XXI & XXI(i)	Chemical Quality (Heavy Metal and Uranium)of Ground Water in NER, during Pre & Post Monsoon (2020-21)

FOREWORD

Ground water is a dynamic and replenishable resource and monitoring spatial and temporal changes of this resource is essential for sustainable development and management. The water level data is of paramount importance in development and management of water resources in the country. Central Ground Water Board decided to issue a Ground Water Year Book annually for each State by compiling the hydro-geological, hydro- chemical and water level data collected from the Ground Water Monitoring Stations (GWMS) established by the Board in the States. CGWB, NER has a permanent network of 624 GWMSs in the North Eastern Region covering the States of Arunachal Pradesh, Assam, Manipur, Meghalaya, Nagaland and Tripura. Monitoring of water level and chemical quality furnish valuable information on the ground water regime, characteristics of the different hydro-geological units in the States, viz. the pattern of ground water movement, changes in recharge-discharge relationship, behaviour of water level and changes in quantity of ground water in space and time. It also helps in identifying and delineating water logged areas, possible ground water pollution hazards and areas prone to lowering of water table/piezometric surface due to large scale withdrawal of ground water.

The behaviour of ground water level monitored from existing GWMSs and the chemical quality of ground water along with maps depicting the ground water scenario for the periods of measurement are presented in this report.

The water level data of GWMS in the States have been effectively compiled, analyzed and presented in this report by Ms. Mophi Mili, "Sc-B". Young Professional, Ms. Dimpi Barpatra is duly acknowledged for preparing the various thematic maps. The scientific officers of the Regional Office have systematically collected field data from the GWMSs four times in the year viz. March, August, November and January. The sincere effort of Ms. D. Rabha, "Sc-B" and Dr. D. J. Khound, Sc. B, in scrutiny, processing and issuance are gratefully acknowledged.

It is hoped that this report would be of immense use for administrators, planners, and officials as a reference in ground water development and planning in time and space.

30/08/2021
(Biplab Ray)
Head of Office

EXECUTIVE SUMMARY

North Eastern Region covers seven states namely Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura occupying an area of 2,55,083 sq. km. The Region is mostly occupied by hilly terrain and only 77,068 sq. km. is occupied by valley area, which forms 30% of the total area. In different hydrogeological formations of the Region, 673 Ground Water Monitoring Wells (GWMW) have been set up. Most of these wells are located in valley areas. These wells are generally selected from existing ground water abstraction structures i.e. open wells, tube wells, and purpose-built piezometers. As on 31st January 2021, there are 557 dug wells and 65 tube / bore wells in the region, which are being monitored four times a year i.e. during March 1st to 10th (This is the pre-monsoon water level and the water level as it stands at the end of the ground water year after all the inputs and outputs have taken place. In other words it is the resultant ultimate/lowest water level), August 20th to 30th (this water level marks the peak of the water level hydrograph), November 1st to 10th (this is the postmonsoon water level and the water level as it stands after the major portion of rainfall recharge has taken place), and January 1st to 10th. Water samples are being collected for chemical analysis during Pre-monsoon i.e. in the month of March when concentrations of different chemical constituents are expected to be maximum.

Monitoring and investigation is required to gain an understanding of the spatial and temporal variations in quality and quantity of groundwater resources. Groundwater monitoring can be defined as the systematic measurement and observation of the groundwater situation on a regular basis by measurement of water levels in wells and boreholes or of spring discharge and assessing its chemical quality, which provides the simplest indicator of changes in groundwater resources in quantity and/or quality. The objectives of the groundwater monitoring are to measure depth to water level and collect ground water samples for chemical analysis, thereby establish trends of water level and quality; to collect data documenting any change in groundwater storage over time in the principal aquifers; to provide both long-term and short-term data necessary to assess and predict the response of hydrologic systems to natural climatic variations and human-induced stresses; and to provide historical baseline data for studies of local/regional aquifers. Groundwater monitoring also helps in identifying areas showing negative impact due to over-abstraction or contamination or very shallow levels in Canal command e.g.

- Declining groundwater levels and depletion of groundwater reserves;
- Reductions in stream/spring base flows;
- Reduced access to groundwater water for drinking water supply and irrigation;
- Subsidence and foundation damage
- Deterioration of groundwater quality;
- Increased costs for pumping and treatment;

Ground Water Monitoring Wells are distributed in three river basins, viz. Brahmaputra (456) and Meghna (166).

In unconsolidated formations 532 GWMWs are located, while in semi-consolidated formations and consolidated formations 48 and 42 GWMWs are distributed respectively.

The rainfall is the main source of Ground Water recharge. North Eastern Region receives a considerable amount of rainfall. The annual average rainfall varies from 900 mm to more than 5000 mm.

Geologically, the area is underlain by consolidated to unconsolidated formations ranging in age from Archaean to Recent.

Hydrogeologically, the area is grouped into porous and fissured formations based on the nature of openings in the aquifer system. Alluvium and sedimentary formations and fissured consolidated rocks form the main repositories of ground water.

Water levels in the region remain mostly within 5.00 mbgl in all the four measurements. The summarized percentage of wells showing water levels in different depth ranges are as follows.

Depth to water level (mbgl)	March, 2020 (% of wells)	August, 2020 (% of wells)	November, 2020 (% of wells)	January, 2021 (% of wells)
0 – 2	18.3	58.1	52	25.7
2 – 5	54.8	32.6	37.6	55.8
5 – 10	21.2	3.5	7.3	13.7
10 – 20	4.5	3.5	2.2	3.2
>20	1.2	2.3	0.9	1.6

Water level fluctuation of GWMWs during August'20, November'20 and January'21 with respect to Pre-monsoon (March'20) data show that there is

- Rise in water level in August 2020 in 94.30% wells.
- Rise in water level in November 2020 in 95.1% wells.
- Rise in water level in January 2021 in 83.9% wells

Comparison of water levels of GWMWs during March'20, August'20, November'20 and January' 21, with respect to the same month during the previous year shows that there is

- Fall in water level in March 2020 in 52.9% wells.
- Rise in water level in August 2020 in 73.2% wells.
- Rise in water level in November 2020 in 78.9% wells.
- Rise in water level in January 2021 in 51.8% wells.

Comparison of mean water level of the previous decade to the water level for the same period during 2020-21 shows that-

- During March 2020, rise is recorded in 52.4% GWMWs, as compared to decadal mean (March 2010- March'19).
- During August 2020, rise is recorded in 62.7% GWMWs, as compared to decadal mean (August 2010-August'19).
- During November 2020, rise is recorded in 75.5% GWMWs, as compared to decadal mean (November 2010-November'19).
- During January 2021, rise is recorded 66.0% GWMWs, as compared to decadal mean (January 2011-January'20).

Trend analysis of Pre-monsoon water level data of last ten years i.e. 2010-2020 shows falling trend in 45.12% stations and rising trend in 54.88 % stations.

Trend analysis of Postmonsoon water level data of last ten years i.e. 2010-2019 shows falling trend in 36.2% stations and rising trend in 63.8% stations.

During pre-monsoon period (March 2019), 19.7% (85/431) stations show water logging condition, whereas 15.3% (66/431) stations shows prone to water logging condition.

During post monsoon period (November, 2019), 39.5% (172/435) stations show water logging condition, whereas 22.8% (99/435) stations shows prone to water logging condition.

Water samples from GWMWs are collected during the month of March every year when the soluble chemical constituents are expected to be maximum in concentration. Concentration of iron exceeds the permissible limit of drinking water standards in all the North-Eastern states. The concentration of Fluoride and Arsenic was also observed beyond permissible limit of BIS (2012) in some areas of Assam. However, in general, the quality of ground water, in the North Eastern States is good for both irrigation and drinking purposes. The water samples are collected mainly from open wells. Higher concentrations of iron are also noticed in tube wells in different parts of the region.

As per 2017resources estimation, the region is enriched with more than 32.36 BCM of replenishable ground water resources and the stage of development is less than 20%. If it is planned properly this huge resource can be harnessed to develop the agro-economic scenario of the region. However, for the hilly terrain (about 70% of the total geographical area) where ground water is not sufficient, further development of spring water and rain water harvesting may be taken up.

GROUND WATER YEAR BOOK

NORTH EASTERN REGION 2020-2021

1. INTRODUCTION

North Eastern Region is bounded between North Latitudes $21^{\circ} 57'$ & $29^{\circ} 28'$ and East Longitudes $89^{\circ} 40'$ & $97^{\circ} 25'$ with a geographical area of 2.55 lakh sq.km., comprising the States of Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura. (Fig-1) Hill ranges occupy about 70% of the total geographical area. The State-wise distributions of hilly and plain areas are given in Table-1.1. The region has two principal drainage systems viz. Brahmaputra and Meghna (Fig-2). Both the drainage systems join together and drain into Bangladesh. There are two sub-ordinate drainage systems in the region i.e. Chindwin and Kaladan. Even though, the region receives highest rainfall in the country and it experiences high flood during monsoon, there is acute shortage of drinking water in many hilly terrains such as Cherrapunji, in Meghalaya which is the second wettest place in the world. Despite endowed with one-third of water resource potential in the country, the agro-economic condition of the region is poor, as only a negligible amount of ground water resource (about 35%) has been utilized so far. Harnessing this enormous resource with proper planning and management can uplift the agro-economic scenario of the region.

