XXI	Chemical Quality (Trace Metals)of Ground Water in NER, during Pre & Post Monsoon (2018-19)

## **FOREWORD**

Ground water is a dynamic and replenishable resource and monitoring spatial and temporal changes of this resource is essential for sustainable development and management. The water level data is of paramount importance in development and management of water resources in the country. Central Ground Water Board decided to issue a Ground Water Year Book annually for each State by compiling the hydro-geological, hydro-chemical and water level data collected from the Ground Water Monitoring Stations (GWMS) established by the Board in the States. CGWB, NER has a permanent network of 624 GWMSs in North Eastern Region covering the States of Arunachal Pradesh, Assam, Manipur, Meghalaya, Nagaland and Tripura. Monitoring of water level and chemical quality furnish valuable information on the ground water regime, characteristics of the different hydro-geological units in the States, viz. the pattern of ground water movement, changes in recharge-discharge relationship, behaviour of water level and changes in quantity of ground water in space and time. It also helps in identifying and delineating water logged areas, possible ground water pollution hazards and areas prone to lowering of water table/piezometric surface due to large scale withdrawal of ground water.

The behaviour of ground water level monitored from existing GWMSs and the chemical quality of ground water along with maps depicting the ground water scenario for the periods of measurement are presented in this report.

The water level data of GWMS in the States have been effectively compiled, analyzed and presented in this report by Ms. D. Rabha, "Sc-B" and Ms. Mophi Mili, "Sc-B". The scientific officers of the Regional Office systematically collected field data from the GWMSs four times in the year viz. March, August, November and January. The sincere effort of Dr.D.J. Khound, Sc-B in scrutiny, processing and issuance are gratefully acknowledged.

It is hoped that this report would be of immense use for administrators, planners, and officials as a reference in ground water development and planning in time and space.

## **EXECUTIVE SUMMARY**

North Eastern Region covers seven states namely Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura occupying an area of 2,55,083 sq. km. The Region is mostly occupied by hilly terrain and only 77,068 sq. km. is occupied by valley area, which forms 30% of the total area. In different hydrogeological formations of the Region, 624Ground Water Monitoring Wells (GWMW) have been set up. Most of these wells are located in valley areas. These wells are generally selected from existing ground water abstraction structures i.e. open wells, tube wells, and purpose-built piezometers. As on 31<sup>st</sup> January 2020, there are 559 dug wells and 65tube / bore wells in the region, which are being monitored four times a year i.e. during March 1<sup>st</sup> to 10<sup>th</sup> (This is the pre-monsoon water level and the water level as it stands at the end of the ground water year after all the inputs and outputs have taken place. In other words it is the resultant ultimate/lowest water level), August 20<sup>th</sup> to 30<sup>th</sup> (this water level marks the peak of the water level hydrograph), November 1<sup>st</sup> to 10<sup>th</sup>(this is the postmonsoon water level and the water level as it stands after the major portion of rainfall recharge has taken place), and January 1<sup>st</sup> to 10<sup>th</sup>. Water samples are being collected for chemical analysis during Pre-monsoon i.e. in the month of March when concentrations of different chemical constituents are expected to be maximum.

Monitoring and investigation is required to gain an understanding of the spatial and temporal variations in quality and quantity of groundwater resources. Groundwater monitoring can be defined as the systematic measurement and observation of the groundwater situation on a regular basis by measurement of water levels in wells and boreholes or of spring discharge and assessing its chemical quality, which provides the simplest indicator of changes in groundwater resources in quantity and/or quality. The objectives of the groundwater monitoring are to measure depth to water level and collect ground water samples for chemical analysis, thereby establish trends of water level and quality; to collect data documenting any change in groundwater storage over time in the principal aquifers; to provide both long-term and short-term data necessary to assess and predict the response of hydrologic systems to natural climatic variations and human-induced stresses; and to provide historical baseline data for studies of local/regional aquifers. Groundwater monitoring also helps in identifying areas showing negative impact due to over-abstraction or contamination or very shallow levels in Canal command e.g.

- Declining groundwater levels and depletion of groundwater reserves;
- Reductions in stream/spring base flows;
- Reduced access to groundwater water for drinking water supply and irrigation;
- Subsidence and foundation damage
- Deterioration of groundwater quality;
- Increased costs for pumping and treatment;

Ground Water Monitoring Wells are distributed in three river basins, viz. Brahmaputra (532), Meghna (163), and Imphal (25).

In unconsolidated formations 612GWMWs are located, while in semi-consolidated formations and consolidated formations 62 and 46 GWMWs are distributed respectively.

The rainfall is the main source of Ground Water recharge. North Eastern Region receives a considerable amount of rainfall. The annual average rainfall varies from 900 mm to more than 5000 mm.

Geologically, the area is underlain by consolidated to unconsolidated formations ranging in age from Archaean to Recent.

Hydrogeologically, the area is grouped into porous and fissured formations based on the nature of openings in the aquifer system. Alluvium and sedimentary formations and fissured consolidated rocks form the main repositories of ground water.

Water levels in the region remain mostly within 5.00 mbgl in all the four measurements. The summarized percentage of wells showing water levels in different depth ranges are as follows.

<b>Depth to water level (mbgl)</b>	<b>March, 2019(% of wells )</b>	<b>August, 2019 (%of wells )</b>	<b>November, 2019(% of wells)</b>	<b>January, 2020(% of wells)</b>
0 – 2	19.7	53.3	40	28.5
2 – 5	55.1	36.4	48	54.3
5 – 10	19.9	6.9	8.7	12.9
10 – 20	3.9	2.3	2.1	2.8
>20	1.4	1.1	1.2	1.5

Water level fluctuation of GWMWs during August'19, November'19 and January'20 with respect to Pre-monsoon (March'19) data show that there is

- Rise in water level in August 2019 in 93.20% wells.
- Rise in water level in November 2019 in 87.90% wells.
- Rise in water level in January, 2020 in 76.50% wells

Comparison of water levels of GWMWs during March'19, August'19, November'19 and January' 20, with respect to the same month during the previous year shows that there is

- Fall in water level in March 2019 in 66.5% wells.
- Fall in water level in August 2019 in 54.3% wells.
- Fall in water level in November 2019 in 50.8% wells.
- Rise in water level in January 2020 in 66 % wells.

Comparison of mean water level of the previous decade to the water level for the same period during 2019-20 shows that-

- During March 2019, rise is recorded in 55.7% GWMWs, as compared to decadal mean (March 2010- March'18).
- During August 2019, fall is recorded in 53.6% GWMWs, as compared to decadal mean (August 2010-August'18).
- During November 2019, rise is recorded in 52.5% GWMWs, as compared to decadal mean (November 2010-November'18).
- During January 2020, rise is recorded 60.8% GWMWs, as compared to decadal mean (January 2010-January'19).

Trend analysis of Pre-monsoon water level data of last ten years i.e. 2010-2019 shows falling trend in 33.7% stations and rising trend in 66.3% stations.

Trend analysis of Postmonsoon water level data of last ten years i.e. 2010-2019 shows falling trend in 45.1% stations and rising trend in 54.9% stations.

During pre-monsoon period (March 2019), 19.7% (85/431) stations show water logging condition, whereas 15.3% (66/431) stations shows prone to water logging condition.

During post monsoon period (November, 2019), 39.5% (172/435) stations show water logging condition, whereas 22.8% (99/435) stations shows prone to water logging condition.

Water samples from GWMWs are collected during the month of March every year when the soluble chemical constituents are expected to be maximum in concentration. Concentration of iron exceeds the permissible limit of drinking water standards in all the North-Eastern states.

The concentration of Fluoride and Arsenic was also observed beyond permissible limit of BIS (2012) in some areas of Assam. However, in general, the quality of ground water, in the North Eastern States is good for both irrigation and drinking purposes. The water samples are collected mainly from open wells. Higher concentrations of iron are also noticed in tube wells in different parts of the region.

As per 2017resources estimation, the region is enriched with more than 32.36 BCM of replenishable ground water resources and the stage of development is less than 20%. If it is planned properly this huge resource can be harnessed to develop the agro-economic scenario of the region. However, for the hilly terrain (about 70% of the total geographical area) where ground water is not sufficient, further development of spring water and rain water harvesting may be taken up.

# **GROUND WATER YEAR BOOK**

## **NORTH EASTERN REGION 2019-2020**

### **1. INTRODUCTION**

North Eastern Region is bounded between North Latitudes  $21^{\circ} 57'$ &  $29^{\circ} 28'$  and East Longitudes  $89^{\circ} 40'$ &  $97^{\circ} 25'$  with a geographical area of 2.55 lakh sq.km., comprising the States of Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura. (Fig-1) Hill ranges occupy about 70% of the total geographical area. The State-wise distributions of hilly and plain areas are given in Table-1.1. The region has two principal drainage systems viz. Brahmaputra and Meghna (Fig-2). Both the drainage systems join together and drain into Bangladesh. There are two sub-ordinate drainage systems in the region i.e. Chindwin and Kaladan. Even though, the region receives highest rainfall in the country and it experiences high flood during monsoon, there is acute shortage of drinking water in many hilly terrains such as Cherrapunji, in Meghalaya which is the second wettest place in the world. Despite endowed with one-third of water resource potential in the country, the agro-economic condition of the region is poor, as only a negligible amount of ground water resource (about 35%) has been utilized so far. Harnessing this enormous resource with proper planning and management can uplift the agro-economic scenario of the region.

