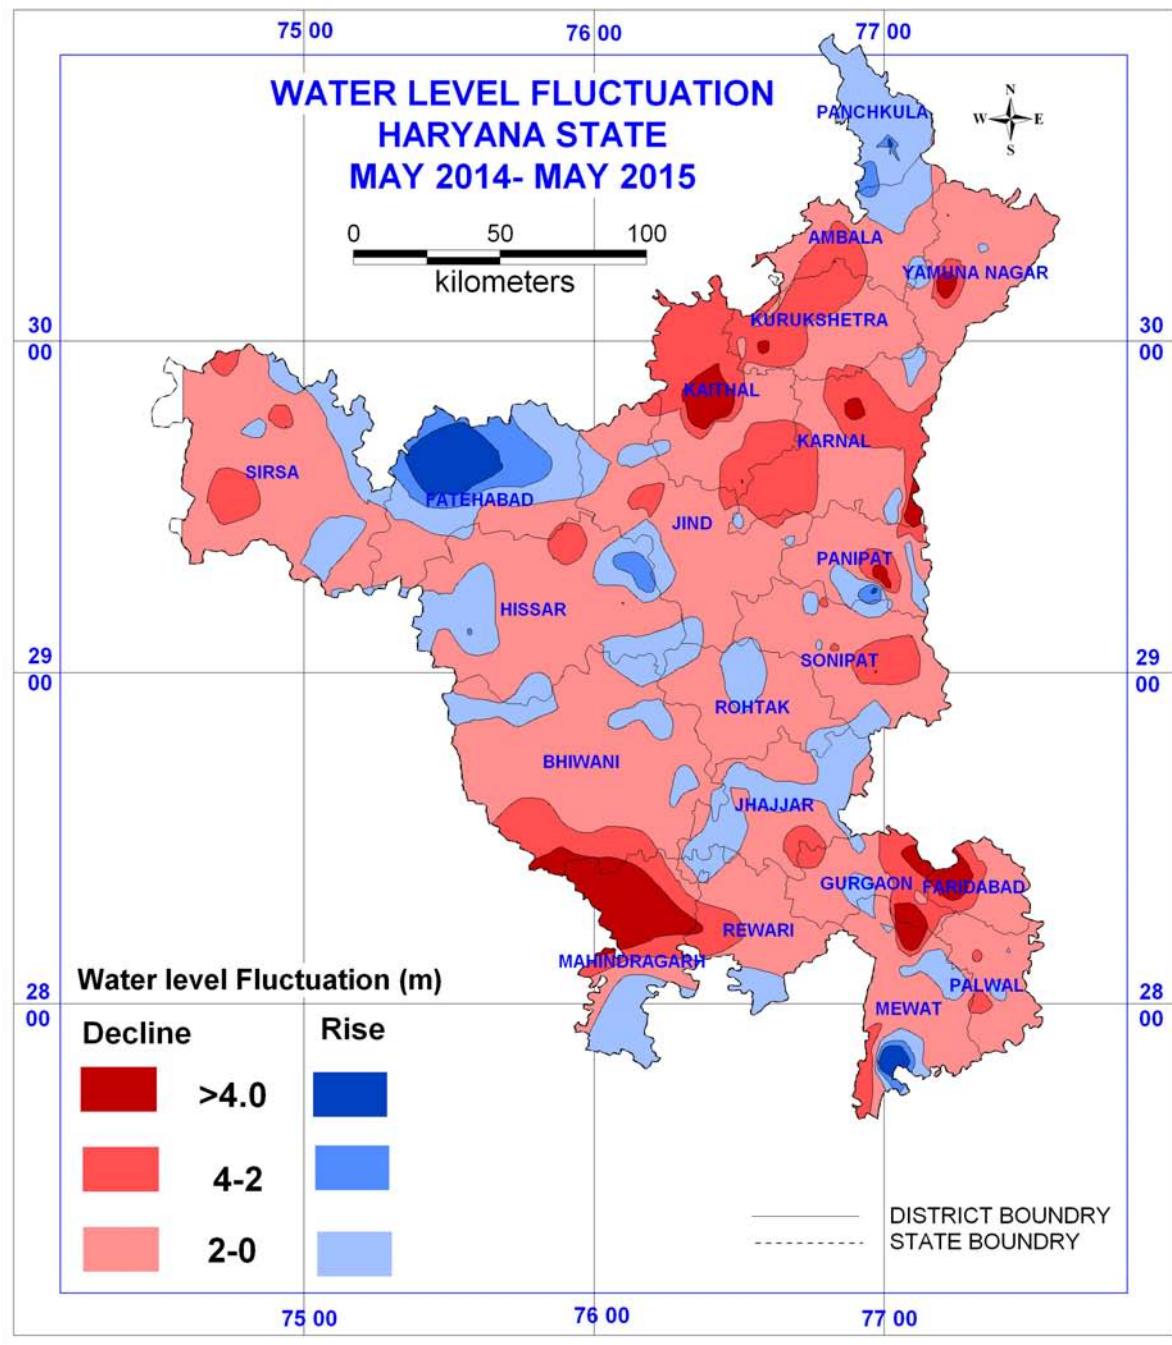

The behavioral pattern of annual fluctuations is discussed along with (Fig. 10) and data are presented in Annexure-3 (Col-4).

The interpretations of annual water level fluctuation depicts water level decline in about 71% of wells monitored and 79% of the area of the state. Water level Decline (0-2m) has been recorded in 54% of wells and 60% of area in isolated patches especially in Panchkula, Ambala, Kurukshetra, Fatehabad, Sirsa, Bhiwani, Mahendragarh, Rewari, Gurgaon, Jind, Karnal, Panipat and Sonipat districts. Water level decline (2-4m) has recorded in 12% of wells and 15% of area in small patches in Kurukshetra, Kaithal and Sirsa districts. Water level decline of more than 4m is observed in 5% of wells and 4% of area.

Water level rise has recorded in 29% of the wells and 21% of the area. Water level Rise (0-2m) has been recorded in 26% of the wells and 18% area covering central parts of the state. Water level Rise of 2-4m has been observed in small patches in 2% of wells and 2% of area of the state in parts of Bhiwani, Gurgaon, Rewari, Jhajjar and Ambala districts. Water level Rise of more than 4m observed in 1% of wells and 1% of area.

Summarized Details of Annual Water Level Fluctuation								
Water level fluctuation(m)	Decline				Rise			
	2-0	4-2	>4	Total	2-0	4-2	>4	Total
%age								
Wells monitored	54	12	5	71	26	2	1	29
Area covered	60	15	4	79	18	2	1	21

**FIG. 10**

### **3.4.2 August 2014 – August 2015**

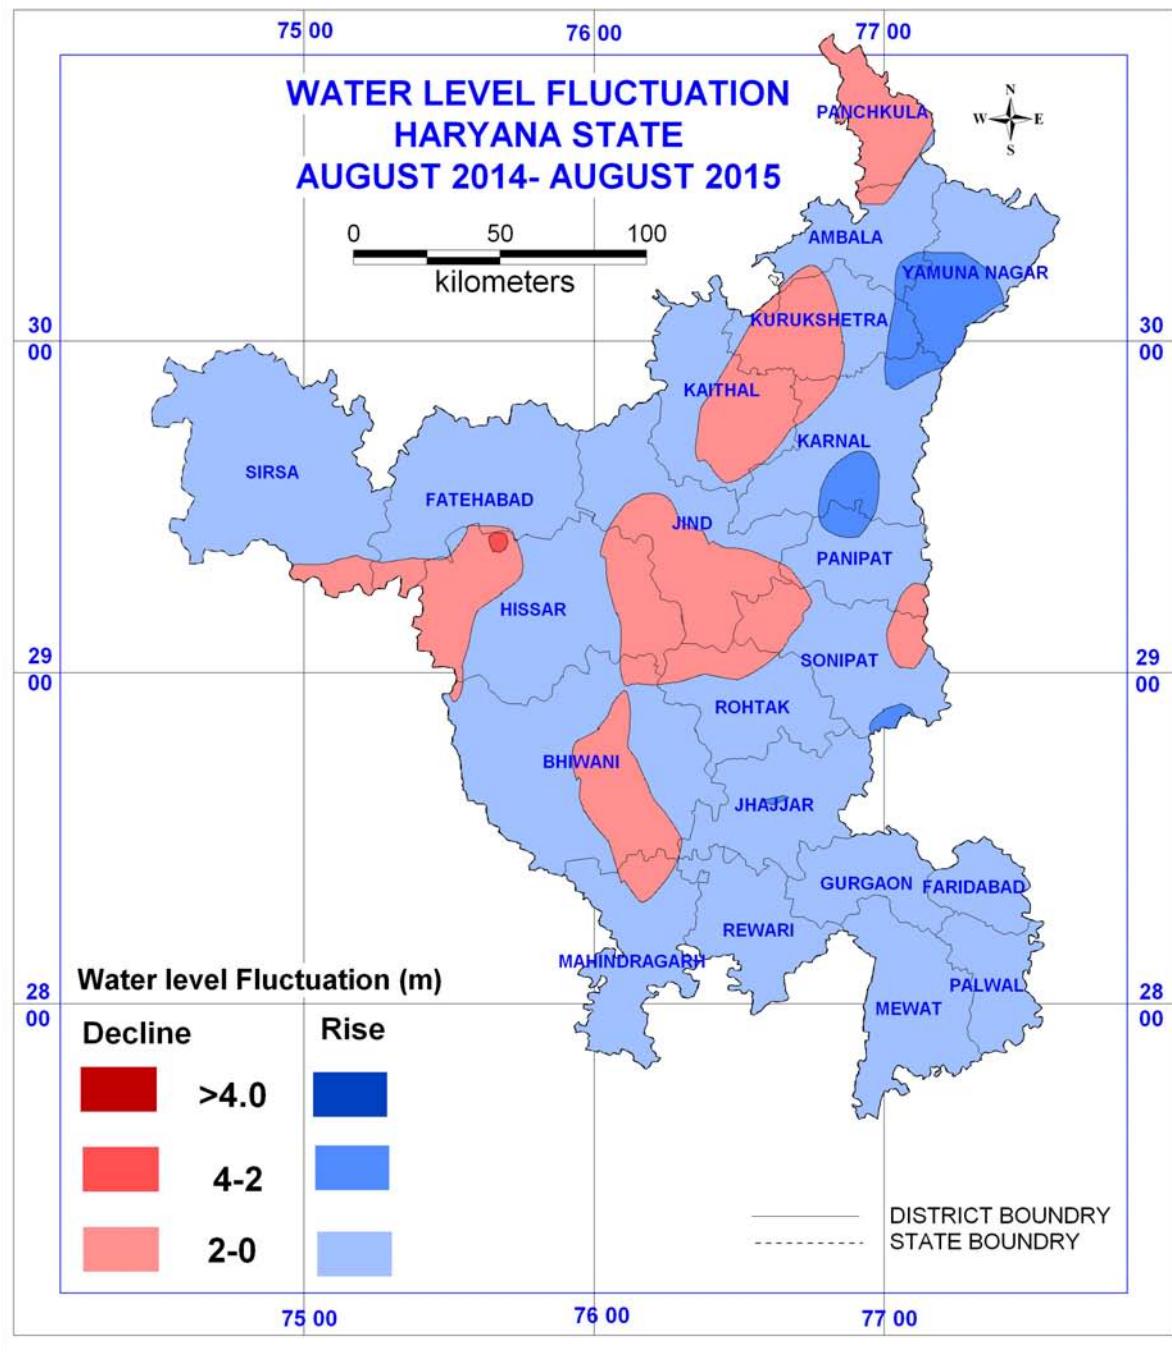

The behavioral pattern of annual fluctuations is discussed along with (Fig.11) below and data are presented in Annexure-3 (Col-5).

The interpretations of annual water level fluctuations depicts water level decline in about 63% of wells monitored and 72% of the area of the state. Water level decline (0-2m) has been recorded in 54% of wells and 68% of area in all districts except Panchkula. Water level Decline (2-4m) has recorded in 9% of wells and 4% of area in small patches in Jind, Karnal, Panipat, Sonipat, Kurukshetra, Kaithal and Sirsa districts. Water level decline of more than 4m was not observed during the period.

The water level rise has been recorded remaining 37% of the wells and 28% of the area. Water level Rise (0-2m) has been recorded in 35% of the wells and 20% area covering central parts of the state. Water level Rise of 2-4m has been observed in small patches in 2% of wells and 8% of area of the state in parts of Bhiwani, Gurgaon, Rewari, Jhajjar and Ambala districts. Water level rise of more than 4m was not observed during the period.