Table – 1.1 Distribution of hilly and plain areas in the region

State	State area (sq.km)	Valley Area (sq.km)	Percentage of Valley Area to total state area (%)
ARUNACHAL PRADESH	83,743	7,500	8.90
ASSAM	78,438	56,951	72.60
MANIPUR	22,327	2,000	8.90
MEGHALAYA	22,429	3,500	15.60
MIZORAM	21,081	226	1.07
NAGALAND	16,579	806	4.86
TRIPURA	10,486	6085	58.02
TOTAL	2,55,083	77,068	30.20

Central Ground Water Board, North Eastern Region, has set up a number of Ground Water Monitoring Stations (GWMS) in different hydrogeological conditions in order to know ground water condition and its variation, in both time and space. Monitoring of water levels and collections of water samples are being carried out periodically to observe any change in water level and its quality consequent to changes in inputs and outputs. In order to have an idea of water level behaviour with respect to time, water levels are being monitored four times a year. First set of measurement is taken during pre-monsoon period (March 1st to 10th), second set is being taken

during peak monsoon (August 20th to 30th), third measurement is taken during post-monsoon (November 1st to 10th) and last set is being taken during January 1st to 10th. In North Eastern Region, it is observed that the ground water level builds up considerably during last part of April as the area receives pre-monsoon rainfall during March to May. Water samples are being collected once in a year during the pre-monsoon measurement i.e. in the month of March. In addition to this, monthly water level data is collected out by local Observers at 72 monitoring stations under ‘Participatory Monitoring Programme’.

As on 31st January, 2021, there are 622GWMS in the Region. The details of GWM Stations are given in Annexure I and its district-wise distribution is given in Table 1.2

The present report deals with the analysis of the water levels of Ground Water Monitoring Stations (GWMS) in North Eastern Region during the Water Year 2020-2021. The GWMS in Manipur and at few locations of Nagaland and Assam could not be monitored regularly due to deterioration of law and order situation. There is no existing GWMS in Mizoram State. In Arunachal Pradesh, there are only 30 monitoring stations and those are restricted along the southern boundary of the state adjacent to Assam.

2. DISTRIBUTION OF GROUND WATER MONITORING WELLS

The distribution of Ground Water Monitoring Wells as per Lithology and river basin wise is dealt below:

2.1. Distribution of Ground Water Monitoring Wells as per Lithology

About 85.5% of the total Network Wells are located in the Unconsolidated Formation, 7.72 % of the Wells are located in the Semi-consolidated Formations and the remaining 6.75% are in the Consolidated Formations. The Lithology-wise distribution of the Network Wells is given in Table 2.1.

Table 2.1 Distribution of GWMW in different Hydrogeological Units:

Sl No.	State	No. of GWMS						
		Unconsolidated Formations		Semi-consolidated Formations		Consolidated Formations		
		No. of GWMS	%	No. of GWMS	%	No. of GWMS	%	
1	Arunachal Pradesh	29	96.7	1	3.3	0	0	30
2	Assam	356	94.7	11	2.9	9	2.4	376
4	Meghalaya	16	25	15	23.4	33	51.6	64
5	Nagaland	23	76.7	7	23.3	0	0	30
6	Tripura	108	88.5	14	11.5	0	0	122
	Total	532	85.5	48	7.7	42	6.8	622

2.2.Distribution of Ground Water Monitoring Wells - River Basin and Sub-Basin wise

In all, there are four major River Basins and twenty-five Sub-basins in the North Eastern Region. Out of the four major Basins, the Brahmaputra Basin occupies the major part of the Region (Fig-3) and about 76%(527) of the Network Wells are located in this Basin. In Meghna Basin, about 21%(146) of the Wells are located and the remaining 8% (25)Wells are located in the Imphal Basin. The Kaladan Basin forms the southernmost parts of Mizoram there is no Network Well located in this basin. The distribution of GWMW in different Basins and Sub-basins are shown in Table – 2.2.

Table – 2.2 Distribution of GWMW in different Basins and Sub-basins

4	Fenny	South Tripura (22) , Khawai (8)	30

3. RAINFALL

The region is characterized by tropical monsoon climate with a rainy summer and dry winter. Heavy rainfall is received during summer and occasional rainfall during winter. January and February are the driest months. The rainfall received during summer is under the spell of South-West monsoon. The onset of South-West monsoon in the region occurs by the end of May or the first week of June and withdraws by late September or early October. But, very often pre-monsoon showers are experienced during March and April. Copious rainfall is received in certain parts of the region during the summer. Mawsynram, located in the State of Meghalaya, has the unique distinction of recording the highest average 11873mm annual precipitation in the world. This is because of its peculiar geographical location. From March to May, the region comes under the influence of equatorial Westerlies and receives precipitation with occasional thundershowers.

The average monthly rainfall of the district for four years (2015-2020) recorded by IMD has been presented in **Table 3**. The isohyets showing the rainfall pattern in the region on the basis of average annual rainfall, has been depicted in **Fig.4**

4. GEOLOGY

Geological Formations encountered, in the North Eastern Region, range in age from Archaeano Recent. The generalized Geological succession of the Region is shown in Table-4.

Table – 4 Generalized Geological Successions in North Eastern India

Age	Group/ Formations	Lithology	
Recent	Newer Alluvium	Clay, Silt, Sand as beds and lenses. ~~~~~ Unconformity ~~~~~~	
Pleistocene	Older Alluvium	Clay, coarse Sand, Shingle, Gravel & Boulder deposits as beds and lenses ~~~~~ Unconformity ~~~~~~	
Pliocene	Dihing	Pebble beds, soft Sandy clay, Conglomerate, Grit and Sandstone. ~~~~~ Unconformity ~~~~~~	
Mio-Pliocene	Dupi Tila	Sandstone, Conglomerate. Mottled clay, and Grit ~~~~~ Unconformity ~~~~~~	
Miocene	Tipam	Mottled clay, Sandy shale, Gritty sandstone, Ferruginous sandstone, Clay, Shale and Conglomerate. Surma	Shale, Sandy shale, Siltstone, Mudstone, Conglomerates etc. ~~~~~ Unconformity ~~~~~~
Oligocene	Barail	Massive sandstone, Shale,Sandy shale etc.	
Eocene	Disang / Jaintia	Shale, Sandstone, Marl, Limestone etc.	
Upper Cretaceous	Khasi Group	Conglomerate, Arkose,Sandstone – Conglomerate alterations. ~~~~~	
Jurassic	Sylhet Trap	Basalt, Rhyolite,acidTuff as flows and lenses ~~~~~ Unconformity ~~~~~~	
Pre-Cambrian	Shillong Group	Quartzite, Phyllite,Conglomerate, Dolerite, Basalt, Porphyritic and coarse Granite, Pegmatite. ~~~~~ Unconformity ~~~~~~	
Archaean		Biotite-gneiss, Biotite-hornblende-Gneiss, Granite, Gneissic Complex Ilemenite-quartz-schist, Mica-Schist etc.	

The North Eastern Region can structurally be classified into five major Geotectonic Provinces. These are as follows.

4.1. Shield area: The stable landmass of Assam-Meghalaya Plateau and the Mishimi massif form the shield area which were unaffected by orogenic movements. The shield area is separated from the other tectonic provinces by deep fractures in all sides.

4.2. Platform area: The areas bordering the shield area are termed as platform area. This zone was also unaffected by Cenozoic orogenic movement. However, late Mesozoic and Cenozoic marine and fluviatile sediments were deposited on this. The Upper Assam valley extending from Mishimi hills to Karbi Anglong, its southern margin and the northern margin of Cachar and N.C. Hills form the platform area, which is the eastern extension of Bengal platform.

4.3. Shelf area: The narrow southern margin bordering the Shield area is known as shelf area.

4.4. Mobile belt: The Geosynclinal deposition on the northern part forming Himalayan mountain system and the east and south-eastern parts forming Naga Patkai and Lushai Hill ranges due to orogenic movement are termed as mobile belts.

4.5. Foredeeps: The depressions in the northern and south-eastern margin of the platform are known as foredeeps. These foredeeps are covered by thick pile of molassic sediments derived from still rising mountains of mobile belt.

5.HYDROGEOLOGY

Recharge to the ground water of an area is controlled, mainly by three factors – Topography, Geology and Climate. Topography controls the gradient of an area. Geology plays an important role in storage and transmission of ground water and Climate forms the main source of ground water recharge through precipitation.

Based on the ground water occurrence and movement, the Geological Formations of the Region can be broadly grouped into Porous and Fissured Formations.