**Table – 1.1 Distribution of hilly and plain areas in the region**

<b>State</b>	<b>State area (sq.km)</b>	<b>Valley Area (sq.km)</b>	<b>Percentage of Valley Area to total state area (%)</b>

TRIPURA	10,486	6085	58.02
<b>TOTAL</b>	<b>2,55,083</b>	<b>77,068</b>	<b>30.20</b>

Central Ground Water Board, North Eastern Region, has set up a number of Ground Water Monitoring Stations (GWMS) in different hydrogeological conditions in order to know ground water condition and its variation, in both time and space. Monitoring of water levels and collections of water samples are being carried out periodically to observe any change in water level and its quality consequent to changes in inputs and outputs. In order to have an idea of water level behaviour with respect to time, water levels are being monitored four times a year. First set of measurement is taken during pre-monsoon period (March 1<sup>st</sup> to 10<sup>th</sup>), second set is being taken

during peak monsoon (August 20<sup>th</sup> to 30<sup>th</sup>), third measurement is taken during post-monsoon (November 1<sup>st</sup> to 10<sup>th</sup>) and last set is being taken during January 1<sup>st</sup> to 10<sup>th</sup>. In North Eastern Region, it is observed that the ground water level builds up considerably during last part of April as the area receives pre-monsoon rainfall during March to May. Water samples are being collected once in a year during the pre-monsoon measurement i.e. in the month of March. In addition to this, monthly water level data is collected out by local Observers at 72 monitoring stations under ‘Participatory Monitoring Programme’.

As on 31<sup>st</sup> January, 2020, there are 624GWMS in the Region. The details of GWM Stations are given in Annexure I and its district-wise distribution is given in Table 1.2

The present report deals with the analysis of the water levels of Ground Water Monitoring Stations (GWMS) in North Eastern Region during the Water Year 2019-2020. The GWMS in Manipur and at few locations of Nagaland and Assam could not be monitored regularly due to deterioration of law and order situation. There is no existing GWMS in Mizoram State. In Arunachal Pradesh, there are only 27 monitoring stations and those are restricted along the southern boundary of the state adjacent to Assam.

## **2. DISTRIBUTION OF GROUND WATER MONITORING WELLS**

The distribution of Ground Water Monitoring Wells as per Lithology and river basin wise is dealt below:

### **2.1. Distribution of Ground Water Monitoring Wells as per Lithology**

About 84.95% of the total Network Wells are located in the Unconsolidated Formation, 8.7% of the Wells are located in the Semi-consolidated Formations and the remaining 6.35% are in the Consolidated Formations. The Lithology-wise distribution of the Network Wells is given in Table 2.1.

**Table 2.1 Distribution of GWMW in different Hydrogeological Units:**

Sl No.	State	No. of GWMS			
		Unconsolidated Formations	Semi-consolidated Formations	Consolidated Formations	Total
1	Arunachal Pradesh	27	0	0	27
2	Assam	367	11	7	385
4	Meghalaya	16	15	36	67
5	Nagaland	23	7	0	30
6	Tripura	103	12	0	115
	<b>Total</b>	<b>536</b>	<b>45</b>	<b>43</b>	<b>624</b>

### **2.2.Distribution of Ground Water Monitoring Wells - River Basin and Sub-Basin wise**

In all, there are four major River Basins and twenty-five Sub-basins in the North Eastern Region. Out of the four major Basins, the Brahmaputra Basin occupies the major part of the Region (Fig-3) and about 76%(527) of the Network Wells are located in this Basin. In Meghna Basin, about 21%(146) of the Wells are located and the remaining 8% (25)Wells are located in the Imphal Basin. The Kaladan Basin forms the southernmost parts of Mizoram there is no Network Well located in this basin. The distribution of GWMW in different Basins and Sub-basins are shown in Table – 2.2.

**Table – 2.2 Distribution of GWMW in different Basins and Sub-basins**

### **3. RAINFALL**

The region is characterized by tropical monsoon climate with a rainy summer and dry winter. Heavy rainfall is received during summer and occasional rainfall during winter. January and February are the driest months. The rainfall received during summer is under the spell of South-West monsoon. The onset of South-West monsoon in the region occurs by the end of May or the first week of June and withdraws by late September or early October. But, very often pre-monsoon showers are experienced during March and April. Copious rainfall is received in certain parts of the region during the summer. Mawsynram, located in the State of Meghalaya, has the unique distinction of recording the highest average 11873mm annual precipitation in the world. This is because of its peculiar geographical location. From March to May, the region comes under the influence of equatorial Westerlies and receives precipitation with occasional thundershowers.

The average monthly rainfall of the district for four years (2015-2018) recorded by IMD has been presented in **Table 3**. The isohyets showing the rainfall pattern in the region on the basis of average annual rainfall, has been depicted in **Fig.4**

**Table 3. Rainfall data (in mm) (2015-2018)**

## 4. GEOLOGY

Geological Formations encountered, in the North Eastern Region, range in age from Archaean to Recent. The generalized Geological succession of the Region is shown in Table-4.

**Table – 4 Generalized Geological Successions in North Eastern India**

Age	Group/ Formations	Lithology
Recent	Newer Alluvium	Clay, Silt, Sand as beds and lenses. ~~~~~ Unconformity ~~~~~~
Pleistocene	Older Alluvium	Clay, coarse Sand, Shingle, Gravel & Boulder deposits as beds and lenses ~~~~~ Unconformity ~~~~~~
Pliocene	Dihing	Pebble beds, soft Sandy clay, Conglomerate, Grit and Sandstone. ~~~~~ Unconformity ~~~~~~
Mio-Pliocene	Dupi Tila	Sandstone, Conglomerate. Mottled clay, and Grit ~~~~~ Unconformity ~~~~~~
Miocene	Tipam	Mottled clay, Sandy shale, Gritty sandstone, Ferruginous sandstone, Clay, Shale and Conglomerate.
	Surma	Shale, Sandy shale, Siltstone, Mudstone,
	Conglomerates etc.	~~~~~ Unconformity ~~~~~~
Oligocene	Barail	Massive sandstone, Shale, Sandy shale etc.
Eocene	Disang / Jaintia	Shale, Sandstone, Marl, Limestone etc.
Upper Cretaceous	Khasi Group	Conglomerate, Arkose, Sandstone – Conglomerate alterations. ~~~~~
	Unconformity ~	~~~~~
Jurassic	Sylhet Trap	Basalt, Rhyolite, acid Tuff as flows and lenses ~~~~~ Unconformity ~~~~~~
Pre-Cambrian	Shillong Group	Quartzite, Phyllite, Conglomerate, Dolerite, Basalt, Porphyritic and coarse Granite, Pegmatite. ~~~~~ Unconformity ~~~~~~
Archaean		Biotite-gneiss, Biotite-hornblende-Gneiss, Granite, Gneissic Complex Ilemenite-quartz-schist, Mica-Schist etc.

The North Eastern Region can structurally be classified into five major Geotectonic Provinces. These are as follows.

**4.1. Shield area:** The stable landmass of Assam-Meghalaya Plateau and the Mishimi massif form the shield area which were unaffected by orogenic movements. The shield area is separated from the other tectonic provinces by deep fractures in all sides.

**4.2. Platform area:** The areas bordering the shield area are termed as platform area. This zone was also unaffected by Cenozoic orogenic movement. However, late Mesozoic and Cenozoic marine and fluviatile sediments were deposited on this. The Upper Assam valley extending from Mishimi hills to Karbi Anglong, its southern margin and the northern margin of Cachar and N.C. Hills form the platform area, which is the eastern extension of Bengal platform.

**4.3. Shelf area:** The narrow southern margin bordering the Shield area is known as shelf area.

**4.4. Mobile belt:** The Geosynclinal deposition on the northern part forming Himalayan mountain system and the east and south-eastern parts forming Naga Patkai and Lushai Hill ranges due to orogenic movement are termed as mobile belts.

**4.5. Foredeeps:** The depressions in the northern and south-eastern margin of the platform are known as foredeeps. These foredeeps are covered by thick pile of molassic sediments derived from still rising mountains of mobile belt.

## **5.HYDROGEOLOGY**

Recharge to the ground water of an area is controlled, mainly by three factors – Topography, Geology and Climate. Topography controls the gradient of an area. Geology plays an important role in storage and transmission of ground water and Climate forms the main source of ground water recharge through precipitation.

Based on the ground water occurrence and movement, the Geological Formations of the Region can be broadly grouped into Porous and Fissured Formations.

- (a) Porous Formations
  - 1. Unconsolidated Formations
  - 2. Semi-consolidated Formations
- (b) Fissured Formations
  - 1. Consolidated Formations

### **5.1 Porous Formations**

#### **5.1.1 Unconsolidated Formations:**

Unconsolidated Formations (Alluvium) occupy about 77,068 sq.km areas which are about 30% of the total area of the region and it covers mostly the plains of Brahmaputra valley and Barak valley of Assam. This Alluvial Formation comprises of Clay, Silt, Sands of various grain size and Gravel, etc. The foot-hill zone of Arunachal Pradesh comprises Boulder, Pebble, Cobble, Gravel, Sand, Silt, Clay etc. known as ‘Bhabar Zone’. In general the grain size of the formations decreases from north to south in the northern part of the Brahmaputra River and from south to north in the southern part of the River. The foot-hill areas in northern and southern part form the recharge zone of ground water for the plains of Assam.

Ground water, in general, occurs under unconfined to semi-confined conditions. However, in parts of Darrang, Nalbari, northern part of Kamrup, part of Cachar district of Assam and in southern part of West Garo Hills district of Meghalaya, ground water occurs under confined conditions giving rise to auto flow wells.