Summarized Details of Annual Water Level Fluctuation

Area covered	68	4	0	72	20	8	0	28

**FIG. 11**

### **3.4.3 NOVEMBER 2014 – NOVEMBER 2015**

The behavioral pattern of annual fluctuations is discussed along with (Fig. 12) below and data are presented in Annexure-3 (Col-6).

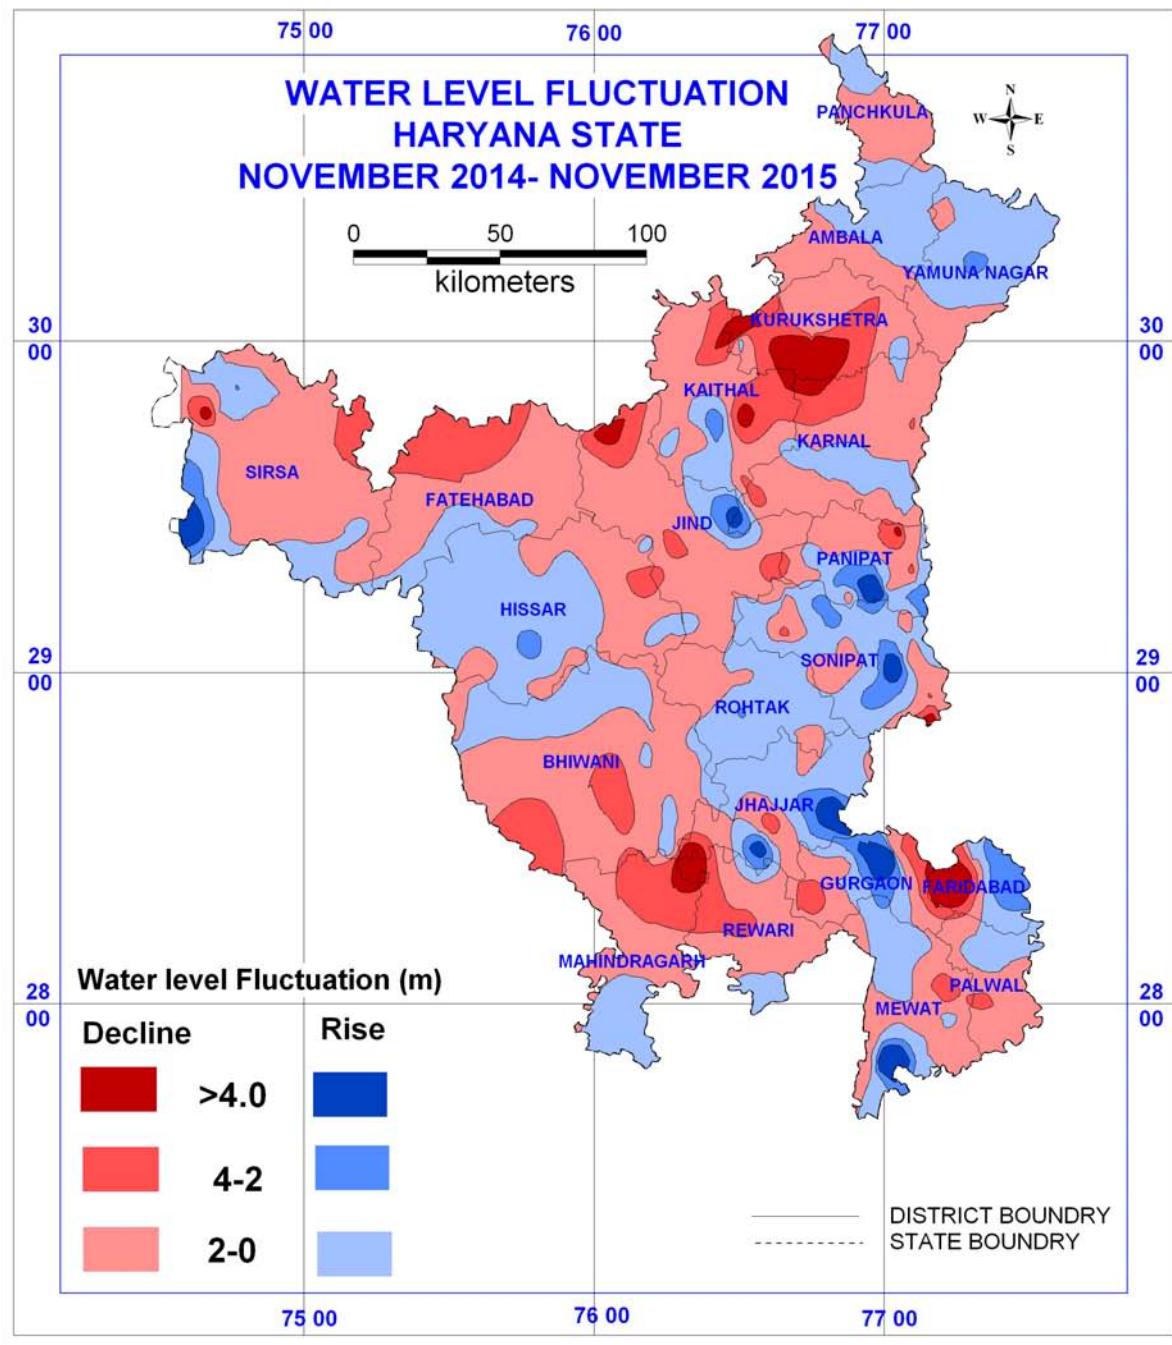

The interpretations of annual water level depicts water level Decline in about 54% of wells monitored and 62% of the area of the state. Water level decline (0-2m) has been recorded in 42% of wells and 50% of area in all districts in the state. Water level Decline (2-4m) has recorded in 8% of wells and 10% of area in Kurukshetra, Sirsa, Bhiwani, Mahendragarh, Rewari, Gurgaon, Jind, Karnal, Panipat and Sonipat districts. Water level Decline of >4m recorded in 4% of wells and 2% of area of the state.

Water level Rise recorded in 46% of the wells and 38% of the area. Water level Rise (0-2m) has been recorded in 38% of the wells and 33% area covering parts Karnal, Kurukshetra, Ambala, Jind, Fatehabad, Sirsa, Hissar and Bhiwani districts. Water level Rise of 2-4m has been observed in small patches in 5% of wells and 3% of area and water level Rise of >4m recorded in 3% of wells and 2% of area of the state.

**Summarized Details of Annual Water Level Fluctuation**

Water level fluctuation(m)	Decline				Rise			
	2-0	4-2	>4	Total	2-0	4-2	>4	Total

Area covered	50	10	2	62	33	3	2	38

**FIG. 12**

### **3.4.4 JANUARY 2015 – JANUARY 2016**

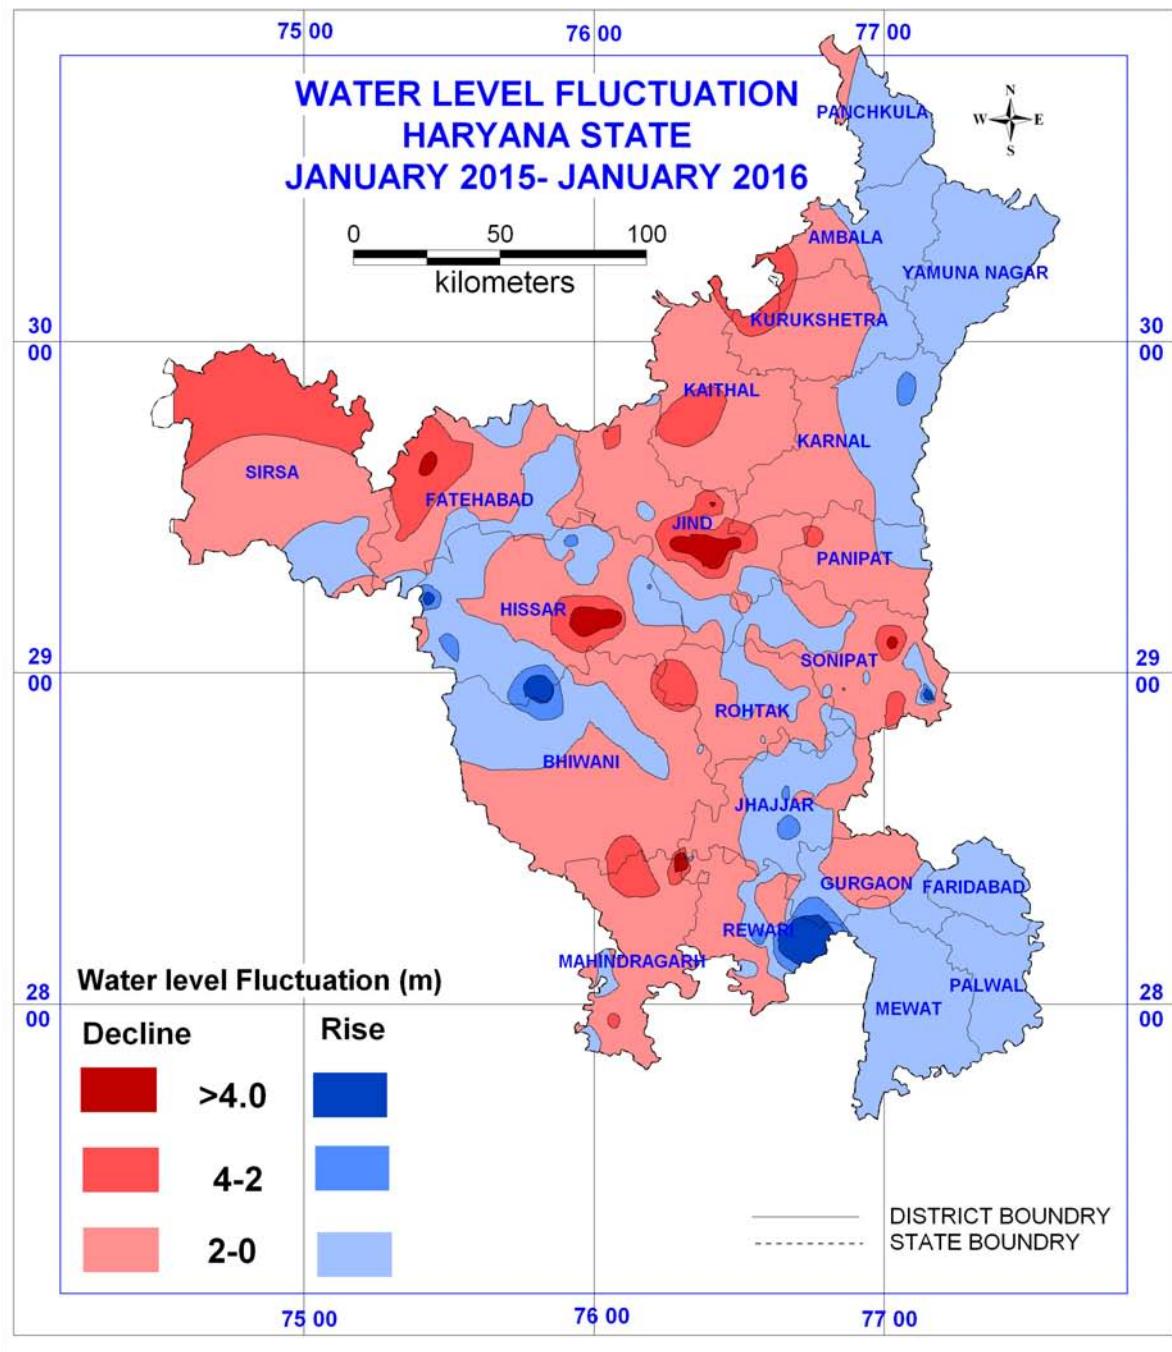

The behavioral pattern of annual fluctuations is discussed along with (Fig. 13) below and data are presented in Annexure-3 (Col-7).

The interpretations of annual water level fluctuations depicts water level decline in about 63% of wells monitored and 60% of the area of the state. Water level decline (0-2m) has been recorded in 52% of wells and 50% of area in Panchkula, Ambala, Yamunanagar, Kurukshetra, Kaithal, Jind, Fatehabad, Hissar, Bhiwani, Mahendragarh, Rewari, Gurgaon, Mewat, Palwal, Faridabad, Karnal, Panipat and Sonipat districts. Water level decline (2-4m) has recorded in 4% of wells and 1% of area in small patches in Kurukshetra, Kaithal and Sirsa districts. Water level decline of more than 4m was observed in 4% of wells and 1% of area of the state.

Water level rise has been recorded in 37% of the wells and 40% of the area of the state. Water level Rise (0-2m) has been recorded in 33% of the wells and 38% area covering parts of Sirsa, Fatehabad, Hissar, Bhiwani, Mahendragarh Jhajjar, Rohtak and Sonipat districts. Water level Rise of 2-4m has been observed in small patches in 2% of wells and 1% of area of the state especially in parts of Bhiwani, Rohtak and Sonipat districts. Water level rise of more than 4m was observed in 2% of wells and 1% of area of the state.