- (a) Porous Formations
 - 1. Unconsolidated Formations
 - 2. Semi-consolidated Formations
- (b) Fissured Formations
 - 1. Consolidated Formations

5.1 Porous Formations

5.1.1 Unconsolidated Formations:

Unconsolidated Formations (Alluvium) occupy about 77,068 sq.km areas which are about 30% of the total area of the region and it covers mostly the plains of Brahmaputra valley and Barak valley of Assam. This Alluvial Formation comprises of Clay, Silt, Sands of various grain size and Gravel, etc. The foot-hill zone of Arunachal Pradesh comprises Boulder, Pebble, Cobble, Gravel, Sand, Silt, Clay etc. known as ‘Bhabar Zone’. In general the grain size of the formations decreases from north to south in the northern part of the Brahmaputra River and from south to north in the southern part of the River. The foot-hill areas in northern and southern part form the recharge zone of ground water for the plains of Assam.

Ground water, in general, occurs under unconfined to semi-confined conditions. However, in parts of Baksa, Udalguri, Darrang, Nalbari, northern part of Kamrup, part of Cachar district of Assam and in southern part of West Garo Hills district of Meghalaya, ground water occurs under confined conditions giving rise to auto flow wells.

A total of 532 Ground Water Monitoring Stations are located in Unconsolidated Formations. During the year 2020-2021, the range of pre and postmonsoon water levels in dugwells varied from 0.07 magl to 12.61 mbgl and 0.55 magl to 10.83 mbgl respectively. The range of pre and postmonsoon water levels in piezometers varied from 1.91 mbgl to 28.09 mbgl and 0.81 mbgl to 25.91 mbgl respectively

5.1.2 Semi-consolidated Formations:

The Semi-consolidated Formations occupy the hill ranges of Tripura, southern hill ranges of Arunachal Pradesh, eastern part of Nagaland, Manipur, Mizoram, eastern fringe of Assam bordering Arunachal and Nagaland and hill ranges of Barak valley in southern Assam. The semi-consolidated formations in the region belong to Tertiary age. The granular zones comprise fine to medium grained sandstone, siltstone with intermittent shale beds. Ground water, in these formations occurs mostly under semi-confined to confined conditions.

In the semi-consolidated formation, 48GWMS are located. The pre and postmonsoon water levels in dugwells ranged from 0.34 to 20.82 mbgl and 0.21 to 15.25 mbgl respectively. In piezometers, water level ranged from 2.81 mbgl to 15.60 mbgl in pre-monsoon and 1.18 mbgl to 14.52 mbgl in post-monsoon.

5.2 Fissured Formations

5.2.1 Consolidated Formation:

The Consolidated Formations form the high hill ranges of Arunachal Pradesh, high land plateau of Meghalaya, Karbi Anglong district of Assam and isolated inselbergs of Brahmaputra valley scattered along both northern and southern bank of Brahmaputra River in middle and lower Assam. This formation mostly comprises of gneissic and schistose rocks belonging to Archaean and Pre-Cambrian age. These rocks are very compact and hard devoid of primary porosity. However, the secondary porosity developed by fractures, fissures and joints form ground water conduits and reservoirs. Due to high rainfall in the area, the weathered residuum has developed a considerable thickness, which varies from 10 to 20 m in general. This weathered residuum forms a good ground water reservoir. In the hill ranges of the area, springs are a common sight, which emanate through contacts of joints, fractures, topographic lows and hill slopes.

A total of 42 GWMS are located in consolidated formations. In Dugwells, the range of water levels during pre & post-monsoon varied from 0.90 to 18.00 mbgl and 0.18 to 15.84 mbgl respectively. In piezometers, pre-monsoon water level ranged from 2.87 mbgl to 45.83 mbgl and post monsoon water level ranged from 0.52 mbgl to 41.37 mbgl.

6. BEHAVIOUR OF WATER LEVEL DURING THE YEAR 2020-21

Based on the water level data collected from the Ground Water Monitoring Stations, the following maps has been prepared for each monitoring period. The details of GWM Stations and water level data during the year,2020– 2021are given in Annexure I and II.

- i. Depth to water level maps
- ii. Fluctuation of water level between Pre and Post monsoon.
- iii. Fluctuation of water level in the current month with respect to that of the same month of the previous year.
- iv. Fluctuation of water level in the current month with respect to the average of the preceding decade for the same month.

6.1 Depth to Water Level

6.1.1 Depth to Water level during March, 2020 (Fig. 5 and Annexure III)

Arunachal Pradesh

A significant part of Arunachal Pradesh is hilly.Hence, most of the monitoring stations are located along the southern boundary bordering the Brahmaputra valley of Assam.

During the month of March 2020, groundwater level was recorded in 23.10 % (6) of the monitored stations within 0-2 mbgl, in 50% (13) stations in the range of 2-5 mbgl, in 15.4% (4) stations ranging from 5to10 mbgl and in 11.5 % (3) GWMS was from 10 and 20 mbgl. The minimum and maximum water level of 0.07 magl and 12.61mbgl were recorded in Papumpare district.

Assam

During the month of March 2020, 23.1% (52) of the monitored stations exhibited water level within 0-2 mbgl, 52.4% (118) stations in the range of 2-5 mbgl, 21.3% (48) stations from 5-10 mbgl, 2.67% (6) stations from 10 to 20 mbgl and one well (0.4% of total) shows water level more than 20mbgl. The minimum water level of 0.11 mbgl had been observed in Cachar district. The maximum water level of 20.1 mbgl had been recorded in East Karbi Anglong district.

Meghalaya

The Depth to water level measured during March 2020, indicates water level in the range of 2-5 mbgl in majority (77.3%) of the GWMS. Water level within0-2 mbgl was recorded in 9.09% (4) stations, in the range of 2-5 mbgl in 77.3% (34) stations, in 11.4% (5) stations ranging from 5-10 mbgl and in only one GWMS water level is above20 mbgl. The minimum water level of 0.34 mbglwas recorded in West Jaintia Hills district. The maximum water level (8.12 mbgl) in dugwell

and in piezometer (45.83 mbgl) had been recorded in West Garo Hillsdistrict and in East Jaintia Hills district respectively.

Nagaland

During March 2020, water level in the state was monitored only in 3 stations. Water level is within the range of 10-20 mbgl in all the three stations. Both the minimum water level (10.5 mbgl) and the maximum water level (16.75 mbgl) had been recorded in Dimapur district.

Tripura

During the month of March 2020, in 18.3% (74) of the monitored stations of the state, water level was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 54.8% (222) stations, in the range of 5-10mbgl in 21.2% (86) GWMS, from 10-20mbgl in 4.44%(18) stations and in 1.2% (5) of stations were above 20mbgl. Majority of water level was recorded in the range of 2-5mbgl. The minimum water level of 0.74 mbgl was recorded in Gomati district. The maximum water level (10.41 mbgl) in dugwell and in piezometer (28.09mbgl) had been recorded in Gomati district and in West Tripura district respectively.

6.1.2 Depth to Water level during August, 2020 (Fig. 6 and Annexure IV)

Due to COVID 19 pandemic, lockdown was imposed in several parts of NER and interstate/interdistrict movement was restricted. Hence ground water monitoring of stations in August 2020 was carried out in few districts.

Arunachal Pradesh

During the month of August 2020, only monitoring of stations located in Papumpare district could be taken up. Water level within 0-5 mbgl had been recorded in majority of the wells i.e. 71.4% (5) of the monitored stations of the state. Depth to water level in the range of 2-5 mbgl in one well (14.3%) and one station in 10-20mbgl range was recorded. Minimum water level of 0.36magl and maximum water level of 10.79 mbgl had been recorded during the period.

Assam

In Assam, monitoring was taken up in very few districts. Depth to water level scenario in those districts during August 2020 indicates prevalence of water level within 5mbgl (100%, 46 Nos.). Depth to water level in the range of 0-2mbgl was recorded in 69.9%(32) stations and in the range of 2-5 mbgl in 30.4%(14) stations. Minimum and maximum water levels of 0.90 magl and 3.98 mbgl had been recorded in Udaguri and Kamrup District respectively.

Meghalaya

During the month of August 2020 monitoring work in Meghalaya state could not be taken up due to movement restrictions imposed by State Government for COVID 19 pandemic.

Nagaland

During the month of August 2020 monitoring work in Nagaland state could not be taken up due to movement restrictions imposed by State Government for COVID 19 pandemic.

Tripura

During the month of August 2020, monitoring in districts of Khowai, North Tripura, Sipahijala and West Tripura was carried out. Water level in 58.1% (50) of the monitored stations of the state was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 32.6% (28) stations, in the range of 5-10mbgl in 3.5% (3) stations and in 3.5% (3) stations in the range of 10-20mbgl. Water level beyond 20mbgl was found in 2 piezometers. Majority of water level was recorded within 0-5mbgl. The minimum water level of 0.3 magl was recorded in Sipahijala district. The maximum water level (5.98mbgl) in dugwell and in piezometer (26.35mbgl) had been recorded in West Tripura district.

6.1.3 Depth to Water Level during November 2020 (Fig. 7 and Annexure V)

Arunachal Pradesh

Depth to water level had been measured in 13 GWMS of the state during the month of November 2020. In 69.2% (9) of the monitored stations the water level was found within 0-2 mbgl, in one station water level was in the range of 2-5 mbgl, in 15.4% (2) stations in the range of 5-10 mbgl and in only one station it was recorded in the range of 10-20 mbgl. Both the minimum and maximum water levels of 0.55 magl and 10.83 mbgl had been recorded in Papumpare district.

