FOREWORD

Central Ground Water Board has been monitoring ground water levels and ground water quality of the country since 1968 to depict the spatial and temporal variation of ground water regime. The changes in water levels and quality are result of the development pattern of the ground water resources for irrigation and drinking water needs. Analyses of water level fluctuations are aimed at observing seasonal, annual and decadal variations. Therefore, the accurate monitoring of the ground water levels and its quality both in time and space are the main pre-requisites for assessment, scientific development and planning of this vital resource.

Central Ground Water Board, North Western Region, Chandigarh has established Ground Water Observation Wells (GWOW) in Haryana State for monitoring the water levels. As on 31.03.2017, there were 1190 Ground Water Observation Wells which included 521 dug wells and 669 piezometers for monitoring phreatic and deeper aquifers. In order to strengthen the ground water monitoring mechanism for better insight into ground water development scenario, additional ground water observation wells were established and integrated with ground water monitoring database. As a result, total number of ground water observation wells as on 31.03.2018, has reached 1227 Ground Water Observation Wells which include 521 dug wells and 653 piezometers for monitoring phreatic aquifers besides 47 deep piezometers for monitoring confined/ semi- confined aquifers. These observation wells are being monitored four times a year in the months of May, August, November and January, being undertaken simultaneously throughout the country. This report presents the observations and findings for the period from May 2017 to January 2018.

Shri M. L Angurala, Scientist 'D' and Ms Amandeep Kaur, Scientist 'B' have made concerted efforts to compile and analyse the data and prepare the report in the present form. The chapter on Hydrometeorology in Haryana State compiled and contributed by

Sh. Aditya Sharma, STA (HM) and the chapter on Chemical quality of ground water has been compiled and contributed by **Mrs. B. P. Singh, Scientist 'D' and Shri K. S. Rawat Scientist 'B'**.

This report incorporates all the analytical data on ground water monitoring done in Haryana State and provides valuable information on prevailing ground water regime to the user agencies and other stakeholders as well.

GROUND WATER YEAR BOOK

HARYANA STATE

2017 – 2018

1 INTRODUCTION

The State of Haryana is in North India with its capital at Chandigarh a landlocked state in northern India. The Haryana State is located between between 27°39' to 30°35' N latitude and between 74°28' and 77°36' E longitude covering an area of 44,212 sq. km. The state is sub-divided into nine physiographic units and is drained by two major rivers Ghaggar and Yamuna. It was carved out of the former state of Punjab on 1 November 1966 on the basis of language distribution. The name Haryana is found in the works of the 12th century AD Apabhramsha writer Vibudh Shridhar (VS 1189–1230). It is bordered by Punjab and Prades to the north and by Rajasthan to the west and south. The river Yamuna defines its eastern border with Uttar Pradesh. Haryana surrounds the country's capital Delhi on three sides, forming the northern, western and southern borders of Delhi. Consequently, a large area of south Haryana is included in the National Capital Region for purposes of planning for development.

The state was home to prominent sites of the Indus Valley and Vedic Civilizations. Several decisive battles were also fought in the area, which shaped much of the history of India. These include the epic battle of Mahabharata at Kurukshetra mentioned in Hindu mythology (including the recital of the Bhagavad Gita by Lord Krishna), Banganga or the Bhishma Kund, a legend attached to this water tank says that, when Bhishma lay on his bed of arrows, he felt thirsty and asked for water. To fulfill his desire, Arjuna immediately shot an arrow into the ground and let loose a stream of gushing water. This is how the BhishmaKund is believed to come into existence and the three battles of Panipat. Haryana was administered as part of the Punjab province of British India, and was carved out on linguistic lines as India's 17th state in 1966. Haryana is now a leading contributor to the country's production of food grains and milk. Agriculture is the leading occupation for residents of the state with the flat arable land irrigated by submersible pumps and an extensive canal system. There are four irrigation systems in the state namely

1. Western Yamuna canal,

2. Bhakra canal,

3. Agra canal and
4. Ghaggar canal

Haryana contributed heavily to the Green Revolution that made India self-sufficient in food production in the 1960s.

1.1 Physiography

The altitude of Haryana varies between 700 and 3600 ft (200 meters to 1200 meters) above sea level. An area of 1,553 km² is covered by forest. Haryana has four main geographical features.

- The Yamuna-Ghaggar plain forming the largest part of the state
- The Shivalik Hills to the northeast
- Semi-desert sandy plain to the southwest
- The Aravalli Range in the south

1.2 Geohydrological Conditions

On the basis of Geohydrological conditions as well as groundwater movement and surface drainage pattern, the entire state is divided into the following basins:-

1. Yamuna basin; (a) Upper, (b) Lower
2. Ghaggar Basin; (a) Upper, (b) Lower
3. Inland Alluvial Basin (Chautang and others)
4. Krishnawati Basin
5. Sahibi Basin
6. Landoha Nala Basin
7. Kanti Sub Basin (Loharu Satnali area)

Ground water occurs both under confined and unconfined conditions in the alluvial formation whereas it is mostly under un-confined conditions in Siwaliks and piedmont deposits and semi-confined conditions in hard rocks.

1.3 Rivers of Haryana

The Yamuna flows along the state's eastern boundary while the ancient Sarasvati River is said to have flowed from Yamuna Nagar, but has now disappeared. Haryana's main seasonal river, the Ghaggar rises in the outer Himalayas, between the Yamuna and the Sutlej and enters the state near Pinjore in the Panchkula district. Passing through Ambala and Hissar, it reaches Bikaner in Rajasthan and runs for 460 km before disappearing into the deserts of Rajasthan. Important tributaries include the Chautang and Tangri. The seasonal Markanda River is a stream, which in ancient times was known as the Aruna. It originates from the lower Siwaliks Hills and enters Haryana west of Ambala. During monsoons, this stream swells into a raging torrent notorious for its

devastating power. The surplus water is carried on to the Sanisar Lake where the Markanda joins the Sarasvati and later the Ghaggar. Shahbad Markanda town is situated on its bank. Mentioned in the epic Shatapatha Brahmana as the Drishadwati, the Sahibi River originates in the Jaipur district in Rajasthan. However, before seismic activities some 7,500 years ago in the Aravalli Hills, the river brought water from as far as the Ajmer district. Gathering volume from about a hundred tributaries in Rajasthan and the Mewat areas, it reaches voluminous proportions, forming a broad stream around Alwar and Patan. Further flowing via Rewari District and Dharuhera, it reaches Jhajjar then splits into two smaller streams, finally reaching the outskirts of Delhi and flowing into the Najafgarh Lake that flows into the Yamuna through the Najafgarh drain. Recently hardly any water flows in Sahibi as most of the water is impounded in small check dams upstream in the Alwar district of Rajasthan and the Masani barrage in Rewari district, built on this river on NH 8 (Delhi-Jaipur highway). Three other rivulets in and around the Mewat hills, the Indori, Dohan and Kasavati all flow from East to West.

1.4 HYDROMETEOROLOGY:

1.4.1 CLIMATE:

Most of the year, the climate of Haryana is of a pronounced continental character, very hot in summer and markedly cold in winter. In between are the pleasant months of spring. Haryana is extremely hot in summer at around 45 °C and mild in winter. The hottest months are May and June and the coldest are December and January. The climate is arid to semi-arid. Around 29% of rainfall is received during the months from July to September, and the remaining rainfall is received during the period from December to February.

1.4.2 RAINFALL ANALYSIS OF HARYANA

The annual rainfall in 2017 over the state of Haryana is quite uneven which increases from 169 mm at Fatehabad to 1016 mm at Yamunanagar. The lowest rainfall of 54% less than their corresponding normals of IMD are recorded at Fatehabad & Panchkula and the highest rainfall of 2% more than the IMD annual normal is received at Kaithal during 2017.

The annual rainfall of 2017 when analysed and compared to the rainfall of 2016, it is observed that out of all districts, Kurukshetra District shows maximum rise in rainfall which is 125% more than the rainfall of 2016 and other districts showing rise as Rohtak

(+5%), Jind (+8%), Sirsa (+10%), Yamunanagar (+11%), Panchkula (+11%), Panipat (+17%), Karnal (+41%), Ambala (+50%), Sonipat (+53%), Kaithal (+74%).

Similarly it is observed that out of all districts, maximum fall in rainfall observed at Gurugram district which is 31% less than the rainfall of last year 2016 and the remaining districts show fall as Mahendragarh (-2%), Hisar (-2%), Faridabad (-5%), Jhajjar (-9%), Mewat (-10%), Bhiwani (-19%), Fatehabad (-20%), Palwal (-26%), Rewari (-28%).

The mean annual rainfall of Haryana state during 2017 is 450 mm which is almost 8% more than mean annual rainfall (418 mm) during 2016.

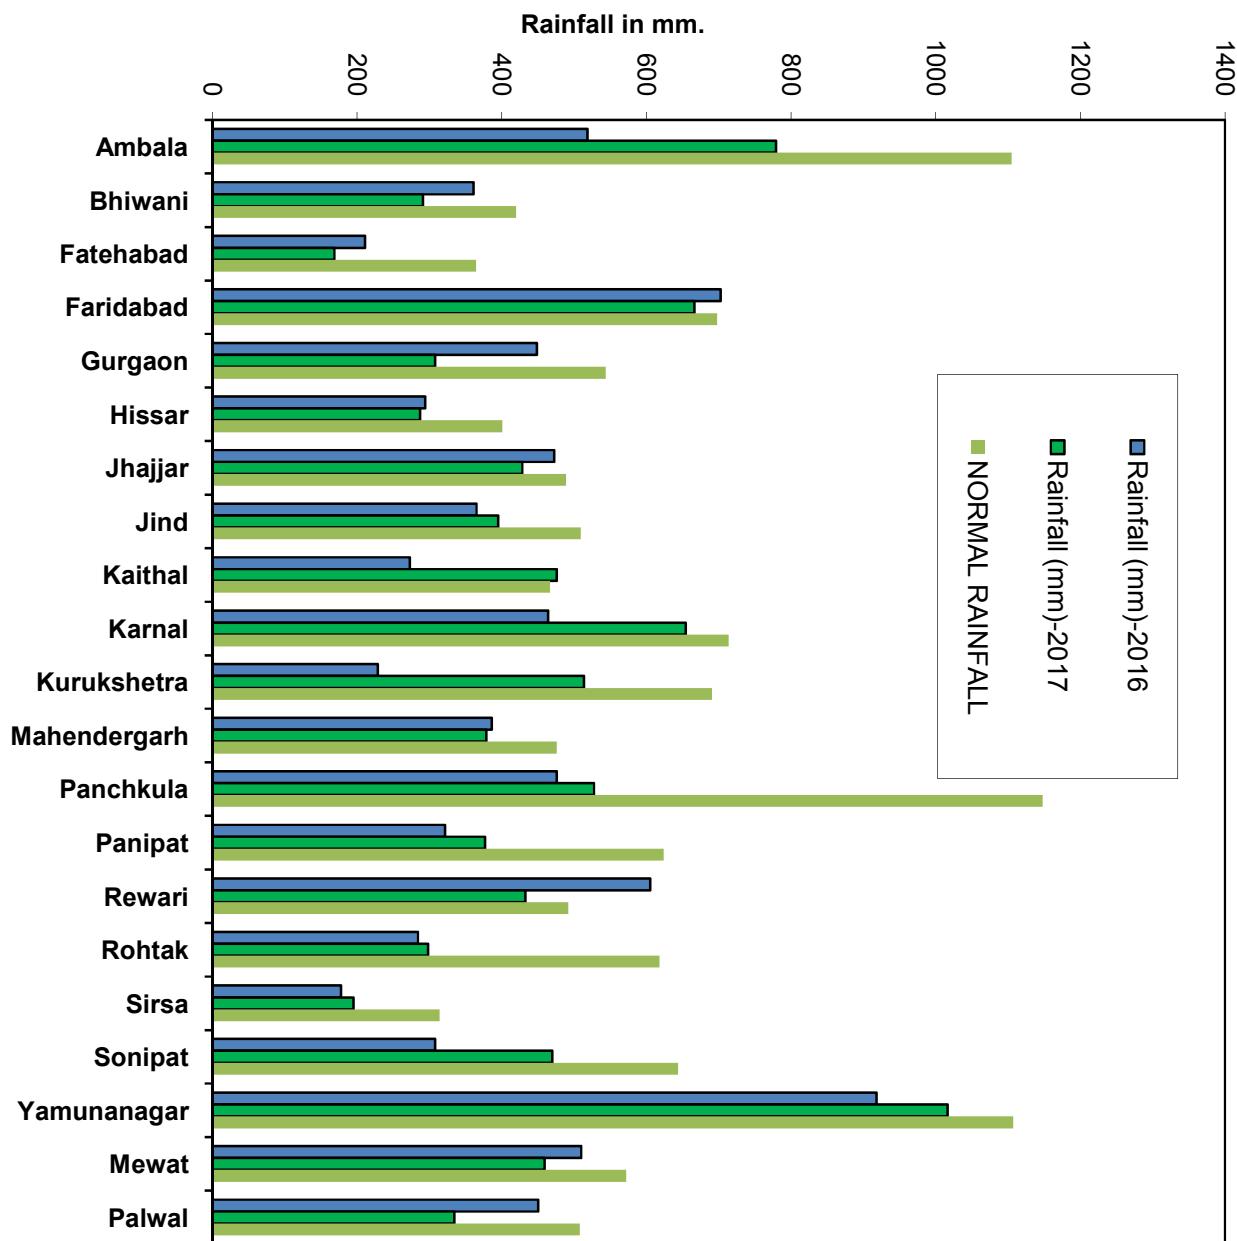

1.4.3 DISTRICT-WISE AND MONTH WISE NORMAL RAINFALL (in mm):

2.0 HYDROGEOLOGICAL SETUP

Three geological groups are represented in the state viz. Pre-Cambrian, Tertiary and Quaternary. The Quaternary group comprises of Alluvium which occupies 98% of the area of the state. The tertiary group is represented by the outermost zone of the Siwalik system composed mainly of sandstones, clay and boulders. The rocks of Pre-Cambrian age which form part of the Aravalli hill ranges are exposed in Gurgaon, Mewat and Faridabad districts and as small outcrops in other Southern districts. The thickness of alluvium deposits decreases from North to South. All the three major physiographic units viz. Peninsula, Extra-Peninsula and Indo-Gangetic areas, terminating in the hard rock formations of Delhi systems (Pre-Cambrian age) towards South, Siwaliks system (Tertiary age) in the North and in between the alluvial formations (Recent to sub recent age) are observed in the state. The general geological succession of the various units of the Peninsula and Indo-Gangetic plains traversing the Haryana state are given below (table-1).

Table:-1 Generalized Stratigraphy of Haryana State (after GSI, 2012)

Age	Super Group	Group/Formations	Lithology
Quaternary		Older and Newer Alluvium and Aeolian Deposits	Grey and brown sand, silt, silt-clay, clay with calcrete, limestone and gypsum.
Tertiary	Siwalik Super Group	Upper Siwalik	Boulder conglomerate, sandstones, clay/ mudstone and pebble beds.
		Middle Siwalik	Sandstone with variegated clay/mudstone.
		Lower Siwalik	Sandstone, mudstone/ shale
		Sabathu	Fine-grained sandstone, clay and limestone.
Pre-Tertiary (?)		Tundapathar 'Series' Lower (Paleozoic Unconformity)	Stromalitic limestone, Tosham rhyolite, Granite (Erinpura), migmatite, ultramafic and pegmatite.
Proterozoic	Delhi Super Group	Ajabgarh Group (Divided into Formations) 5	Quartzite and basic flows, mica-schist, carbonaceous phyllites and slates, calc-schist, dolomite, marble, calc-silicate, amphibolite, hornblende-schist, phyllite.
		Alwar Group	Quartzite, conglomerate, amphibolite, mica-schist and arkosic quartzite.

In the extra peninsular region (northern part of Panchkula district) Siwalik System (Upper Tertiary) and Sabathu Series (Lower Tertiary) are exposed. Sabathu comprises of greenish grey and red gypseous shales with thin bands of sand stones and limestone. Shales and limestone are richly fossiliferous. Siwaliks system comprises of mainly greywacke, sandstones, grits, clays, siltstones, conglomerates and pseudo-conglomerates. These are fluviatile deposits and are rich in mammalian fossils.

The area in Panchkula, Ambala & Yamunanagar is underlain by the 'Kandi, Sirowal and the Alluvium. The Kandi belt which forms the upper higher portions of the composite fan deposits is 2 to 4 kms wide running more or less parallel to the Shivalik foothills. The sediments comprise boulders, pebbles, gravel and sand with clays mixed in varying proportions. Sirowal belt and the adjoining Gangetic plain on the south of the Kandi belt are underlain by silt, fine to medium sand and clays. Gravel and pebbles also occur occasionally. The area in Gurgaon district is underlain by the rocks of Delhi system and by Quaternary alluvium. The Ajabgarh shales and quartzite form the basement in the western part of the area where the thickness of alluvium is very less.

In Hissar and Bhiwani districts area is underlain by unconsolidated sediments of Quaternary age. The sediments comprise sand, silt clay and kankar. In Sonipat, Jind, Karnal and Kurukshetra districts the area is underlain by alluvium deposits of Quaternary age. Alluvium comprises clay, silt, sands of various grades, kankar, gravel and pebbles. The alluvium deposits are generally lenticular in shape. In Mohindergarh and part of Bhiwani districts the following geological succession is met. Recent to sub Recent- Alluvium and windblown sands etc, Post Delhi intrusive- Pegmatite, quartz veins, granites etc. Algonquian Delhi system-Ajabgarh Series Kushalgarh Limestone, Alwar Series. The alluvium in the area belonging to the Older Alluvium comprises of sand, silt, clay loam and kankar. Newer alluvium is mainly confined to the sides of the river natural water courses. The alluvium is the fresh water deposit of the Indo-Gangetic river system. The sub-aerial deposits are represented by the talus material on the hill slopes and windblown sands. Rohtak district is underlain by alluvium deposits of Quaternary age.

The alluvium overlies the rocks of Algonquians system outcrops of which are seen outside the district. The alluvium consists of clay, silt and various grades of sand. Windblown sand occurring as sand dunes is often seen overlaying the alluvium in various parts of the district.

The unconsolidated alluvial sediments cover around 98% of the state while hard rock's cover just around 2% area of the state. Alluvial deposits are of older and newer types and consist chiefly of clay, silt and fine to medium sand. Other deposits are piedmont deposits, which are confined to a narrow zone, about 2 to 4 kms wide, between Siwalik Hills and alluvial plains. Sand-dunes are found in the districts of Bhiwani, Mohindergarh, Hissar and Sirsa Coarse sand, gravels and boulders are found to occur in piedmont areas and in the adjacent alluvial tracts. These deposits have developed in the north part of Ambala district. The thickness of alluvial sediments is more than 600 m. and along Yamunanagar-Karnal stretch it is reported to be more than 3000 m. However, the thickness of sediments progressively decreases towards Delhi and hard rock areas of Bhiwani, Gurgaon, Faridabad and Mohindergarh districts.