Summarized Details of Annual Water Level Fluctuation

**FIG. 13**

### **3.5 DECADAL MEAN WATER LEVEL FLUCTUATION**

To determine the changes in water level behaviour since last one decade have been observed using decadal mean data. Mean of Water level data of all ground water observation wells for past one decade, (say, May 2005:2014) are computed and compared with the water level data of current month (say May 2015).

#### **3.5.1 MAY (2005:2014) & MAY 2015**

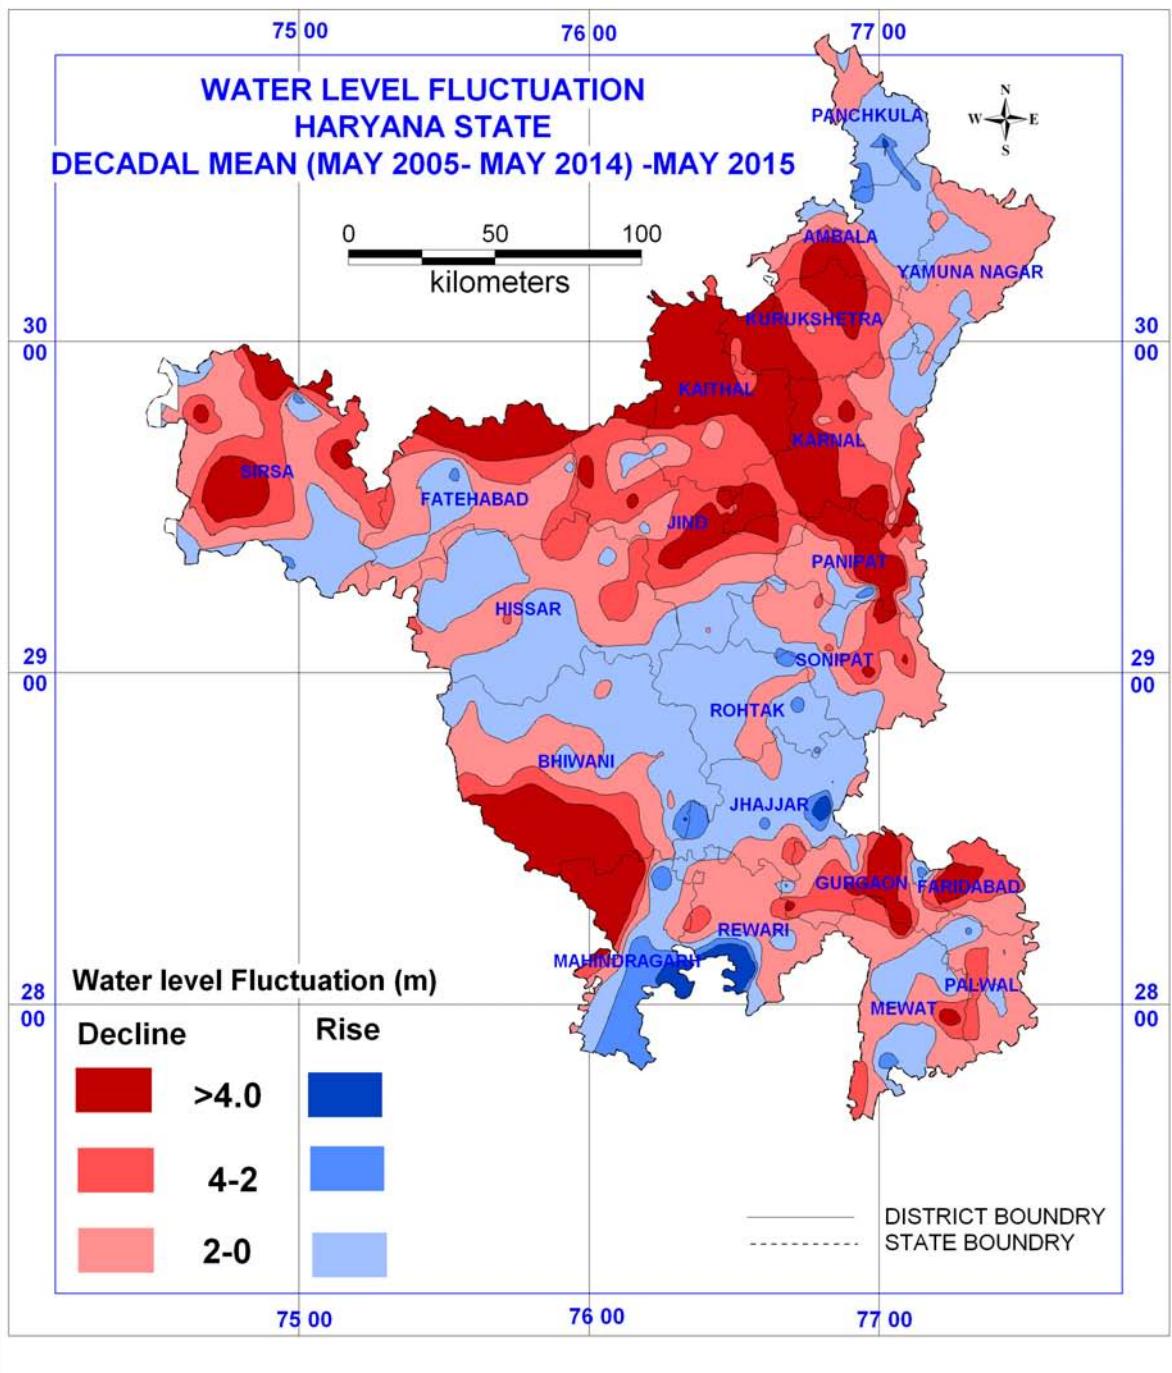

The behaviour of water level over the period under reference is discussed in following paragraph along with map (Fig. 14) and data are given in (Annexure-IV Col-4).

The interpretations of decadal mean fluctuations so arrived at indicate water level decline ranges from 0.01m to 14.48m in 60% of wells which covers about 68% area of the State in parts of Panchkula, Ambala, Kurukshetra, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Mahendragarh, Gurgaon, Faridabad and Palwal districts of the State. Water level decline in the range of 0-2m has been reported from 31% of the wells covering 34% of area of the state, Water level decline between 2-4 m has been reported from 15% of wells covering 18% area of the state in parts of Panipat, Karnal, Kurukshetra, Kaithal, Ambala, Bhiwani, Mahendragarh, Rewari Gurgaon and Faridabad districts. Water level decline of more than 4m has been observed in 14% wells and 16% of the area of state covering parts of Ambala, Karnal, Kurukshetra, Kaithal, Fatehabad, Jind, Sirsa, Bhiwani, Rewari and Faridabad districts.

The water level rise ranges from 0.66m to 2.13m has been observed in 40% of wells and 32% area. Water level rise in the range of 0-2m has been observed in 34% wells covering 29% area of the state, covering Panchkula, Ambala, Yamuna nagar Sonipat, Jind, Rohtak, Fatehabad, Sirsa, Hissar, Bhiwani, Mahendragarh, Rewari, Mewat and Palwal districts. Water level rise between 2-4 m has been observed patches in small patches in 4% wells and 2% area of the state. Water level decline of more than 4m has been observed in 2% wells and 1% of the area of state covering parts of Ambala, Karnal, Kurukshetra, Kaithal, Fatehabad, Jind, Sirsa, Bhiwani, Mahendragarh and Faridabad districts.

Summarized Details Of Decadal Mean Water Level Fluctuation								
Water level fluctuation(m)	Decline				Rise			
	%age	2-0	4-2	>4	Total	2-0	4-2	>4

Area covered	34	18	16	68	29	2	1	32

**FIG. 14**

### 3.5.2 MEAN AUGUST (2005:2014) & AUGUST 2015

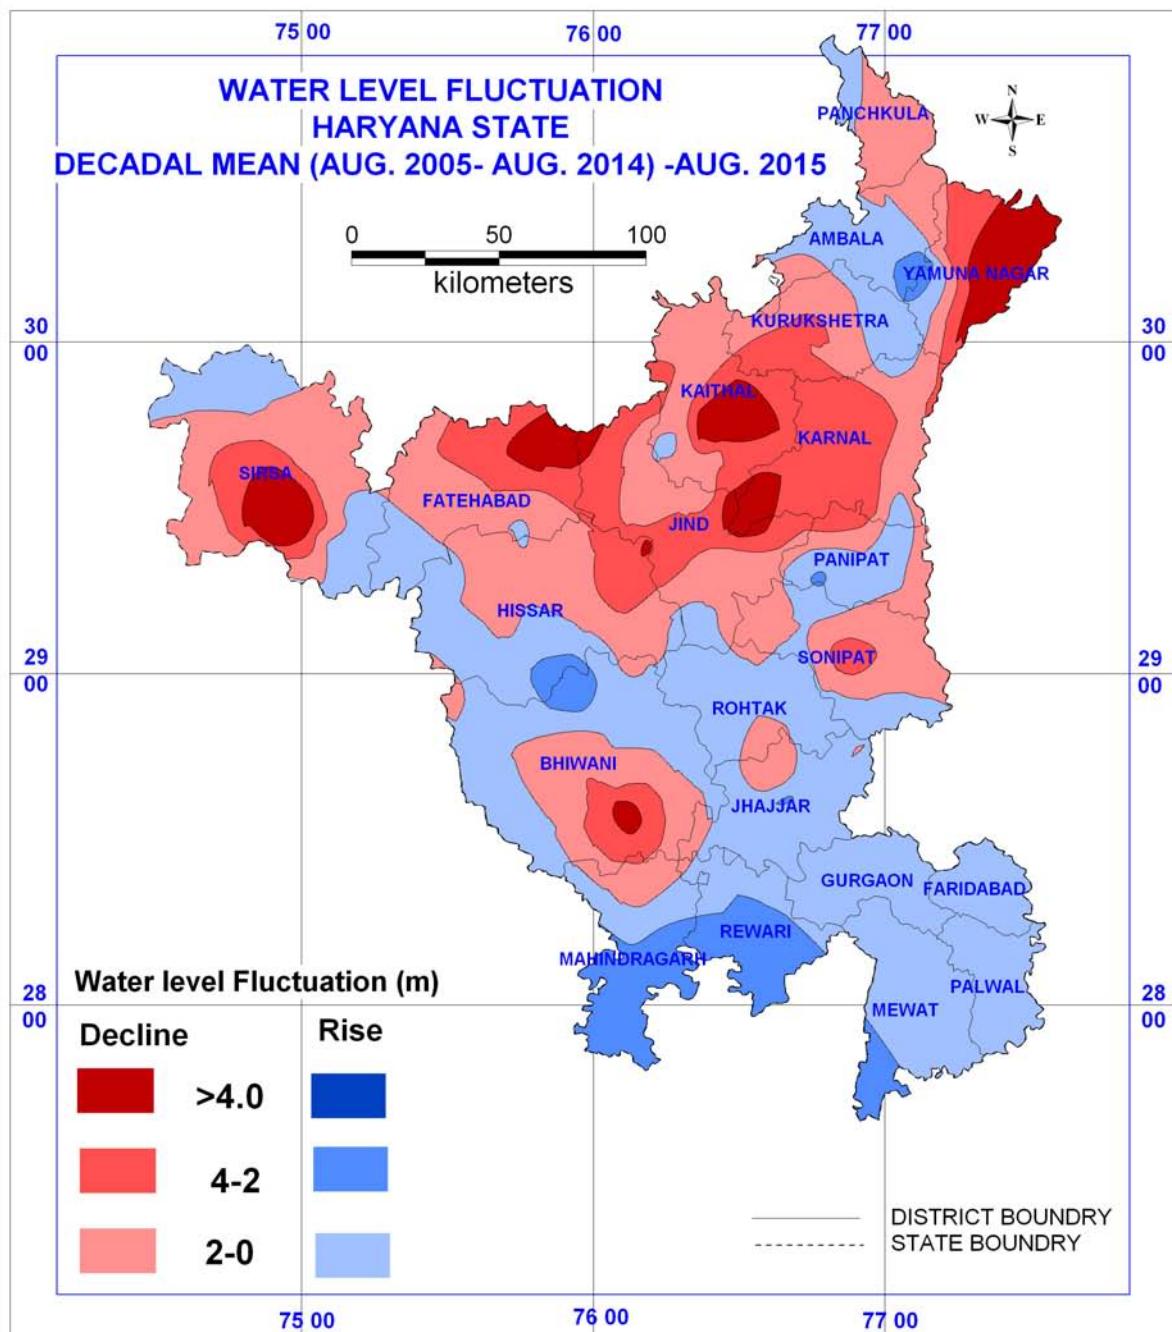

The behaviour of water level over the period under reference is discussed in following paragraph alongwith map (Fig.15) and data are given in (Annexure-IV- Col. 5).