Assam

During November 2020, depth to water level in majority of the stations(93.7%, 251 Nos.) was found in the range of 0-5mbgl. Depth to water level in the range of 0-2mbgl was measured in 59.7%(160) stations, in the range of 2-5 mbgl in 91%(34) stations and in the range of 5-10mbgl in 5.22%(14) stations. Water level in the range of 10-20 mbgl was recorded in 3(1.1%) stations only. Minimum water level (0.05magl) and maximum water level (15.84 mbgl) were recorded in Dhemaji and Dhubri District respectively.

Meghalaya

During November 2020, water level in the state was recorded within 0-2 mbgl in 47.5% (29) of the monitored stations, in the range of 2-5 mbgl in 42.6% (26) stations, in the range of 5-10 mbgl in 4.92% (3) stations and one well shows water level in the range of 10 to 20mbgl. Water level above 20mbgl was observed in 3.3% (2) stations. The minimum water level of 0.18 mbgl was recorded in East Khasi Hills district. The maximum water level (9.72mbgl) in dugwell and in piezometer (41.37 mbgl) had been recorded in West Jaintia Hills district and in East Jaintia Hills district respectively.

Nagaland

During November 2020, water level had been monitored only in Dimapur district of the state. Water level in 27.3% (3) of the monitored stations had been recorded within 0-2 mbgl and in 45.5% (5) stations, in the range of 2-5 mbgl and 27.3% (3) stations show water level between 5-10 mbgl. The minimum and maximum water level had been recorded as 0.23 and 9.6 mbgl.

Tripura

During the month of November 2020, water level in 36.6% (41) of the monitored stations of the state was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 46.4% (52) stations, in the range of 5-10mbgl in 10.7% (12) stations and in 4.5% (5) stations in the range of 10-20mbgl. Only in 2 stations water level was observed beyond 20 mbgl. Majority of water level was recorded within 0-5mbgl. The minimum water level of ground level was recorded in Dhalai district. The maximum water level (9.03 mbgl) in dugwell and in piezometer (25.91 mbgl) had been recorded in Gomati district and in West Tripura district respectively.

6.1.4 Depth to water level during January 2021 (Fig. 8 and Annexure VI)

Arunachal Pradesh

During the month of January 2021, groundwater level in the state was recorded in 23.1% (6) of the monitored stations within 0-2 mbgl, in 53.85% (14) stations in the range of 2-5 mbgl, in 15.4% (4) stations in the range of 5-10 mbgl and only in 7.7% (2) GWMS in the range of 10-20mbgl. Both the minimum and maximum water levels of 0.07 magl and 13.47 mbgl had been recorded in Papumpare district.

Assam

Depth to water level scenario in the state during January 2021 indicate water level within 5mbgl (83.7%, 251 Nos.) in major part of the state. Depth to water level in the range of 0-2mbgl was recorded in 28.7%(86) stations, in the range of 2-5 mbgl in 55%(165) stations and in the range of 5-10mbgl in 13.3%(40) stations. Water level in the range of 10-20 mbgl was recorded in 8 (2.67%) stations and above 20mbgl in one station only. The minimum water level was recorded in Nagaon and Sibsagar district. The maximum water level of 20.82 mbgl had been recorded in East Karbi Anglong District.

Meghalaya

During the month of January 2021, water level in the range of 0-5 mbgl was recorded in 89.3% (50) of the monitored stations in the state. In 30.4% (17) stations, it was recorded in the range of 0-2 mbgl, in 58.93% (33) stations in the range of 2-5mbgl, and in 3.57% (2) stations in the range of 5-10mbgl. Water level in the range of 10-20mbgl was recorded only in 1 station and beyond 20mbgl was found in 3(5.36%) stations. The minimum water level (0.02mbgl) was recorded in Ri Bhoi district. The maximum water level (10.7 mbgl) in dugwell and in piezometer (42.24 mbgl) had been recorded in West Jaintia Hills district and in East Jaintia Hills district respectively.

Nagaland

During January 2021, water level in the state had been monitored only in Dimapur district. Water level was recorded in one well (9.1%) of the monitored stations within 0-2 mbgl, in 45.5% (5) stations in the range of 2-5mbgl, in 18.2% (2) stations in the range of 5-10mbgl and in 2 (18.2%) station in the range of 10-20 mbgl. Beyond 20mbgl water level is recorded in one well. The Minimum and the maximum water level recorded are 1.73 mbgl/21.3 mbgl respectively.

Tripura

During the month of January 2021, water level in 17.8% (20) of the monitored stations in the state was recorded within 0-2 mbgl. Water level in the range of 2-5mbgl was found in 58.04% (65) stations, in the range of 5-10mbgl in 18.8% (21) GWMS and in 2.68%(3) stations in the range of 10-20mbgl. Water level above 20mbgl was found in 3 stations in West Tripura district. Majority of water level was recorded within 0-5mbgl. The minimum water level of 0.30 mbgl was recorded in Dhalai district. The maximum water level (8.05mbgl) in dugwells and in

piezometers (26.37 mbgl) had been recorded in South Tripura district and in West Tripura district respectively.

6.2 Water Level Fluctuation with respect to August 2020

6.2.1 Water Level Fluctuation;August 2020 and March 2020 (Fig. 9 and Annexure VII)

Arunachal Pradesh

Due COVID 19 pandemic, mintoring could be carried out only in Papumpare district for the month of August 2020. Rise in water level was observed in all the monirored stations during August 2020 as compared to that of March 2020. Rise had been recorded in 83.3% (5) stations in the range of 0-2 m and in 16.7% (1) stations in the range of 2-4 m. The rise was mostly restricted to 2m only.

Assam

Due to movement restriction imposed for COVID 19 pandemic, monitoring in very few districts of Assam could be carried out viz; Kamrup, Kamrup Metro, Morigaon, Lakhimpur and Nalbari. Rise in water level in August 2020 was observed in all the montored stations in comparison to March 2020. Rise was recorded in 55.6% (10) stations in the range of 0-2 m, in 33.3% (6) stations in the range of 2-4 m and in 11.1% (2) stations above 4 m.

Meghalaya and Nagaland

Water level monitoring could not be taken up in Meghalaya and Nagaland state due to movement restrictions imposed by respective state governments.

Tripura

Stations located in Khowai, North Tripura, Sipahijala and South Tripura districts were only monitored during August 2020. Majority of the GWMS recorded rise in water level during the month of August 2020 in comparison to that of March 2020. Rise was observed in 62.1% (18) stations in the range of 0-2 m and in 27.6% (8) stations in the range of 2-4 m. Fall in water level was restricted to 2m only and was recorded in 10.3% (3) stations.

6.3 Water Level Fluctuation with respect to November 2020

6.3.1 Water Level Fluctuation;November 2020 and March 2020 (Fig. 10 and Annexure VIII)

Arunachal Pradesh

Comparison of water level of November 2020 and March 2020 indicates rise in 91.7% of the GWMS during November 2020. Rise was recorded in 66.7% (8) of the GWMS in the range of 0-2 m and in 1 (8.3%) stations in the range of 2-4 m and 16.7% (2) wells in above 4m range. Fall was recorded only in 1 (8.3%) station which may be due to rise in water level in March 2020 caused by pre-monsoon shower.

Assam

By comparing the water level of November 2020 with that of March 2020 it is found that rise was recorded in about 95% (192) of the GWMS. Rise was observed in 62.9% (127) stations in the range of 0-2 m, in 26.2% (53) stations in the range of 2-4 m and in 5.9% (12) stations beyond 4 m. Fall was recorded in 5% (10) stations. Entire fall was restricted to 2 m. The fall may be due to rise in water level caused by the occurrence of pre-monsoon shower in certain parts of the state.

Meghalaya

Comparison of water level of November 2020 with that of March 2020 indicates rise in majority of the stations during November 2020. Rise was recorded in the range of 0-2 m in 67.4% (29) stations, in the range of 2-4 m in 21% (9) of the stations and above 4 m in 7% (3) stations. Fall was recorded in one well each in 0-2 m and 2-4 m range.

Tripura

Most of the GWMS recorded rise in water level during November 2020 in comparison to March 2020. Rise in the range of 0-2 m was recorded in 69.5% (73) stations, in 23.8% (25) stations in 2-4 m and in 1.9% (2) stations in the range of above 4 m. Fall was observed in 4.8% (5) GWMS within the range of 0-2 m.

6.4 Water Level Fluctuation with respect to January 2021

6.4.1 Water Level Fluctuation January 2021 and March 2020 (Fig. 11 and Annexure IX)

Arunachal Pradesh

By comparing the water levels of January 2021 with that of March 2020 it was found rise in 87.5% (21) of the monitored stations during January 2021. Rise was recorded in 83.3% (20) stations in the range of 0-2 m and only in 1 (4.77%) stations in the range of 2-4 m. Entire fall was within 2 m. The fall observed may be due to rise in water level caused by pre-monsoon shower during March 2020.