3.0 GROUND WATER REGIME MONITORING

Central Ground Water Board, North Western Region, Chandigarh has established Ground Water Observation Wells (GOW) in Haryana State for monitoring the water levels. As on 31.03.2017, there were 1190 Ground Water Observation Wells which included 521 dug wells and 669 piezometers for monitoring phreatic and deeper aquifers. However, with establishment of new ground water observation wells including dug wells and piezometers, and reconciliation of ground water observation wells, total number of ground water observation wells as on 31.03.2018, has reached 1190 ground water observation wells which include 521 dug wells and 653 piezometers for monitoring phreatic aquifers besides 53 deep piezometers for monitoring confined/ semi- confined aquifers.

The district wise Ground Water Observation Wells are shown in Plate-1 and split is given in Table 2. The density of the observation wells being monitored in the state of Haryana is given in Table 3 and depicted in Plate 2.

Plate 2: Density of ground water observation wells in Haryana State.

3.0 BEHAVIOUR OF GROUND WATER LEVEL

In order to assess the quantitative change in ground water resources, water levels as a routine were monitored four times May 2017, August 2017, November 2017 and January 2018 and compared with previous water level records to ascertain the change in ground water level scenario.

3.1 DEPTH TO WATER LEVEL

The behaviour of water level in all four seasons May 2017, August 2017, November 2017 and January 2018 along with maps is discussed in following paragraphs and data is presented in annexure-I. The maximum and minimum water levels recorded in four seasons is given below Table 4.

Table 4 Range of depth to water levels during the period

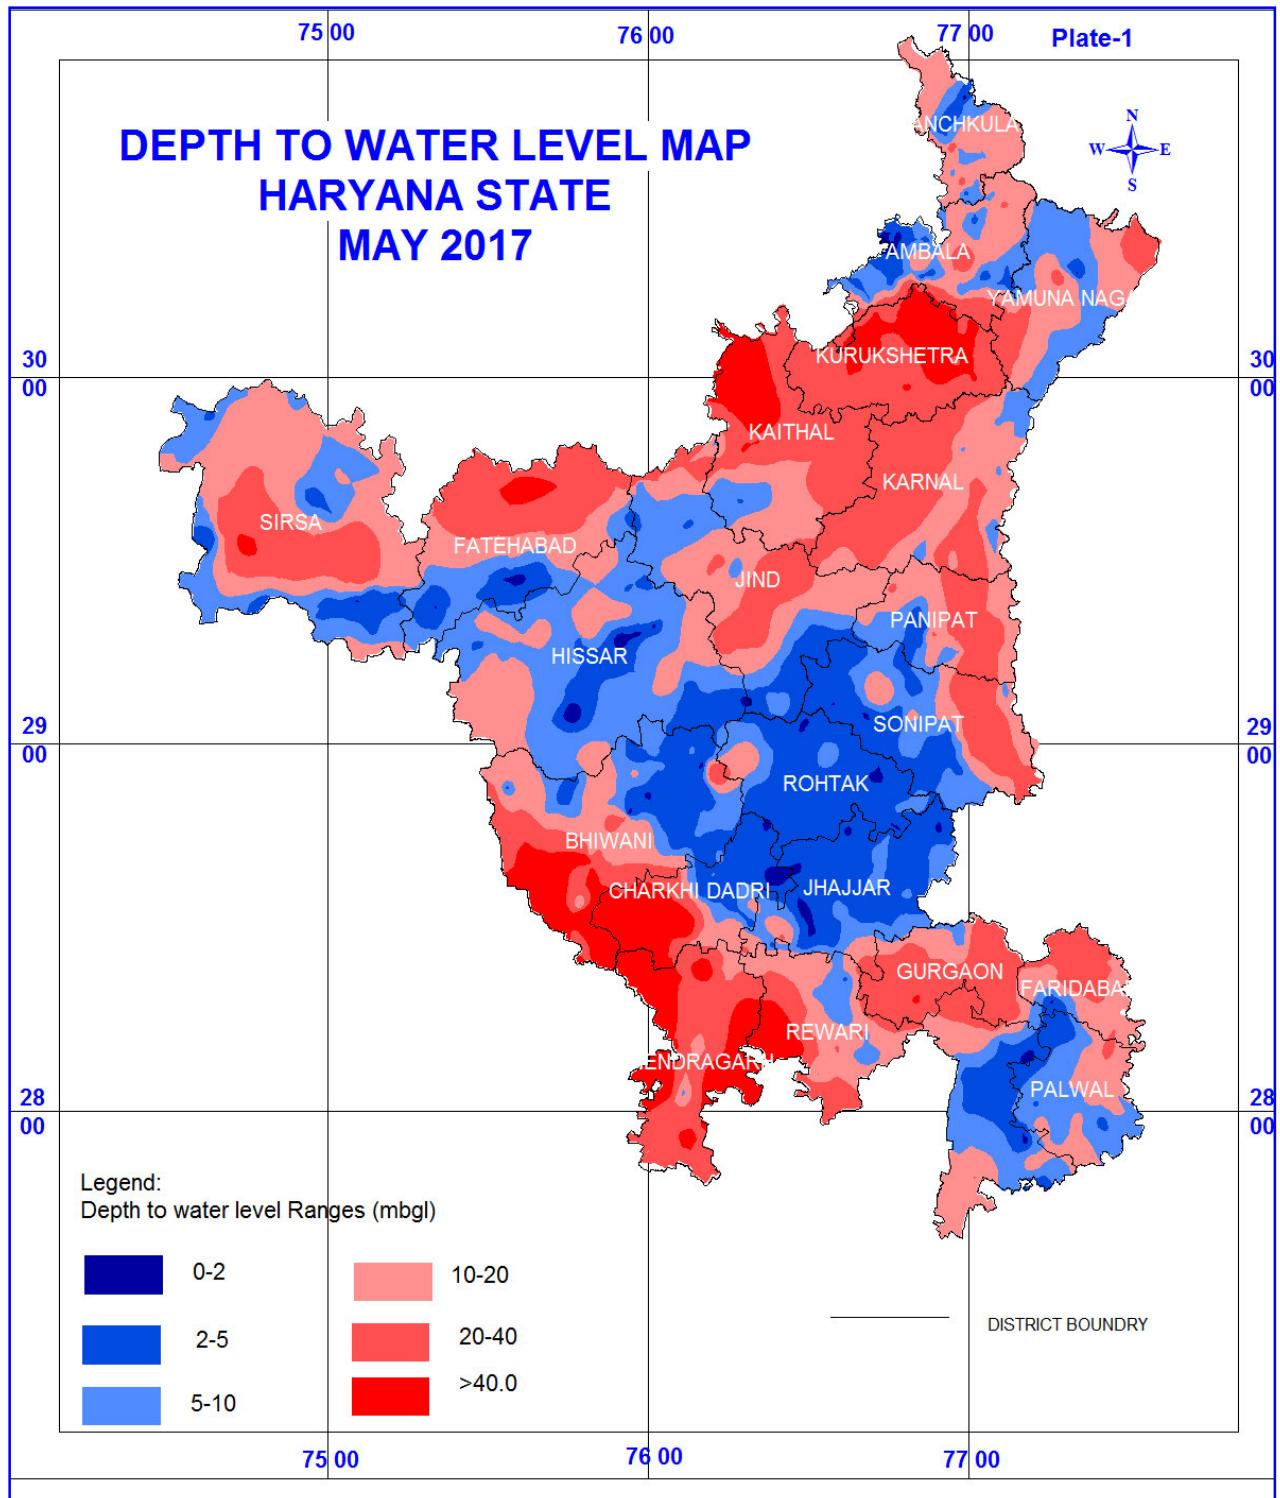

Range	May 2017	August 2017	November 2017	January 2018
Minimum	0. 51 m bgl Sankol (Jhajjar district)	0.14 m bgl Dhanana (Bhiwani district)	0.18 m bgl Subnah (Jhajjar district)	0.89 m bgl Dhanana (Bhiwani district)
Maximum	99.50 m bgl Kultajpur-DW (Mahendragarh)	71.30 m bgl Mangala (Sirsa)	98.50 m bgl Kultajpur-DW (Mahendragarh)	50.86 m bgl Landi-PZ (Kurukshetra)

3.1.1 MAY 2017

The behavioral pattern of depth to water level data of May 2017 is discussed below along with depth to water level map (Fig.1) and data are presented in Annexure-1 (Col-4).

The depth to water level during May 2017 varies from 0.51 m bgl at Sankol in Jhajjar district to 99.50m bgl at Kultajpur-DW in Mahendragarh district. Very shallow (0-2m) water levels conditions are observed in isolated patches in Jhajjar, Sonipat and Rohtak districts. More than 5% wells and <1% area of state fall in this group which indicates water logging conditions. Shallow water levels (2-5m) observed in 25% wells and 16% area mainly in the central part and in few isolated patches in Sonipat, Rohtak, Jhajjar, Charkhi Dadri, Bhiwani, Hissar, Sirsa, Fatehabad, Palwal, Mewat districts. Moderate water levels (5-10m) occur in 1% wells covering 22% of area of the state. Moderately deep water levels of 10-20m are observed in nearly 59% wells and 29.02% of the area falling in Panchkula, Ambala, Yamunanagar, Karnal, Panipat, Sonipat, Kaithal, Jind, Fatehabad, Sirsa Hissar, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. Deep water levels of (20-40m) have been recorded in 8% of wells and about 25% area in Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Bhiwani, Rewari, Mahendragarh and Gurgaon districts. **Ground Water Trough has been created in in Karnal Panipat and Sonipat districts along Ambala Delhi National Highway.** Very Deep water levels (>40m) also occur in less than 2% of the wells and 7% area falling in Kurukshetra, Kaithal, Bhiwani and Mahendragarh districts & isolated patches in Fatehabad and Sirsa districts.

Depth to water level range	Wells monitored		Area covered	
	No.	%age	Sq. Km.	%age
0-2	41	5	265	1
2-5	191	25	7137	16
5-10	7	1	9653	22
10-20	459	59	12843	29
20-40	60	8	11098	25
>40	15	2	3218	7

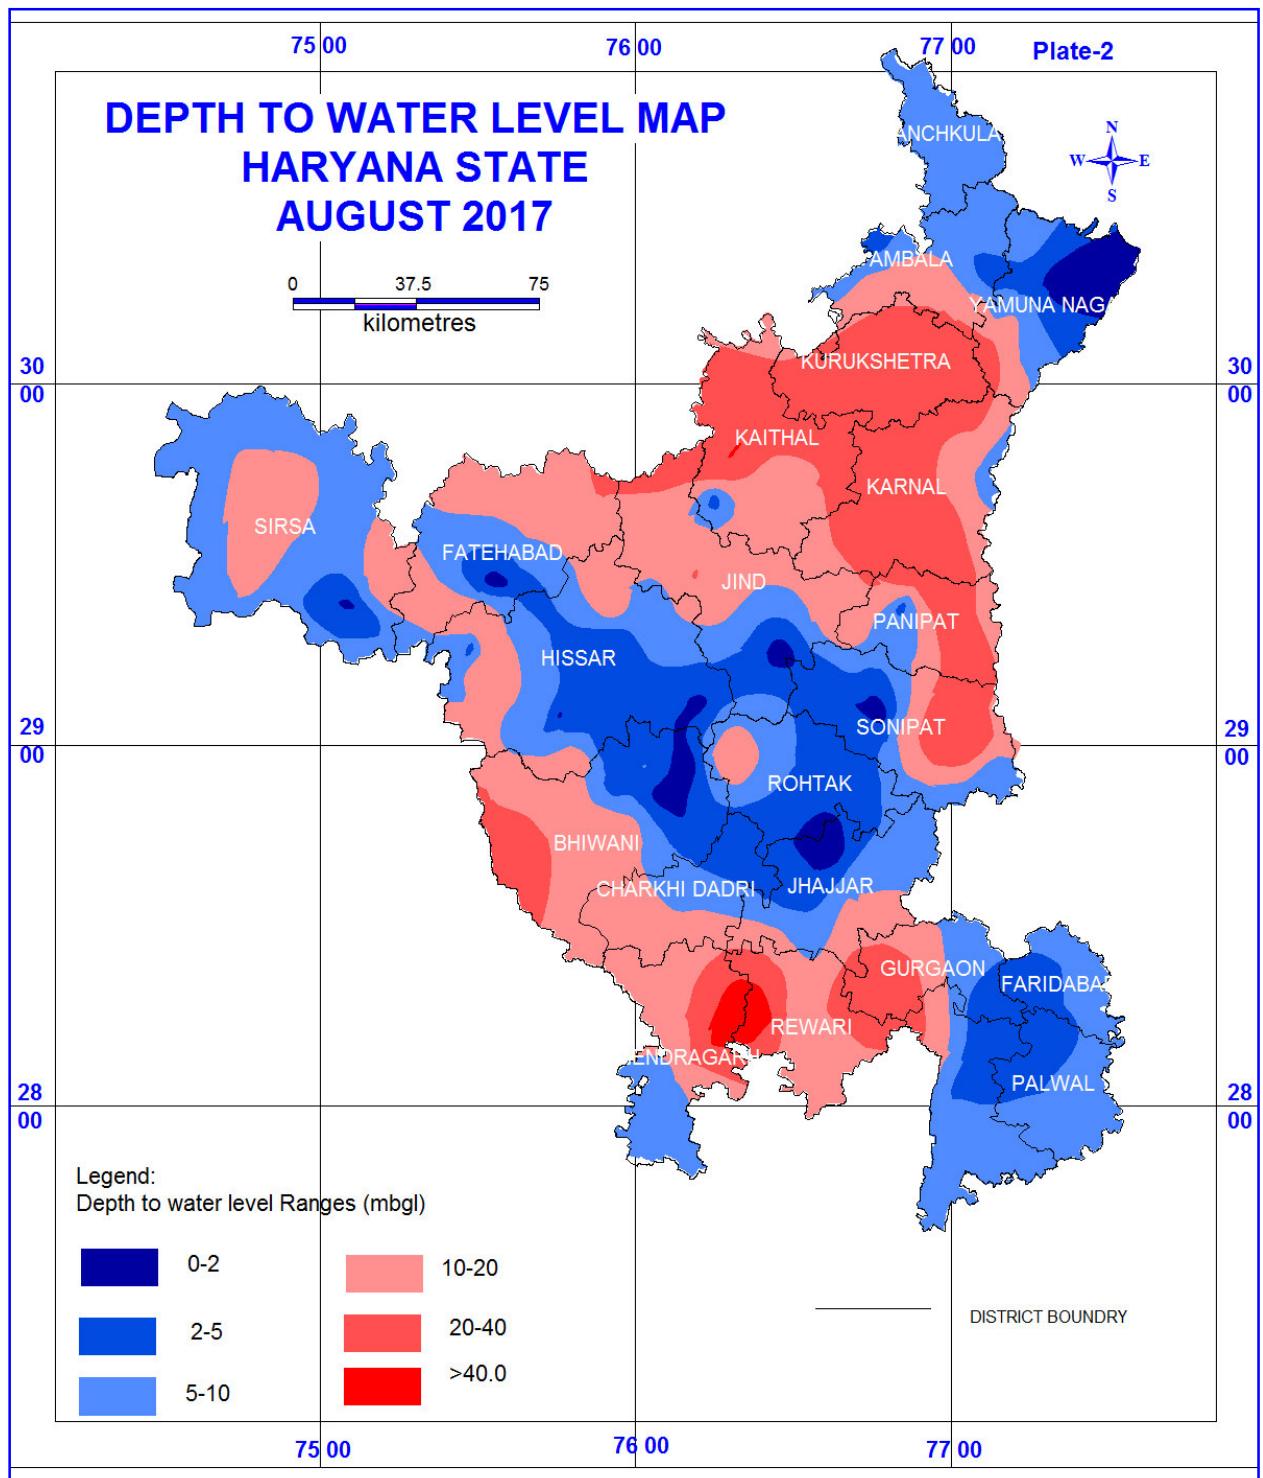

3.1.2 AUGUST 2017

The behavioral pattern of depth to water level data of August 2017 discussed below along with depth to water level map (Fig.2) and data are presented in Annexure-1 (Col-5).

The depth to water level during August 2017 varies from 0.14m bgl at Dhanana in Bhiwani district to 71.30 m bgl at Mangala in Sirsa district. Very shallow (0-2m) water levels conditions are observed in small pockets in the central part of the state comprising Jhajjar Sonipat and Rohtak districts. More than 13% wells and 3% area of state fall in this group which indicates water logging conditions. Shallow water levels (2-5m) observed in 22% wells and 17% area mainly in the central part and in few isolated patches in Sonipat Rohtak, Jhajjar, Charkhi Dadri, Bhiwani, Hissar, Fatehabad and Mewat districts. Moderate water levels (5-10m) occur in 28% wells covering 30% of area covering south and south central parts of the state. Moderately deep water levels of 10-20m are observed in nearly 21% wells and 31% of the area falling in Ambala, Yamunanagar, Sonipat, Panipat, Jind, Fatehabad, Sirsa Hissar, Bhiwani, Charkhi Dadri, Mahendragarh, Rewari, Gurgaon and Faridabad districts. Deep water levels of 20-40m have been registered in 13% of wells and about 18% area reported from Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Bhiwani, Rewari, Mahendragarh and Gurgaon districts. Very Deep water levels (>40m) also occur in less than 3% of the wells and 1% area falling in Sirsa and Mahendragarh districts.