The interpretations of decadal mean fluctuations indicate water level decline ranges from 0.01m to 14.48m in 65% of wells monitored and about 76% area of the State. Water level decline in the range of 0-2m has been reported from 44% of the wells covering 5231% of area in parts of Panchkula, Ambala, Kurukshetra, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Mahendragarh, Gurgaon, Faridabad and Palwal districts of the State. , Water level decline between 2-4 m has been reported from 15% of wells covering 18% area of the state in parts of Panipat, Karnal, Kurukshetra, Kaithal, Ambala, Bhiwani, Mahendragarh, Rewari Gurgaon and Faridabad districts. Water level decline of more than 4m has been observed in 6% wells and 6% of the area of state covering parts of Ambala, Karnal, Kurukshetra, Kaithal, Fatehabad, Jind, Sirsa, Bhiwani, Rewari and Faridabad districts.

The water level rise from 0.01m to 14.48m has been observed in 35% of wells and 24% area. Water level rise in the range of 0-2m has been observed in 29% wells covering 19% area of the state, covering Panchkula, Ambala, Yamuna nagar Sonipat, Jind, Rohtak, Fatehabad, Sirsa, Hissar, Bhiwani, Mahendragarh, Rewari, Mewat and Palwal districts. Water level rise 2-4m has been observed small patches in small patches in 3% wells and 3% area of the state. Water level rise >4m has been observed small patches in small patches in 3% wells and 2% area of the state. Summarized details of water level fluctuation in various ranges with percentage of wells monitored and percentage of area is shown in table below.

Summarized Details Of Decadal Mean Water Level Fluctuation								
Water level fluctuation(m)	Decline				Rise			
	2-0	4-2	>4	Total	2-0	4-2	>4	Total
Wells monitored	47	16	2	65	30	4	1	35
Area covered	41	18	6	65	28	7	0	35

**FIG. 15**

### 3.5.3 Mean November (2005:2014) & November 2015

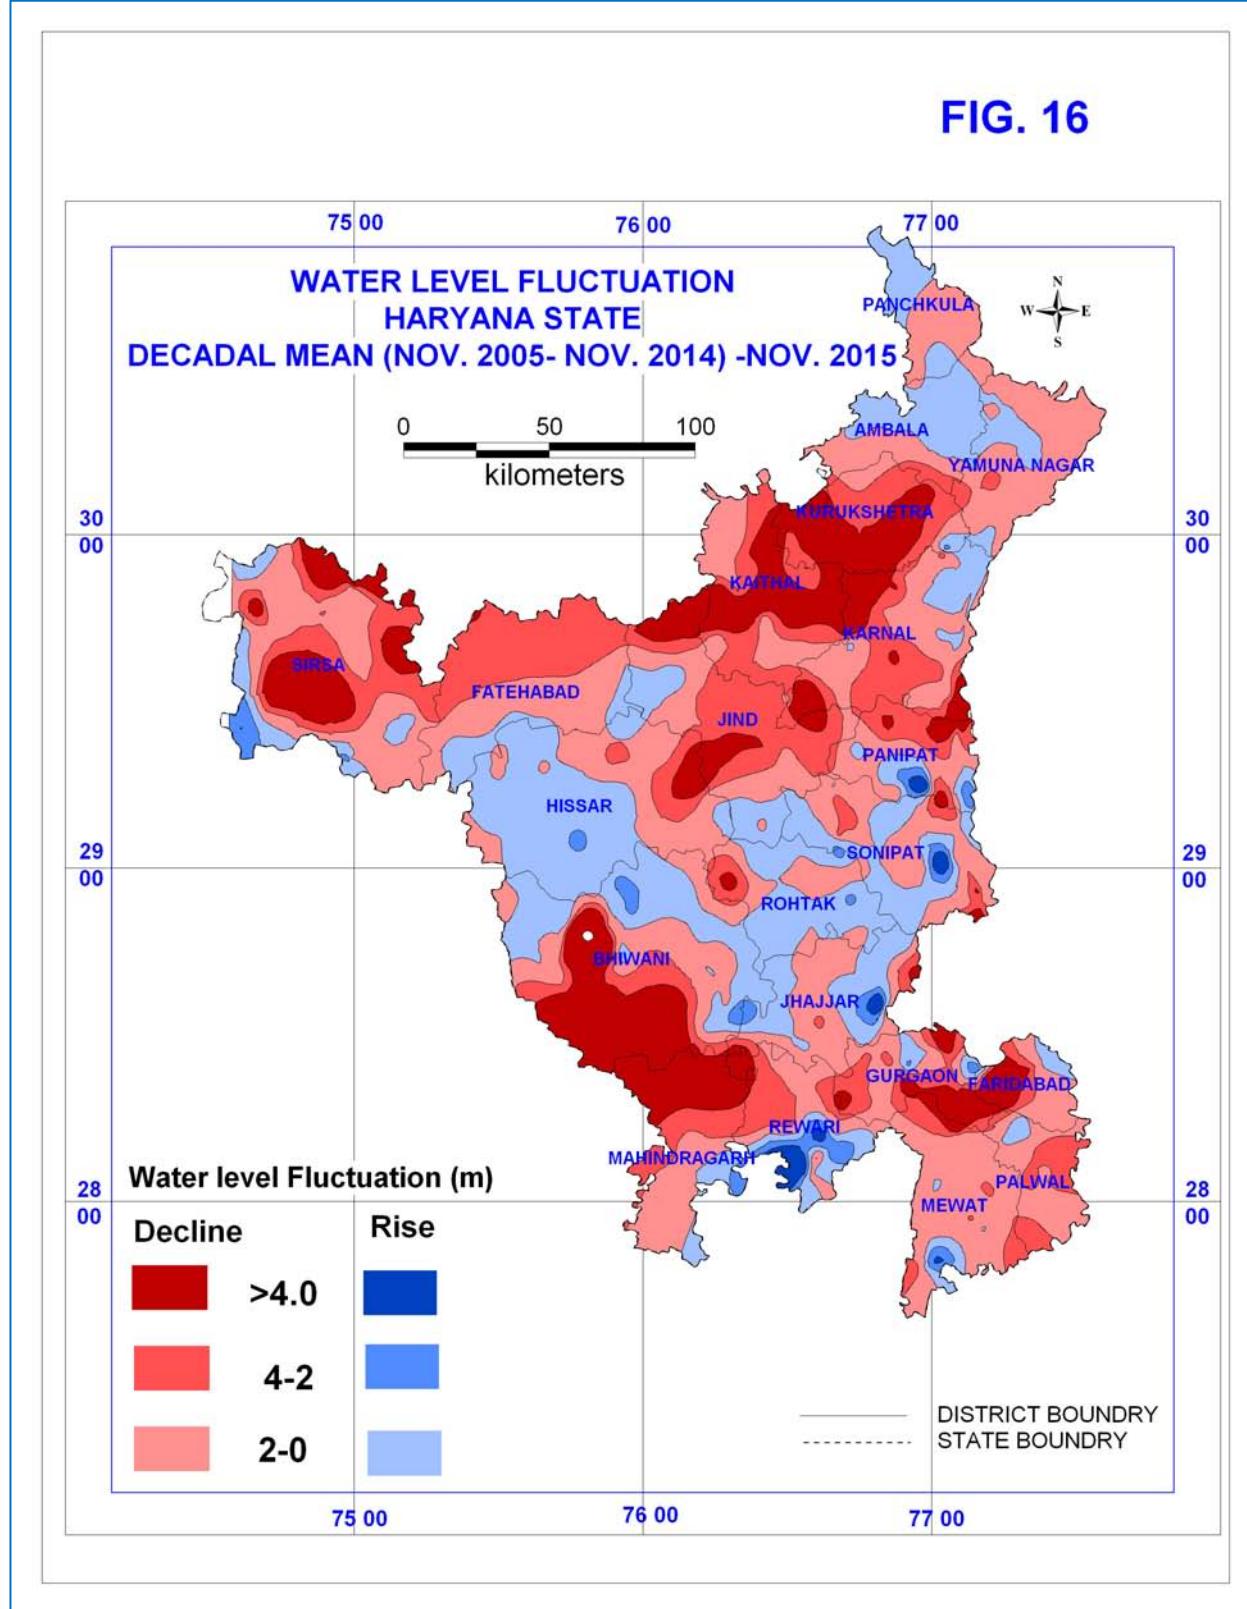

The behaviour of water level over the period under reference is discussed in following paragraph along alongwith map (Fig.16) and data are given in (Annexure-IV-Col. 6).

The interpretations of decadal mean fluctuations so arrived at indicate general water level decline from 0.01m to 14.48m in 69% of wells which covers about 80% area of the State have shown water level decline. Water level decline in the range of 0-2m has been reported from 43% of the wells covering 46% of area in all districts of the state. Water level decline between 2-4 m has been reported from 16% of wells covering 22% area of the state in parts of Panipat, Karnal, Kurukshetra, Kaithal, Fatehabad, Sirsa, Bhiwani, Mahendragarh, Rewari Gurgaon and Faridabad districts. Water level decline of more than 4m has been observed in 10% wells and 12% of the area of state covering parts of Karnal, Kurukshetra, Kaithal, Fatehabad, Jind, Sirsa, Bhiwani, Mahendragarh, Rewari and Faridabad districts.

The water level rise from 0.01m to 14.48m has been observed in 31% of wells and 20% area. Water level rise in the range of 0-2m has been observed in 27% wells covering 19% area of the state, covering Panchkula, Ambala, Yamuna Nagar Sonipat, Jind, Rohtak, Fatehabad, Sirsa, Hissar and Bhiwani districts. Water level rise of 2-4m has been observed in 3% wells and 1% area of the state. Water level rise of >4m has been observed in 1% wells and <1% area of the state. Summarized details of water level fluctuation in various ranges with percentage of wells monitored and percentage of area is shown in table below.

Summarized Details of Decadal Mean Water Level Fluctuation								
Water level fluctuation(m)	Decline				Rise