A total of 536 Ground Water Monitoring Stations are located in Unconsolidated Formations. During the year 2019-2020, the range of pre and postmonsoon water levels varied from 0.21 magl to 27.25 mbgl and 0.02 mbgl to 27.35 mbgl respectively.

#### **5.1.2 Semi-consolidated Formations:**

The Semi-consolidated Formations occupy the hill ranges of Tripura, southern hill ranges of Arunachal Pradesh, eastern part of Nagaland, Manipur, Mizoram, eastern fringe of Assam bordering Arunachal and Nagaland and hill ranges of Barak valley in southern Assam. The semi-consolidated formations in the region belong to Tertiary age. The granular zones comprise fine to medium grained sandstone, siltstone with intermittent shale beds. Ground water, in these formations occurs mostly under semi-confined to confined conditions.

In the semi-consolidated formation, 45GWMS are located. The pre and postmonsoon water levels ranged from 0.51 to 15.15 mbgl and 0.52 to 20.06 mbgl respectively.

## **5.2 Fissured Formations**

### **5.2.1 Consolidated Formation:**

The Consolidated Formations form the high hill ranges of Arunachal Pradesh, high land plateau of Meghalaya, Karbi Anglong district of Assam and isolated inselbergs of Brahmaputra valley scattered along both northern and southern bank of Brahmaputra River in middle and lower Assam. This formation mostly comprises of gneissic and schistose rocks belonging to Archaean and Pre-Cambrian age. These rocks are very compact and hard devoid of primary porosity. However, the secondary porosity developed by fractures, fissures and joints form ground water conduits and reservoirs. Due to high rainfall in the area, the weathered residuum has developed a considerable thickness, which varies from 10 to 20 m in general. This weathered residuum forms a good ground water reservoir. In the hill ranges of the area, springs are a common sight, which emanate through contacts of joints, fractures, topographic lows and hill slopes.

A total of 43 GWMS are located in consolidated formations. The range of water levels during pre & post-monsoon varied from 0.56 to 31.91 mbgl and 0.79 to 43.95 mbgl respectively.

## **6. BEHAVIOUR OF WATER LEVEL DURING THE YEAR 2019-20**

Based on the water level data collected from the Ground Water Monitoring Stations, the following maps has been prepared for each monitoring period. The details of GWM Stations and water level data during the year, 2019– 2020 are given in Annexure I and II.

- i. Depth to water level maps
- ii. Fluctuation of water level between Pre and Post monsoon.
- iii. Fluctuation of water level in the current month with respect to that of the same month of the previous year.
- iv. Fluctuation of water level in the current month with respect to the average of the preceding decade for the same month.

### **6.1 Depth to Water Level**

#### **6.1.1 Depth to Water level during March, 2019 (Fig. 5 and Annexure III)**

##### **Arunachal Pradesh**

A significant part of Arunachal Pradesh is hilly. Hence, most of the monitoring stations are located along the southern boundary bordering the Brahmaputra valley of Assam.

During the month of March 2019, groundwater level was recorded in 46.2% (12) of the monitored stations within 0-2 mbgl, in 30.8% (8) stations in the range of 2-5 mbgl, in 19.2% (5) stations ranging from 5 to 10 mbgl and only in 1(3.8%) GWMS was from 10 and 20 mbgl. The minimum and maximum water level of 0.21 magl and 12.69mbgl were recorded in Papumpare district.

##### **Assam**

During the month of March 2019, 17.9% (45) of the monitored stations exhibited water level within 0-2 mbgl, 59.4% (149) stations in the range of 2-5 mbgl, 19.5% (49) stations from 5-10 mbgl and 3.2% (8) stations from 10 and 20 mbgl. The minimum water level of 0.14 mbgl had been observed in Udaguri district. The maximum water level of 17.39mbgl had been recorded in Dhubri district.

##### **Meghalaya**

The Depth to water level measured during March 2019, indicates water level in the range of 2-5 mbgl in majority of the GWMS. Water level within 0-2 mbgl was recorded in 14.3% (8) stations, in the range of 2-5 mbgl in 51.8% (29) stations, in 26.8% (15) stations ranging from 5-10 mbgl, only in 1 station in the range of 10-20 mbgl and in 5.4% (3) GWMS above 20 mbgl. The minimum water level of 0.51 mbgl was recorded in West Jaintia Hills district. The maximum

waterlevel (12.96mbgl) in dugwell and in piezometer (43.95mbgl ) had been recorded in West Jaintia Hills district and in East Jaintia Hills district respectively.

### **Nagaland**

During March 2019, water level in the state was monitored only in few stations. Water level in within 2mbgl was recorded only in 1 station and in 50% (3) stations in the range of 2-5 mbgl in 25.8% (8) stations. In 2 (33%) stations water level was observed in the range of 10-20 mbgl . Both the minimum water level (1.15 mbgl) and the maximum water level (11.62mbgl had been recorded in Dimapur district.

### **Tripura**

During the month of March 2019, in 20.6% (20) of the monitored stations of the state, water level was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 52.6% (51) stations , in the range of 5-10mbgl in 18.6% (18) GWMS, from 10-20mbgl in 5.1%(5) stations and in three pieometers above 20mbgl. Majority of water level was recorded in the range of 2-5mbgl. The minimum water level of 0.45 mbgl was recorded in South Tripura district. The maximum water level (9.76mbgl) in dugwell and in piezometer (27.25mbgl ) had been recorded in Gomati district and in West Tripura district respectively.

### **6.1.2 Depth to Water level during August, 2019 (Fig. 6 and Annexure IV)**

#### **Arunachal Pradesh**

During the month of August 2019, water level within 0-5 mbgl had been recorded in 90% (27) of the monitored stations of the state. Depth to water level within 0-2 mbgl was observed in 51.7% (15) stations, in the range of 2-5 mbgl in 41.3%(12) stations and one station each in the range of 5-10mbgl and 10-20mbgl. Both minimum water level of 0.34magl and maximum water levels of 10.85 mbgl had been recorded in Papumpare district.

#### **Assam**

Depth to water level scenario in the state during August, 2019 indicate prevalence of water level within 5mbgl (93%, 255 Nos.). Depth to water level in the range of 0-2mbgl was recorded in 59.8%(164) stations, in the range of 2-5 mbgl in 33.2%(91) stations and in the range of 5-10mbgl in 5.5%(15) stations. Water level in the range of 10-20 mbgl was recorded in 4(1.5%) stations only. Minimum and maximum water levels of 0.16 mbgl and 16.84 mbgl had been recorded in Marigaon and Dhubri District respectively.

### **Meghalaya**

During the month of August 2019, water level in the range of 0-2 mbgl was recorded in 45.2% (28) of the monitored stations of the state. In 38.7% (24) stations, it was recorded in the range of 2-5 mbgl, in 9.7% (6) stations in the range of 5-10, only in 1 station in the range of 10-20mbgl and in 3 stations(4.8%) above 20mbgl. The minimum water level (0.05 mbgl) was recorded in East Khasi Hills district. The maximum water level (11.03mbgl) in dugwell and in piezometer (39.51mbgl ) had been recorded in West Jaintia Hills district and in East Jaintia Hills district respectively.

### **Nagaland**

During August 2019, water level in the state was monitored only in Dimapur district. It was recorded within 0-2 mbgl in 30% (3) of the monitored stations, in the range of 2-5 mbgl in 60% (6) stations and in the range of 5-10 mbgl in 10%(1) station. The minimum and maximum had been recorded as 0.98 mbgl and 6.83 mbgl respectively.

### **Tripura**

During the month of August 2019, water level in 42.8% (42) of the monitored stations of the state was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 39.8% (39) stations , in the range of 5-10mbgl in 10.2% (10) stations and in 5.1%(5) stations in the range of 10-20mbgl. Water level beyond 20mbgl was found in 2 piezometers. Majority of water level was recorded within 0-5mbgl. The minimum water level of 0.3 magl was recorded in Dhalai district. The maximum water level (8.97mbgl) in dugwell and in piezometer (26.9mbgl ) had been recorded in Gomati district and in West Tripura district respectively.

### **6.1.3 Depth to Water Level during November, 2019 (Fig. 7 and Annexure V)**

#### **Arunachal Pradesh**

Depth to water level had been measured in 25GWMS of the state during the month of November 2019. In 44% (11) of the monitored stations the water level was found within 0-2 mbgl, in 36% (9) stations in the range of 2-5 mbgl, in 16% (4) stations in the range of 5-10 mbgl and in only one station it was recorded in the range of 10-20 mbgl. Both the minimum and maximum water levels of 0.25 magl and 10.4 mbgl had been recorded in Papumpare district.

#### **Assam**

During November 2019, depth to water level in majority of the stations(92.2%, 224 Nos.) was found in the range of 0-5mbgl. Depth to water level in the range of 0-2mbgl was measured in 46.5%(113) stations, in the range of 2-5 mbgl in 45.7%(111) stations and in the range of 5-10mbgl in 6.6%(16) stations. Water level in the range of 10-20 mbgl was recorded

in 3(1.2%) stations only. Minimum water level (0.01magl) and maximum water level ( 18.32 mbgl) were recorded in Jorhat and Dhubri District respectively.

### **Meghalaya**

During November 2019, water level in the state was recorded within 0-2 mbgl in 38.7% (24) of the monitored stations, in the range of 2-5 mbgl in 48.4% (30) stations and in the range of 5-10 mbgl in 8.1(5) stations . Water level above 20mbgl was observed in 4.8%(3) stations. The minimum water level of 0.15 mbgl was recorded in East Khasi Hills district. The maximum water level (9.74mbgl) in dugwell and in piezometer (39.89mbgl ) had been recorded in West Jaintia Hills district and in East JaintiaHills district respectively.