Depth to water level range	Wells monitored		Area covered	
	No.	%age	Sq. Km.	%age
0-2	12	13	1165	3
2-5	21	22	7512	17
5-10	26	28	13409	30
10-20	20	21	13697	31
20-40	12	13	8138	18
>40	3	3	293	1

3.1.3 NOVEMBER 2017

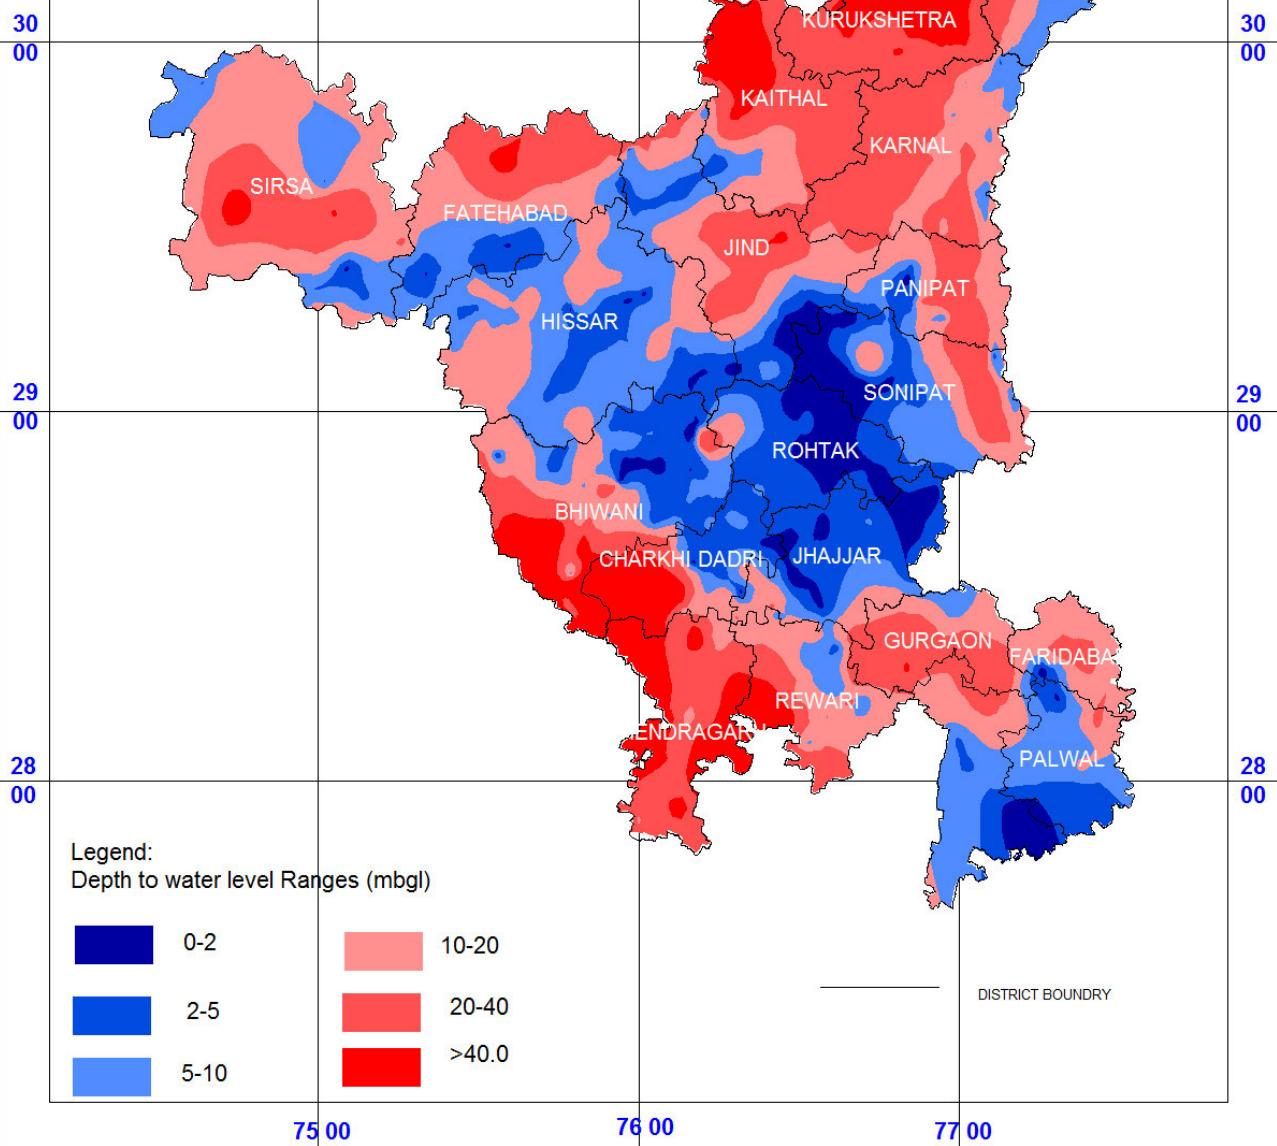

The depth to water level during November 2017 varies from 0.18m bgl at Subnah in Jhajjar district to 98.50m bgl at Kultajpur-DW in Mahendragarh district. The distribution of water level in various ranges is discussed below along with depth water level map for November 2017 (Fig.3). The water level data are presented in Annexure-1 (Col-6). Very shallow (0-2m) water levels conditions are observed in small pockets in the central part of the state comprising Sonipat, Rohtak, Jhajjar and Mewat districts. 7% wells and 5% area of state fall in this group which indicates water logging conditions. Shallow water levels (2-5m) observed in 15% wells and 14% area mainly in the central part and in few isolated patches in Fatehabad, Palwal Mewat, Jind and Fatehabad districts. Moderate water levels (5-10m) occur in 19% wells covering 21% of area covering parts of Sonipat, Panipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Mewat, Palwal, Ambala and Yamuna Nagar districts of the state. Moderately deep water levels of 10-20m are observed in nearly 24% wells and 28% of the area falling in Panchkula, Ambala, Yamuna Nagar, Karnal, Kurukshetra, Kaithal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Charkhi Dadri, Rewari, Mahendragarh, Gurgaon and Faridabad Districts Deep water levels of 20-40m have been registered in 26% of wells and about 24% area reported from Ambala, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Bhiwani, Rewari, Mahendragarh, Gurgaon and Faridabad districts. **Ground Water Trough has been created in in Karnal Panipat and Sonipat districts along Ambala Delhi National Highway.** Very Deep water levels (>40m) also occur in less than 9% of the wells and 8% area falling in Bhiwani and Mahendragarh districts & isolated patches in Kurukshetra, Kaithal, Fatehabad and Sirsa districts.

3.1.4 JANUARY 2018

The behavioral pattern of depth to water level data of January 2018 discussed below along with depth to water level map (Fig.4) and data are presented in Annexure-1 (Col-7). The depth to water level during January 2018 varies from 0.89 m bgl at Dhanana in Bhiwani district to 50.86 m bgl at Landi in Kurukshetra district. Very shallow (0-2m) water levels conditions are observed in 5% wells and 1% area of state fall in this group which indicates water logging conditions. It is observed in central parts, Sonipat and Rohtak districts of the state. Shallow water levels (2-5m) observed in 22% wells and 14% area mainly in the central Haryana covering parts of Sonipat, Rohtak and Jhajjar districts, western haryana in parts of Hisaar and Sirsa districts Sirsa and Hissar and in the south, Faridabad, Palwal and Mewat districts. Moderate water levels (5-10m) occur in 22% wells covering 27% of area of the state covering parts of Sonipat, Jind, Jhajjar, Rohtak, Rewari, Bhiwani, Hissar, Fatehabad, Sirsa, Mohindergarh, Mewat and Palwal districts. Moderately deep water levels of 10-20m are observed in nearly 29% wells and 31% of the area falling in Karnal, Jind, Fatehabad, Sirsa Hissar, Bhiwani, Charkhi Dadri, Mahendragarh and Rewari districts. Deep water levels of 20-40m have been registered in 19% of wells and about 24% area reported from Karnal, Kurukshetra, Kaithal, Fatehabad, Sirsa, Bhiwani districts. Very Deep water levels (>40m) also occur in less than 4% of the wells and 3% area falling in Bhiwani and Mahendragarh districts & isolated patches in Kurukshetra, of Fatehabad and Sirsa districts.

20-40	48	19	10738	24
>40	9	4	1206	3

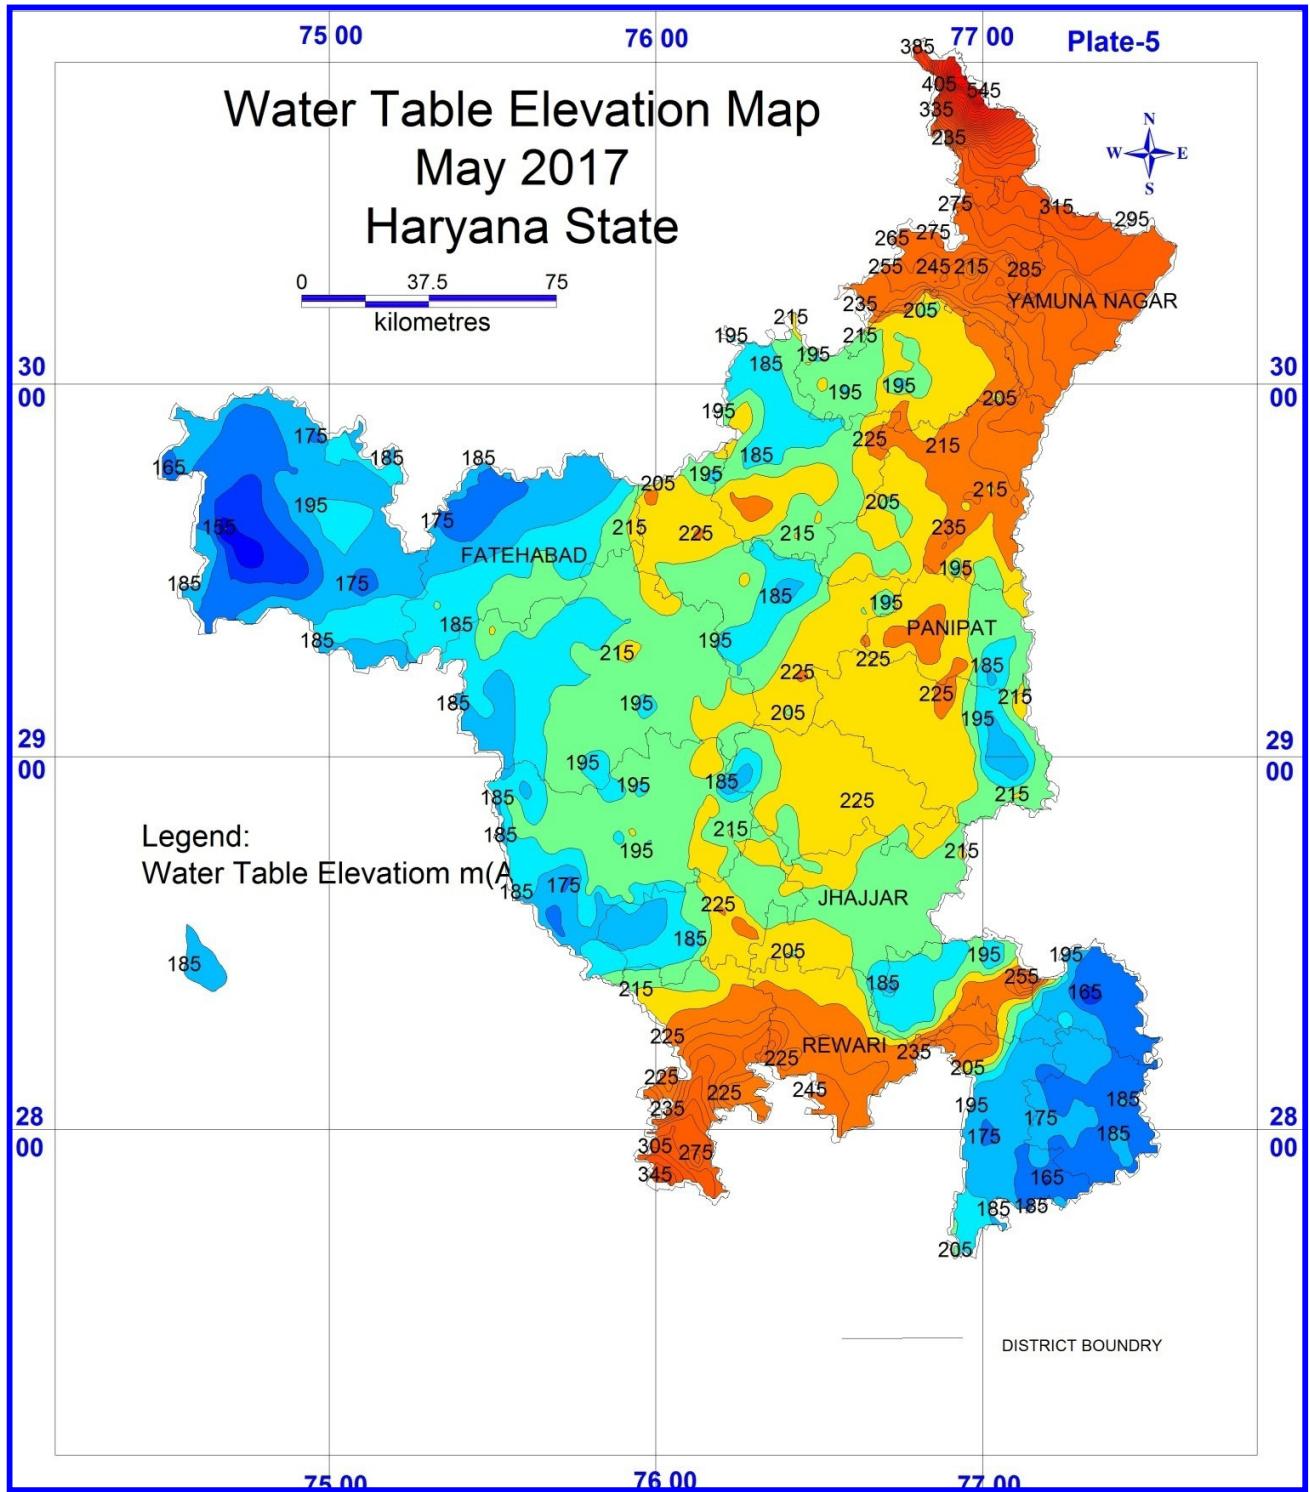

3.2 GROUND WATER ELEVATION AND FLOW DIRECTIONS

Ground water flows from areas of high hydraulic head (high water-level elevation) to areas of low head (low water level elevation). Because hydraulic heads vary laterally and vertically in a ground-water system, ground-water movements generally have a vertical as well as a horizontal component. Contour maps of heads in aquifers are constructed to determine the horizontal direction of flow. A contour map of the water table represents the elevation of the top of the saturated part of the uppermost unconfined aquifer.

The horizontal direction of ground-water flow is generally perpendicular to the contour lines and water flows down the slope of the contours in a manner analogous to the flow of water down the slope of the land surface. Water-table maps are prepared from water levels measured in ground water observation wells the elevation of the water-table surface.

3.2.1 MAY 2017

The water table elevation map helps in determining the hydraulic gradient and ground water flow direction. The water table elevation contours in the area follows the topography and it varies from 562.65m AMSL in northeastern part in Panchkula district to 142.31m AMSL in southeastern part in Palwal district. The general ground water flow is from Northeast to Southwest direction. However, in the southern part it is towards central part thus creating a closed basin causing water logging conditions in the central Haryana in parts of Rohtak, Bhiwani and Hissar districts. The hydraulic gradient is steep in the northern, eastern and southwestern parts of the State, whereas, it is gentle in the southeastern part. The major part of the state has moderate water table gradients. The sluggish ground water movement (0.07 m/km) observed in central part results in water logging on regional scale besides it, a major ground water troughs have created one in Karnal, Panipat and Sonipat districts along Ambala- Delhi National Highway (NH-1) and another in Sirsa District as depicted in (Fig.5).

3.3 SEASONAL FLUCTUATIONS

The water level data of current month or monitoring period is compared with water level data of monitoring period and seasonal water level fluctuation is determined.

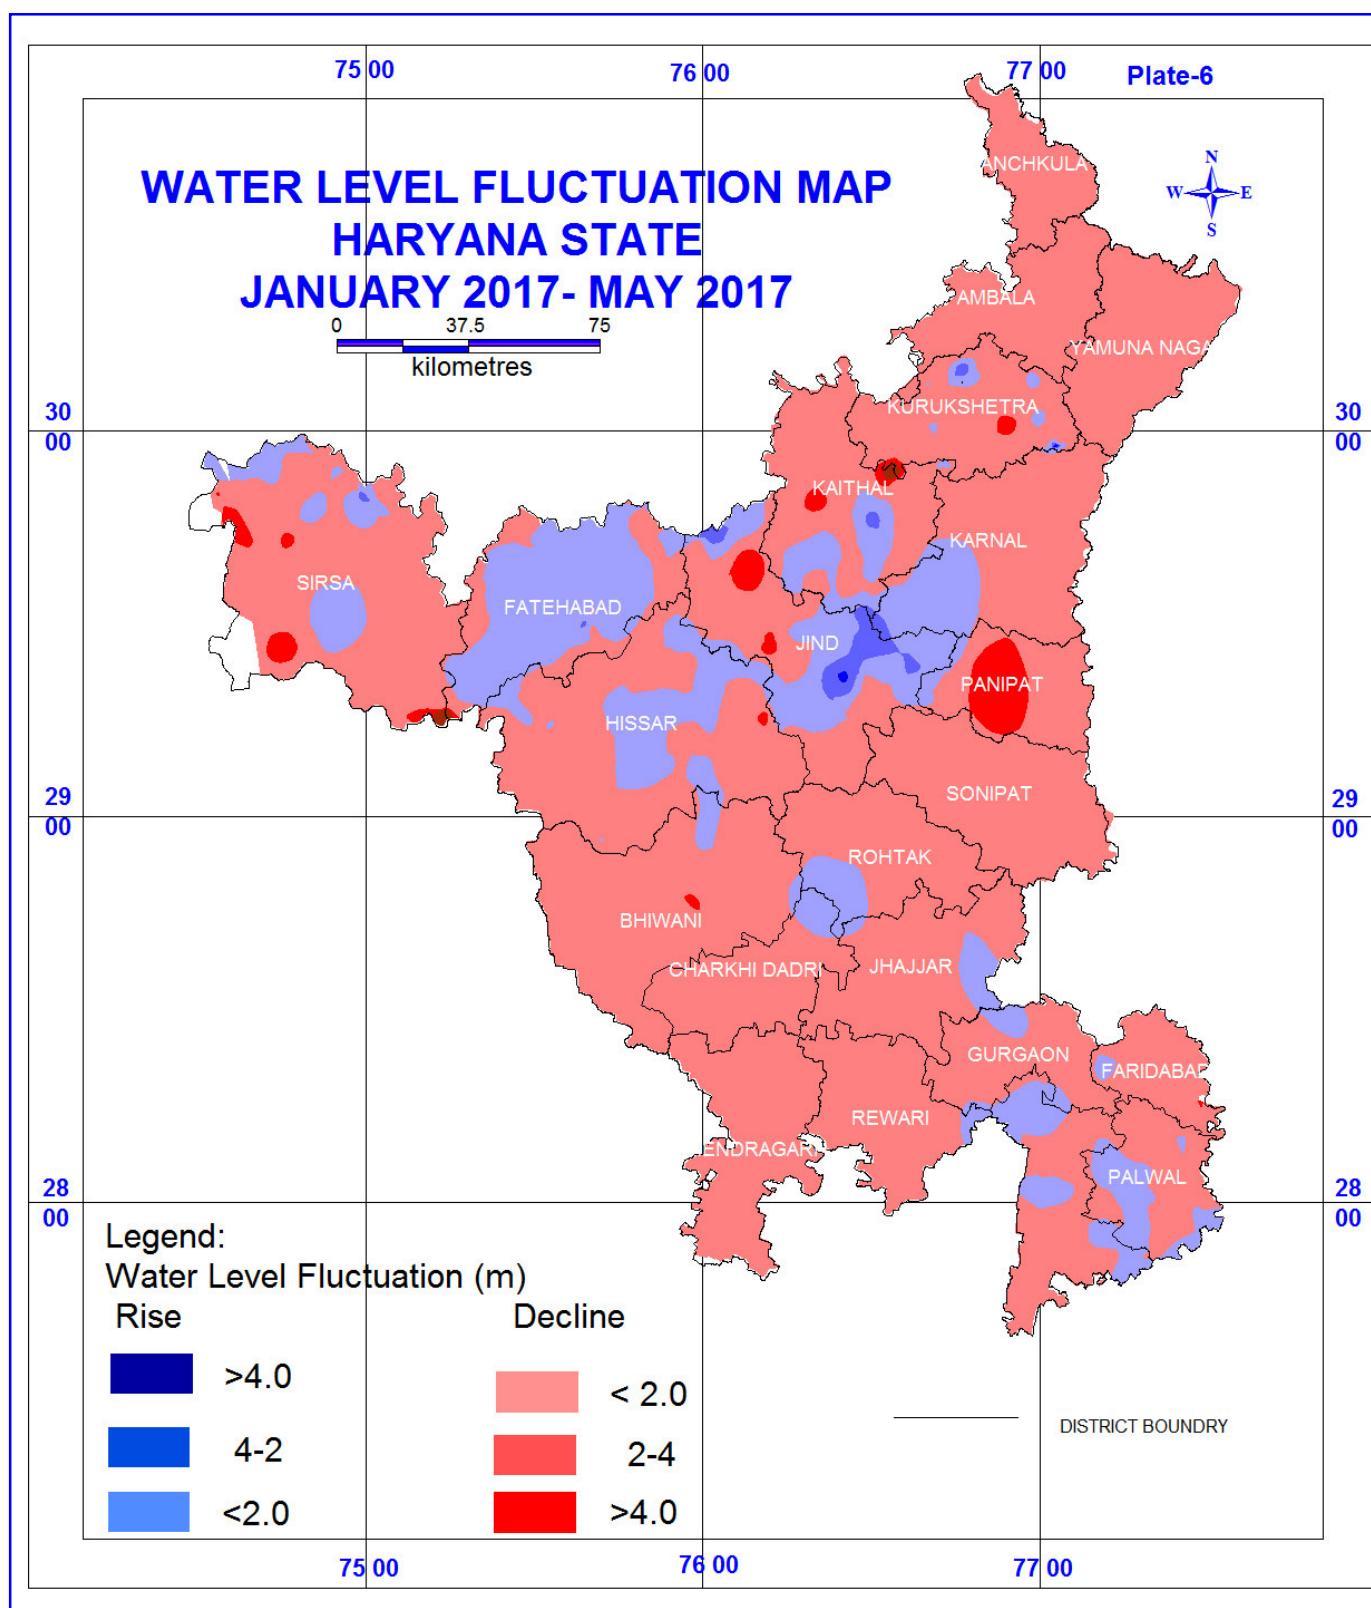

3.3.1 JANUARY 2017 - MAY 2017

The behavioral pattern of seasonal water level fluctuation is discussed below along with map (Fig. 6) and data are presented in Annexure-2 (Col-4).