Assam

During January 2021 rise in water level was observed in majority of the stations in comparison to that of March 2020. Rise in the range of 0-2 m was recorded in 72% (149) stations, in the range of 2-4 m in 6.7% (14) stations and in 2 (0.9%) stations beyond 4 m.

Fall in water level was observed in 17.4% (36) of the GWMS in the range of 0-2 m and in 1.9% (4) station in the range of 2-4 m and in 2 (0.97%) stations above 4 m.

Meghalaya

By comparing the water levels of January 2021 with March 2020 it was observed rise in majority (91.3%) of the stations during January 2020. Fall was recorded only in 4 (9.76%) stations. Entire fall was within 2m. Rise was observed in 65.9% (27) stations in the range of 0-2 m, in 22% (9) stations in the range of 2-4m and only in one station above 4m.

Nagaland

Comparison of water levels of Dimapur district for January 2021 and March 2020 could be compared for two stations only due to paucity of data. Both stations indicate rise; one station in the range of 0-2m and the other above 4m.

Tripura

Comparison of water levels of January 2021 and March 2020 indicates rise during January 2021 in 89.5% (22) monitored stations. Rise was observed in 79.8% (83) stations in the range of 0-2 m, in 7.7% (8) stations in the range of 2-4m and only in one station above 4m. Fall was recorded in 12 (11.5%) stations, all in the range of 0-2m.

6.5 Fluctuation of Water Level with respect to same month of the previous year

6.5.1 March 2019 and March 2020 (Fig. 12 and Annexure X)

Arunachal Pradesh

Comparison of water levels of March 2019 and March 2020 indicated fall in 75% (15) stations in the state in March 2020. Rise was observed in 25% (5) stations. Rise was observed in 20% (4) stations in the range of 0-2 m and in 5% (1) stations in the range of 2-4m. Fall was observed in 50% (10) stations in the range of 0-2 m, in 15% (3) stations in the range of 2-4m and only in 2 (10%) stations above 4m.

Assam

Rise in water level in 55.2% (106) stations of the state was observed during March 2020 in comparison to that of March 2019. In 49.5% (95) stations showing rise was recorded in the range of 0-2 m, in 4.7% (9) stations in the range of 2-4 m and in 1% (2) stations above 4 m. In total, 44.8% (86) stations indicated fall; of which 43.3% (83) are within 2m, and one in each in 2-4m and above 4m range.

Meghalaya

Comparison of water level of March 2020 with that of March 2019 indicate rise during March 2020 in 70.3% (26) of monitored stations and 29.7% (11) stations show falling trend.

All the fall(29.23%, 11) had been found within 2m. Rise in 62.2% (23) stations are in 0-2m range and 8.1% (3) stations show rising trend in 2-4m range.

Nagaland

Comparison of water levels of March 2020 of Dimapur district with that of March 2019 was done only in two stations and both indicate fall during March 2020. One station shows fall in 0-2m range and the other shows fall above 4m.

Tripura

Fall in water level in major part 73.1% (68) stations of the state was observed during March 2020 in comparison to that of March 2019. In 65.6% (61) stations fall was recorded in the range of 0-2 m, in 6.1% (6) stations in the range of 2-4 m and in 1.1% (1) stations above 4 m. In total, 26.9% (25) stations indicated rise; all of which are within 2m.

6.5.2 August 2020 and August 2019 (Fig. 13 and Annexure XI)

Arunachal Pradesh

Due to COVID 19 restrictions, monitoring was restricted in Papumpare district only. Comparison of water levels of August 2020 and August 2019 indicate rises during August 2020 in 83.3% (6) stations. Rise in the range of 0-2m was observed in all the stations. Fall was recorded in 16.7% (1) stations in the range of 0-2m.

Assam

Due to COVID 19 monitoring was restricted to parts of Baksa, Darrang, Kamrup, Kamrup (Metro), Lakhimpur, Morigaon, Nagaon and Udalguri Districts only. By comparing the water levels of August 2020 with August 2019 it was observed rise in 75.6% (31) stations of the state during August 2020. In 73.2% (30) stations fall was recorded in the range of 0-2m and in 2.4% (1) station in the range of 2-4 m. Fall in water level was observed in 24.4% (10) stations all in the range of 0-2m. Both rise and fall had been observed in most of the districts.

Meghalaya and Nagaland

Water level monitoring could not be taken up in Meghalaya and Nagaland state due to movement restrictions imposed by respective state governments Nagaland

Tripura

Monitoring for August 2020 was done for parts of Khowai, North Tripura, Sipahijala and West Tripura districts. Comparison of water levels of August 2020 and August 2019 indicates rise in water level in major part (66.7) of the state during August 2020 and all the stations are in the range of 0-2m. Fall was recorded in 33.4%(8) stations of which 29.2% (7) in the range of 0-2m and in 4.2%(1) stations in the range of 2-4m

6.5.3 November 2020 and November 2019(Fig. 14 and Annexure XII)

Arunachal Pradesh

By comparing the water level of November 2020 and November 2019 it was observed rise in most of the monitored stations of the state during November 2020. In 75% (9) of the GWMS, rise was recorded and in 25%(3) of the stations fall was recorded. Entire rise and fall were within 2m.

Assam

In November 2020 rise in water level was observed in the state in comparison to that of November 2019 in 75.8%(169) stations. Rise in the range of 0-2 m was recorded in 73.1%(163) stations, in the range of 2-4 m was recorded in 2.2% (5) stations and above 4m range rise was recorded only in one station. Fall was observed in 24.2%(54) stations of which 22% (49) stations are in range of 0-2m and five stations (2.2%) are in 2-4m range.

Meghalaya

In comparison to November 2019, rise in water level was recorded in 74.6%(44) monitored stations during November 2020. Rise was observed in the range of 0-2 m in 64.4% (38) stations and 5.1%(3) stations each in the range of 2-4 m and above 4m range. Fall was recorded in 25.4%(15) stations all in the range of 0-2m.

Nagaland

During November 2020 rise in water level was observed in all (10) of the monitored stations in Dimapur district of the state in comparison to November 2019. Rise was within the range of 0-2m.

Tripura

Comparison of water levels of November 2020 and November 2019 indicated rise in major part of the state during November 2020. In total, rise was recorded in 87.2%(82) stations. Fall was

observed in 85.1% (80) stations in the range of 0-2 m and in 2.1% (2) stations in the range of 2-4 m. Total fall was recorded in 12.8% (12) stations of which 11.7% (11) stations are in the range of 0-2m and one well is above 4m range.

6.5.4 January 2021 and January 2020 (Fig. 15 and Annexure XIII)

Arunachal Pradesh

Rise in water level during January 2021 had been observed in most of the stations of the state in comparison to January 2020 data. Rise was observed in 66.7% (16) stations and fall in 8(33.4%) stations. In 62.5% (15) stations show rise in 0-2m range and only one well show rise in 2-4m range. Fall was observed in 29.2% (7) stations in 0-2m range and one station show fall in 2-4m range.

Assam

In January 2021 rise in 46.5% (112) stations and fall in 53.6% (129) stations were observed in comparison to that of January 2020. In 43.2% (104) stations rise was found in the range of 0-2 m, in 5 (2.1%) stations in the range of 2-4 m and in 3 (1.24%) stations above 4m. Fall was observed in 48.9% (118) stations in the range of 0-2m, in 7 (2.9%) stations in the range of 2-4m and in 4 (1.7%) stations above 4m.

Meghalaya

In comparison to January 2020, rise in water level was recorded during January 2021, in major part of the state. In 61.1% (33) of the stations rise was observed; of which 53.7% (29) stations was in the range of 0-2 m, in 3 (5.6%) stations in the range of 2-4 m and one station above 4m range. Fall was observed in 21 (38.9%) stations all in the range of 0-2 m.

Nagaland

By comparing the water level of January 2021 and January 2020, it was observed fall in most of the stations (7 Nos, 70%) in Dimapur district of the state during January 2021. Fall in the range of 0-2m was recorded in 50% (5) stations and in the range above 4m in 20% (2) stations. Rise was observed in 3 (30%) stations; 1 station each in the range of 0.2m, 2-4m and above 4m.

Tripura

A total of 100 wells were analysed. Rise in water level was recorded in major part of the state during January 2021 in comparison to January 2020. Rise in the range of 0-2m was recorded in 57% (57) stations and in the range of 2-4m in one station. The fall in water level was recorded in 40% (40) stations in the range of 0-2m and 2 (2%) stations in the range of 2-4m.

6.6 Fluctuation of Water level with respect to Decadal Mean (Preceding 10 Years)

Water level of a Ground Water Monitoring Stations of the monitored months are compared with the mean water level data of preceding ten years to know any deviation i.e., rise and fall in long term water level trend.

6.6.1 March 2020 and Decadal MeanMarch2010-2019 (Fig. 16 and Annexure XIV)

Arunachal Pradesh

March 2020water level had been compared with mean water level data of the same period of preceding 10 years. Rising trend was observed in 41.2%(7) stations, of which all the stations were in the range of 0-2 m. Declining trend was also observed only in the range of 0-2 m, in58.8%(10) stations. The maximum rising & falling water level trendsare 0.89 m and 1.59 m respectively and had been recorded inPapumpareand Changlang district.