### **Nagaland**

During November 2019, water level in the state had been monitored only in Dimapur districtWater level in 27.3% (3) of the monitored stations had been recorded within 0-2 mbgl and in 4 (36.4%) stationseach in the range of 2-5 mbgland 5-10 mbgl. The minimum and maximum water level had been recorded as 0.41and 9.95 mbgl.

### **Tripura**

During the month of November, 2019, water level in 24.5% (23) of the monitored stations of the state was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 58.5% (55) stations , in the range of 5-10mbgl in 9.6% (9) stations and in 5.3%(5) stations in the range of 10-20mbgl. Only in 2 stations water level was observed beyond 20 mbgl. Majority of water level was recorded within 0-5mbgl. The minimum water level of 0.16 mbgl was recorded in Dhalai district. The maximum water level (9.18mbgl) in dugwell and in piezometer (26.89mbgl) had been recorded in Gomati district and in West Tripura district respectively.

### **6.1.4Depth to water level during January, 2020 (Fig. 8 and Annexure VI)**

#### **Arunachal Pradesh**

During the month of January, 2020 , groundwater level in the state was recorded in 26.9% (7) of the monitored stations within 0-2 mbgl, in 46.2% (5) stations in the range of 2-5 mbgl, in 19.2% (5) stations in the range of 5-10 mbgland only in2(7.7%) GWMS in the range of 10-20mbgl. Both the minimum and maximum water levels of 0.14 mbgl and 12.03mbgl had been recorded in Papumpare district.

## **Assam**

Depth to water level scenario in the state during January,2020 indicate water level within 5mbgl (87.6%, 225Nos.) in major part of the state . Depth to water level in the range of 0-2mbgl was recorded in 33.1%(85) stations, in the range of 2-5 mbgl in 54.5%(140) stations and in the range of 5-10mbgl in 10.5%(27) stations. Water level in the range of 10-20 mbgl was recorded in 4(1.5%) stations and above 20mbgl in one station only. The minimum water level of 0.11 mbgl was recorded in Jorhat and Karimganj district. The maximum water level of 20.06 mbgl had been recorded in Karbi Anglong District.

## **Meghalaya**

During the month of January, 2020, water level in the range of 0-5 mbgl was recorded in 80%(48) of the monitored stations in the state. In 18.3% (11) stations, it was recorded in the range of 0-2 mbgl, in 61.7% (37) stations in the range of 2-5mbgl, and in 13.3% (8) stations in the range of 5-10mbgl. Water level in the range of 10-20mbgl was recorded only in 1 station and beyond 20mbgl was found in 3(5.0%) stations. The minimum water level (0.52mbgl) was recorded in West Jaintia Hills district. The maximum water level (11.63mbgl) in dugwell and in piezometer (43.93mbgl ) had been recorded in West Jaintia Hills district and in East Jaintia Hills district respectively.

## **Nagaland**

During January, 2020, water level in the state was recorded in 16.7% (2) of the monitored stations within 0-2 mbgl, in 50% (6) stations in the range of 2-5mbgl, in 25% (3) stations in the range of 5-10mbgl and only in 1 station in the range of 10-20 mbgl. Both the minimum water level (0.47 mbgl)and themaximum water level (10.4mbgl) had been recorded in Dimapur district.

## **Tripura**

During the month of January, 2020, water level in 24.5% (25) of the monitored stations in the state was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 52% (53) stations , in the range of 5-10mbgl in 15.7% (16) GWMS and in 4.9%(5) stations in the range of 10-20mbgl. Water level above 20mbgl was found in 3 stations in West Tripura district. Majority of water level was recorded within 0-5mbgl. The minimum water level of 0.02 mbgl was recorded in North Tripura district. The maximum water level (10.13mbgl) in dugwell and in piezometer (27.35mbgl) had been recorded in Gomati district and in West Tripura district respectively.

## **6.2 Water Level Fluctuation with respect to August 2019**

### **6.2.1 Water Level Fluctuation, August 2019 and March 2019(Fig. 9 and Annexure VII)**

#### **Arunachal Pradesh**

Rise in water level was observed in all the monitored stations during August 2019 as compared to that of March 2019. Rise had been recorded in 79.2% (19) stations in the range of 0-2 m and in 12.5% (3) stations in the range of 2-4 m. The rise was mostly restricted to 2m only. Fall was recorded only in two stations in Papumpare district.

#### **Assam**

Rise in water level in August 2019 was observed in 88.8%(198) of the GWMS in comparison to March 2018. Rise was recorded in 57.5% (126) stations in the range of 0-2 m, in 28.8% (63) stations in the range of 2-4 m and in 7.8% (17) stations above 4 m. Fall was observed in 5.9% (13) of the GWMS. The occurrence of fall in few stations may be due to pre-monsoon shower which caused rise in water level during March 2019.

#### **Meghalaya**

Comparison of water levels of August 2019 with that of March 2019 show rise in water level during August in majority of the GWMS. Rise in the range of 0-2 m was observed in 61.1% (33) stations, in the range of 2-4 m in 31.4% (17) stations and above 4 m in 3.7% (2) stations. Only 2(3.8%) stations recorded ; one station each in the range of 0-2m and beyond 4m.

#### **Nagaland**

Rise in water level in Dimapur district of the state was observed in 80% (4) GWMS during August 2019 in comparison to that of March 2019. Rise was recorded in 2(40%) stations each in the range of 2-4m and beyond 4m. Only in 1 station fall was observed and it was restricted to 2 m.

#### **Tripura**

Majority of the GWMS recorded rise in water level during the month of August 2019 in comparison to that of March 2019. Rise was observed in 72.8% (67) stations in the range of 0-2 m, in 16.3% (15) stations in the range of 2-4 m and only in 1(1.1%) stations beyond 4 m. Fall in water level was restricted to 2m only and was recorded in 9.8%(9) stations.

## **6.3 Water Level Fluctuation with respect to November 2019**

### **6.3.1 Water Level Fluctuation, November 2019 and March 2019(Fig. 10 and Annexure VIII)**

### **Arunachal Pradesh**

Comparison of water level of November 2019 and March 2019 indicates rise in 71.4% of the GWMS during November 2019. Rise was recorded in 47.6% (10) of the GWMS in the range of 0-2 m and in 3(14.3%) stations in the range of 2-4 m. Fall was recorded only in 7 (33.3%) stations which may be due to rise of water level in March, 2019 caused by pre-monsoon shower.

### **Assam**

By comparing the water level of November 2019 with that of March 2019 it is found that rise was recorded in about 90.9%(180) of the GWMS. Rise was observed in 66.1% (131) stations in the range of 0-2 m, in 19.2% (38) stations in the range of 2-4 m and in 5.6% (11) stations beyond 4 m. Fall was recorded in 9.1% (18) stations. Entire fall was restricted to 2m. The fall may be due to rise in water level caused by the occurrence of pre-monsoon shower in certain part of the state.

### **Meghalaya**

Comparison of water level of November 2019 with that of March 2019 indicates rise in majority of the stations during November, 2019. Rise was recorded in the range of 0-2 m in 62.9% (34) stations, in the range of 2-4 m in 25.9% (14) of the stations and above 4m in 5.6% (3) stations. Fall was recorded in 6.25.6% (3) GWMS and it was in the range of 0-2 m.

### **Tripura**

Most of the GWMS recorded rise in water level during November 2019 in comparison to March 2018. Rise in the range of 0-2m was recorded in 76.7%(69) stations and in 7.8%(7) stations in the range of 2-4 m. Fall was observed in 13.3% (12) GWMS in the range of 0-2 and only in 2 (2.2%) stations in the range of 2-4 m.

## **6.4 Water Level Fluctuation with respect to January 2020**

### **6.4.1 Water Level Fluctuation, January 2020 and March 2019 (Fig. 11 and Annexure IX)**

#### **Arunachal Pradesh**

By comparing the water levels of January 2020 with that of March 2019 it was found rise in 40%(8) of the monitored stations during January, 2020. Entire rise was within 2m. Fall was recorded in 40% (8) stations in the range of 0-2 m and in 3((15%) stations in the range of 2-4m and only in one station above 4m. The fall observed may be due to rise in water level caused by of pre-monsoon shower during March 2019 .

### **Assam**

During January, 2020 rise in water level was observed in majority of the stations in comparison to that of March, 2019. Rise in the range of 0-2 m was recorded in 67.2% (142) stations, in the range of 2-4 m in 11.4% (24) stations and in 6(2.8%) stations beyond 4 m. Rise was observed mostly in Upper Assam, covering major parts of Dhemaji, Lakhimpur, Dibrugarh, Tinsukia, Biswanath, Jorhat and Golaghat district. Rise was also observed in parts of Karbi Anglong, Nagaon, Darrang, Morigaon and in Kamrup district. A general rise in water level had been recorded in the Barak valley.

Fall in water level was observed in 17.5% (37) of the GWMS in the range of 0-2 m and in one station each in the range of 2-4 m and above 4 m. Fall was observed in major parts of Bongaigaon, Dhubri and Udalguri district.

### **Meghalaya**

By comparing the water levels of January 2020 with March 2019 it was observed rise in majority of the stations during January 2020. Fall was recorded in 6(11.5%) stations. Entire fall was within 2 m. Rise was observed in 71.2% (37) stations in the range of 0-2 m, in 15.4% (8) stations in the range of 2-4 m and only in one station above 4 m.

### **Nagaland**

Comparison of water levels of Dimapur district for January 2020 and March 2019 indicates rise during January, 2020 in 66.6% (4) monitored. Fall was recorded only in 2 stations, 1 station each in the range of 0-2 m and above 4 m.