### 3.5.4 Mean January (2005:2015) & January2016

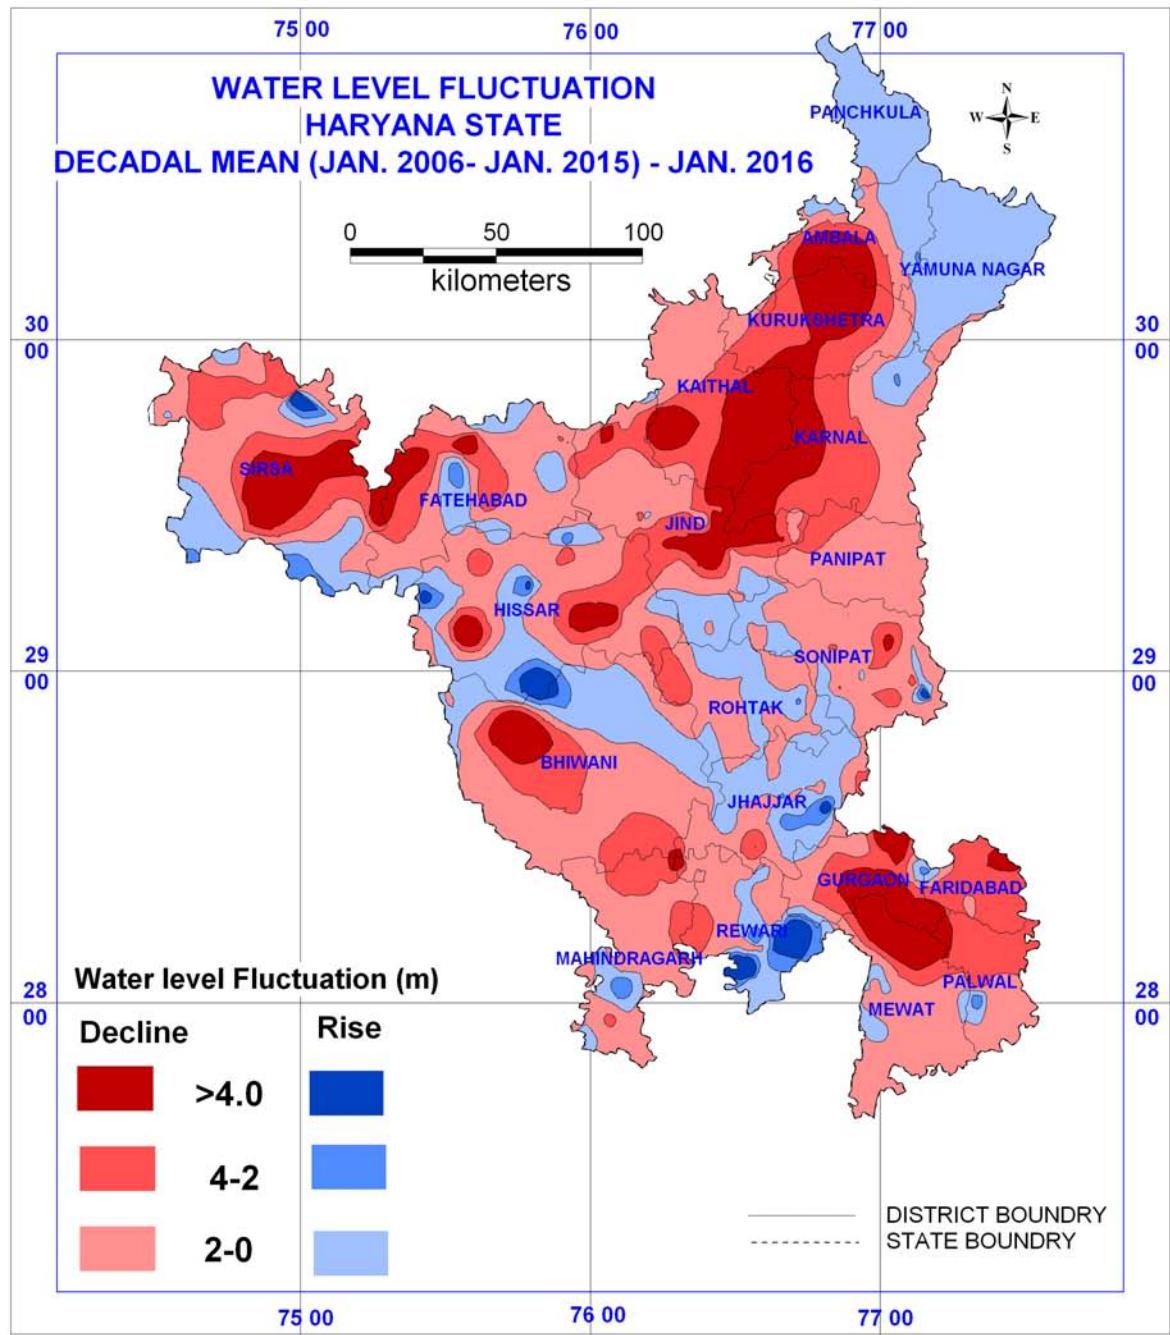

The behaviour of water level over the period under reference is discussed in following paragraph along alongwith map (Fig.17) and data are given in (Annexure-IV- Col. 7).

The interpretations of decadal mean fluctuations so arrived at indicate water level decline from 0.01m to 14.48m in About 58% of wells which covers about 63% area of the State have shown water level decline. Water level decline in the range of 0-2m has been reported from 34% of the wells covering 38% of area in Panchkula, Ambala, Kurukshetra, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Mahendragarh, Gurgaon and Mewat districts of the State. Water level decline between 2-4 m has been reported from 18% of wells covering 14% area of the state in parts of Panchkula, Ambala, Panipat, Karnal, Kurukshetra, Kaithal, Jind, Fatehabad, hissar, Bhiwani, Mahendragarh, Rewari and Gurgaon districts. Water level decline of more than 4m has been observed in 6% wells and 10% of the area of state covering parts of Karnal, Kurukshetra, Kaithal, Fatehabad, Jind, and Rewari districts.

The water level rise from 0.01m to 14.48m has been observed in 42% of wells and 37% area. Water level rise in the range of 0-2m has been observed in 34% wells covering 30% area of the state, covering Panchkula, Ambala, Sonipat, Rohtak, Sirsa, Hissar, Bhiwani, Mahendragarh, Mewat, Faridabad and Palwal districts. Water level rise of 2-4m has been observed in 5% wells and 7% area of the state. Water level rise of >4m has been observed in 1% wells and <1% area of the state.

**FIG. 17**

## **4.0 GROUND WATER QUALITY IN HARYANA STATE**

Natural quality of ground water is dependent on geological characteristics and climatic conditions. It is further influenced and generally degraded by human activities. Indiscriminate extraction of groundwater for day to day uses, application of fertilizers in agriculture and unscientific disposal of industrial waste have great impact on ground water quality. The quality of ground water is normally ascertained through concentration values of number of physical, chemical and biological parameters present in it. Concentration of these parameters affects its acceptability and usefulness for domestic, agriculture, industrial and other purposes. It is, therefore, essential to know the chemical composition of ground water to determine its suitability for the intended use. Knowledge of quality of ground water not only helps in finding its suitability for various purposes, but it also helps in taking effective remedial measures for its improvement on scientific lines. In rural as well as in urban area of Haryana State, ground water is a major resource for drinking and other uses. Wherever surface water is inadequate or unavailable, ground water is exploited for drinking and irrigation purposes.

In the backdrop of various uses of ground water, its quality is monitored annually by CGWB, NWR Chandigarh through dedicated ground water monitoring stations (GWMS) of dug wells and/or hand pumps of shallow depth.

### **4.1 Sampling and Analysis**

351 water samples were collected in 1-liter capacity good quality polyethylene bottle from national ground water monitoring stations distributed over 20 districts of Haryana during May 2015. Recognizing the enormity and severity of the problem of contamination of ground water by Arsenic and Iron, water samples were also collected from ground water monitoring stations from all the districts of Haryana State for measurement of arsenic concentration under the quality-monitoring program. Therefore, samples were collected in two sets of 1 liter each and one of the sets of samples was acidified '*in situ*' with 1:1 HCl to bring the pH of the sample to below 2.

The water samples were analyzed for major cations (Ca, Mg, Na, K) and anions (CO<sub>3</sub>, HCO<sub>3</sub>, Cl, NO<sub>3</sub>, SO<sub>4</sub>, F, PO<sub>4</sub>) in addition to pH, EC, SiO<sub>2</sub> and TH as CaCO<sub>3</sub> in the Regional Chemical Laboratory by following 'Standard analytical procedures' as given in APHA 2012. Results of chemical analysis of 334 No. water samples are placed in Annexure-V.

The acidified water samples were analyzed for total arsenic (As) and Iron. Arsenic (total) was estimated by atomic absorption using continuous hydride generation technique while Iron was determined by UV-VIS spectrophotometer. Analytical results of Arsenic and Iron are placed in Annexure VI.

Sampling points are mostly open dug wells and hand pumps, which are fully or at least are partially in use. Chemical analysis was carried out for major cations (Ca, Mg, Na, K) and anions ( $\text{CO}_3$ ,  $\text{HCO}_3$ , Cl,  $\text{SO}_4$ ,  $\text{NO}_3$ , F) in addition to pH, EC,  $\text{PO}_4$ ,  $\text{SiO}_2$ , TH as  $\text{CaCO}_3$ , in the Chemical Laboratory at Chandigarh. Standard analytical procedures as given in APHA 2012 were followed.

#### **4.2 Composition of waters**

Chemical analysis shows that ground water is slightly to moderate alkaline with pH ranging between 7.05 (Rasulpur, block Sadaura district Yamunanagar) and 9.15 pH units (Mangaiana, block Dabwali district Sirsa). EC (salinity) is found to vary widely with a minimum value of  $238\mu\text{S}/\text{cm}$  at Mauzabad, block Pataudi, in district Gurgaon and a maximum value of  $14640\mu\text{S}/\text{cm}$  at  $25^\circ\text{C}$  at Nagina in district Mewat.

Among anions, carbonate though generally absent in ground water samples is found in significant number of water samples and it varies from nil to 199 mg/l at Lahori, block Madlauda in district Panipat. Bicarbonate varies from 12 to 922 mg/l at Rukhi, block Gohana in Sonipat district, chloride varies from 7.0 mg/l at Barwasni in Sonipat district to 4930 mg/l at Nagina in Mewat district and sulphate varies from nil to 2833 mg/l at Rasalia Khera(Block Dabwali in Sirsa district). However, exceptionally high concentrations of 4028mg/l of sulphate are also encountered in Mewat district (Nagina). Nitrate, an indicator of domestic, irrigation and industrial contamination, is found at many locations. Its concentration in State varies from below detection limit to 1876mg/l at Dadri in Bhiwani district. Fluoride is found to be present in all the water samples and it varies from nil to 15.72 mg/l at Mohana in Sonipat district. In about 18.9% of the samples, it is found more than the drinking water limit of 1.5 mg/l F (BIS 2012). Phosphate has not been detected in most of the locations but the highest concentration of 2.78 mg/l has been observed in well water of Bhunderi in Sonepat district. Among cations, calcium is found to vary from 2.1 mg/l (Rukhi in Sonipat district) to 601 mg/l at Nagina in Mewat district whereas magnesium generally varies from nil to 1216mg/l at Nagina in Mewat district. Sodium is found to range between 4.5 mg/l (Kalri Jagir, district

Karnal) and 2400 mg/l at Nagina in Mewat. Potassium in ground waters is normally below 10 mg/l and its higher concentration indicates contamination from point as well as non-point sources. In Haryana, potassium in shallow waters is found to range from traces to as high as 790 mg/l at Jhamaula in Jind district. Silica determined as  $\text{SiO}_2$  varied from 8.4 to 41 mg/l. Hardness reported as  $\text{CaCO}_3$  varies between 50 mg/l at Mauzabad in Gurgaon district and 3603 mg/l at Gagiachajat in Rewari district, indicating wide variation. However, very hard water with concentration as high as of 6505 mg/l is also encountered at Nagina in Mewat district. The district-wise concentration range of various chemical constituents in ground water is given in Table 4.

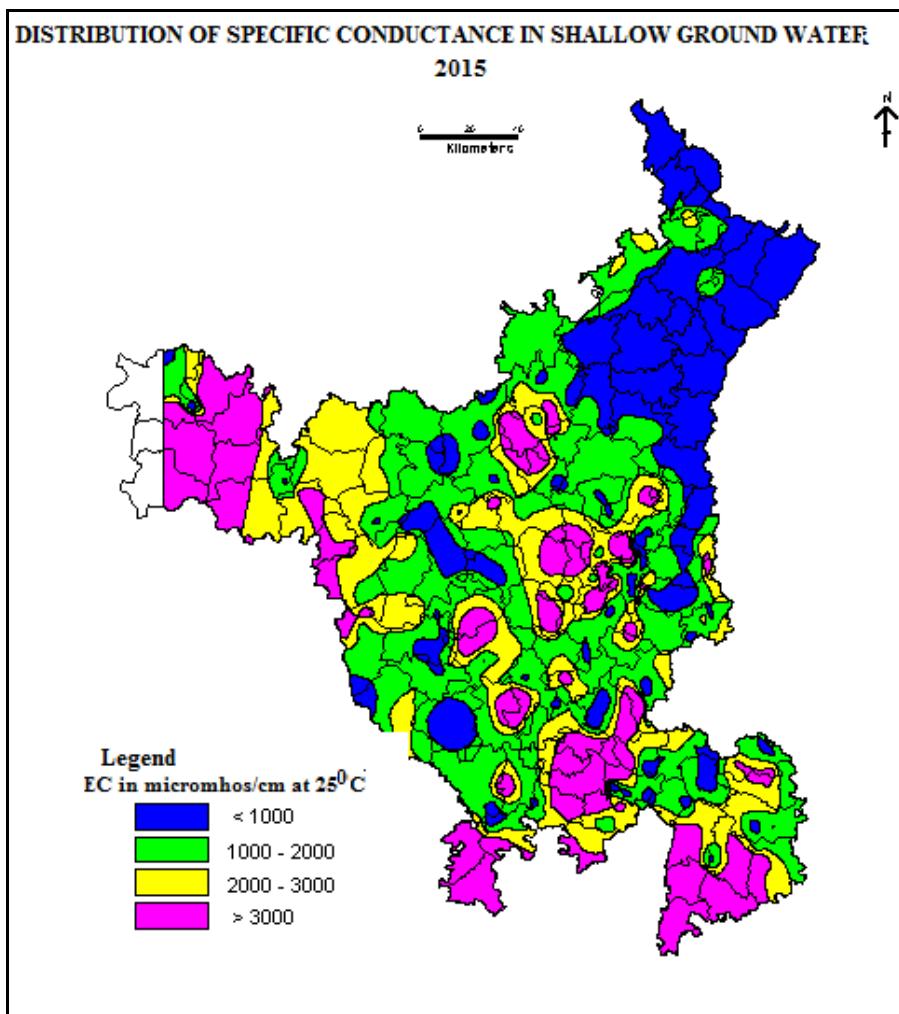

#### **4.3 Distribution of Electrical Conductance (EC)**

EC, a primary indicator of dissolved mineral content, varies from 250  $\mu\text{S}/\text{cm}$  to 21960  $\mu\text{S}/\text{cm}$  at 25°C. About 27.2% of the water samples have EC less than 750  $\mu\text{s}/\text{cm}$ , 54.2% have EC between 750 and 3000  $\mu\text{s}/\text{cm}$  and the remaining 18.6% of the samples have EC more than 3000  $\mu\text{s}/\text{cm}$ . Water with low EC (<750) are found mostly in Ambala, Gurgaon, Panchkula, Panipat, Karnal, Kaithal, Kurukshetra, Sonepat and Yamunanagar districts, water with intermediate EC (750-3000) are found mostly in all the districts and samples with high EC (>3000) are found scattered in Bhiwani, Faridabad, Gurgaon, Hissar, Jhajjar, Kaithal, Mahendergarh, Mewat, Palwal, Rewari, Rohtak, Sirsa and Sonepat districts (Fig 18). The reason for high salinity in ground water of these areas may be due to natural concentration of salts as there is more evapo-transpiration than precipitation (Semi-arid climatic conditions) and lack of drainage.