The interpretation of seasonal fluctuations indicates a general decline in 70% of the wells monitored covering an area of 82% of the State. The water level decline in the range of 0-2m has been observed in 64% wells and 79% of the area in all districts. Water level decline in range of 2-4m has been observed in 5% wells and 2% of the area covering parts of Karnal and Kurukshetra along with isolated patches in Hissar, Mahendragarh, Jind, Palwal and Rewari districts. Water level decline >4m is recorded in 1% wells and <1% of the area in Karnal districts. T

The water level Rise has been observed in 30% of the wells and 18% of the area depict Rise in water levels. The water level Rise of 0-2m has been observed in 26% of wells and 17% of area falling in Sirsa, Hissar, Bhiwani, Fatehabad, Jind, Kaithal and isolated patches in Jhajjar, Rohtak, Mewat and Palwal districts. The water level Rise of 2-4m has been observed in 3% of wells and 1% of area of the state. Water level rise >4m is recorded in 1% wells and >1% of the area in the state. Summarised details of water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Km ²	%Age	Ground water Loss	Ground water Recharge
Decline	0-2	230	64	35129	79	-4215	
	2-4	18	5	857	2	-309	
	>4.0	2	1	75	<1	-45	
Rise	0-2	93	26	7715	17		926
	2-4	11	3	430	1		155
	>4.0	2	1	8	<1		5
		356					-3483

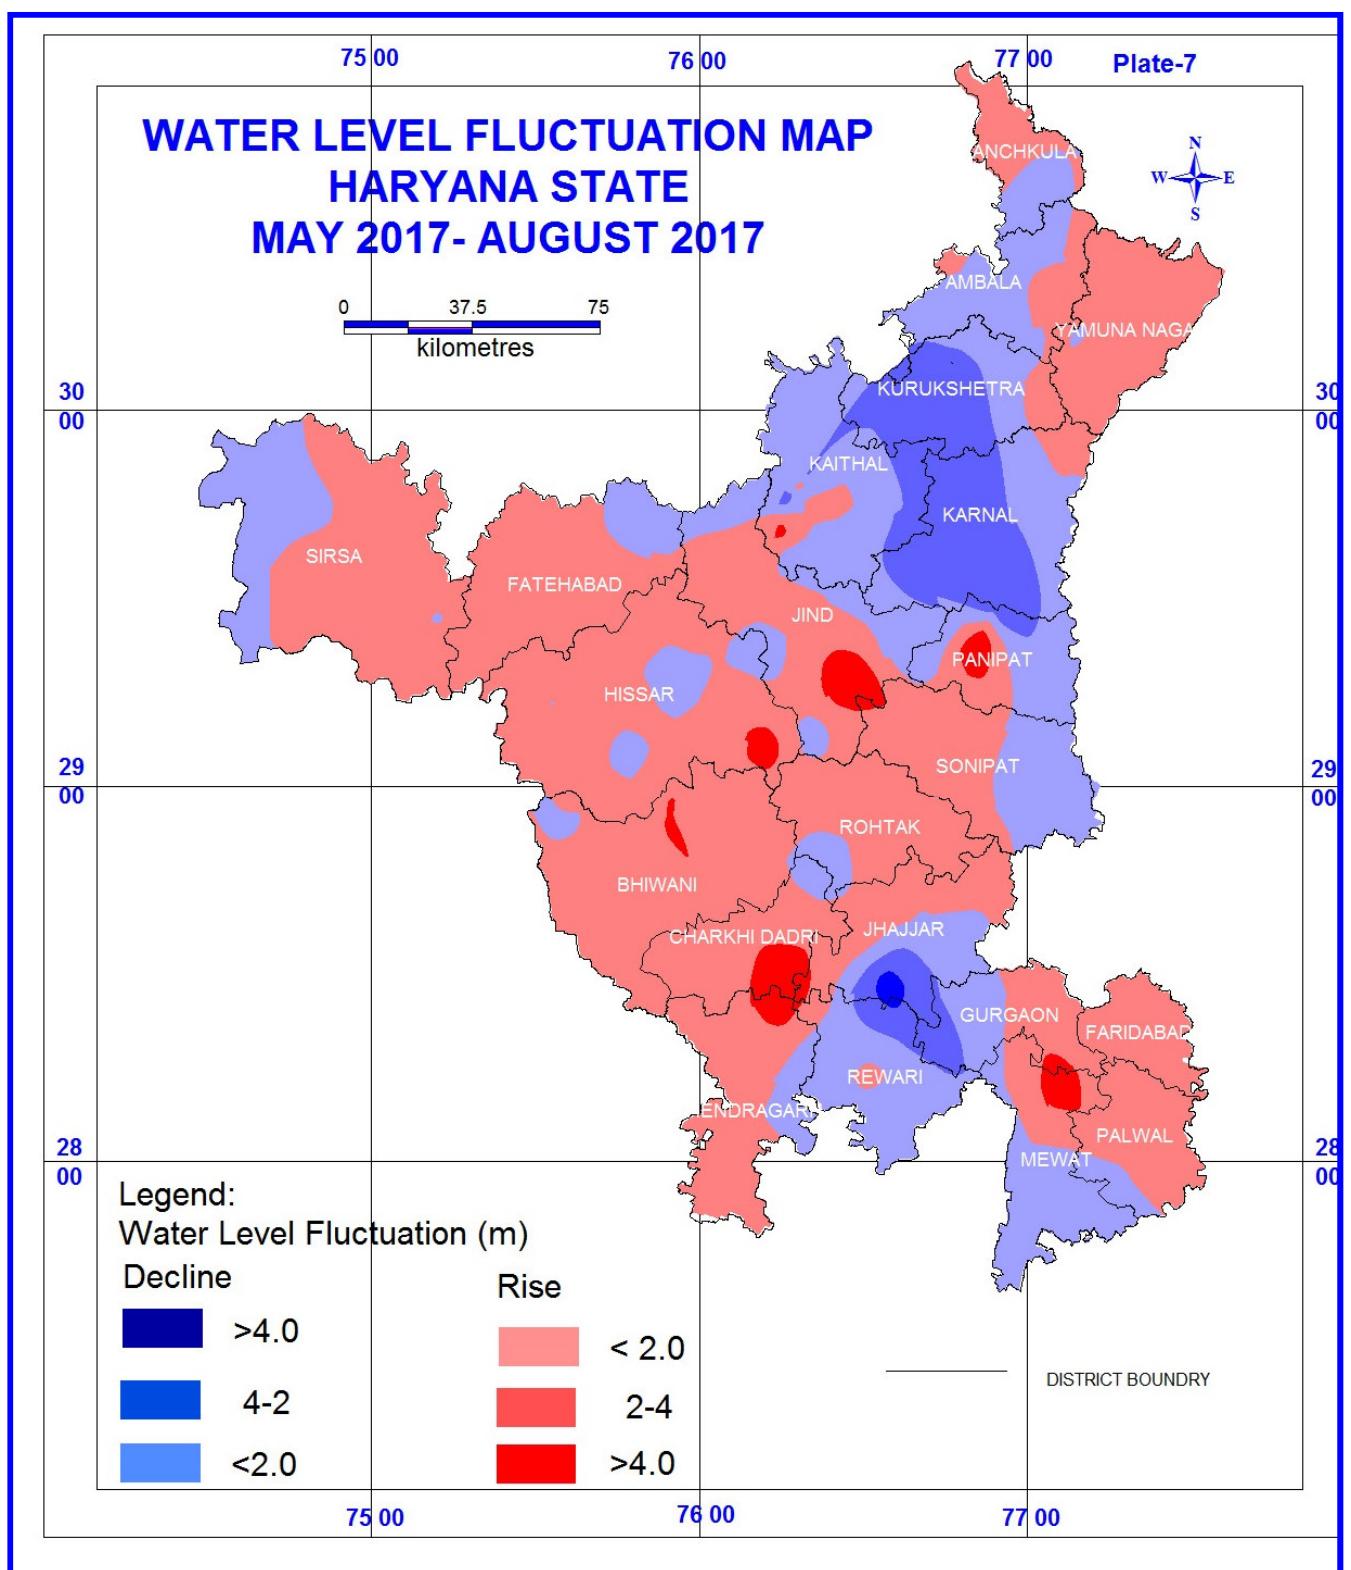

3.3.2 MAY 2017 - AUGUST 2017

The behavioral pattern of seasonal fluctuations is discussed below along with seasonal water level fluctuation map (Fig. 7).and data are presented in Annexure-2 (Col-5). The interpretation of seasonal fluctuations indicates a general decline in 39% of the wells monitored covering an area of 36% of the State. The water level decline in the range of 0-2m has been observed in 32% wells and 28% of the area in Panchkula, Ambala, Yamunanagar, Kurukshetra, Karnal, Kaithal, Jind, Fatehabad, Sirsa, Hissar, Palwal and Faridabad districts. Water level decline in range of 2-4m has been observed in 5% wells and 8% of the area covering parts of Ambala, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat and Sirsa districts. Water level decline >4m is recorded in 1% wells and <1% of the area in Kaithal, Karnal and Kurukshetra districts.

The water level Rise has been observed in 61% of the wells and 63% of the area of the state. The water level Rise of 0-2m has been observed in 52% of wells and 61% of area rising in Panchkula, Ambala, Yamunanagar, Faridabad, Palwal, Mewat, Gurgaon, Mahendragarh, Bhiwani, Sirsa, Fatehabad, Jind, Jhajjar, Rohtak and Sonipat districts. The water level Rise of 2-4m has been observed in 9% of wells and 2% of area rising in Panchkula and Ambala districts. The water level Rise of >4m is not recorded. Summarised details of seasonal water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage	
		No.	%Age	Km ²	%Age	Ground water Loss	Ground water Recharge
Decline	0-2	29	32	12543	28	-1505	
	2-4	5	5	3549	8	-1278	
	>4.0	1	1	82	<1	-49	
Rise	0-2	47	52	26945	61		3233
	2-4	8	9	1095	2		394
	>4.0	0	0	0	0		796

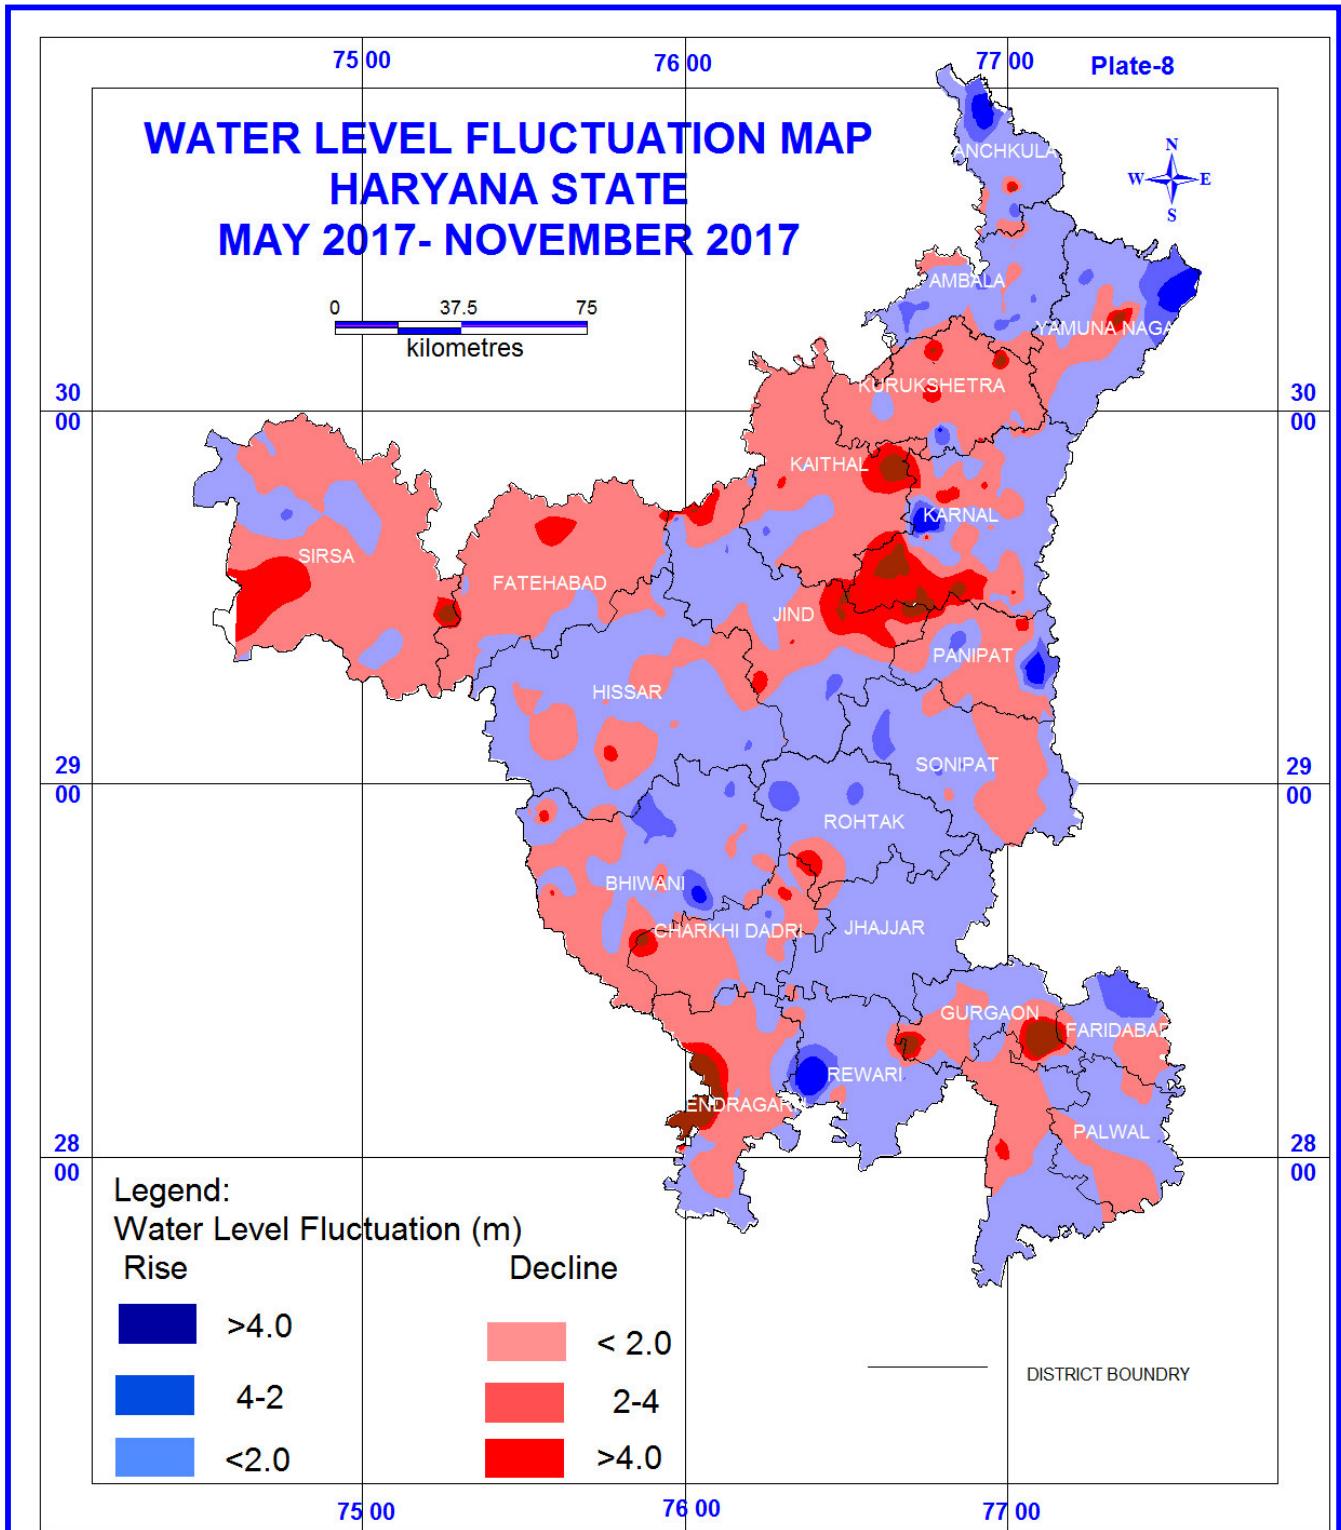

3.3.3 MAY 2017 - NOVEMBER 2017

The behavioral pattern of seasonal fluctuations is discussed below along with seasonal water level fluctuation map (Fig. 8).and data are presented in Annexure-2 (Col-6).

The interpretation of seasonal fluctuations indicates a general decline in 45% of the wells monitored covering an area of 47% of the State. The water level decline in the range of 0-2m has been observed in 37% wells and 42% of the area covering parts of Kaithal, Karnal, Kurukshetra, Jind, Panipat, Sonipat Sirsa, Bhiwani, Rewari, Gurgaon and Faridabad districts. Water level decline in range of 2-4m has been observed in 5% wells and 4% of the area. Water level decline more than 4m is recorded in 3% wells and 1% of the area in isolated patches.

The water level rise has been observed in 53% of the wells and 52% of the area depict Rise in water levels covering parts Panchkula, Ambala, Yamuna Nagar, Karnal, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Charkhi Dadri, Rewari, Jhajjar, Rohtak, Sonipat and Palwal districts. The water level Rise of 0-2m has been observed in 47% of wells and 48% of area. The water level Rise of 2-4m has been observed in 5% of wells and 3% of area. Water level decline more than 4m is recorded in 1% wells and 1% of the area in isolated patches. Summarised details of seasonal water level fluctuation and change in Ground Water storage are given in table below;

water level fluctuation range		Wells monitored		Area covered		Change in Ground water Storage (MCM)	
		No.	%age	Km ²	%age	Groun Water Loss	Groun Water Recharge

Total		356	100	44214	100		-54

3.3.4 MAY 2017 – JANUARY 2018

The behavioral pattern of seasonal fluctuations is discussed below along with seasonal water level fluctuation map (Fig. 9).and data are presented in Annexure-2 (Col-7).