### **Tripura**

By comparing the water level of January 2020 with that of March 2019 it was observed rise during January, 2020 in 64.8% (61) stations in the range of 0-2 m and one station each in the range of 2-4 m and above 4 m. Fall was recorded in 28.7% (27) stations in the range of 0-2 m and in 4.3% (4) stations in the range of 2-4 m. Both rise and fall in water level had been observed in all the districts. However, fall was observed mostly in Dhalai, Gomati, North Tripura and South Tripura district.

## **6.5 Fluctuation of Water Level with respect to same month of the previous year**

### **6.5.1 March 2019 and March 2018 (Fig. 12 and Annexure X)**

### **Arunachal Pradesh**

Comparison of water levels of March 2019 and March 2018 indicated rise in 84.2% (16) stations in the state in March, 2019. Fall was observed in 15.8% (3) stations. Entire

fall was found within 2m. Rise was observed in 42.1%(8) stations in the range of 0-2 m, in 31.6%(6) stations in the range of 2-4m and only in 2(10.5%) station above 4m.

### **Assam**

Fall in water level in major part(66.6%, 137 stations) of the state was observed during March, 2019 in comparison to that of March, 2018. In 54.4%(112) stations fall was recorded in the range of 0-2 m, in 8.3% (17) stations in the range of 2-4 m and in 3.9% (8) stations above 4 m. In total, 33.4%(69) stations indicated rise; of which, 31%(64) was within 2m and in 1.5%(3) stations in the range of 2-4m and in 2 stations above 4m. Fall was mostly observed in Dibrugarh, Tisukia, Jorhat, Golaghat, Biswanath, Kamrup, Morigaon, Nagaon, and Bongaigaon district of the Brahmaputra valley and in Cachar, Karimganj and Hailakandi district of Barak valley. Rise was observed in major part of Dhemaji, Lakhimpur, Sibsagar and Udalguri district.

### **Meghalaya**

Comparison of water level of March,2019 with that of March,2018 indicated fall during March,2019 in 78.8% (41) of monitored stations. All the rise(21.2%, 11) and fall were found within 2m except in one station in Ri-Bhoi district

### **Nagaland**

Comparison of water levels of March 2019 of Dimapur district with that of March 2018 indicated fall during March,2019 in 66.7%(4) of the GWMS.Rise was observed in 33.3%(2) stations.

### **Tripura**

Comparison of water level of March 2019 with that of March 2018 indicated fall in major part of the state during March,2019.Rise in water level was recorded in 27.8%(20) stations in the range of 0-2m and only in one station in the range of 2-4m. In total, fall was observed in 70.9%(51) stations, of which 68.1%(49) was in the range of 0.2m and in 1 station in the range of 2-4m.All the rise and fall had been found to be restricted to 2m except in 3 stations.Rise was observed in major parts of Dhalai and Khowai district and sporadically in Gomati, North Tripura, South Tripura and Unakoti district

## **6.5.2 August 2019 and August 2018(Fig. 13 and Annexure XI)**

### **Arunachal Pradesh**

Comparison of water levels of August 2019 and August 2018 indicated rise during August, 2019 in 73.9% (19) stations. Rise in the range of 0-2m was observed in 56.5%(13) stations, in the range of 2-4 m 13%(3) stations and only in 1(4.6%) station above 4m. Fall was recorded in 21.7%(5) stations in the range of 0-2m and in 1(4.4%) station in the range of 2-4 m. Both rise and fall were mostly restricted to 2m.

### **Assam**

By comparing the water levels of August 2019 with August 2018 it was observed fall in 55.1%(124) stations of the state during August, 2019. In 49.3%(111) stations fall was recorded in the range of 0-2m, in 4.5%(10) stations in the range of 2-4 m and in 1.3%(3) stations above 4m. Rise in water level was observed in 43.6%(98) stations in the range of 0-2m and in 3(1.3%) stations in the range of 2-4. Both rise and fall had been observed in most of the district. However, in major parts of Dibrugarh, Tinsukia, Dhemaji, Lakhimpur, Sonitpur, Kamrup, Goalpara and Dhubri district fall was observed. In Barak valley fall was observed in major part. Rise was observed mostly in Sibsagar, Jorhat, Golaghat, Karbi Anglong, Morigaon and Nagaon district.

### **Meghalaya**

Comparison of water levels of August 2019 and August 2018 indicated fall in water in 48.3%(28) stations in the range of 0-2m and 1 station each in the range of 2-4m and above 4m. All the rise in water level had been found within 2m only and in 48.3%(28) stations.

### **Nagaland**

By comparing the water level of Dimapur district for August 2019 and August 2018 it was observed rise during August, 2019 in 90% (9) of the monitored stations of the state. Fall was recorded only in 1 station. Entire rise and fall were restricted to 2m.

### **Tripura**

Comparison of water levels of August, 2019 and August 2018 indicates fall in water level in major part of the state during August, 2019. In 32.1%(425) monitored stations rise was observed. Entire rise was within 2m. Fall was recorded in 58.9%(46) stations in the range of 0-2m, in 6.4%(5) stations in the range of 2-4m and only in two stations above 4m. The range of 2-4m located in Unakoti district. Entire fall was restricted to 2m and was recorded in 40.7%(24) stations.

### **6.5.3 November 2019 and November 2018 (Fig. 14 and Annexure XII)**

#### **Arunachal Pradesh**

By comparing the water level of November 2019 and November 2018 it was observed rise in most of the monitored stations of the state during November, 2019. In 77.3% (17) of the GWMS rise was recorded and in 22.7% (5) fall was recorded. Entire rise and fall were within 2m.

#### **Assam**

In November, 2019 rise in water level was observed in the state in comparison to that of November, 2017 in 51.7% (120) stations. Rise in the range of 0-2 m was recorded in 48.7% (113) stations and in the range of 2-4 m in 3% (7) stations. Fall was observed in 48.3% (112) stations. Rise was recorded in major parts of Tinsukia, Sibsagar, Jorhat, Golaghat, Sonitpur, Biswanath, Kamrup and Karbi Anglong district. Fall was observed mostly in Bongaigaon, Cachar, Darrang, Dhemaji, Dibrugarh, Morigaon, Nagaon and Udaguri district.

#### **Meghalaya**

In comparison to November 2018, fall in water level was recorded in 53.3% (31) monitored stations of the state during November 2019. Rise was observed in the range of 0-2 m in 46.5% (27) stations and in the range of 2-4 m in 3.4% (2) stations. Fall was recorded in 48.3% (28) stations in the range of 0-2 m and only in one station in West Garo Hills district in the range of 2-4 m and at two stations above 4 m located in Ri-Bhoi and West Garo Hills district.

#### **Nagaland**

During November, 2019 rise in water level was observed in 63.6% (7) monitored stations in Dimapur district of the state in comparison to November, 2018. Rise in the range of 0-2 m was recorded in 54.5% (6) stations and only in 1 station in the range of 2-4 m. Fall was observed in 2 stations each in the range of 0-2 m and 2-4 m.

#### **Tripura**

Comparison of water levels of November 2019 and November 2018 indicated fall in major part of the state during November 2019. In total, fall was recorded in 66.7% (52) stations except in one location in Dhalai district. Fall was observed in 60.3% (47) stations in the range of 0-2 m, in 5.1% (4) stations in the range of 2-4 m and only in 1 (1.3%) station above 4 m located in West Tripura district. All the rise (33.3%, 26 stations) was recorded within 2 m.

#### **6.5.4 January 2020 and January 2019 (Fig. 15 and Annexure XIII)**

##### **Arunachal Pradesh**

Rise in water level during January 2020 had been observed in most of the stations of the state in comparison to January 2018 data. Rise was observed in 13(61.9%) stations and fall in 8(38.1%) stations. Both rise and fall were restricted to 2m only.

##### **Assam**

In January, 2020 rise in water level was observed in majority of the stations in comparison to that of January, 2019. In 60.8% (152) stations it was found in the range of 0-2 m and in 3(1.2%) stations each in the range of 2-4 m and above 4m. Fall was observed in 36.8%(88) stations, of which 33.6%(84) was in the range of 0-2m, in 6(2.4%) stations in the range of 2-4m and in 2(0.8%) stations above 4m. Rise has been recorded in major parts of Tinsukia, Lakhimpur, Biswanath, Sonitpur, Jorhat, Karbi Anglong, Kamrup(M), Nagaon, Bongaigaon and Dhubri district. A general rise in water level was observed in the Barak valley. Fall was mostly recorded in Dhemaji, Morigaon and Udaguri district.

##### **Meghalaya**

In comparison to January 2019, rise in water level was recorded during January 2020, in major part of the state. In 69.1% (38) of the stations rise was observed; of which 65.5%(36) stations was in the range of 0-2 m and in 2(3.6%) stations in the range of 2-4 m. Fall was observed in 16(29.1%) stations in the range of 0-2 m and only in 1(1.8%) station in the range of 2-4 m located in East Garo Hills district.

##### **Nagaland**

By comparing the water level of January 2020 and January 2019, it was observed rise in most of the stations (8 Nos, 72.7%) in Dimapur district of the state during January 2020. Rise in the range of 0-2m was recorded in 54.5% (6) stations and in the range of 2-4m in 18.2%(2) stations. Fall was observed in 27.3%(3) stations; 1 station each in the range of 0.2m, 2-4m and above 4m.