**Table 4, District wise distribution of chemical constituents in groundwater of Haryana State (GWMS 2015)**

**Fig 18**

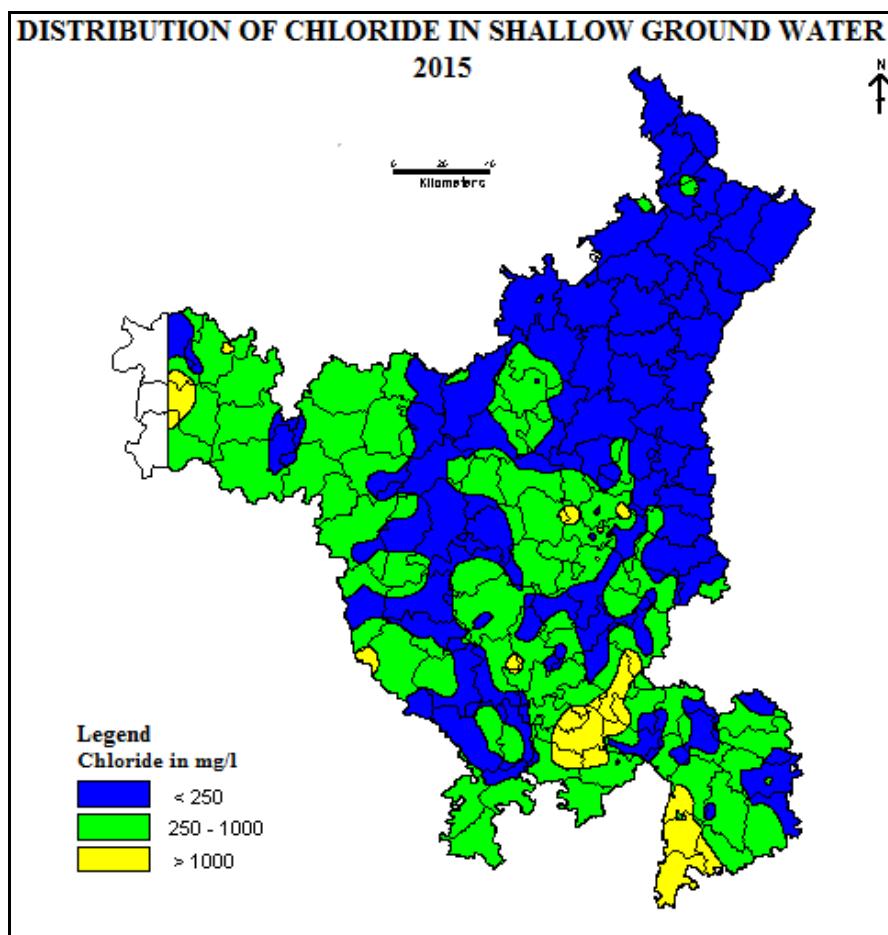

#### 4.4 Distribution of Chloride

The distribution of chloride in ground water follows the distribution pattern of EC and it ranges from 7.0 mg/l at Barwasni in Sonipat district to 4930 mg/l at Nagina in Mewat district. Chloride above 400 mg/l, in drinking water, may give salty taste to consumers. Bureau of Indian Standards (BIS 2012) has assigned a desirable concentration of 250 mg/l chlorides in drinking water. This limit can be extended to 1000 mg/l in case no other source with desirable chloride concentration is available. Out of 334 samples analyzed, 64.1% have chloride below desirable limit (250mg/l), 29.3% have between desirable and permissible level (250-1000 mg/l) and the remaining 6.6% of samples have chloride more than the permissible limit of 1000 mg/l. Spatial distribution of chloride in ground water indicates that few sites at Bhiwani, Gurgaon, Hissar, Jhajjar, Mahendergarh, Mewat, Palwal, Rewari, Rohtak, Sirsa and Sonepat districts (Fig 19) have chloride concentration

above 1000 mg/l. High concentration of chloride is mostly observed in samples having high sodium content indicating highly saline nature of these shallow ground waters.

**Fig 19**

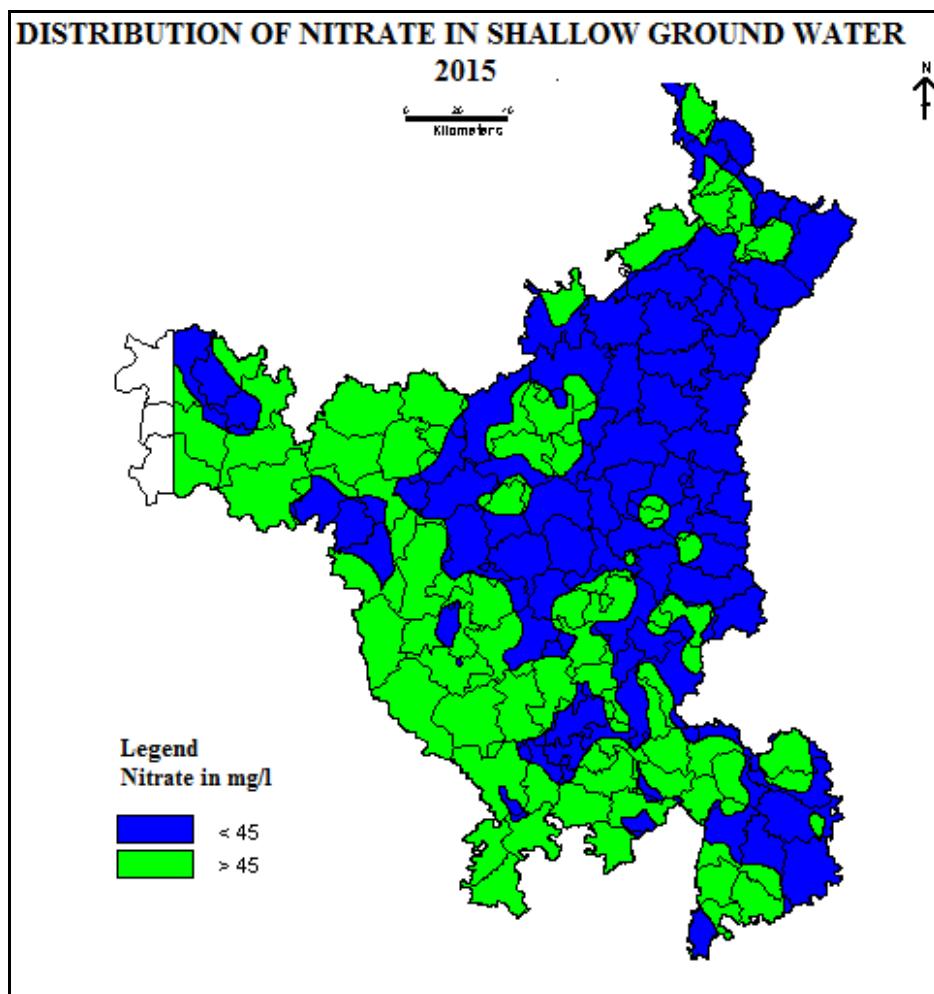

#### 4.5 Distribution of Nitrate

Presence of nitrate above 5.0 mg/l in ground water reflects contamination at some stage of its percolation and circulation. The probable major sources of nitrate content in ground water are excessive application of fertilizers, bacterial nitrification of organic nitrogen, seepage from animal and human wastes and atmospheric inputs. Its concentration in State varies from below detection limit to 876 at Dubledhan in district Jhajjar. Exceptionally high concentration of are encountered at Sui(998mg/l) district Bhiwani, Mataur(1148 mg/l), district Kaithal and Dadri(1876 mg/l), district Bhiwani. Spatial distribution of nitrate indicates that nitrate is less than 45 mg/l in majority of the areas (Fig 20). Out of 334 samples analyzed, 71.3% of the samples have nitrate within BIS limit of

45 mg/l for drinking waters and 28.8% have nitrate more than 45 mg/l. Out of these 28.8% samples, 50% of samples, mostly from districts of Ambala, Bhiwani, Faridabad, Fatehabad, Gurgaon, Jhajjar, Jind, Kaithal, Mahendergarh, Mewat, Panchkula, Panipat, Rewari, Rohtak, Sirsa and Yamunanagar districts have nitrate contents even more than 100mg/l.

**Fig 20**

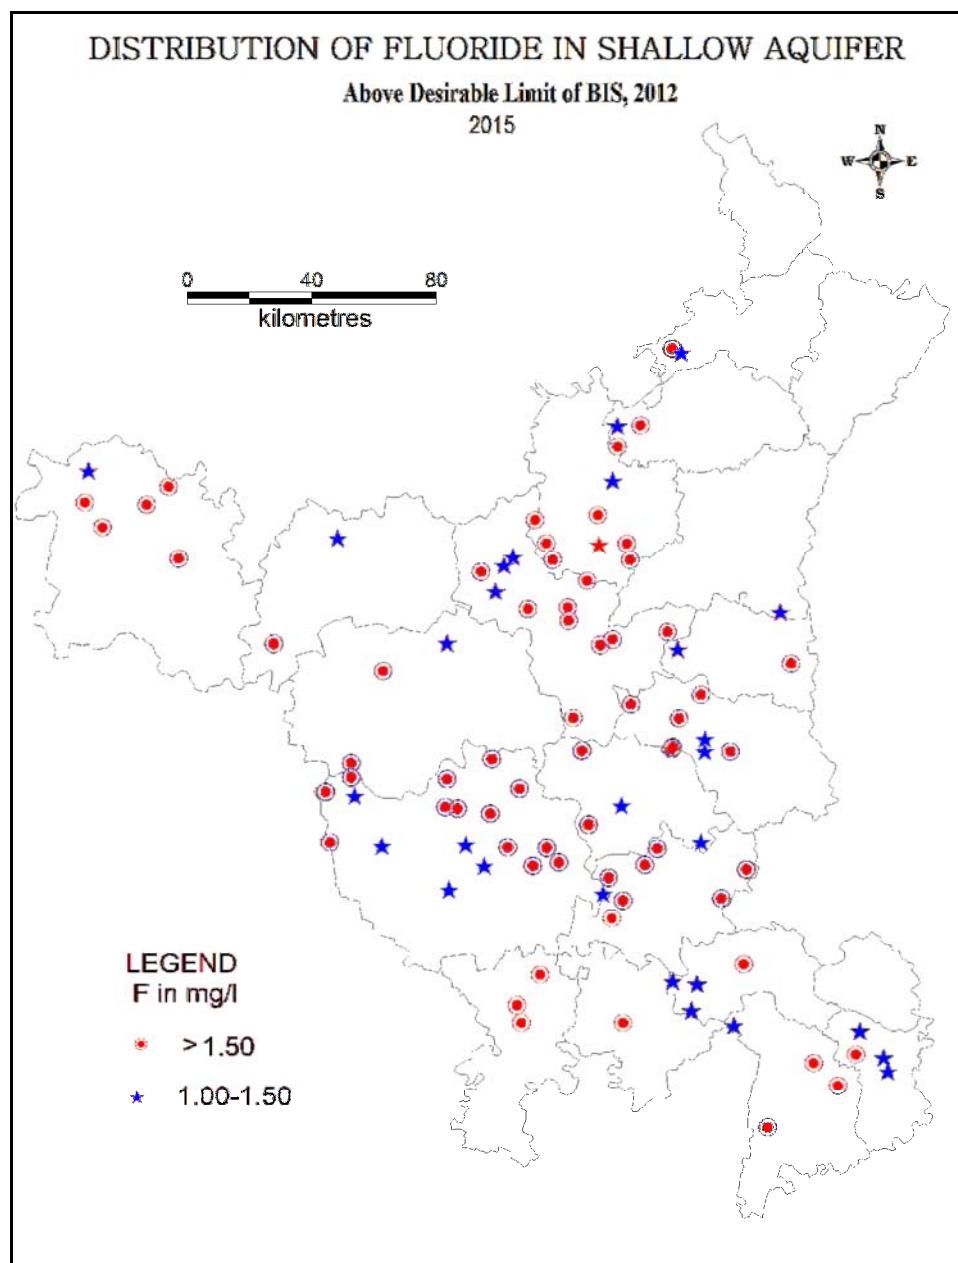

#### 4.6 Distribution of Fluoride

Fluoride, in small amounts in drinking water, is beneficial in reducing dental decay but when present in large amounts, has deleterious effects ranging from staining of tooth enamel to skeletal fluorosis. The fluoride contents in ground water of the State ranges from below detection limit to 15.72 mg/l at Mohana in Sonipat district. Spatial distribution of fluoride indicates that fluoride is less than 1.5 mg/l in 72.5% samples. It is between 1.0 and 1.5 mg/l in 8.7% samples and is above 1.5 mg/l in the remaining 18.9% samples.