Assam

Comparison of March 2020 water level with mean water level data of the same period of preceding 10 years indicate rising trend in51.5%(86) stations in the range of 0-2 m and in6.6% (11) stationsin the range of 2-4 m.Falling trend was observed in39.5%(66) stationsin the range of 0-2, in 1.8%(3) stations in the range of 2-4m andin 1 (0.6%) station above 4m. In total, rising trend was observed in 58.1%(97)of the monitored stations.The rising trend ranges from 0.01 to 3.9 m and the declining trend ranges from 0.03 to 7.39 m. The maximum rising trendand declining trend had been recorded inHailakandiand East Karbi AnglongDistrict respectively. Declining trend beyond 4m had been observed in one station atEast Karbi Anglong district.

Meghalaya

March 2020 water level had been compared with mean water level data of the same period of preceding 10 years. In total, declining water level trend was observed in 58.6% (17) monitored stations of the state; of which 55.1%(16) stations were in the range of 0-2m and one station is in the range of 2-4m.Rising water level trend was observed in 41.4%(12) stations. Entire rising trend was recorded in the range of 0-2 m. The rising trend ranges from 0.07 to 1.41m and the declining trend ranges from 0.01 to 2.32m. Themaximum rising and declining trend had been recorded inEast Garo HillsandNorth Garo Hills district respectively..

Nagaland

In March 2020, only one station was analysed in Dimapur district of the state which show falling water level trend in comparison with the mean water level data of the same period of preceding 10 years.The range of decline was 2-4m.

Tripura

Comparison of March 2020 water level data with the mean of the same period of preceding 10 years indicated both rising and falling trend in all the districts. Rising trend was in 41.9% (13) stations are in the range of 0-2 mbgl. Falling trend was recorded in 54.8% (17) stations in the range of 0-2m and in one station trend was above 4m. The rising trend ranges from 0.01 to 1.45m. The declining trend was found between 0.02 to 5.26m. The maximum rising trend was recorded in Gomati district.

6.6.2 August 2020 and Decadal Mean August 2010-2019 (Fig. 17 and Annexure XV)

Arunachal Pradesh

August 2020 water level of only Papumpare district had been compared with mean water level data of the same period of preceding 10 years. Both rising and falling trend was recorded in the district. Rising trend was observed in August 2020 in 80% (4) stations. The rise ranges from 0.01 to 0.98 m. Falling trend was observed in one station.

Assam

August 2020 water level had been compared with the mean water level of the same period of preceding 10 years and it was observed rising trend in water level in 68% (21) stations in the range of 0-2 mbgl and in 3.2% (1) station in the range of 2-4m. Falling trend was recorded in 29% (9) stations in the range of 0-2m. The maximum rising (3.42 m) and the maximum falling water level (0.94m) had been recorded in Udaguri and Darrang district respectively.

Meghalaya and Nagaland

Due to COVID 2019 pandemic, Water level monitoring could not be taken up in Meghalaya and Nagaland state due to movement restrictions imposed by respective state governments.

Tripura

In August 2020, only in Khowai, Sipaahijala and West Tripura districts were monitored. Both rising water level trend was observed in the state in comparison to the mean water level of the same period of preceding 10 years. Rising trend was in 33.3% (5) stations are in the range of 0-2 mbgl and one station show rising trend in the range of 2-4m. Falling trend was recorded in 60% (9) stations in the range of 0-2m. The declining trend ranges from 0.05 to 0.86m. The rising water level trend ranges from 0.04 to 2.66m; the maximum value was recorded in West Tripura district.

6.6.3 November 2020 and Decadal Mean November 2010-2019 (Fig.18 and Annexure XVI)

Arunachal Pradesh

November 2020 water level of only Changlang, East Siang and Papumparedistricts had been compared with mean water level data of the same period of preceding 10 years.Rise was recorded in 90% (9) stations and only one station show falling trend. All the rising trend and falling trend had been found restricted to 2m. The rise ranges from 0.42 to 0.94m.The maximum rising and the falling trend in water level had been recorded inPapumparedistrict.

Assam

Comparison of November 2020 water level with mean of the same period of preceding 10 years indicate rising trend in77.9%(152) GWMS. Rise in the range of0-2m was recorded in 75.8%(147)stations, in the range of 2-4m in 2.1%(4) stations and only in 1 station above 4m.Declining water level was observed in 20.6%(40) stationsin the range of0-2m and only in 2 (1.0%) station in the range of 2-4m. Most of the rising and declining trends had been found within 2m. The rise ranges from ground level to 6.37 m and the fall ranges from 0.01 to 2.02 m. The maximum rising and the falling trend in water level had been recorded in Dhubriand Kokrajhardistrict respectively.

Meghalaya

Comparing November 2020 water level with mean of the same period of preceding 10 years it was found that54.2%(13) GWMS indicated rising trend and 45.83% (11) GWMS show falling trend in water level during November2020. Entire fall (45.8%) was found within 2m. Rise was recorded in 50%(12) stations in the range of 0-2mand onlyin 1(4.2%) stationin 2 to 4m range.The rising and declining trend ranges from 0.07 to 2.38m and 0.01 to 1.49 m respectively.The maximum rising and declining trend in water level had been recorded in West Garo Hills and North Garo Hills district respectively.

Nagaland

Three stations of Dimapur diostrict was analysed for November 2020. Comparison of November 2020 water level with mean water level data of the same period of preceding 10 years indicated both rising and falling trend. One well showed rising trend in the range of more than 4m and in the remaining two wells, one well showed falling in 0 to 2m and the other in 2 to 4m range.

Tripura

November 2020 water level had been compared with mean water level data of the same period of preceding 10 years and it was observed that 74.3% (29) stations indicated rise and 24.5% (10) indicate falling trend. Fall was recorded in 20.5%(8) stations in the range of 0-2m, and one

well (2.6%) in each 2-4m and above 4m range. Rise had been recorded in 69.2% (27) stations in the range of 0-2m and in 5.1% (2) station in the range of 2-4m. The rising and declining trend range from 0.12 to 3.27 m and 0.03 to 5.53 m respectively. The maximum rising and declining trend in water level had been recorded in West Tripura and Dhalai district respectively.

6.6.4 January 2021and Decadal Mean, January 2011-2020 (Fig.19 and Annexure XVII)

Arunachal Pradesh

January 2021 water level had been compared with mean water level data of the same period of preceding 10 years. It was observed falling trend in 35.3% (6) of the monitored stations during January 2021 and in the range of 0-2m. All the rising trend was recorded within 2m and in 64.7% (11) stations. The maximum rising trend of 0.87 m and maximum falling trend of 1.81 m had been recorded in Papumpare district.

Assam

Comparison of January 2021 water level with mean of the same period of preceding 10 years indicate rising trend in 68.3% (150) stations during January 2021. Rise in the range of 0-2m was recorded in 66% (145) stations and in the range of 2-4m in 5 (2.3%) stations. Declining trend was observed in 28% (62) stations in the range of 0-2m, in 2.7% (6) stations in the range of 2-4m and 1% (3) is in more than 4m range. Most of the rising and declining trend had been found within 2m. The maximum rising (3.33m) and the falling trend (5.15 m) in water level had been recorded in Udaguri and Sonitpur district respectively. Rise and fall occur nearly in all the districts except in Chirang where rising trend shows and in Dhemaji which shows falling trend.

Meghalaya

Comparing January 2021 water level with mean of the same period of preceding 10 years it was found that 66.6% (20) stations indicated rising trend in water level during January 2021. In 33.3% (10) stations, decline was recorded in the range of 0-2m. The rising trend was observed in 63.3% (19) stations in 0 to 2m and only in 1 station in the range of 2-4m. The maximum rising (3.81m) and declining trend (1.58 m) in water level had been recorded in West Garo Hills district and Ri Bhoi district respectively.

Nagaland

Comparison of January 2021 water level with mean water level data of the same period of preceding 10 years had been carried out for Dimapur district only. Rise in water level was recorded in 56% (5) stations in 0-2m and one (11.1%) station found above 4m range. The falling trend had been found in three (33%) stations in Dimapur district.

Tripura

January 2021 water level had been compared with mean water level data of the same period of preceding 10 years and it was observed that 55.7% (24) stations indicated rise in January 2021. Rise was recorded in 53.4% (23) stations in the range of 0-2m and only in one (2.3%) station in the range of 2-4m. The falling trend had been found in the range of 0-2m in 41.9% (18) stations and only in one station in the range of 2 to 4m. Both the maximum rising of 3.44m and declining trend of 2.93m in water level had been recorded in West Tripura district. Rise and fall had been observed in parts in all the district.

6.7 Ground Water Level Trend (2010-2020), Pre Monsoon

The historical water level data of GWMS have been analysed for determining long term water level trends for the period, 2010-2020. A total number of 563 stations have been analysed for pre-monsoon water level trends. The frequency of stations showing rising or falling trend during pre-monsoon period is given in Annexure-XVIII. State-wise analysis is as follows.