##### **Tripura**

Rise in water level was recorded in major part of the state during January 2020 in comparison to January 2019. Rise in the range of 0-2m was recorded in 69.2%(56) stations, in the range of 2-4m in 2.5%(2) stations and above 4m in 1.2%(1) station. The fall in water level was recorded in 25.9%(21) stations in the range of 0-2m and only in 1 station in the range of 2-4m, located in West Tripura district. Fall had been observed in major part of Dhalai district. In other districts, it was observed in pockets.

## **6.6 Fluctuation of Water level with respect to Decade Mean ( Preceding 10 Years )**

Water level of a GWMS of the monitored months are compared with the mean water level data of preceding ten years to know any deviation i.e., rise and fall in long term water level trend .

### **6.6.1 March, 2019 and Decadal Mean, March ,2009-2018 (Fig. 16 and Annexure XIV)**

#### **Arunachal Pradesh**

March, 2019water level had been compared with mean water level data of the same period of preceding 10 years. Rising trend was observed in 84.6%(11) stations, of which 30.8%(4) stations were in the range of 0-2 m, 46.2% stations were in the range of 2-4m and in 1 station above 4m.. Declining trend was observed only in the range of 0-2 m, in15.4%(2) stations. The maximum rising & falling water level trendsare 6.56 m and 0.97 m respectively and had been recorded in Tirap and Papumparedistrict.

#### **Assam**

Comparison of March 2019 water level with mean water level data of the same period of preceding 10 years indicate rising trend in49.1%(82) stations in the range of 0-2 m, in3.6% (6) stationsin the range of 2-4 m and only in 2(1.2%) stations above 4m. .Falling trend was observed in41.3%(69) stationsin the range of 0-2, in 5%(3) stations in the range of 2-4m andin 2(1.5%) stationsabove 4m. In total, rising trend was observed in53.9%(90)of the monitored stations.The rising trend ranges from 0.01 to 4.53m and the declining trend ranges from 0.02 to 7.10 m. Both the rising and falling trend were mostly within 2 m. The maximum rising trendand declining trendhad been recordedinBongaigaon and Karbi AnglongDistrict respectively. One station each in Cachar and Bongaigaon district indicated rise above 4m. Declining trend beyond 4m had been observed in three stations;one in Biswanath district and two stations in Karbi Anglong district.Both rise and fall had been observed in part of every district except Goalpara. However, in major parts of Tinsukia, Dhemaji, Lakhimpur, Biswanath, Sibsagar, Jorhat, East Karbi Anglong and Barpeta district of the Brahmaputra valley and Cachar, Hailakandi and Karimganj district of the Barak valley rise was recorded. Fall had been recorded in Goalpara district and mostly in parts of Nagaon, Morigaon and Dhubri district.

#### **Meghalaya**

March 2019 water level had been compared with mean water level data of the same period of preceding 10 years. In total, declining water level trend was observed in 82.6%(19) monitored stations of the state; of which 73.9%(17) stations were in the range of 0-2m and 8.75(2) stations in the range of 2-4m.Rising water level trend was observed in 17.4%(4)

stations. Entire rising trend was recorded in the range of 0-2 m. The rising trend ranges from 0.20 to 1.09 m and the declining trend ranges from 0.22 to 2.2m. The maximum rising and declining trend had been recorded in West Jaintia Hillsand South West Garo Hills district respectively..

### **Nagaland**

In March, 2019, rising water level trend was observed in Dimapur district of the state in comparison with the mean water level data of the same period of preceding 10 years.The rising water level trend ranges from 0.90-9.31m.

### **Tripura**

Comparison of March,2019 water level data with the mean of the same period of preceding 10 yearsindicated rising trend in major part of the state except at 2stations; located inUnakoti and West Tripura district. The rising trend ranges from 0.13- 3.71m and was found restricted to 2m in most of the stations (76%, 19Nos.). The decliningtrend was found within 2m only.Themaximum rising trend was recorded in Unakoti district.

## **6.6.2 August 2019 and Decadal Mean,August, 2009-2018 (Fig. 17 and Annexure XV)**

### **Arunachal Pradesh**

August, 2019 water level had been compared with mean water level data of the same period of preceding 10 years. Falling trend was observed in August, 2019 in 58.8%(10) stations. The decline ranges from 0.06 to 2.59m. Rising trend was observed in 41.2%(7) stations and found ranging from 0.06-1.72m.The maximum decline was recorded in Changlang district.

### **Assam**

August 2019 water level had been compared with the mean water level of the same period of preceding 10 years and it was observed rising trend in water level in42.5%(71) stations in the range of0-2 mbgl and in2.4%(4) stationsin the range of2-4m.Falling trend was recorded in 50.3%(84) stationsin the range of0-2m, andin 4(2.4%) stations each in the range of 2-4 mand above4m. Both the rising and falling trends were found mostly within 2 m and in part in most of the districts.However, rise was recorded in major parts of Golaghat, Jorhat, Morigaon, Nagaon and Karimganj district. Decline was recorded in major parts of Dibrugarh, Dhemaji, Lakhimpur, Biswanath, Sonitpur, Udaguri, Darrang, Karbi Anglong and Kamrup district. The maximum rising (2.8 m)and the maximum falling water level (4.80m )had been recorded inHojai and Cachar district respectively.

### **Meghalaya**

August, 2019 water level had been compared with mean water level data of the same period of preceding 10 years. In August, 2019 it was found rising and falling water level trend in equal no. of monitored stations in the state. The entire declining trend was observed restricted to 1m only. The rise ranges from 0.03 to 2.81 m and the fall ranges from 0.03 to 1.01 m. The maximum rising and falling water level had been recorded in West Garo Hills and Ri-Bhoi district respectively.

### **Nagaland**

Comparison of August 2019 water level with mean of the same period of preceding 10 years of the state could be done only for Dimapur district. The comparison indicates rising water level trend in all the monitored stations. The rise ranges from 0.52 to 1.93m.

### **Tripura**

In August, 2019, rising water level trend was observed in the state in comparison to the mean water level of the same period of preceding 10 years. Both rise and falling trend had been observed in parts of all the districts except in Sipahi-Jala district. Fall had been recorded in all the stations located in Sipahi-Jala district and in major parts of Gomati and South Tripura district. Rise had been observed in major parts of Dhalai, Khawai, North Tripura and Unakoti district. The declining trend ranges from 0.07-5.25m. Maximum fall was recorded in Dhalai district. Most of the rising and falling trend had been observed within 2m. The rising water level trend ranges from 0.07-2.59m; the maximum value was recorded in West Tripura district.

### **6.6.3 November 2019 and Decadal Mean, November, 2009-2018 (Fig.18 and Annexure XVI)**

#### **Arunachal Pradesh**

November 2019 water level had been compared with mean water level data of the same period of preceding 10 years. It was observed falling trend in 52.9%(9) of the monitored stations during November, 2019. Rise was recorded in 47.1%(8) stations. All the rising trend and falling trend had been found restricted to 2m. The rise ranges from 0.02 to 1.10m and the fall ranges from 0.06 to 1.54 m. The maximum rising and the falling trend in water level had been recorded in Papumpare and Lohit districts respectively.

#### **Assam**

Comparison of November 2019 water level with mean of the same period of preceding 10 years indicate rising trend in 58.6%(85) GWMS. Rise in the range of 0-2m was recorded in 55.1%(80) stations, in the range of 2-4m in 2.8%(4) stations and only in 1 station above 4m. Declining water level was observed in 40.7%(59) stations in the range of 0-2m and only in

1(0.7%) station in the range of 2-4m. Most of the rising and declining trends had been found within 2m. The rise ranges from 0.02 to 4.14 m and the fall ranges from 0.01 to 2.02 m. The maximum rising and the falling trend in water level had been recorded in Golaghat and Dhubri district respectively.

Rise and fall occur nearly in all the districts. However, rise was recorded in major parts of Cachar, Hailakandi and Karimganj of Barak Valley and in Dhemaji, Lakhimpur, Tinsukia, Sibsagar, Sonitpur, Jorhat, Kamrup and Karbi Anglong district of the Brahmaputra valley. Fall was observed in Dibrugarh, Biswanath, Nagaon, Darrang, Udaguri, Bongaigaon and Dhubri district.

### **Meghalaya**

Comparing November 2019 water level with mean of the same period of preceding 10 years it was found that 57.9%(11) GWMS indicated falling trend in water level during November, 2019. Entire fall was found within 2m. Rise was recorded in 36.8%(&0 stations in the range of 0-2m and only in 1(5.3%) station above 4m. The rising and declining trend ranges from 0.11 to 2.89m and 0.01 to 1.53 m respectively. The maximum rising and declining trend in water level had been recorded in West Garo Hills and east Garo Hills district respectively.

### **Nagaland**

Comparison of November 2019 water level with mean water level data of the same period of preceding 10 years indicated falling trend during November, 2019 in 75%(3) stations of Dimapur district of the state. Fall was recorded only in 1 station. The only rise (6.48m) and the declining trends range from 1.5 to 2.96m .

### **Tripura**

November 2019 water level had been compared with mean water level data of the same period of preceding 10 years and it was observed that 62.5%(20) stations indicated fall. Fall was recorded in 59.4%(19) stations in the range of 0-2m and only in 1(3.1%) station above 4m. Rise had been recorded in 37.5%(12) stations; of which 34.4%(11) stations were in the range of 0-2m and in 1 station in the range of 2-4m.. The rising and declining trend range from 0.08 to 2.66 m and 0.01 to 5.10 m respectively. The maximum rising and declining trend in water level had been recorded in West Tripura and Dhalai district respectively.