The interpretation of seasonal fluctuations indicates a general decline in 47% of the wells monitored covering an area of 50% of the State. The water level decline in the range of 0-2m has been observed in 40% wells and 42% of the area in Ambala, Yamunanagar, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Faridabad, Palwal, Gurgaon, Mewat, Rewari, Mahindragarh, Bhiwani, Charkhi Dadri, Jind, Fatehabad, Sirsa and Hissar districts. Water level decline in range of 2-4m has been observed in 3% wells and 5% of the area. Water level decline more than 4m is recorded in 4% wells and 3% of the area in isolated patches.

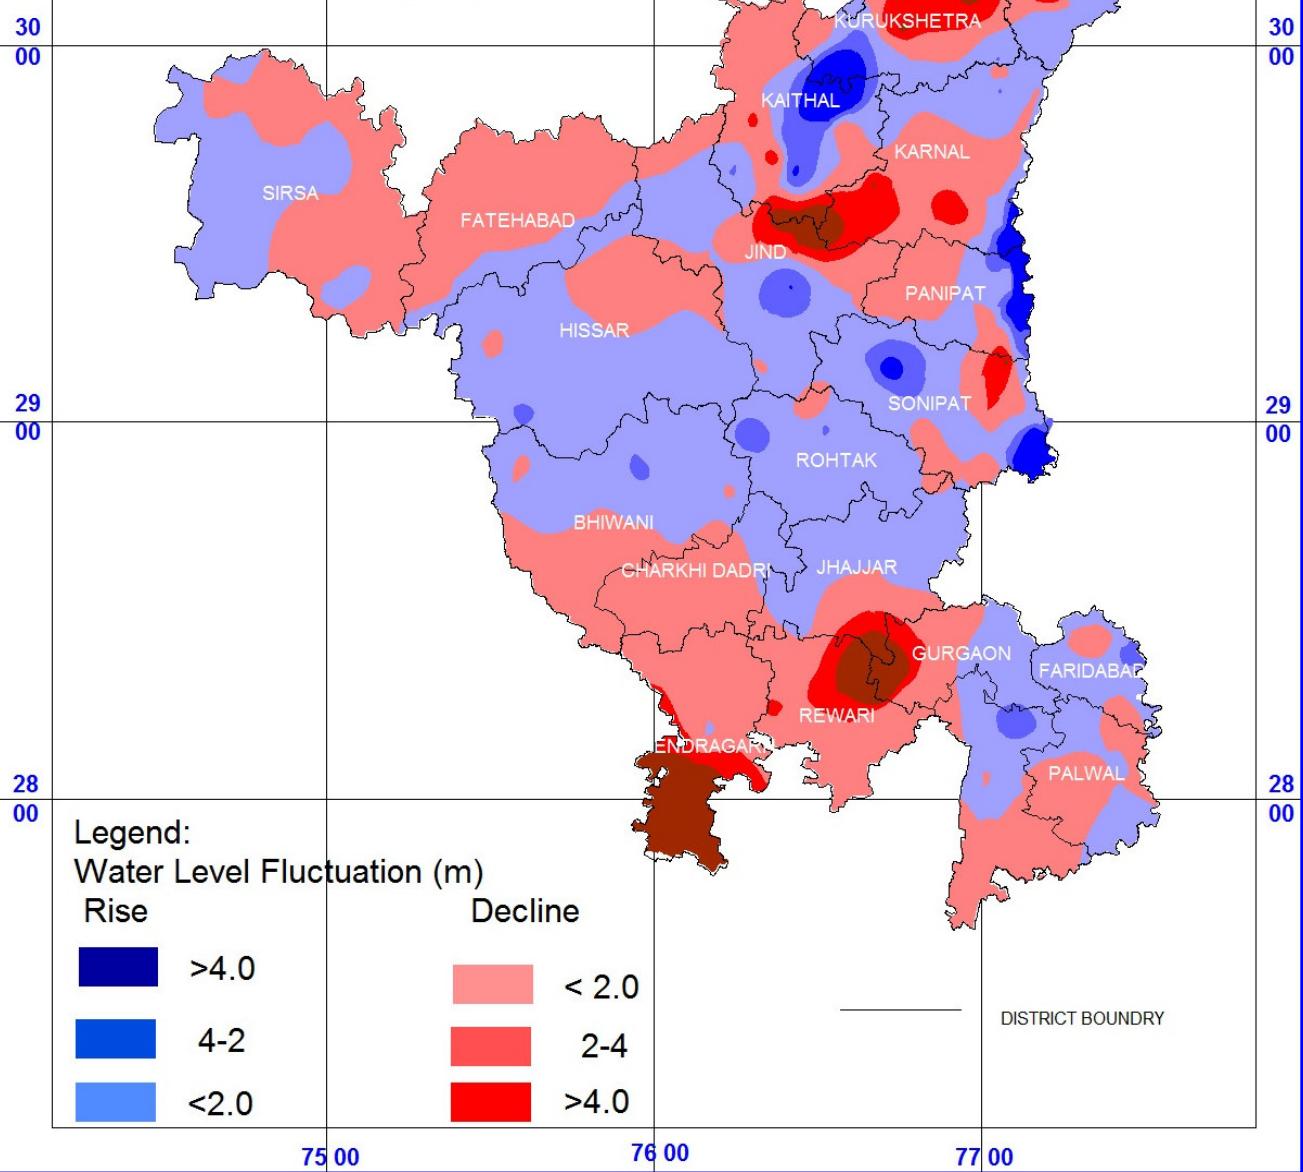

The water level Rise has been observed in 53% of the wells and 50% of the area. The water level rise has been observed in Sonipat, Jhajjar, Rohtak, Bhiwani, Hissar, Sirs and isolated patches in all other districts in state. The water level Rise of 0-2m has been observed in 41% of wells and 44% of area. The water level Rise of 2-4m has been observed in 7% of wells and 4% of area. Water level rise more than 4m is recorded in 5% wells and 2% of the area in isolated patches. Summarised details of seasonal water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)

3.4 ANNUAL WATER LEVEL FLUCTUATIONS

The water level data of current season (i.e. May 2016) when compared with water level data of corresponding period of previous year (i.e. May 2017) annual water level fluctuations is determined.

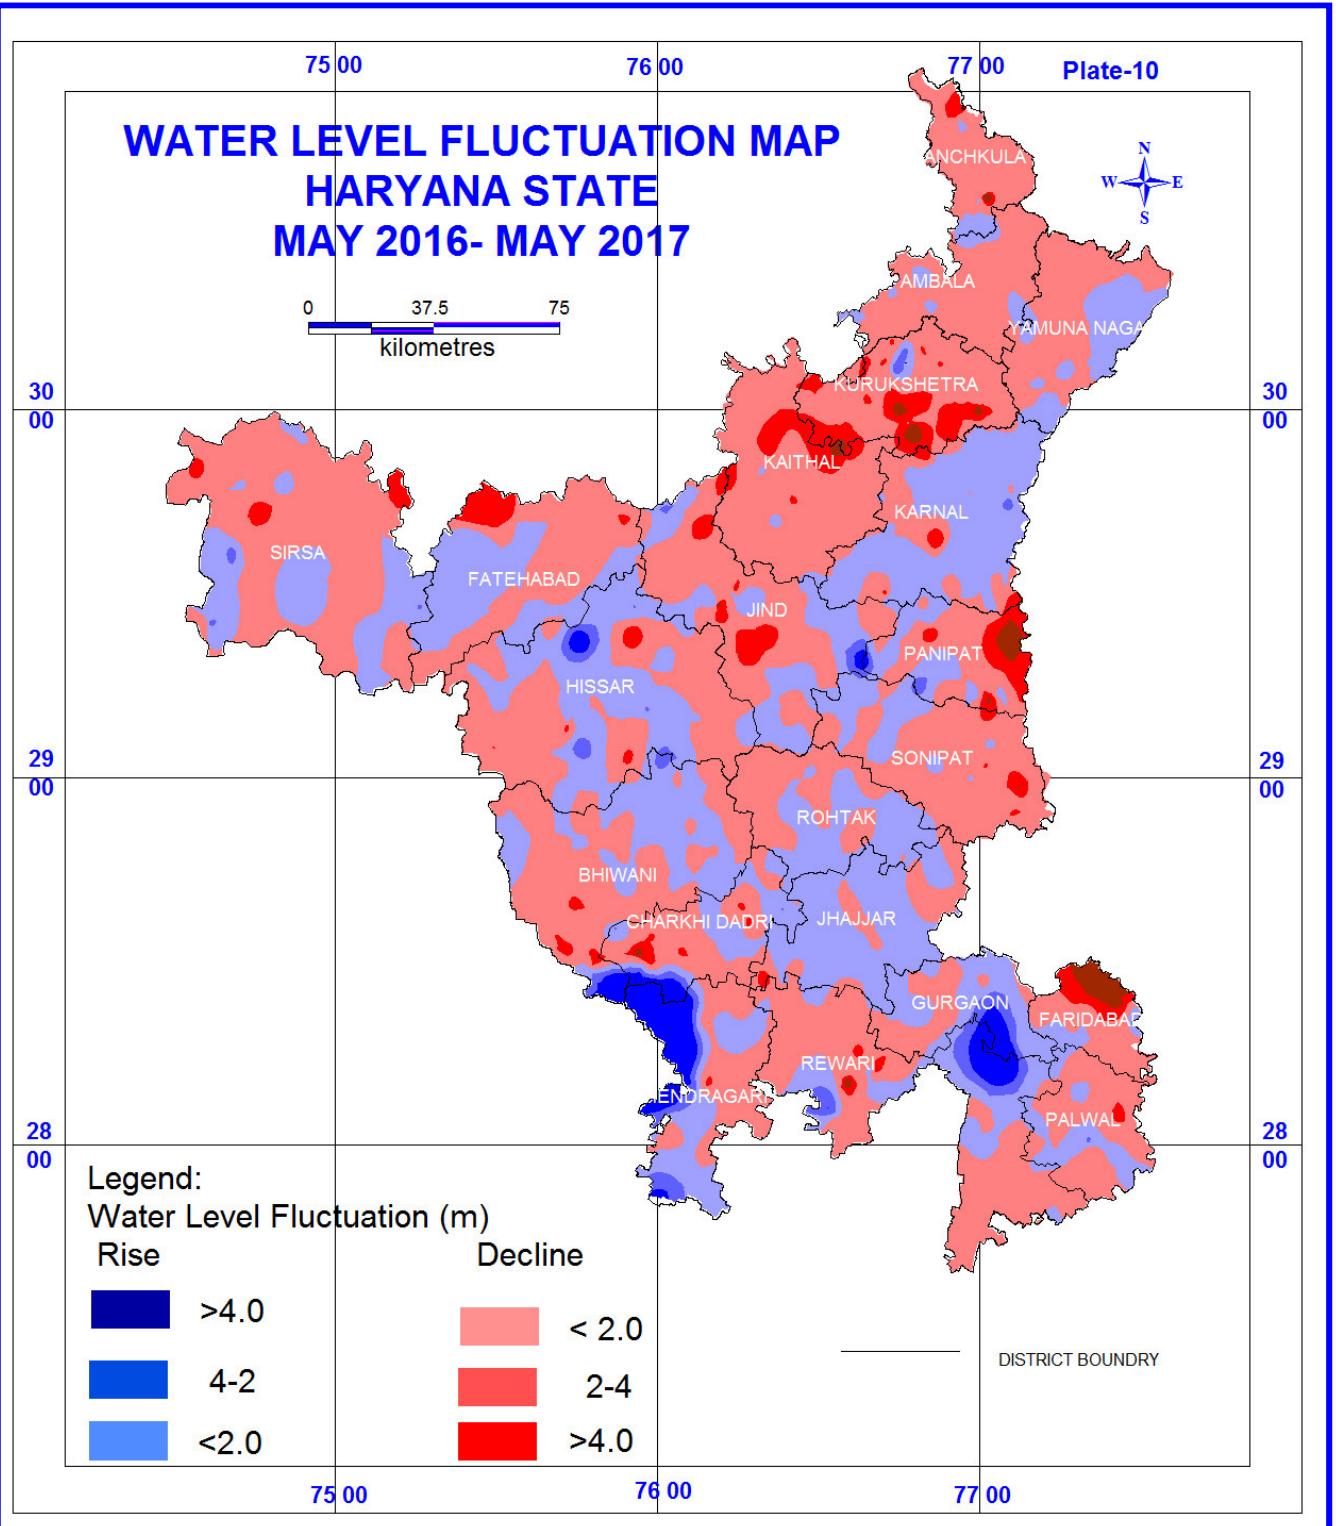

3.4.1 MAY 2016 – MAY 2017

The behavioral pattern of annual fluctuations is discussed along with (Fig. 10) and data are presented in Annexure-3 (Col-4).

The interpretations of annual water level fluctuation depicts water level decline in about 60% of wells monitored and 62% of the area in all districts of the state. Water level Decline (0-2m) has been recorded in 51% of wells and 57% of area. Water level decline (2-4m) has recorded in 7% of wells and 4% of area. Water level decline of more than 4m is observed in 2% of wells and 1% of area.

Water level rise has recorded in 40% of the wells and 38% of the area. Water level Rise (0-2m) has been recorded in 37% of the wells and 34% area covering central parts of the state. Water level Rise of 2-4m has been observed in small patches in 2% of wells and 2% of area. Water level Rise of more than 4m observed in 1% of wells and 2% of area. Summarised details of annual water level fluctuation and change in Ground Water storage are given in table below;

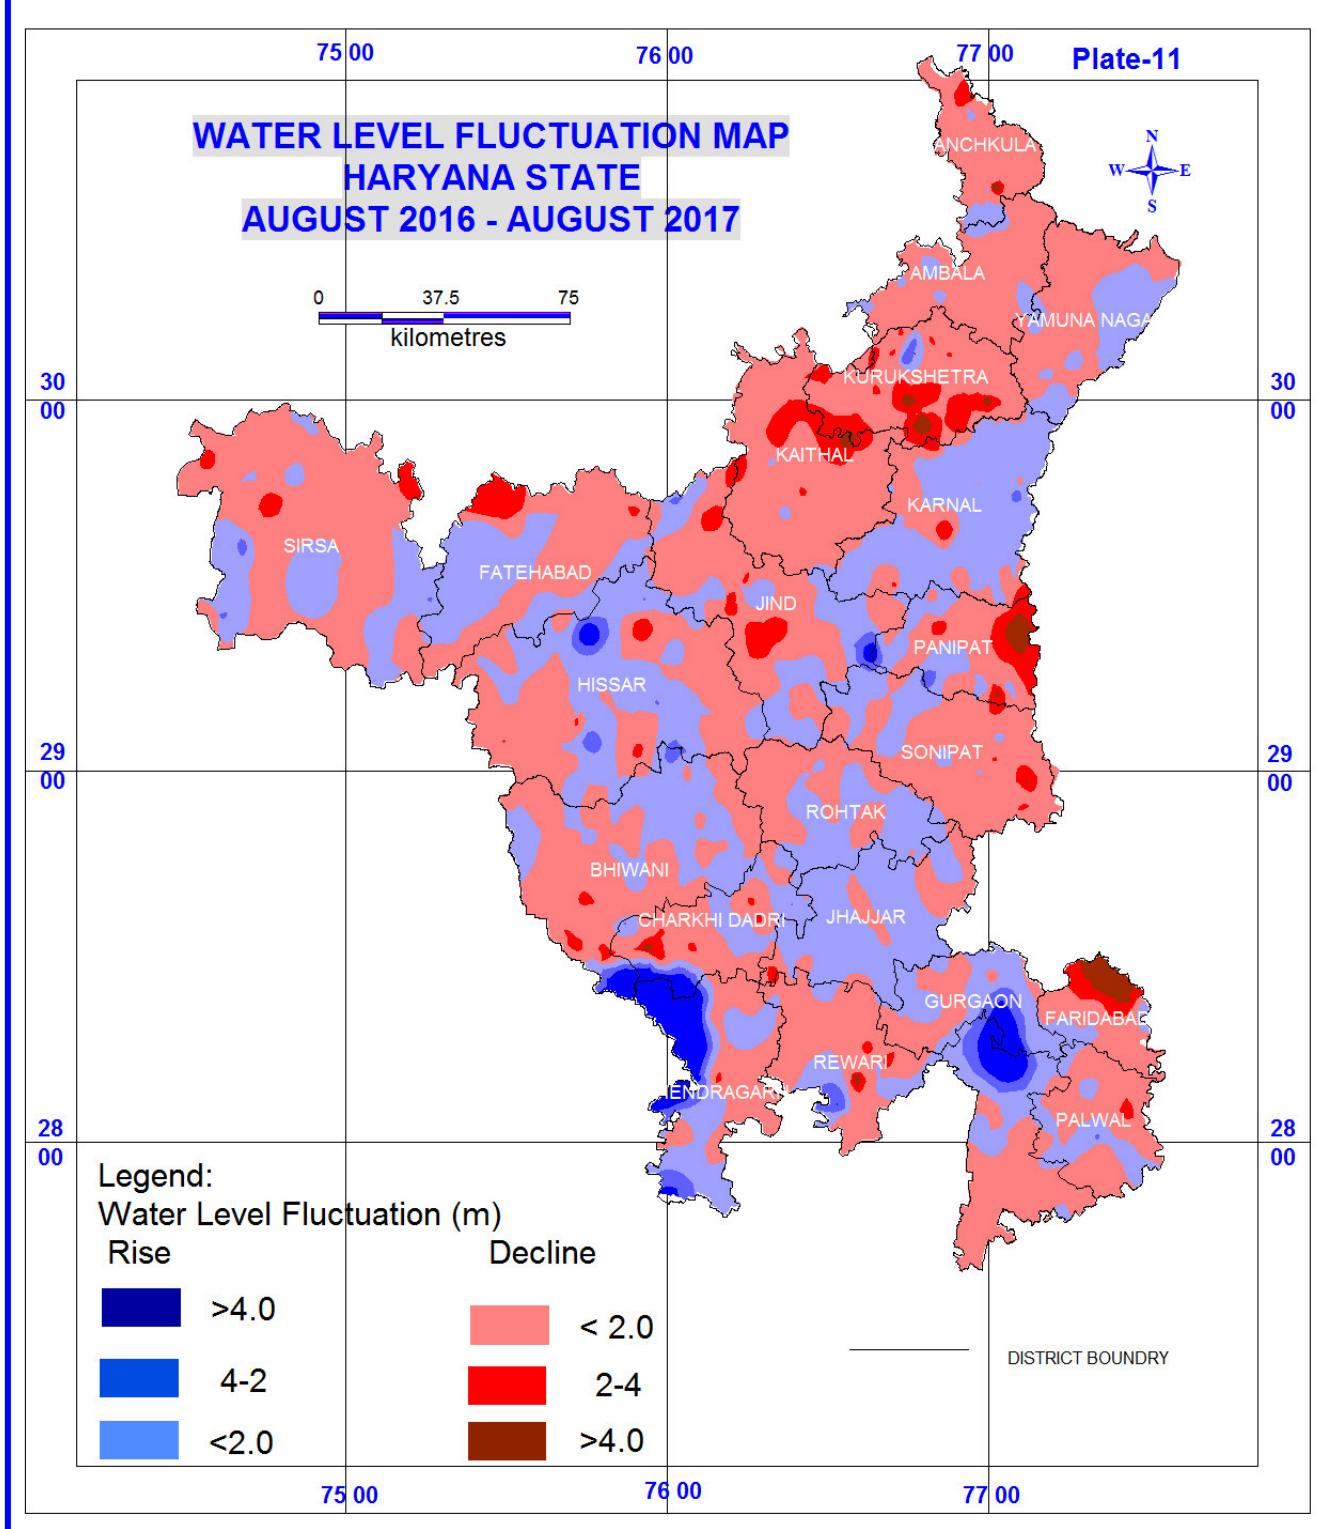

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Km ²	%Age	Ground Water Loss	Ground Water Recharge

3.4.2 August 2016 – August 2017

The behavioral pattern of annual fluctuations is discussed along with (Fig.11) below and data are presented in Annexure-3 (Col-5). The interpretations of annual water level fluctuations depicts water level decline in about 59% of wells monitored and 59% of the area in Panchkula, Ambala, Yamunanagar, Kurukshetra, Karnal, Kaithal, Jind, Panipat, Sonipat, Fatehabad, Sirsa, Bhiwani, Charkhi, Dadri and Mahendragarh districts of the state. Water level decline (0-2m) has been recorded in 55% of wells and 58% of area. Water level Decline (2-4m) has recorded in 3% of wells and 1% of area. Water level decline of more than 4m has recorded in 1% of wells and <1% of area during the period. The water level rise has been recorded remaining 39% of the wells and 41% of the area Fatehabad, Hissar, Bhiwani, Rohtak, Jhajjar, Gurgaon, Rewari, Mewat, Palwal and Faridabad districts. Water level Rise (0-2m) has been recorded in 36% of the wells and 37% area. Water level Rise of 2-4m has been observed in small patches in 3% of wells and 4% of area of the state in parts of Bhiwani, Gurgaon, Rewari, Jhajjar and Ambala districts. Water level rise of more than 4m was not observed during the period. Water level rise of more than 4m has not been recorded in the state during the period. Summarised details of annual water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Sq. Km.	%Age	Ground Water Loss	Ground Water Recharge

3.4.3 NOVEMBER 2016 – NOVEMBER 2017

The behavioral pattern of annual fluctuations is discussed along with (Fig.12) below and data are presented in Annexure-3 (Col-6).