Ground waters with fluoride above 1.5 mg/l are found mostly in parts of Bhiwani, Fatehabd, Gurgaon, Hissar, Jhajjar, Jind, Kaithal, Mahendergarh, Mewat, Palwal, Panipat, Rewari, Rohtak, Sirsa and Sonepat districts (Fig 21) and are not suitable for drinking purpose. At many places, fluoride above 1.5 mg/l is observed in areas where agricultural activities are dominant. The likely causes for high fluoride in ground water are (i) leaching from phosphatic fertilizers where it is present as an impurity and (ii) depletion of calcium either due to precipitation or exchange phenomenon.

**Fig 21**

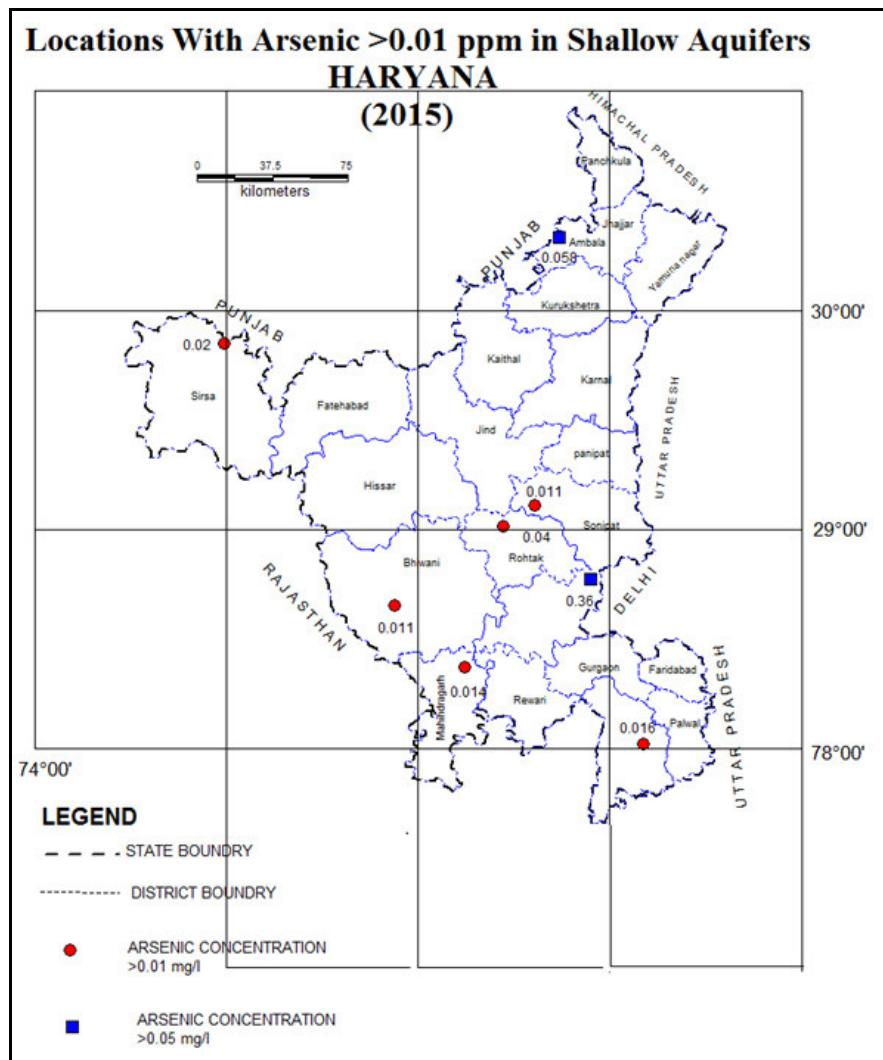

#### 4.7 Trace Elements in Ground Water

**Arsenic:** During 2015, 354 No. water samples were collected from districts and the samples analysed in house. As per the analytical data generated, it is observed that isolated cases from five districts namely, Ambala, Bhiwani, Mahendergarh, Jhajjar, Palwal and Sirsa have Arsenic concentration more than the desirable limit of >0.01mg/l. The locations with arsenic concentration >0.01 mg/l alongwith block details, well depth, water level during May 2015 and coordinates are tabulated (Table 5) and placed on map of Haryana (Fig 22).

**Table 5 :** Ground Water Monitoring Stations with Arsenic concentration above 0.01 mg/l  
(2015)

S.No.	District	Block	Location	Well Depth in mt	Water Level mbgl	Aquifer	As >0.01 mg/l
1	Ambala	Ambala	Balana	19.65	1.95	Alluvium	0.058
2	Bhiwani	Tosham	Laxmanpura	21.50	9.51	Alluvium	0.011
3	Jhajjar	Bahadurgarh	Kulashi	5.60	0.62	Alluvium	0.36
4	Mahendergarh	Mahendergarh	Kheri Talwana	26.60	17.2	Residual Hills Quartzite	0.014
5	Palwal	Hathin	Lakhnacka	25.00	8.08	Residual Hills Quartzite	0.016
6	Rohtak	Maham	Nidana	19.00	4.55	Alluvium	0.04

8	Sonipat	Gohana	Bhanderi	5.90	2.72	Alluvium	0.011

**Fig 22**

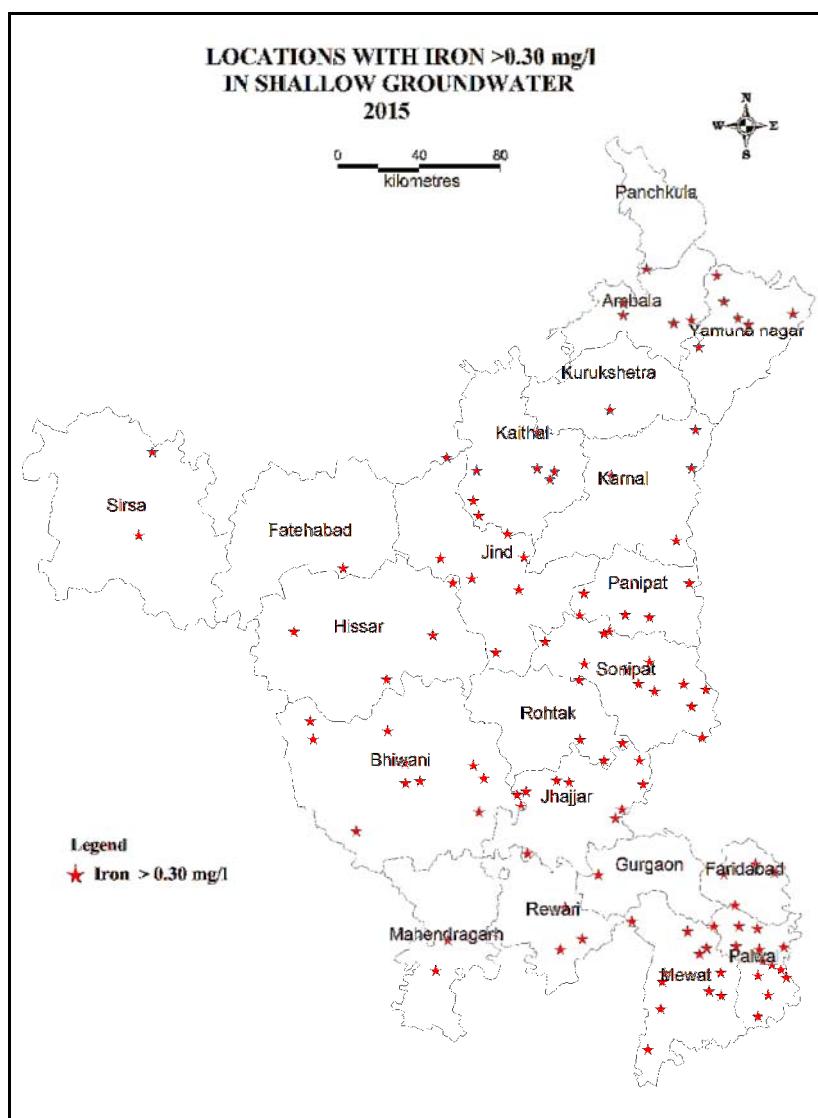

**Iron:** The concentration of iron (total) in ground water of the study area ranges from below detection limit to 11.638 mg/l at Bhopani village, block Faridabad in Faridabad district. The point values of locations with Iron above BIS permissible limit of 0.30 mg/l for drinking water are depicted in Fig 23 and its observed that 32.5% samples have iron concentration exceeding this limit. The high iron concentration in untreated ground water gives it a metallic taste.

Iron is an essential nutrient for man, animal, and plants. It is found in both the ferrous ( $\text{Fe}^{2+}$ ) and ferric ( $\text{Fe}^{3+}$ ) state. Under reducing conditions in water, the mobile ferrous ion is present but upon exposure to air, it is oxidized to the less mobile form and gets

precipitated as the ferric ion. In water, such iron precipitates produce reddish brown stains on porcelain, enamel, plumbing, and clothing. The solubility of iron increases with decreasing pH. Iron bacteria are often associated with foul taste and odour, causes encrustation in pipes and leads to 'red rot' disease. Iron may be present in natural sources in igneous rocks, amphiboles, ferro manganese soils and in combined form i.e. as iron sulphide, iron sulphite, magnetite, iron oxide etc. It may be constituent of sandstone rocks, oxides, carbonates, sulphides or iron clay minerals but these are absent in study area. Anthropogenically, industrial wastes, the burning of coke and coal, acid mine drainage, mineral processing and corrosion of iron and steel may contribute iron to environment.

**Fig 23**

#### **4.8 Types of Groundwater**

Considering the predominance of the cation and anion in the chemical composition of ground water, its type is determined and its relation with its occurrence in an area as well as with its salinity is studied. It is found that no discernible relationship between type of water and its occurrence in any particular area could be established. Nearly all types of waters are available in each district of the State. However, study of relation of water type with salinity of the water clearly indicates that nearly 27% ground waters of the State are fresh, have low salinity and predominance of calcium or magnesium or calcium + magnesium cations and bicarbonate as anion. Ground waters having intermediate salinity are mostly mixed cation type -  $\text{HCO}_3$  type. At some places  $\text{HCO}_3$ -type of waters with sodium as dominant cation are also encountered in low to moderately saline ground waters. This can be attributed either to precipitation of  $\text{CaCO}_3$  due to loss of  $\text{CO}_2$  or dissolution of Na-salts from the topsoil layers or to ion exchange reaction during the downward percolation of water. At some isolated locations sulphate is found to be dominant anion. In ground waters, where salinity is high; mostly Na is the dominant cation and Cl or Cl +  $\text{SO}_4+\text{NO}_3$  (Mixed anion) are dominant. permanent hardness is observed at few locations in Hissar, Jhajjar and Bhiwani district depicted by dominance of Ca-Cl. Nevertheless, a few exceptions have also been found in these simple and well-defined types of ground waters.