### **6.6.4 January 2020and Decadal Mean ,January, 20010-2019 (Fig.19 and Annexure XVII)**

### **Arunachal Pradesh**

January 2019 water level had been compared with mean water level data of the same period of preceding 10 years. It was observed falling trend in 61.2%(11) of the monitored stations during January, 2020. Fall in the range of 0-2m was recorded in 55.6%(10) stations and in the range of 2-4m in 1(5.6%) station only. All the rising trend was recorded within 2m and in 38.8%(7) stations. The maximum rising trend of 0.75 m and maximum falling trend of 2.05m had been recorded in Papumpare and Tirap district respectively.

### **Assam**

Comparison of January, 2019 water level with mean of the same period of preceding 10 years indicate rising trend in 64.8%(127) stations during January, 2020. Rise in the range of 0-2m was recorded in 59.2%(116)stations, in the range of 2-4m in 4.1%(8) stations and beyond 4m in 1.5%(3) stations. Declining trend was observed in 32.5%(64) stations in the range of 0-2m and in 2.6%(5) stations in the range of 2-4m. Most of the rising and declining trend had been found within 2m. The maximum rising (6.46m) and the falling trend (3.59 m) in water level had been recorded in Biswanath and East Karbi Anglong district respectively. Rise and fall occur nearly in all the districts. However, rise was recorded in major part of Cachar, Hailakandi and Karimganj of Barak Valley and in Dhemaji,Lakhimpur, Dibrugarh, Tinsukia, Sibsagar,Jorhat, Goalghat, Sonitpur, Karbi Anglong, Nagaon, Morigaon, Kamrup(M) and Goalpara district of the Brahmaputra valley. Fall was observed in major part of Bongaigaon, Dhubri and Udaguri district.

### **Meghalaya**

Comparing January, 2020water level with mean of the same period of preceding 10 years it was found that 52%(13) stations indicated rising trendin water level during January, 2020. In 44%(11) stations decline was recorded in the range of 0-2m and only in 1(4%) station in the range of 2-4m. Therising trend was observed within 2m in 48%(12)stations and only in 1station in the range of 2-4m.The maximum rising (3.10m) and declining trend(2.12m) in water level had been recorded in West Garo Hills district and North Garo Hills district respectively.

### **Nagaland**

Comparison of January, 2020water level with mean water level data of the same period of preceding 10 years had been carried out for Dimapur district only. Rise in water level was recorded in 66.7%(2) stations and found within 1m.The falling trend (2.42m) had been found in one station. in Dimapur district.

## **Tripura**

January, 2020 water level had been compared with mean water level data of the same period of preceding 10 years and it was observed that 55.8%(19) stations indicated rise in January, 2020. Rise was recorded in 50%(17) stations in the range of 0-2m and in 1(2.9%) station each in the range of 2-4m and above 4m. The falling trend had been found in the range of 0-2m in 41.3(14) stations and only in one station in the range of 2 to 4m. Both the maximum rising (4.43m) and declining trend (4.0m) in water level had been recorded in West Tripura district. Rise and fall had been observed in parts in all the district. However, in major parts of Khowai, North Tripura, South Tripura and Sipahi-Jala district rise had been recorded. Decline in water level was recorded mostly in Dhalai and Gomati district.

### **6.7 Ground Water Level Trend (2010-2019), Pre Monsoon**

The historical water level data of GWMS have been analysed for determining long term water level trends for the period , 2010-2019. A total number of 552 stations have been analysed for pre-monsoon water level trends. The frequency of stations showing rising or falling trend during pre-monsoon period is given in Annexure-XVIII. State-wise analysis is as follows.

#### **6.7.1 Arunachal Pradesh**

Water level data of 27 stations have been analysed for pre-monsoon water level trend. Out of these, 22 stations show rising trend ranging from 0.01 to 0.21m/year whereas, 5 stations show falling trend ranging from 0.03 to 0.15m/year. The maximum fall is observed in Papumpare district. Significant decline in water level trend has not been observed in the state.

#### **6.7.2 Assam**

Water level data of 349 stations have been analysed for pre-monsoon water level trend. Out of these, 180(51.6%) stations show rising trend ranging from 0.01 to 2.89m/year and 169(48.4%) stations show declining trend ranging from 0.01 to 1.19m/year. Both rising and falling trends of water level have been observed all over the state .

The rising trend above 0.20m/year was observed in 52 stations in the state. The falling trend beyond 0.20 m/yr has been observed in 38 stations. The maximum falling trend has been observed in Cachar district. A general decline in water level has been observed in the pre monsoon period.

### **6.7.3 Meghalaya**

Data of 62 stations have been analysed for pre-monsoon water level trend. Out of these, 24 stations show rising trend ranging from 0.01 to 0.507m/year and 38 stations show declining trend ranging from 0.02 to 0.497m/year in dugwells. Most of the rising and declining trends have been restricted below 0.2m/year except in few stations. In piezometers the rising and declining trends have been observed as 0.14 to 6.39m/year and 0.07 to 1.32m/year.

### **6.7.4 Nagaland**

Data of 29 stations have been analysed for pre-monsoon water level trend. Out of these, 24 stations show rising trend ranging from 0.05 to 2.31m/year whereas, 5 stations show falling trend ranging from 0.038 to 0.501m/year.

### **6.7.5 Tripura**

Analysis for ground water level trend of Tripurastate has been done for 85 stations for pre-monsoon period. Out of these, 53 stations show rising trend and 32 stations show declining trend. The rising trend ranges from 0.003 to 2.26 m/year and the declining trend was observed in the range of 0.001 to 2.36m/year. Both the maximum decline and maximum rise have been observed in South Tripuradistrict .

## **6.8 Ground Water Level Trend (2010-2019) ,Post Monsoon**

The historical water level data of GWMShave been analysed for determining long term water level trendfor the period ,2010-2019. Water level data of 564 stations have been analysed for postmonsoon water level trend. The frequency of stations showing rising or falling trends of water levels during post-monsoon period is given in Annexure-XIX. State-wise analysis is as follows.

### **6.8.1 Arunachal Pradesh**

Data of 21 stations have been analysed for post-monsoon water level trend. Out of these, 16 stations show rising trend ranging from 0.047 to 0.438/year whereas, 5 stations show falling trend ranging from 0.013 to 0.103m/year. The maximum fall has been observed in Lower Subansiri district. The declining water level trend observed is not significant.

### **6.8.2 Assam**

Data of 350 stations have been analysed for post-monsoon water level trend. Out of these, 225(64.3%)stations show rising trend ranging from 0.01 to 2.33m/year and 125(35.7%)

stations show falling trend ranging from 0.01 to 0.94 m/year. Both rising and falling trends have been observed all over the State.

The rising trend above 0.20 m/year has been observed in 70 stations in the State. The fall beyond 0.20 m/yr has been observed in 28 stations. The maximum falling trend has been found as 0.94m/year in Kamrup(M) district. A general rise in water level has been observed in the post monsoon period.

### **6.8.3 Meghalaya**

Water level data of 65 stations have been analysed for post-monsoon water level trends. Out of these, 37 stations show rising trend ranging from 0.01 to 0.73m/year and 28 stations show declining trend ranging from 0.004 to 2.86m/year in dugwells. Most of the rising and declining trends have been restricted below 0.2m/year. In piezometers the rising and declining trends have been observed as 0.4 to 6.4m/year and 0.01 to 2.97m/year.

### **6.8.4 Nagaland**

Data of 29 stations have been analysed for post-monsoon water level trend. Out of these, 25 stations show rising water level trend ranging from 0.03 to 2.312m/year. In 7 stations falling trend ranging from 0.004 to 0.51m/year has been observed. The maximum fall is observed in Wokha district.

### **6.8.5 Tripura**

Data of 99 stations have been analyzed for post-monsoon water level trends for the state of Tripura. Out of these, 71 stations show rising trend and 28 stations declining trend. The rising trend was in the range of 0.01 to 2.26 m/year and the declining trend in the range of 0.01 to 1.62m/year. Maximum declining and maximum rising trends have been observed in South Tripura district. Most of the rise and decline have been recorded below 0.20m/year.

## **6.9 Area under water logged and prone to water logging conditions (Fig.20 and Fig.21)**

Water logging conditions prevail in many places of the North Eastern States. Water level in phreatic condition is found to occur mostly within 5.0 mbgl throughout the year. Water levels within 3.00 mbgl are recorded in 35%(151) stations during premonsoon and in 62.3% (271) stations during post-monsoon period. Shallow water level conditions in the region occur due to high rainfall recharge and poor ground water draft from shallow aquifers. Low ground water gradient in valley areas results in water logging conditions. Maps showing areas under

water logged and prone to water logging conditions have been prepared (Fig. 20 and 21) for both pre- and post-monsoon.

#### **Water Logged Area and Area prone to water logging condition:**

Water logged area is demarcated based on depth to water levels within 2.0 mbgl. Prone to water logging areas are demarcated with depth to water level from 2-3mbgl. During pre-monsoon period (March 2019), 19.7% (85) stations show water logging condition, whereas 15.3% (66) stations show prone to water logging condition. During post monsoon period (November 2019) 39.5%(172) stations show water logging condition and 22.8% (99) stations show prone to water logging condition. During Pre-monsoon period water logged and prone to water logging areas have been observed in Dhemaji, Lakhimpur, Biswanath, Tinsukia, Sibsagar, Jorhat, Sonitpur Kamrup, Karbi Anglong and Bongaigaon district of the Brahmaputra valley. In major parts of Cachar, Hailakandi and Karimganj district of Barak valley waterlogging condition was observed. Water logged and prone to water logging areas have been observed in pockets in Arunachal Pradesh, Meghalaya and in Dhalai, Gomati, Khowai, North Tripura, Sipahi-Jala, Unakoti and South Tripura district of Tripura.