The interpretations of annual water level depicts water level Decline in about 57% of wells monitored and 56% of the area covering all districts in the state. Water level decline (0-2m) has been recorded in 49% of wells and 53% of area in all districts in the state. Water level Decline (2-4m) has recorded in 6% of wells and 3% of area. Water level Decline of >4m recorded in 2% of wells and <1% of area of the state.

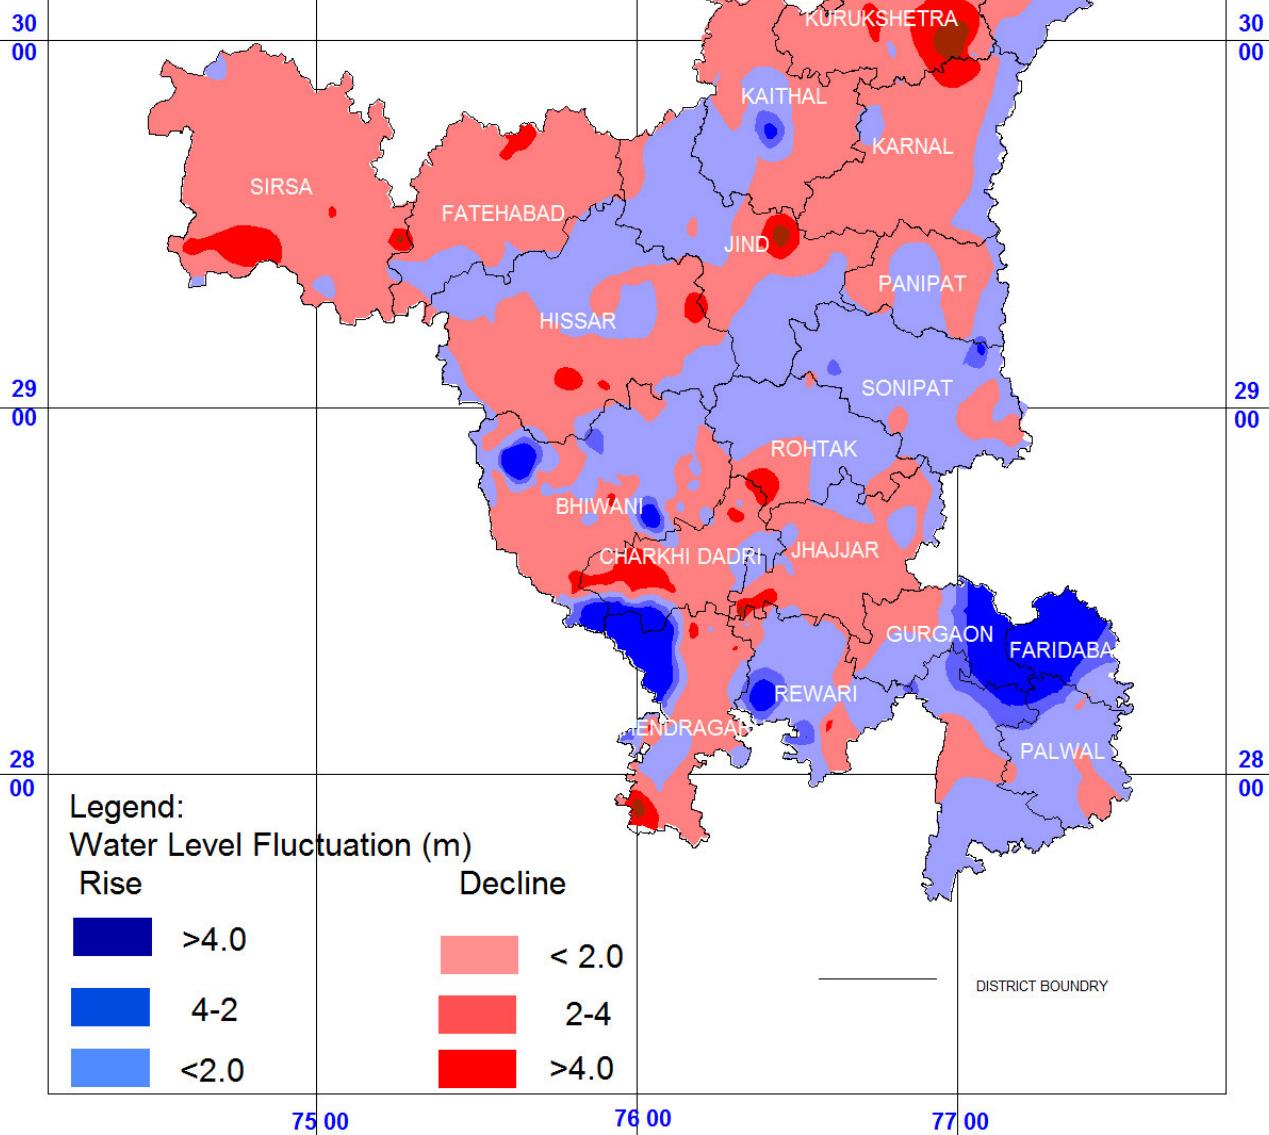

Water level Rise recorded in 41% of the wells and 44% of the area. Water level Rise (0-2m) has been recorded in 39% of the wells and 37% area in parts along the Yamuna river Yamunanagar, Karnal, Panipat and Sonipat besides Parts of Kaithal Fatehabad, Hissar, Bhiwani, Rohtak, Jhajjar, Rewari, and Palwal districts. Water level Rise of 2-4m has been observed in small patches in <1% of wells and 3% of area and water level Rise of >4m recorded in 2% of wells and 4% of area of the state. Summarised details of annual water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)

3.4.4 JANUARY 2017 – JANUARY 2018

The behavioral pattern of annual fluctuations is discussed along with (Fig. 13) below and data are presented in Annexure-3 (Col-7).

The interpretations of annual water level fluctuations depicts water level decline in about 56% of wells monitored and 54% of the area in Panchkula, Ambala, Yamunanagar, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat Jind, Fatehabad, Hissar, Mewat, Palwal and Faridabad districts of the state. Water level decline (0-2m) has been recorded in 45% of wells and 38% of area. Water level decline (2-4m) has recorded in 8% of wells and 7% of area. Water level decline of more than 4m was observed in 3% of wells and 9% of area of the state.

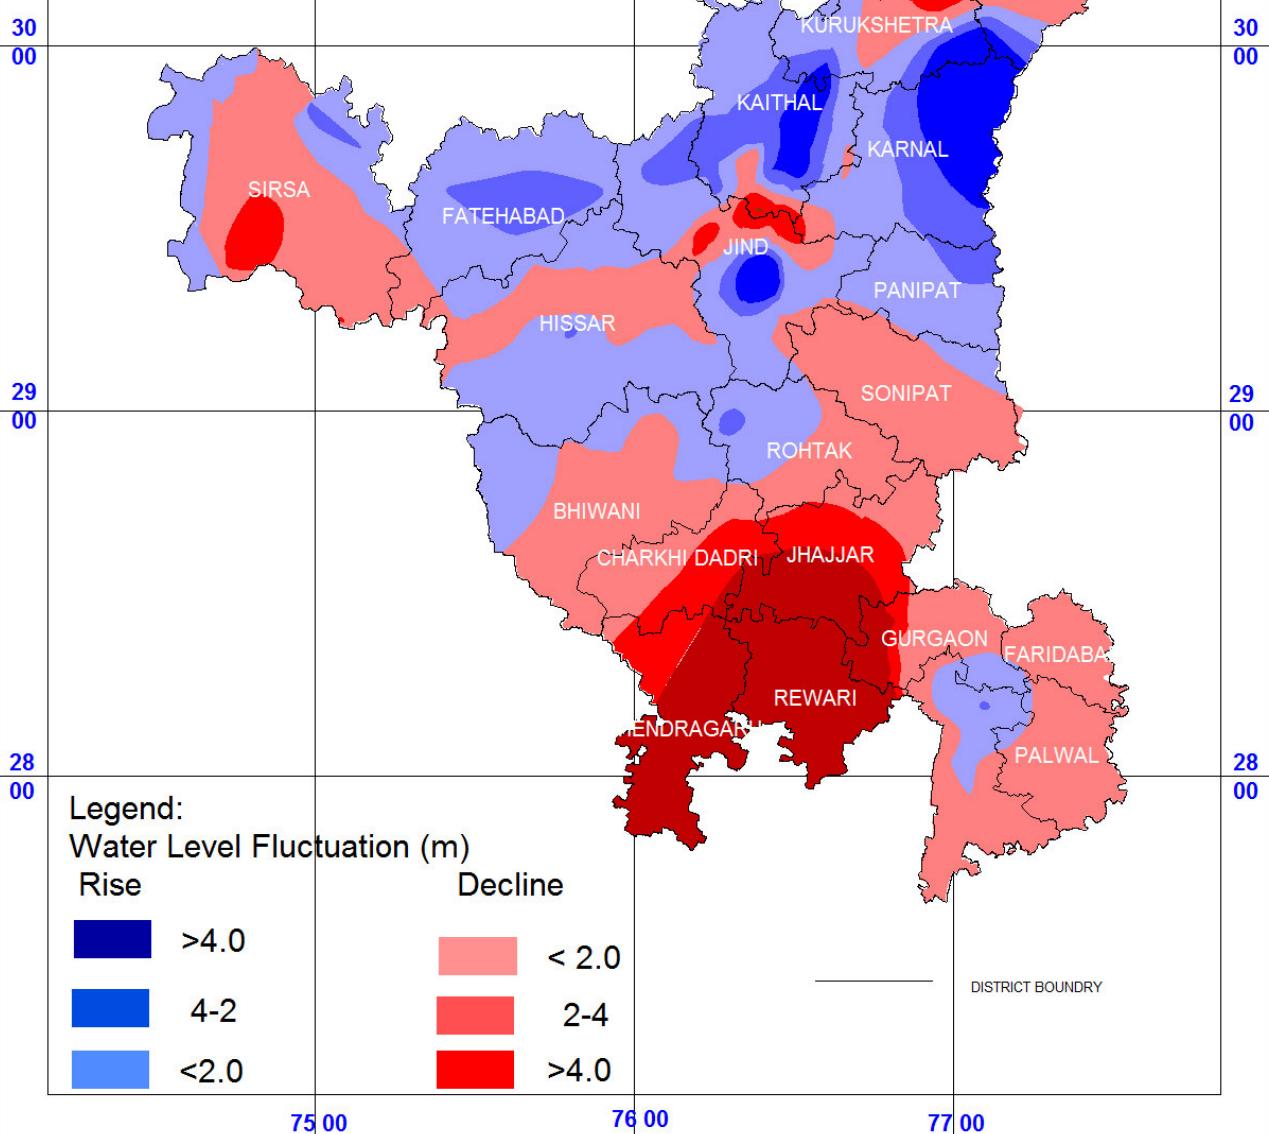

Water level rise has been recorded in 43% of the wells and 46% of the area Sirsa, Fatehabad, Hissar, Bhiwani, Charkhi Dadri, Mahendragarh Jhajjar, Rohtak, Rewari, Gurgaon, Mewat, Palwal, and Faridabad districts of the state. Water level Rise (0-2m) has been recorded in 23% of the wells and 32% area. Water level Rise of 2-4m has been observed in small patches in 13% of wells and 9% of area. Water level rise of (>4m) was observed in 7% of wells and 5% of area of the state. Summarised details of annual water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)

Plate-14

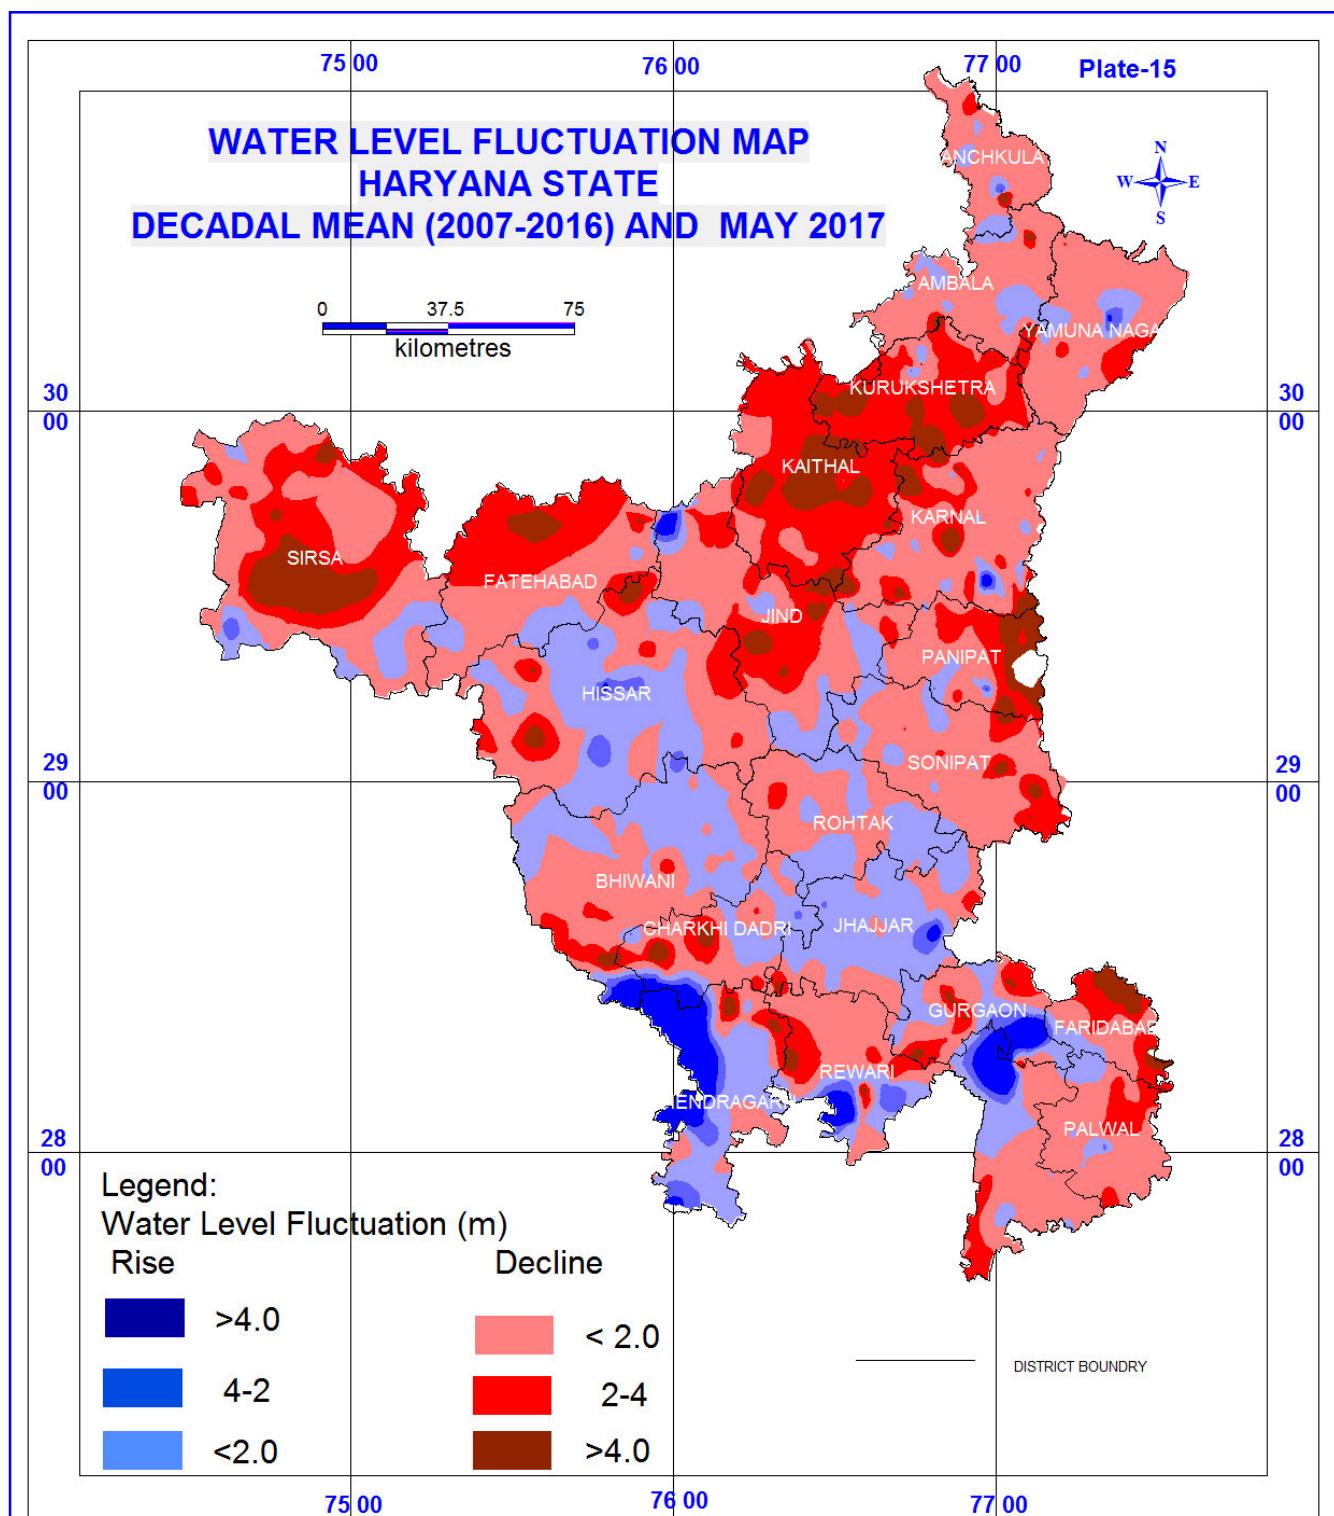

3.5 DECADAL MEAN WATER LEVEL FLUCTUATION

To determine the changes in water level behaviour since last one decade have been observed using decadal mean data. Mean of Water level data of all ground water observation wells for past one decade, (May 2007:2016) are computed and compared with the water level data of May 2017.