6.7.1 Arunachal Pradesh

Water level data of 25 stations have been analysed for pre-monsoon water level trend. Out of these, 17 stations show rising trend ranging from 0.008 to 0.459m/year whereas, 8 stations show falling trend ranging from 0.02 to 0.925m/year. The maximum fall is observed in East Siang district. Significant decline in water level trend has not been observed in the state.

6.7.2 Assam

Water level data of 343 stations have been analysed for pre-monsoon water level trend. Out of these, 190 (55.40%) stations show rising trend ranging from 0.003 to 2.33m/year and 153 (44.60 %) stations show declining trend ranging from 0.002 to 1.889m/year. Both rising and falling trends of water level have been observed all over the state.

The rising trend above 0.20m/year was observed in 48 stations in the state. The falling trend beyond 0.20 m/yr has been observed in 19 stations. The maximum falling trend has been observed in Cachar district.

6.7.3 Meghalaya

Data of 60 stations have been analysed for pre-monsoon water level trend. Out of these, 26 stations show rising trend ranging from 0.002 to 0.582m/year and 34 stations show declining trend ranging from 0.002 to 1.917m/year in dugwells. Most of the rising and declining trends have

been restricted below 0.2m/year except in few stations. In piezometers the range of rising and declining trends has been observed as 0.305 to 0.323m/year and 0.02 to 1.454m/year respectively.

6.7.4 Nagaland

Data of 30 stations have been analysed for pre-monsoon water level trend. Out of these, 24 stations show rising trend ranging from 0.029 to 2.312m/year whereas, 6 stations show falling trend ranging from 0.02 to 0.51m/year.

6.7.5 Tripura

Analysis for ground water level trend of Tripura state has been done for 105 stations for pre-monsoon period. Out of these, 52 stations show rising trend and 53 stations show declining trend. The rising trend ranges from 0.002 to 2.264 m/year and the declining trend was observed in the range of 0.001 to 1.726m/year. Both the maximum decline and maximum rise have been observed in South Tripura district.

6.8 Ground Water Level Trend (2010-2020), Post Monsoon

The historical water level data of GWMShave been analysed for determining long term water level trendfor the period, 2010-2020. Water level data of 569 stations have been analysed for postmonsoon water level trend. The frequency of stations showing rising or falling trends of water levels during post-monsoon period is given in Annexure-XIX. State-wise analysis is as follows.

6.8.1 Arunachal Pradesh

Data of 26 stations have been analysed for post-monsoon water level trend. Out of these, 18 stations show rising trend ranging from 0.039 to 0.988/year whereas, 8 stations show falling trend ranging from 0.02 to 0.925m/year. The maximum fall has been observed in Tirapdistrict. The declining water level trend observed is not significant.

6.8.2 Assam

Data of 346 stations have been analysed for post-monsoon water level trend. Out of these, 217(62.72%) stations show rising trend ranging from 0.001 to 2.33m/year and 129(37.28%) stations show falling trend ranging from 0.001 to 1.117 m/year. Both rising and falling trends have been observed all over the State.

The rising trend above 0.20 m/year has been observed in 55stations in the State. The fall beyond 0.20 m/yr has been observed in 15 stations. The maximum falling trend has been

found as 1.117m/year in Kamrup (Metro) district. A general rise in water level has been observed in the post monsoon period.

6.8.3 Meghalaya

Water level data of 62 stations have been analysed for post-monsoon water level trends. Out of these, 36 stations show rising trend in range from 0.007 to 2.513m/year and 26 stations show declining trend in the range of 0.001 to 0.428 m/year. Most of the rising and declining trends have been restricted below 0.2m/year.

6.8.4 Nagaland

Data of 29 stations have been analysed for post-monsoon water level trend. Out of these, 24 stations show rising water level trend ranging from 0.033 to 2.428 m/year. In 5 stations falling trend ranging from 0.011 to 0.51m/year has been observed. The maximum fall is observed in Tuensang district.

6.8.5 Tripura

Data of 106 stations have been analyzed for post-monsoon water level trends for the state of Tripura. Out of these, 68 stations show rising trend and 38 stations declining trend. The rising trend was in the range of 0.001 to 2.264 m/year and the declining trend in the range of 0.001 to 1.127m/year. Maximum declining and maximum rising trend have been observed in South Tripura district. Most of the rise and decline have been recorded below 0.20m/year.

6.9 Area under water logged and prone to water logging conditions (Fig.20 and Fig.21)

Water logging conditions prevail in many places of the North Eastern States. Water level in phreatic condition is found to occur mostly within 5.0 mbgl throughout the year. Water levels within 3.00 mbgl are recorded in 30.3% (92) stations during premonsoon and in 69.74% (212) stations during post-monsoon period. Shallow water level conditions in the region occur due to high rainfall recharge and poor ground water draft from shallow aquifers. Low ground water gradient in valley areas results in water logging conditions. Maps showing areas under water logged and prone to water logging conditions have been prepared (Fig. 20 and 21) for both pre- and post-monsoon.

Water Logged Area and Area prone to water logging condition:

Water logged area is demarcated based on depth to water levels within 2.0 mbgl. Prone to water logging areas are demarcated with depth to water level from 2-3mbgl. During pre-monsoon period (March 2020), 51.8% (73) stations show water logging condition, whereas

48.2% (68) stations show prone to water logging condition in Pre-monsoon. During post monsoon period (November 2020), 71.2% (242) stations show water logging condition and 28.8% (98) stations show prone to water logging condition. During Pre-monsoon period water logged and prone to water logging areas have been observed in Biswanath Chariali, Bongaigaon, Dhemaji, Dhubri, Goalpara, Jorhat, Lakhimpur, Morigaon, Nagaon, Morigaon, Tinsukia, Sibsagar, Sonitpur and in one location of Kamrup (Metro) district of the Brahmaputra valley. In major parts of Cachar, Hailakandi and Karimganj district of Barak valley waterlogging condition was observed. Water logged and prone to water logging areas have been observed in districts of East Siang, Lohit, Lower Subansiri and Papumpare in Arunachal Pradesh. In the state of Meghalaya, East Garo Hills, East Khasi Hills, Ri Bhoi, South West Garo Hills, West Garo Hills and West Jaintia Hills district show Water logged and prone to water logging areas in pockets. Dhalai, Gomati, Khowai, North Tripura, Sipahi-Jala, South Tripura, Unakoti and West Tripura district of Tripura show Water logged and prone to water logging areas.

During post-monsoon period (November 2020), water logged and prone to water logging conditions have been observed in almost all the districts of Assam and in parts of Changlang, East Siang, Lower Subansiri and Papumpare districts in Arunachal Pradesh. In Meghalaya and Tripura also, in all the districts shallow water levels in pockets have been observed. Out of 340 analysed stations, water level in the range 0-2mbgl had been recorded in 242 (71.2%) stations and in the range of 2-3mbgl in 98 (28.8%) stations. Remaining stations, most of which are located near inselbergs or in hard rock areas or in foothills show water levels above 3mbgl.

It is observed that in both pre and post monsoon periods, a large part of the alluvial area in the region show water level in the range of 0 to 3 mbgl (Fig 20 and 21). Occurrence of water logging conditions in the region is due to high rainfall, shallow water level and a poor ground water draft in vast flood plains of the Brahmaputra and Barak river system.

7. HYDROCHEMISTRY

Chemical quality of ground water is being monitored every year for temporal and spatial changes and to study their causes. Water samples are collected in the month of March (pre-monsoon) and November (post monsoon) every year. Water quality standards for drinking use and the overall chemical quality of gorund water of North Eastern region for the year 2020-2021, are shown in **Annexures – XX.**

The chemical constituents analyzed were compared with the standard values given by BIS (IS 10500:2012). The minimum and maximum values of iron (Fe) and16 basic constituents of ground water in North Eastern region for the pre-monsoon period (March, 2020) are presented in Table 5.

Table – 5 Chemical qualities of ground water samples of NE-region (Pre-Monsoon, 2020) showing the maximum and minimum values vis-à-vis drinking water standards (IS 10500:2012)

In North-Eastern region, both the maximum (9.24 in Khowai district) and minimum (3.42 in North Tripura) values of pH are recorded in Tripura. Also, in Assam, the maximum pH (9.08 in Barpeta district) is beyond the permissible limit. The turbidity of the groundwater samples from all these five North-Eastern states is well below the BIS prescribed limits. In the case of Total Dissolved

Solids, the level is within the permissible limit in Arunachal Pradesh, Meghalaya and Nagaland. However, in Assam, the maximum TDS recorded is 769.30 mg/L, and in Tripura, it is 1035.00 mg/L which are beyond the acceptable limit. Total Alkalinity have been found within permissible limit in Arunachal Pradesh, Meghalaya, and Nagaland but beyond limit in few samples of Assam (744.80 mg/L) and Tripura (1330.86 mg/L). Chloride concentration is below the permissible limit in most of the locations except in Assam where the maximum value is 347.41 mg/. Presence of fluoride in higher concentration has been pockets in Assam and Tripura. In Assam maximum value of 2.4mg/L have been found in Kamrup district and in Tripura maximum value of 10.2mg/L have been found in Khowai District. Calcium is within the permissible limit in all the states, except in Assam where maximum value of calcium is 209.92mg/L. In case of magnesium, although the values in all the states are below the BIS permissible limit, Assam, Meghalaya and Tripura have samples with magnesium content above the acceptable limit. Total hardness in all the locations are within permissible limit. The concentration of other basic parameters viz. sulphate, nitrate, sodium and potassium in groundwater samples of the North-Eastern states are within the prescribed limits.