#### **4.9 Suitability for Drinking**

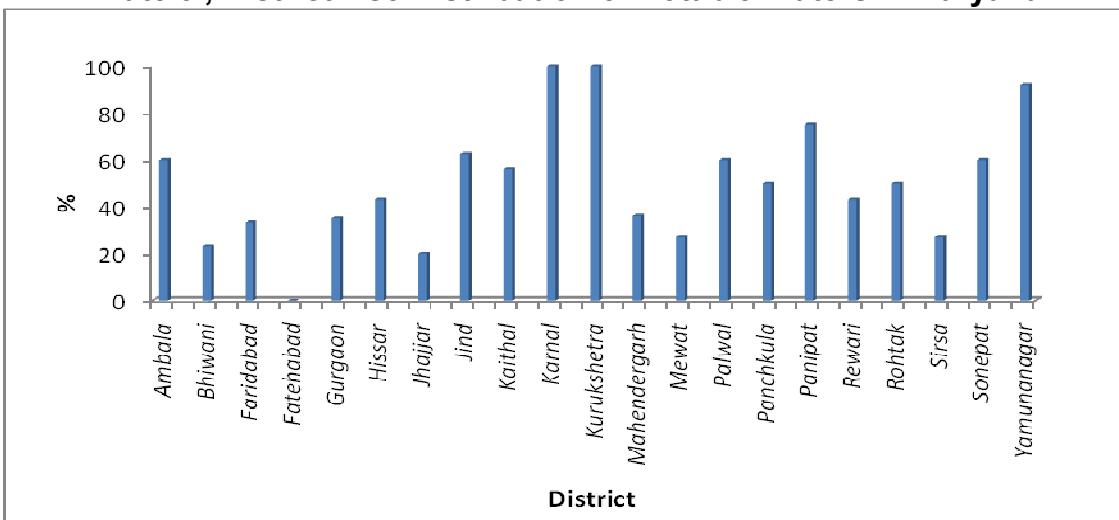

Salinity, nitrate, sulphate, fluoride, hardness and alkalinity are the parameters normally considered for evaluating the suitability of drinking water. BIS have assigned desirable and permissible concentration limits for these constituents. Based on BIS recommendations, ground water occurring in the northern and north-eastern areas of the State is suitable for drinking. However, ground water at several places in the southern and western parts of the State is not suitable for drinking either due to one or more constituent exceeding the maximum permissible limits. Waters falling under different classes of suitability for drinking uses are shown in Table 6 and district-wise distribution of potable waters based upon EC, Cl,  $\text{NO}_3$  & F contents are shown as bar diagram in Plate 3.

**Table 6, District wise distribution of Ground waters of Haryana State in different classes of drinking water suitability**

S.	District	No. of Sample	EC in 25°C in µS/cm			Cl in mg/l			F in mg/l			NO <sub>3</sub> in mg/l

On perusal of Bar diagram, it is observed that ground water occurring in the districts of Ambala, Jind, Kaithal, Karnal, Kurukshetra, Palwal, Panipat, Panchkula, Rohtak, Sonepat and Yamunanagar are mostly suitable for drinking as more than 50% water samples are having all the above quality parameters within the permissible limits. In the districts of Faridabad, Gurgaon Hissar, Gurgaon, Mahendergarh, and Rewari, 30-50% water samples are having potable quality as per BIS 2012 standards. Ground water is mostly unsuitable for drinking due to one or more of these constituents exceeding the maximum permissible limits Bhiwani, Fatehabad, Jhajjar, Mewat and Sirsa as these districts have less than 30% ground waters having chemical parameters within the permissible limits.

**Plate 3 , Districtwise Distribution of Potable Waters in Haryana**

#### 4.10 Suitability for Irrigation

The suitability of ground water for irrigation is assessed based on EC, SAR and RSC values of waters. The diagram, suggested by USSL staff by taking EC and SAR into consideration is widely used for determining the irrigational classes of water. Salinity in terms of EC varies widely from 238  $\mu\text{S}/\text{cm}$  to 14640  $\mu\text{S}/\text{cm}$  at  $25^{\circ}\text{C}$  while SAR values range from 0.14(Kalri Jagir, district Karnal) to 33.61 (Rukhi, district Sonipat). Based on EC and SAR values, plot of USSL diagram indicates that about 75% of the samples fall under C2S1, C2S2, C3S1, C3S2, C4S1, and C4S2 classes of irrigation water. Continuous use of such waters may lead to low to vary high salinity hazards, while they may not cause sodium hazards because of low SAR. The remaining 25% of water samples having C3S3, C3S4, C4S3, C4S4, and classes may lead to salinity as well as sodium hazards when used for irrigation under normal practices. However, these waters can be used for irrigation along with an appropriate quantity of gypsum.

The ground waters in the districts of Ambala, Fatehabad, Kaithal, Karnal, Kurukshetra, Panchkula, Panipat, Rohtak and Yamunanagar are mostly of C1, C2, C3 salinity and S1-S2 sodicity classes. Such waters can be used for irrigation on soils with good permeability for growing salt tolerant or semi salt tolerant crops. Addition of small quantity of gypsum may improve the permeability of the soil and avoid the sodium hazards. Ground waters from southern and western part of Haryana comprising of districts of Bhiwani, Faridabad, Gurgaon, Hissar, Jhajjar, Jind, Mahendergarh, Mewat, Rewari, Sirsa, and Sonepat fall under C4S1, C4S2, C3S3, C3S3, C4S2, C4S3 and C4S4 classes. Use

of such waters for irrigation under normal conditions may lead to both high to very high salinity as well as sodium hazards.

**Table 7, District wise Irrigation Rating of Well Waters of Haryana.**

S.	District	IRRIGATION SUITABILITY			USSL Classification	
		EATON's INDEX (RSC in meq/l)				
		Safe	Marginal	Unsafe		
		<1.25	1.25-2.5	>2.5		
1	Ambala	3	1	6	C2S1, C3S2, C3S3, C4S3	
2	Bhiwani	27	1	7	C2S1, C3S1, C3S2, C3S3, C3S4, C4S1, C4S3, C4S4	
3	Faridabad	5	0	1	C2S1, C3S1, C3S2, C3S3, C3S4, C4S1, C4S2, C4S3	
4	Fatehabad	3	0	0	C3S1, C4S2	
5	Gurgaon	12	0	5	C1S1, C2S1, C2S2, C2S3, C4S1,C4S2, C4S3, C4S4	
6	Hissar	21	0	0	C1S1, C2S1, C3S1, C3S2, C4S2, C4S4	
7	Jhajjar	13	4	3	C2S1, C2S2, C2S3, C4S1, C4S2, C4S3	
8	Jind	9	0	7	C2S1,C3S1, C3S2, C3S3, C4S1	
9	Kaithal	7	3	6	C2S1, C3S1,C3S2, C4S2,C4S3,C4S4	
10	Karnal	11	6	6	C2S1, C3S2, C3S3	
11	Kurukshetra	8	6	6	C2S1, C3S1, C3S2	
12	Mahendergarh	5	1	5	C2S1, C3S2, C3S3, C3S4, C4S4	
13	Mewat	11	0	0	C2S1, C3S1,C4S1, C4S2, C4S3	
14	Palwal	13	2	5	C2S2, C3S1,C3S2, C3S3, C4S1, C4S2, C4S4	
15	Panchkula	13	1	4	C2S1, C3S1, C3S2, C3S3, C4S2, C4S4	
16	Panipat	8	1	3	C2S1, C2S2, C3S1, C3S3,C4S2	
17	Rewari	6	0	1	C3S1, C3S2, C4S3	
18	Rohtak	12	1	1	C2S1, C3S1, C3S2, C4S2, C4S3	
19	Sirsa	8	1	2	C2S1, C3S1, C3S2,C3S3, C4S3, C4S4	
20	Sonepat	23	2	5	C2S1, C3S1,C3S2,C4S2,C4S3,C4S4	
21	Yamunanagar	12	0	1	C2S1, C3S1, C3S2	

Alkali hazards of irrigation ground waters are estimated through the computation of Residual sodium carbonate (RSC) also known as Eaton's Index. The values of RSC of ground waters are found to vary from below zero to 16.13 meq/l (Lahori, district Panipat). Based on Eaton's index, it is found that 69% of the waters are rated fit, 8.9% marginal and the remaining 22.1% unfit for irrigational use. The distribution of ground waters in various Eaton's index and irrigation rating based on USSL classification is given in Table 7.

#### **4.11 Suitability for Industries**

Industries, in general, use water for variety of works depending upon the nature and size of the industry. As such specifications for suitability of water for industries vary widely depending upon the process in each industry. Therefore, chemical quality of water and its suitability could not be discussed due to diversified nature of industries.

#### **4.12 Temporal Variation**

The temporal changes in ground water quality are studied by considering important parameters such as salinity (EC), chloride, nitrate and fluoride contents of waters. The percent well waters falling in desirable, permissible and unsuitable classes of BIS-2012 standards during 2015 are compared with percent well waters in same classes during 2011. Table 8 shows increase or decrease of percent well water falling in various suitability classes for drinking purposes.

**Table 8, Periodic Variation in Suitability Classes of Well Waters of Haryana**

Parameter	Class	% of Samples					Periodic Variation 2011-15
		2011 (n=359)	2012 (n= 331)	2013 (n=320)	2014 (n=358)	2015 (n=334)	
Salinity as EC (in $\mu\text{S}/\text{cm}$ at $25^{\circ}\text{C}$ )	<750	30	29	37	25	27	-3
	750-3000	49	50	48	55	54	+5
	>3000	21	21	15	20	19	-2
Chloride as Cl (in mg/l)	<250	65	64	65	62	64	-1
	250 - 1000	29	28	29	31	29	0
	>1000	6	8	6	7	7	+1
Nitrate as $\text{NO}_3$ (in mg/l)	< 45	73	69	77	72	71	-2
	> 45	27	31	23	28	29	+2
Fluoride as F (in mg/l)	<1.0	69	62	70	70	72	+3
	1.0 - 1.50	15	15	12	9	9	-6
	>1.50	16	23	18	21	19	+3

n=number of samples

It is evident from the table above that there is a slight deterioration in the quality of ground water, based on the parameters considered, from 2011 to 2015, as indicated by increase in the percent samples having concentrations beyond permissible limits and decrease in percent samples having desirable quality. The ground water quality based on chloride, nitrate and flouride content shows a deterioration as there is increase of nearly 1%, 2% and 3% respectively, of samples falling above the permissible level and subsequent decrease in % samples falling under suitable(desirable) class. There is a small improvement in groundwater water quality (2%) with respect to Salinity from 2011 to 2015.

On comparing the percent wells of 2014 and 2015 for potability and considering a change of  $\pm 1\%$  as constant, it is observed that, in general, there is decrease in salinity, chloride, nitrate and Fluoride content. The cause of improvement of ground water quality may be related to factors like dilution due to rainfall/recharge.

#### **4.13 Conclusion & Recommendations**

From the discussion above, it can be concluded that in Haryana

1. Shallow ground water occurring in northern and northeastern parts is suitable for drinking as well as for irrigation.
  2. Shallow ground water occurring in central parts has intermediate quality and is permitted for drinking use in case there is no alternative source. However, it is suitable for irrigation on well-drained soil for salt tolerant crops such as wheat, maize, barley etc.
  3. Shallow ground water occurring in southern and western parts is not suitable for drinking as well as for customary irrigation. The reason for unsuitability for drinking uses is high concentrations of either salinity or nitrate or fluoride. The reason for rejection for irrigation uses is high salinity coupled with high SAR and RSC more than 2.5 meq/l. However, these waters can be used for irrigation in conjunction with surface water.
- Elevated Arsenic content in ground water is one of the most serious concerns as it affects large unconsolidated aquifers and the problem is compounded because the drinking water supply in the thickly populated parts is dependent on shallow aquifers which are found to be contaminated.
  - It is recommended that areas identified with unsuitable or marginally suitable water quality should be monitored on micro level to effectively delineate such areas and use suitable management measures.
  - In addition to various initiatives for preservation of quality of the water resources, following recommendations are made for containment of arsenic contamination of ground water:
  - Elevated Arsenic content in ground water is one of the most serious concerns as it affects large unconsolidated aquifers and the problem is compounded because the

drinking water supply in the thickly populated parts is dependent on shallow aquifers which are found to be contaminated.

- It is recommended that areas identified with unsuitable or marginally suitable water quality should be monitored on micro level to effectively delineate such areas and use suitable management measures.
- In addition to various initiatives for preservation of quality of the water resources, following recommendations are made for containment of arsenic contamination of ground water:
  - The arsenic affected wells should be clearly demarcated and not used for drinking purposes if it is not possible to seal.
  - Tapping of Arsenic safe alternate aquifers: this technique advocates to tap safe alternate aquifers right within the affected areas. In most of the cases, shallow aquifers are contaminated by Arsenic as seen in the CGWB study. Accordingly wells should be constructed with proper sealing to tap deeper Arsenic free aquifers.
  - The remedial measures includes variety of options, ranging from removing arsenic from ground water after it is extracted, searching alternative aquifers, reducing the level within the aquifer itself, dilution of the contaminants by artificial recharge, blending with potable water etc.
  - A number of techniques can be used for removal of arsenic in the ground water. The options of first choice should be mitigation or to provide alternative sources of safe water. It is suggested that each individual technique should be applied in each of the pockets on pilot basis. Dedicated monitoring mechanism should be established to know the effectiveness of the technique so as to arrive at the best method suitable for the entire area.