3.5.1 MAY (2007:2016) & MAY 2017

The behaviour of water level over the period under reference is discussed in following paragraph along with map (Fig. 14) and data are given in (Annexure-IV Col-4). The interpretations of decadal mean fluctuations so arrived at indicate water level decline in 72% of wells which covers about 74% area in all districts of the State. Water level decline in the range of 0-2m has been reported from 47% of the wells covering 48% of area of the state, Water level decline between 2-4 m has been reported from 17% of wells covering 20% area of the state. Water level decline of more than 4m has been observed in 8% wells and 6% of the area of state. The water level rise has been observed in 29% of wells and 26% area in Panchkula, Ambala, Sirsa, Hissar, Bhiwani, Charkhi Dadri, Jhajjar, Rohtak, Mahendragarh and Rewari districts. Water level rise in the range of 0-2m has been observed in 25% wells covering 22% area of the state. Water level rise between 2-4 m has been observed patches in small patches in 2% wells and 2% area of the state. Water level decline of more than 4m has been observed in 2% wells and 2% of the area of state. Summarised details of Decadal Mean water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Km ²	%Age	Ground Water Loss	Ground Water Recharge
Decline	0-2	450	47	21137	48	-2536	
	2-4	160	17	8823	20	-3176	
	>4.0	74	8	2592	6	-1555	
Rise	0-2	246	25	9715	22		1166
	2-4	18	2	823	2		296
	>4.0	15	2	1124	2		674
Total		963	100	44214	100	-5131	

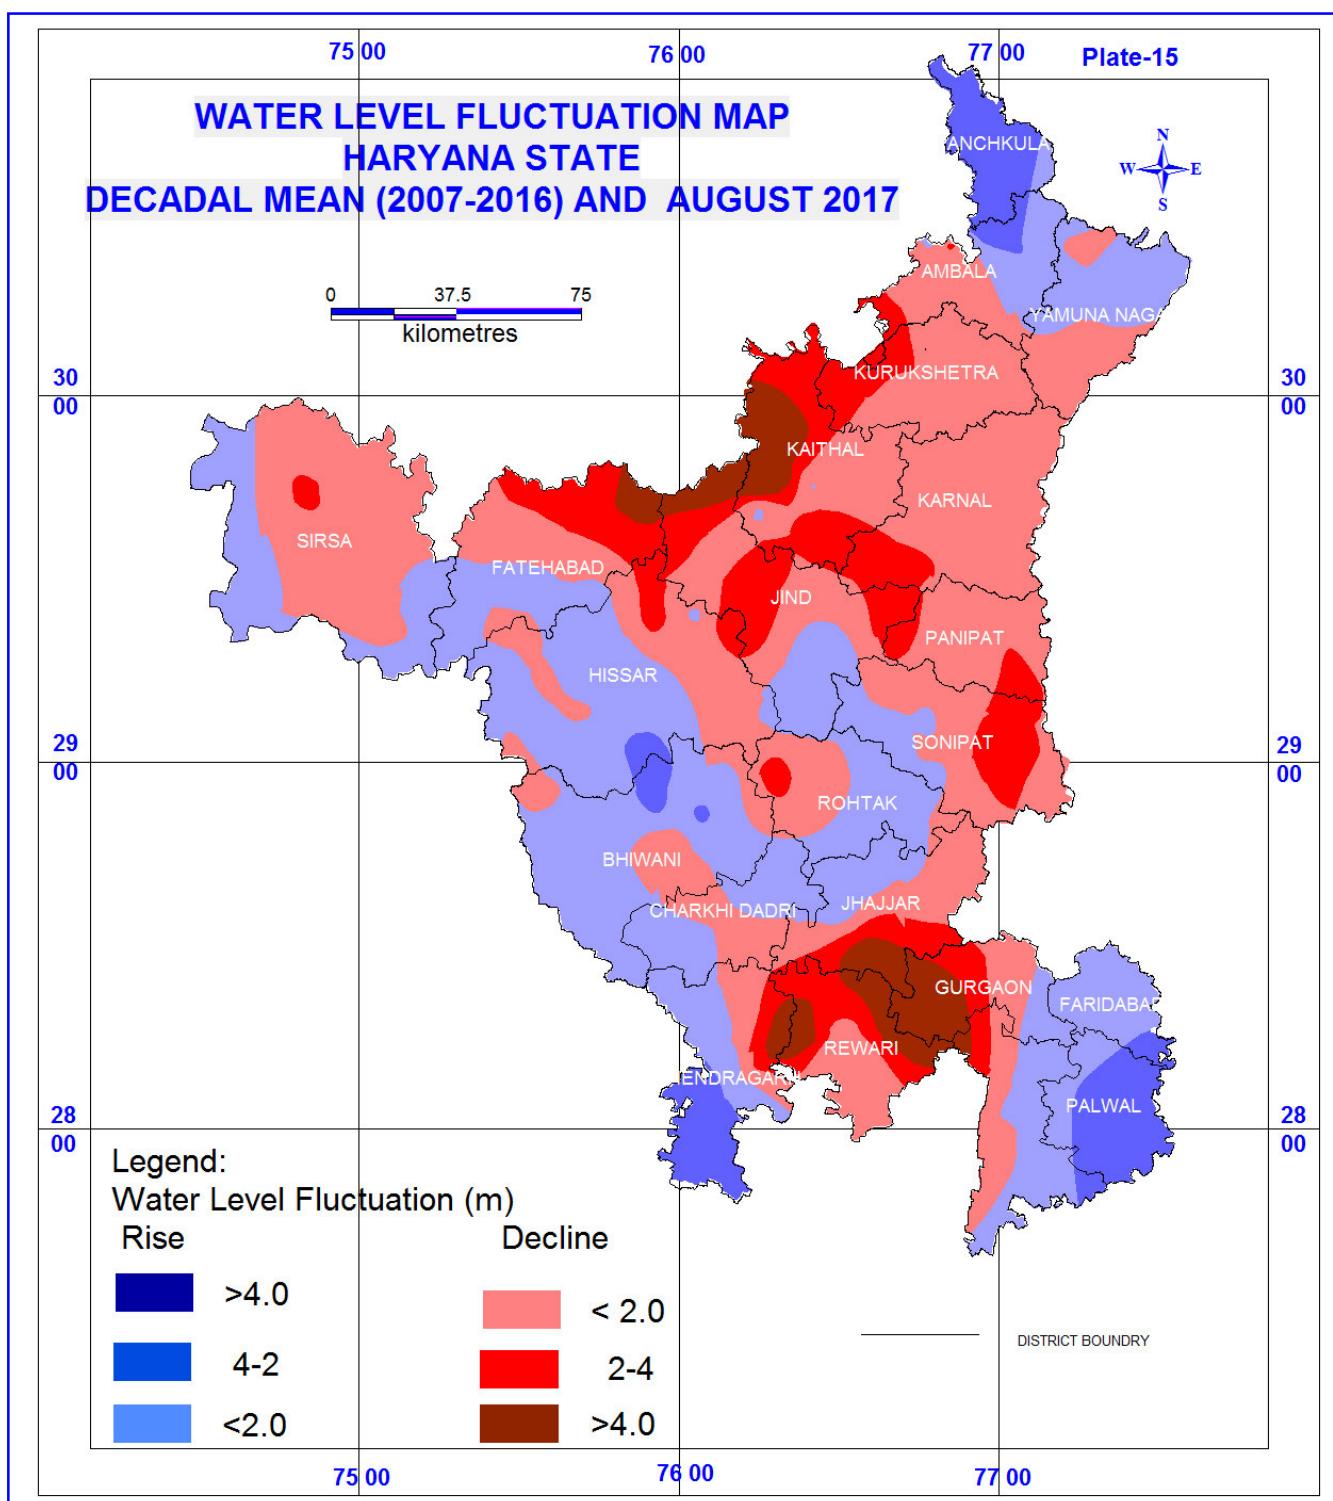

3.5.2 MEAN AUGUST (2007:2016) & AUGUST 2017

The behaviour of water level over the period under reference is discussed in following paragraph alongwith map (Fig.15) and data are given in (Annexure-IV- Col. 5).

The interpretations of decadal mean fluctuations indicate water level decline in 52% of wells monitored and about 60% area of the State falling in Yamunanagar, Ambala, Kurukshetra, Kaithal, Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Charkhi Dadri, Mahendragarh, Rewari, Gurgaon, Faridabad and Palwal districts. Water level decline in the range of 0-2m has been reported from 31% of the wells covering 42% of area. Water level decline between 2-4 m has been reported from 13% of wells covering 13% area of the state. Water level decline of more than 4m has been observed in 8% wells and 5% of the area of state.

The water level rise has been observed in 48% of wells and 40% area Panchkula, Ambala, Yamunanagar, Sirsa, Fatehabad, Hissar, Bhiwani, Charkhi Dadri, Jhajjar, Rohtak, Mahendragarh, Rewari and Palwal districts. Water level rise in the range of 0-2m has been observed in 39% wells covering 32% area of the state. Water level rise 2-4m has been observed small patches in small patches in 9% wells and 8% area of the state. Water level rise >4m has not been observed in the state. Summarised details of Decadal Mean water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Km ²	%Age	Ground Water Loss	Ground Water Recharge
Decline	0-2	29	31	18742	42	-2249

Total		92	100	44214	100		-2803

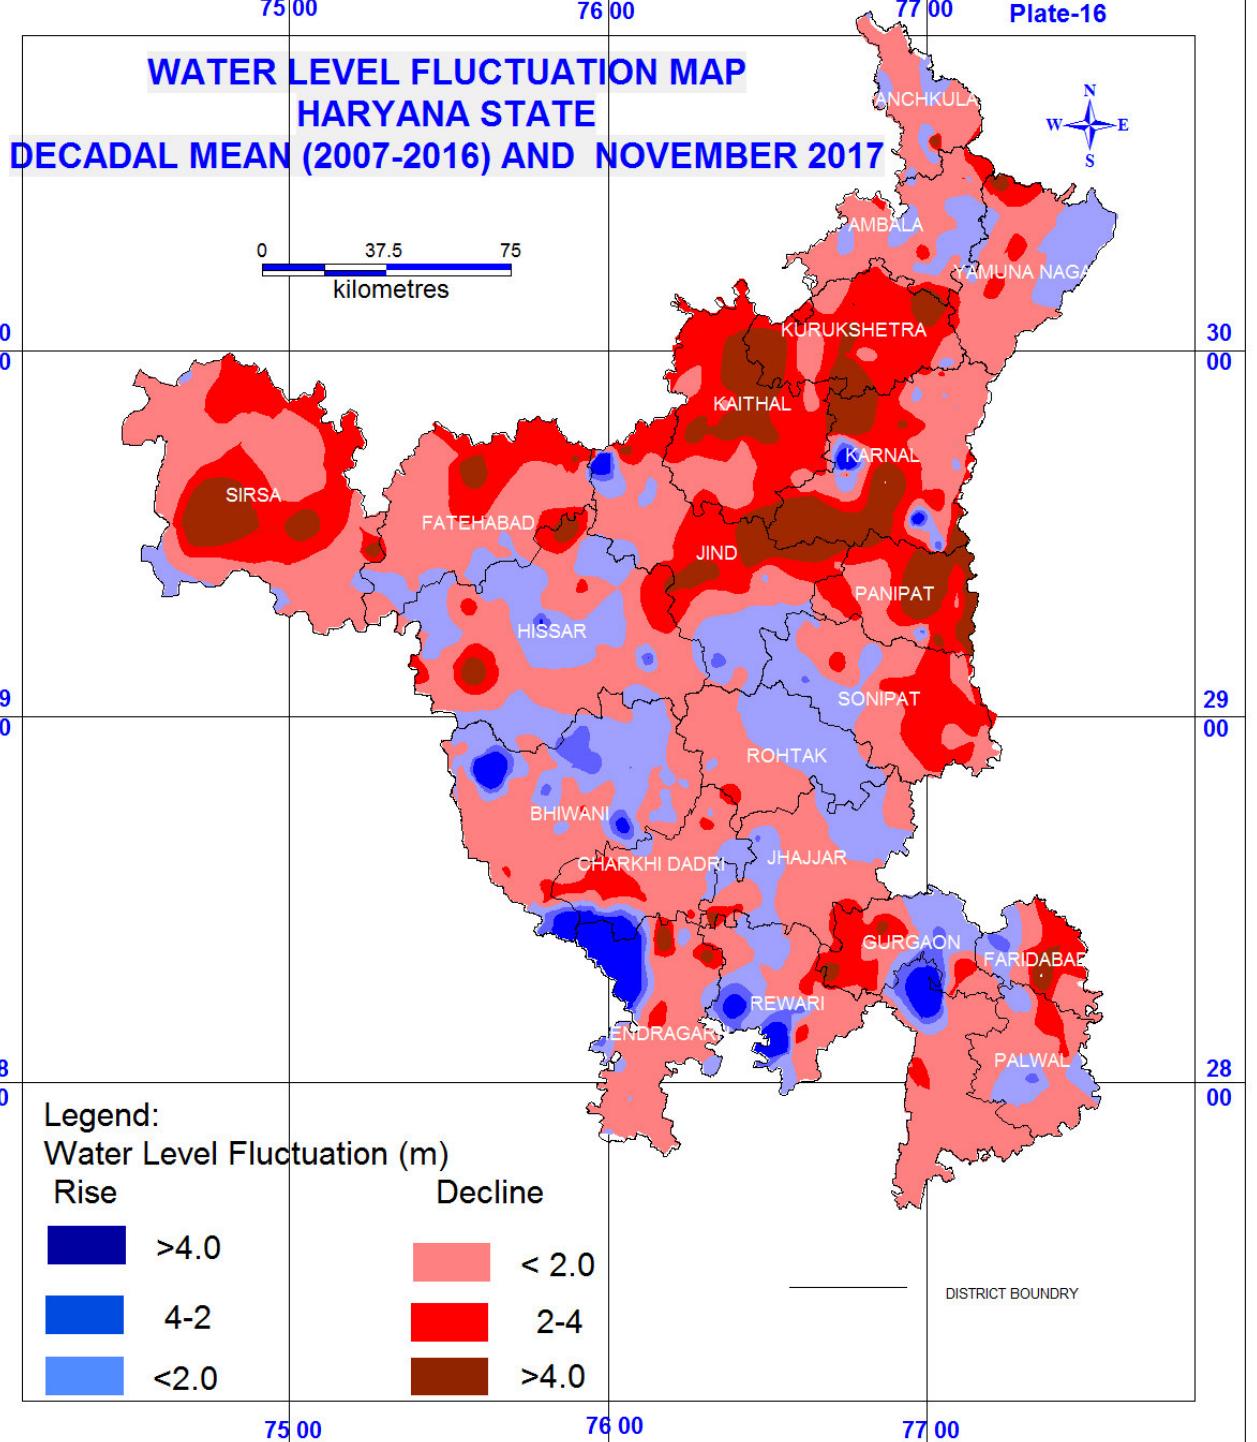

3.5.3 Mean November (2007:2016) & November 2017

The behaviour of water level over the period under reference is discussed in following paragraph along with map (Fig.16) and data are given in (Annexure-IV-Col. 6).

The interpretations of decadal mean fluctuations so arrived at indicate general water level decline in 69% of wells and 76% area covering all Districts of the State. Water level decline in the range of 0-2m has been reported from 43% of the wells covering 49% of area of the state. Water level decline between 2-4 m has been reported from 18% of wells covering 20% area. Water level decline of more than 4m has been observed in 8% wells and 7% of the area of state falling in Kurukshetra, Kaithal, Karnal, Panipat, Jind, Fatehabad and Sirsa districts.