Iron contamination in groundwater is found to be prevalent in North East. All the North-Eastern states depict the higher concentration of iron. The maximum concentration of iron is observed in Arunachal Pradesh (12.97 mg/L in Papum Pare district), the second highest state being Assam (11.61 mg/L in Cachar district).

Further details of the basic constituents and iron analysed in groundwater samples collected during March 2020 and November 2020 are shown in **Annexure XX**.

Table 6 shows the minimum and maximum values of 10 heavy metals constituents (chromium, manganese, nickel, copper, zinc, arsenic, selenium, silver, cadmium and lead) along with radioactive uranium of groundwater in the North-Eastern region. Data of heavy metals and Uranium in groundwater samples collected during March 2020 and November 2020 are shown in **Annexure XXII**. Chromium concentration in groundwater samples are below the permissible limit for all the North-Eastern states. However, in the Gomati district of Tripura, it is found that the maximum value of chromium is 0.18 mg/L which is above the BIS acceptable limit. Manganese is found to exceed the BIS drinking water permissible limit of 0.30 mg/L in all the North-Eastern states. The maximum value is found in Assam (6.31 mg/L in Nagaon district) followed by Tripura (4.40 mg/L in North Tripura), Meghalaya (2.12 mg/L in SW Garo Hills), Arunachal Pradesh (1.00 mg/L in Papum Pare district) and lastly Nagaland (0.43 mg/L in Dimapur district). Nickel content in groundwater of Assam, Meghalaya and Tripura are found to have values above acceptable limit, which are 0.07 mg/L in Tinsukia district of Assam, 0.05 mg/L in West Garo Hills in Meghalaya and

0.08 mg/L in Khowai district of Tripura. Copper concentration in groundwater samples of north eastern region are below the permissible limit. However, the sample from the Gomati district (0.059 mg/L) of Tripura shows copper content slightly above the acceptable limit of 0.05 mg/L. Apart from Assam, arsenic concentration in groundwater samples of all other states is well below the permissible limit. In Assam, the maximum arsenic content in groundwater samples recorded is 71.29 µg/L in the Cachar district. Lead concentration is within the limit in all the state except in Assam where, the maximum lead content is 18.32 µg/L in Cachar district. The concentration of the rest of the heavy metals viz. zinc, selenium, silver and cadmium in groundwater samples are within limit. Radioactive uranium concentration in samples of North Eastern states is also found to be well below the maximum permissible limit.

Details of the basic constituents of water samples collected from GWMS of Kamrup urban during March 2020 are shown in **Annexure XX(i)** and heavy metal (iron and arsenic) along with radioactive uranium are shown in **Annexure XXII (i)**. All the basic parameters except fluoride are below the prescribed BIS drinking water limits. Arsenic and radioactive uranium content in the groundwater samples from Kamrup urban are below the permissible limits while iron value slightly exceeds the prescribed limit of 1.00 mg/L.

8. CONCLUSIONS

1. Seven states viz. Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland and Tripura together form North Eastern Region occupying a geographical area of 2,55,083 sq. km. Most of the States are being hilly, only 30% of the total region is plain area. Assam is the only State in the region, which is occupied by 73% of plain area. In the Region, 624 stations are being monitored of which 385 are in Assam.
2. Geologically, the region is underlain by different formations, ranging in age from Archaean to Recent. More than 90% of the aquifers in the region belong to the Recent Alluvium and Tertiary Sandstones.
3. Hydro-geologically, the area is divided into Unconsolidated, Semi-consolidated and Consolidated Formations. In the entire area, about 31% area is covered by Unconsolidated Formations. Ground water occurs in unconfined to confined conditions. Major parts of Manipur, Nagaland, Mizoram, Tripura, parts of Arunachal Pradesh, Meghalaya and southern part of Assam States are underlain by Semi-consolidated Formations of Tertiary sandstone. In Consolidated Formations, ground water is restricted to the weathered residuum, joints and fractures.
4. During the year, 2020-21, the general depth to water level scenario in the region in March, 2020, depicts water level within 5.0 mbgl, in 72.3%, i.e. 292 stations show a depth range of 0 to 5 mbgl, out of which about 18.3% of the stations indicated water level within 2 mbgl and 54.8% stations between 2 and 5 mbgl. 86 (21.2%) stations recorded water level between 5 and 10 mbgl, most of which are located near the inselbergs. Water levels ranging between 10 and 20 mbgl were observed in 19(4.5%) stations in East Siang, Lower Dibang Valley and Papumpare district of Arunachal Pradesh, Dhubri, East Karbi Anglong, Nagaon and Sibsagar district of Assam, Dimapur in Nagaland and piezometers of Gomati, Khowai, South Tripura and West Tripura district of Tripura. In 7 (1.2%) of Ground Water Monitoring Stations ie. piezometers of East Khasi Hills, East Jaintia and Ri-Bhoi district of Meghalaya and in West Tripura district water level was recorded at depths beyond 20m.
5. The water level during post-monsoon period (November 2020) was mostly recorded in the range of 0 to 5 mbgl. Water level within 5 mbgl has been recorded in 423(89.6%) stations, out of which, 243 (52%) stations recorded water level within 2 mbgl and 182 (37.6%) stations record water levels from 2 to 5 mbgl. Water level in the range of 5 to 10 mbgl was recorded in 36 (7.3%) stations and in 10 (2.2%) stations in the range of 10 to

20mbgl. In 4 (0.9%) piezometers of East Jaintia Hills and Ri Bhoi districts of Meghalaya and West Tripura in Tripura water level beyond 20mbglwas observed.

6. In comparison to pre-monsoon, during post monsoon rise in water level within 4 m had been recorded in 307(81.2%) stations. Rise was recorded within 2 m in 278 (88.8%) stations and in the range of 2 to 4m in 31 (9.9%) stations. In 6 (1.9%) stations rise in water levelabove 4m had been observed. In 64 (16.9%) stations fall in water level was observed, out of that 57 (89%) stations indicated fall in the range of 0 to 2 m,in4 (6.3%) stations from 2 to 4m and in 2stations above 4m. The reverse ground water scenario occurs at few places due to sufficient pre-monsoon shower resulting considerable rise in water level during pre-monsoon and at some places due to scanty and erratic rainfall received during monsoon period of 2020.
7. Water level monitored during March 2020 was compared with mean water level data of preceding 10 years. The compared result indicates, in general, a rise in 130 (52.5%) stations and fall in 118(47.5%) monitored stations. Rise within 2 m have been observed in 119 (91.5%) stations and in the range of 2 to 4m in 11 (8.5%) stations. Fall in water level with respect to decadal mean have been observed within 2m in 111 (94.1%) stations, in the range of 2m to 4m in 3 (2.5%) stations and beyond 4 m in 4 (3.4%) stations
8. Comparison of water level monitored during November 2020and mean water level data of preceding 10 years rise in 203 (75%) stations and fall in 65 (25%) monitored stations. Rise within 2 m have been observed in 195 (96%) stations, in the range of 2 to 4m in 6 (3%) stations and beyond 4 m rise in 2(1%) stations. Fall in water level with respect to decadal mean have been observed within 2m in 60 (92.3%) stations, in the range of 2m to 4m in 4 (6.2%) stations and beyond 4 m in 1 (1.5%) station.
9. Water levels of post-monsoon for last 10 years were taken for trend analysis. A total number of 435 stations were analysed. During post monsoon period 262 stations show a declining water level trend mostly within 0.19m/year. Only 61 stations showed decline above 0.2m/year. Significant decline is not observed anywhere in the region. The rise is observed in 478stations ranging mostly within 0.19m/year. 159 stations indicated rise above 0.2m/year.
10. In general, the chemical quality of the ground water is good for both the domestic and irrigation purposes except the sporadic occurrence of the high concentration of Iron in considerable parts of the region. In those areas, Iron treatment plants are to be installed and the water should be used only after proper treatment.

11. Development of ground water in North Eastern Region is still in nascent stage. There is an ample scope for development of this replenishable natural resource. This region being hilly, only 30% of the existing valley area can be developed. In the hilly area, there is a very little scope for ground water development. However, the hilly terrain of the region is bestowed with many perennial springs, which can be developed for both the small-scale irrigation and domestic use. Moreover, rainfall in the region being quite sufficient, roof-top rain water harvesting may also be adopted to augment ground water resources in the area. If this natural resource is harnessed with proper planning and management, the entire agro-economic scenario of the region can be uplifted.