During post-monsoon period (November,2019), water logged and prone to water logging conditions have been observed in major parts of Barpeta, Biswanath, Cachar, Dhemaji, Dibrugarh, Goalpara, Hailakandi, Jorhat, Kamrup, Karbi Anglong, Karimganj, Nagaon, Morigaon, Lakhimpur, Sibsagar, Sonitpur and Tinsukia district in Assam and in parts of all the districts of Tripura. In Meghalaya, in all the district shallow water levels in pockets have been observed except in Jaintia Hills. Out of 435 analysed stations, water level in the range 0-2mbgl had been recorded in 172(39.5%) stations and in the range of 2-3mbgl in 99(22.8%) stations. Remaining stations, most of which are located near inselbergs or in hard rock areas or in foothills show water levels above 3mbgl.

It is observed that in both pre and post monsoon periods, a large part of the alluvial area in the region show water level in the range of 0 to 3 mbgl (Fig 20 and 21). Water logging condition during pre-monsoon period in major parts of Goalpara, Golaghat, Dhubri and Hojai district had not been observed but during post-monsoon period, most of these areas were under water logging conditions. Occurrence of water logging conditions in the region is due to high rainfall, shallow water level and a meagre ground water draft in vast flood plains of the Brahmaputra and Barak river system.

## 7. HYDROCHEMISTRY

Chemical quality of ground water is being monitored every year for temporal and spatial changes and to study their causes. Water samples are collected in the month of March (pre-monsoon) and November (post monsoon) every year. Water quality standards for drinking use and the overall chemical quality of ground water of North Eastern region for the year 2019-2020, are shown in **Annexures – XX.**

The chemical constituents analyzed were compared with the standard values given by BIS (IS 10500:2012). The minimum and maximum values of iron (Fe) and 16 basic constituents of ground water in North Eastern region for the pre-monsoon period (March, 2019) are presented in Table 5.

During March, 2019 pH value below acceptable limit was observed in certain parts of Assam, Meghalaya and Tripura. Similarly, ground water with pH beyond permissible range was also found in Assam, Meghalaya and Tripura. In case of Total Dissolved Solids, the level of TDS in entire North Eastern Region was within permissible limit. However, in some parts of Assam and Tripura it was found beyond acceptable limit. Similarly, though Chloride content in all the states were found within permissible limit, in some parts of Assam and Tripura it was beyond acceptable limit (250 mg/L). Fluoride contamination of Ground water was found to some extent in Assam (4.7 mg/L) and Tripura (2.3 mg/L). Total alkalinity (as CaCO<sub>3</sub>) content was found to exceed the permissible limit in parts of Assam (945.76 mg/L) and Tripura (505.40 mg/L). Magnesium content was found beyond permissible limit in pockets in the state of Assam. Other chemical constituents in the entire region was found within permissible limit of BIS (2012), except Iron. Occurrence of high iron content (>1 mg/L) was found in major part of the Brahmaputra valley in Assam and sporadically in Arunachal Pradesh, Meghalaya and Tripura. Maximum concentration of iron (14.28 mg/L) was detected at Dhang of Nagaon District, Assam. However, the overall ground water qualities for other constituents in all the states were found within range for drinking purpose.

The Trace metal (arsenic) analysis of water samples of previous groundwater year (2018-19) for pre-monsoon could not be completed during the year. Hence, results of analyses are incorporated in this report (**Table. 6 & Annexure XXI**).

The Trace metal constituents and uranium content of water samples collected during November, 2019 were analyzed and compared (Table 6) with the standard values given by BIS (IS 10500:2012). Chromium, copper, zinc, aluminium, selenium, silver, cadmium and uranium contents were found well within acceptable limit. Manganese content was found beyond

permissible limit at one location in Arunachal Pradesh and in pockets in Assam, Meghalaya, Nagaland and Tripura. Occurrence of high Lead contents were found in pockets in Udaguri, Baksa, Kokrajhar and Bongaigaon district of Assam.

During pre-monsoon period of previous year (March, 2018) arsenic concentration was found within permissible limit in all the states except Assam. In Assam, it was detected slightly above the permissible limit only at one location (Badarpur, 12.63 µg/L) in Karimganj district of Assam. In the post monsoon period arsenic content was found well within the permissible limit in all the states .

## 8.CONCLUSIONS

1. Seven states viz. Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura together form North Eastern Region occupying a geographical area of 2,55,083 sq. km. Most of the States are being hilly, only 30% of the total region is plain area. Assam is the only State in the region, which is occupied by 73% of plain area. In the Region, 624stations are being monitored of which 385 are in Assam.
2. Geologically, the region is underlain by different formations, ranging in age from Archaean to Recent. More than 90% of the aquifers in the region belong to the Recent Alluvium and Tertiary Sandstones.
3. Hydro-geologically, the area is divided into Unconsolidated, Semi-consolidated and Consolidated Formations. In the entire area, about 31% area is covered by Unconsolidated Formations. Ground water occurs in unconfined to confined conditions. Major parts of Manipur, Nagaland, Mizoram, Tripura, parts of Arunachal Pradesh, Meghalaya and southern part of Assam States are underlain by Semi-consolidated Formations of Tertiary sandstone. In Consolidated Formations, ground water is restricted to the weathered residuum, joints and fractures.
4. During the year, 2019-20, the general depth to water level scenario in the region in March, 2019, depicts water level within 5.0 mbgl, in 74.8%, i.e. 326 stations show a depth range of 0 to 5 mbgl, out of which about 19.7% of the stations indicated water level within 2 mbgl and 55.1% stations between 2 and 5 mbgl. 87 (25.9%) stations recorded water level between 5 and 10 mbgl, most of which are located near the inselbergs. Water levels ranging between 10 and 20 mbgl were observed in 17(3.9%) stations in Papumpare district of Arunachal Pradesh, Dhubri, Hojaiand Karbi Anglong district of Assam West Jaintia Hills district of Meghalaya and piezometers of Khowai, South Tripura, West Tripura district of Tripura..In 6(1.4 %) of GWMS ie.piezometers of East Jaintia and Ri-Bhoi district of Meghalaya and in West Tripura district water level was recordedat depths beyond 20m.
5. The water level during post-monsoon period (November 2019) was mostly recorded in the range of 0 to 5 mbgl. Water level within 5 mbgl has been recorded in 383(88%) stations, out of which, 174(40%) stations recorded water level within 2 mbgl and 209(48%) stations record water levels from 2 to 5 mbgl. Water level in the range of 5 to 10 mbgl was recorded in 38 (8.7%) stations and in 9 (2.1%) stations in the range of 10 to

20mbgl. In 5 (1.2%) piezometers of Meghalaya and Tripura water level beyond 20mbglwas observed..

6. In comparison to pre-monsoon, during post monsoon rise in water level within 4 m had been recorded in 24(87.9%) stations. Rise was recorded within 2 m in 246 (66.7%) stations and in the range of 2 to 4m in 63(17.1%) stations. In 15 (4.1%) stations rise in water levelabove 4m had been observed. In 45 (12.1%) stations fall in water level was observed, out of that 42 (5.5%) stations indicated fall in the range of 0 to 2 m, in3 (0.5%) stations from 2-4mand in 1station above 4m. The reverse ground water scenario occurs at few places due to sufficient pre-monsoon shower resulting considerable rise in water level during pre-monsoon and at some places due to scanty and erratic rainfall received during monsoon period of 2019.
7. Water level monitored during March 2019was compared with mean water level data of preceding 10 years. The compared result indicates, in general, a rise in 128 (55.6%) stations and fall in 102 (54.4%) monitored stations. Rise within 2 m have been observed in 110(47.8%) stations and in the range of 2 to 4m in 14 (6.1%) stations r and beyond 4 m in 4(1.7%) stations. Fall in water level with respect to decadal mean have been observed within 2m in 92(40%) stations, in the range of 2m to 4m in 7(3%) stations and beyond 4 m in 3(1.3%) stations
8. Comparison of water level monitored during November 2019and mean water level data of preceding 10 years rise in 114 (52.5%) stations and fall in 103 (47.5%) monitored stations. Rise within 2 m have been observed in 106(48.8%) stations and in the range of 2 to 4m in 6 (2.8%) stations and beyond 4 m rise in 2(0.9%) stations. Fall in water level with respect to decadal mean have been observed within 2m in 99(45.6%) stations, in the range of 2m to 4m in 3(1.4%) stations and beyond 4 m in 1 (0.5%) station.
9. Water levels of post-monsoon for last 10 years were taken for trend analysis. A total number of 435 stations were analysed. During post monsoon period 144 stations show a declining water level trend mostly within 0.19m/year. Only 49 stations showed decline above 0.2m/year. Significant decline is not observed anywhere in the region. The rise is observed in 119stations ranging mostly from 0.19m/year. 123 stations indicated rise above 0.2m/year.
10. In general, the chemical quality of the ground water is good for both the domestic and irrigation purposes except the sporadic occurrence of the high concentration of Iron in

considerable parts of the region. In those areas, Iron treatment plants are to be installed and the water should be used only after proper treatment.

11. Development of ground water in North Eastern Region is still in nascent stage. There is an ample scope for development of this replenishable natural resource. This region being hilly, only 30% of the existing valley area can be developed. In the hilly area, there is a very little scope for ground water development. However, the hilly terrain of the region is bestowed with many perennial springs, which can be developed for both the small-scale irrigation and domestic use. Moreover, rainfall in the region being quite sufficient, roof-top rain water harvesting may also be adopted to augment ground water resources in the area. If this natural resource is harnessed with proper planning and management, the entire agro-economic scenario of the region can be uplifted.