The water level rise has been observed in 31% of wells and 24% area falling in Hissar, Bhiwani, Rohtak, Jhajjar and a few isolated patches in other districts. Water level rise in the range of 0-2m has been observed in 26% wells covering 20% area of the state. Water level rise of 2-4m has been observed in 3% wells and 2% area of the state. Water level rise of >4m has been observed in 2% wells and 2% area of the state. Summarised details of Decadal Mean water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Km ²	%Age	Ground Water Loss	Ground Water Recharge
Decline	0-2	289	43	21483	49	-2578	
	2-4	118	18	8947	20	-3221	
	>4.0	54	8	3286	7	-1972	
Rise	0-2	173	26	8839	20		1061
	2-4	20	3	817	2		294
	>4.0	11	2	852	2		511
total		665	100	44214	100		-5904

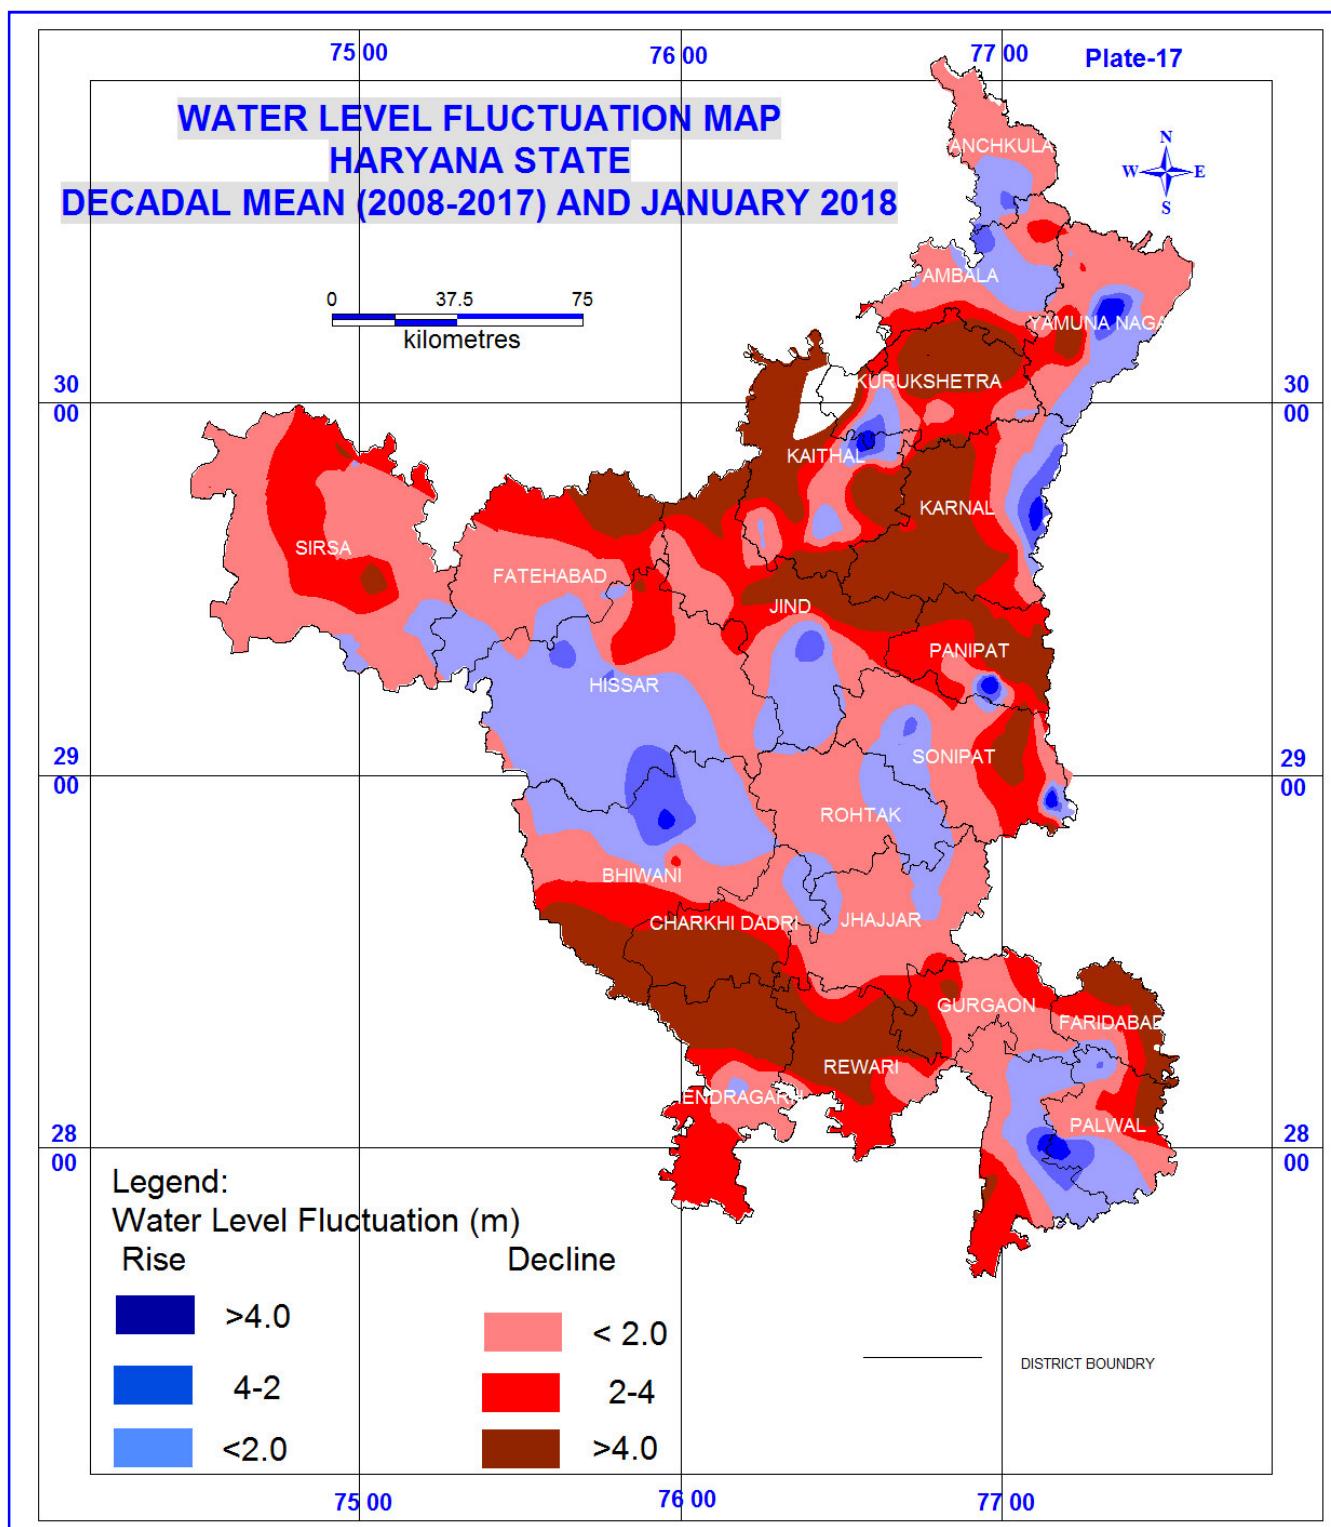

3.5.4 Mean January (2008:2017) & January2018

The behaviour of water level over the period under reference is discussed in following paragraph along alongwith map (Fig.17) and data are given in (Annexure-IV- Col. 7). The interpretations of decadal mean fluctuations so arrived at indicate water level decline in 70% of wells which covers about 76% area of the State falling in Panchkula, Ambala, Yamunanagar, Kurukshetra, Kaithal Karnal, Panipat, Sonipat, Jind, Fatehabad, Sirsa, Hissar, Bhiwani, Charkhi Dadri, Mahendragarh, Rewari, Gurgaon, Mewat, Faridabad and Palwal districts. Water level decline in the range of 0-2m has been reported from 36% of the wells covering 36% of area of the State. Water level decline between 2-4 m has been reported from 15% of wells covering 20% area of the state. Water level decline of more than 4m has been observed in 18% wells and 20% of the area of state covering parts of Kurukshetra, Kaithal Karnal, Panipat, Jind, Fatehabad, Bhiwani, Charkhi Dadri, Mahendragarh, Rewari, Gurgaon, Faridabad and Palwal districts.

The water level rise has been observed in 31% of wells and 24% area falling in Hissar, Bhiwani, Rohtak, Jhajjar and a few isolated patches in other districts. Water level rise in the range of 0-2m has been observed in 22% wells covering 21% area of the state. Water level rise of 2-4m has been observed in 6% wells and 3% area of the state. Water level rise of >4m has been observed in 3% wells and 1% area of the state. Summarised details of Decadal Mean water level fluctuation and change in Ground Water storage are given in table below;

Water Level Fluctuation Range		Wells Monitored		Area Covered		Change in Ground water Storage (MCM)	
		No.	%Age	Km ²	%Age	Ground Water Loss	Ground Water Recharge

Ground Water Quality in Haryana

Character of ground water quality is dependent on geological characteristics and climatic conditions. It is further influenced and generally degraded by human activities. Indiscriminate extraction of groundwater for day to day uses, application of fertilizers in agriculture and unscientific disposal of industrial waste have great impact on ground water quality. The quality of ground water is normally ascertained through concentration values of number of physical, chemical and biological parameters present in it. Concentration of these parameters affects its acceptability and usefulness for domestic, agriculture, industrial and other purposes. It is, therefore, essential to know the chemical composition of ground water to determine its suitability for the intended use. Knowledge of quality of ground water not only helps in finding its suitability for various purposes, but it also helps in taking effective remedial measures for its improvement on scientific lines. In rural as well as in urban area of Haryana State, ground water is a major resource for drinking and other uses. Wherever surface water is inadequate or unavailable, ground water is exploited for drinking and irrigation purposes.

In the backdrop of various uses of ground water, its quality is monitored annually by CGWB, NWR Chandigarh through dedicated ground water monitoring stations (GWMS) of dug wells and/or hand pumps of shallow depth.

Sampling & Analysis

842 (421 for each BA & HM) water samples were collected in 1-liter capacity good quality polyethylene bottle from national ground water monitoring stations distributed over 21 districts of Haryana during May 2017. Sampling points are mostly open dug wells and hand pumps, which are fully or at least are partially in use. Chemical analysis was carried out for major cations (Ca, Mg, Na, K) and anions (CO₃, HCO₃, Cl, SO₄, NO₃, F) in addition to pH, EC, PO₄, SiO₂, TH as CaCO₃, in the Chemical Laboratory at Chandigarh. Standard analytical procedures as given in APHA 2012 were followed. Results of chemical analysis of water samples are placed in Annexure I.

Composition of waters

Chemical analysis shows that ground water is slightly to moderate alkaline with pH ranging between 7.19 (Dobaldhan , Beri,district Jhajjar) and 9.94 pH units (Jowan, Palwal district Palwal). EC (salinity) is found to vary widely with a minimum value of 125µS/cm at Roliawas, Khol in district Rewari and a maximum value of 23906 µS/cm at 25°C at Phaggu, Baragudha in district Sirsa.

Among anions, carbonate though generally absent in ground water samples is found in significant number of water samples and it varies from nil to 132 mg/l. Bicarbonate varies from 37 to 1001 mg/l, chloride varies from 3.0 mg/l to 4885 mg/l (Phaggu) and sulphate varies from nil to 2022 mg/l. However, exceptionally high concentrations of 4611mg/l of sulphate are also encountered in Sirsa district (Phagu). Nitrate, an indicator of domestic, irrigation and industrial contamination, is found at

many locations. Its concentration in State varies from nil to 1600 mg/l. Fluoride is found to be present in almost all the water samples and it varies from nil to 11.61 mg/l at Kheritalwana in Mahendragarhi district. In about 21.38% of the samples, it is found more than the drinking water limit of 1.5 mg/l F (BIS 2012). Phosphate has not been detected in most of the locations but the highest concentration of 1.06/l has been observed in well water of Gubhana in Jhajjar district.

Among cations, calcium is found to vary from 4 mg/l to 566 mg/l whereas magnesium generally varies from 2 to 1134 mg/l. Sodium is found to range between 4 mg/l and 3450 mg/l. at Phagu in district Sirsa. Potassium in ground waters is normally below 10 mg/l and its higher concentration indicates contamination from point as well as non-point sources. In Haryana, potassium in shallow waters is found to range from traces to as high as 538 mg/l. Very high potassium concentrations of 538mg/l is observed at Kansal in Rohtak district and . Hardness reported as CaCO_3 varies between 30 mg/l and 5850 mg/l indicating wide variation. However, very hard water with concentration as high as of wells are also encountered more than 2000 mg/l. The district-wise concentration range of various chemical constituents in ground water is given in Table .

Table 1. District wise distribution of chemical constituents in groundwater of Haryana State (GWMS 2017)

Distribution of Electrical Conductance (EC)

EC, a primary indicator of dissolved mineral content, varies from 125 $\mu\text{S}/\text{cm}$ to 23906 $\mu\text{S}/\text{cm}$ at 25°C. About 25% of the water samples have EC less than 750 $\mu\text{s}/\text{cm}$, 52% have EC between 750 and 3000 $\mu\text{s}/\text{cm}$ and the remaining 23% of the samples have EC more than 3000 $\mu\text{s}/\text{cm}$ (Table). Water with low EC (<750) are found mostly in Ambala, , Hissar, Panchkula, Panipat, Karnal, Kaithal, Kurukshetra, Sonepat and Yamunanagar districts, water with intermediate EC (750-3000) are mostly in Ambala, Bhiwani, Faridabad, Fatehabad,Gurgaon, Jind, Hissar, Kaithal, Karnal, Mewat, Rewari, Palwal, Panipat, Rewari, Rohtak, Sirsa, Sonepat, and Yamunanagar districts and samples with high EC (>3000) are found scattered throughout the State. However, most of them are from Bhiwani, Faridabad, Gurgaon, Hissar, Jhajjar, Kaithal, Palwal, Rohtak, Sirsa and Sonepat districts (Plate). The reason for high salinity in ground water of these areas may be due to natural concentration of salts as there is more evapo-transpiration than precipitation (Semi-arid climatic conditions) and lack of drainage.

DISTRIBUTION OF EC IN HARYANA(2017 - 2018)

Distribution of Chloride

The distribution of chloride in ground water follows the distribution pattern of EC and it ranges from 3.0mg/l to 4885 mg/l. Chloride above 400 mg/l, in drinking water, may give salty taste to consumers. Bureau of Indian Standards (BIS 2012) has assigned a desirable concentration of 250 mg/l chlorides in drinking water. This limit can be extended to 1000 mg/l in case no other source with desirable chloride concentration is available. Out of 421 samples analyzed, 65% have chloride below desirable limit (250mg/l), 28% have between desirable and permissible level (250-1000 mg/l) and the remaining 7% of samples have chloride more than the permissible limit of 1000 mg/l (Table). Spatial distribution of chloride in ground water indicates that few

sites at Bhiwani, Faridabad, Gurgaon, Hissar, Jhajjar, Jind, Kaithal, Mewat, Palwal, and Sirsa districts (Plate) have chloride concentration above 1000 mg/l. High concentration of chloride is mostly observed in samples having high sodium content indicating highly saline nature of these shallow ground waters.

Plate

DISTRIBUTION OF CHLORIDE IN HARYANA(2017 - 2018)

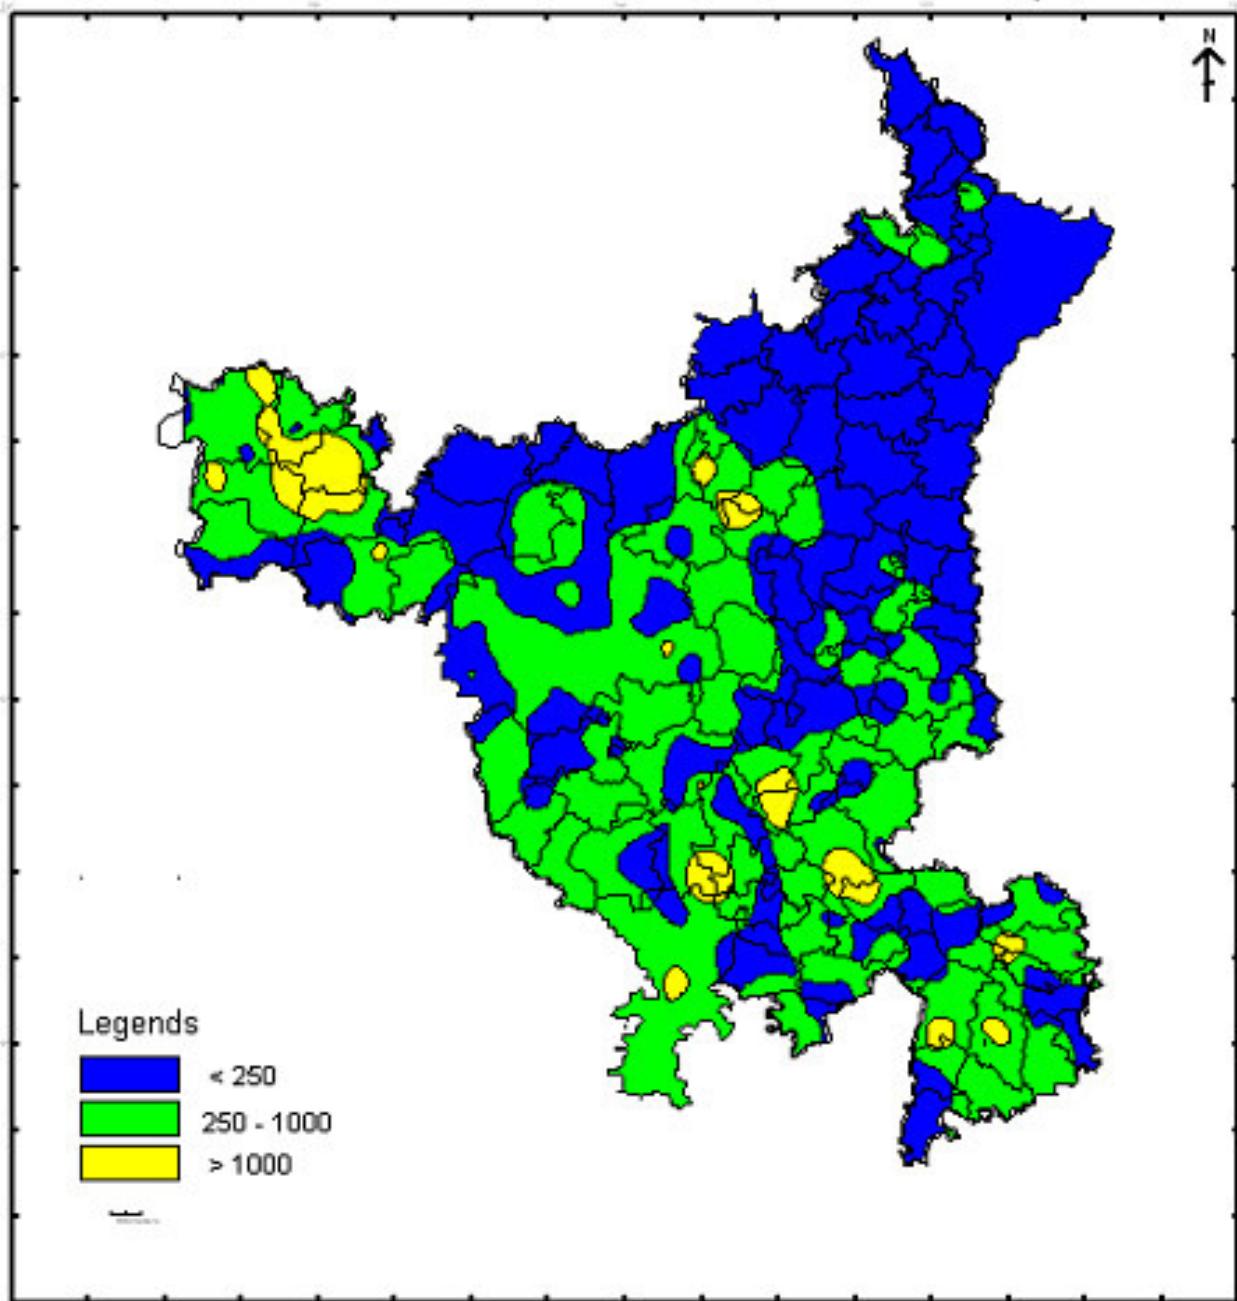

Table 2. District wise distribution of well waters of Haryana State in different classes of drinking water suitability

S.	District	No. of Samples	EC in 25°C in µS/cm			Cl in mg/l			F in mg/l			NO ₃ in mg/l

		421	98	212	88	264	117	27	273	46	89	316	55	36

Distribution of Nitrate

Presence of nitrate above 5.0 mg/l in ground water reflects contamination at some stage of its percolation and circulation. The probable major sources of nitrate content in ground water are excessive application of fertilizers, bacterial nitrification of organic nitrogen, seepage from animal and human wastes and atmospheric inputs. In the State, nitrate varies from nil to 685mg/l. Exceptionally high concentration of are encountered at Lohari(1018mg/l) district Bhiwani, Nahla(1104 mg/l), district Fatehabad, Toshami(1270 mg/l), district Bhiwani. Spatial distribution of nitrate indicates that nitrate is less than 45 mg/l in majority of the areas (Plate). Out of the samples analyzed, 77% of the samples have nitrate within BIS limit of 45 mg/l for drinking waters (Table) and 23% have nitrate more than 45 mg/l. Concentration more than permissible limit samples are mostly from districts of Ambala, Bhiwani, Fatehabad,Gurgaon, Hissar, Jhajjar, Jind, Mahendragarh, Mewat,Palwal, Panipat, Rewari, Rohtak, and Sirsa districts.

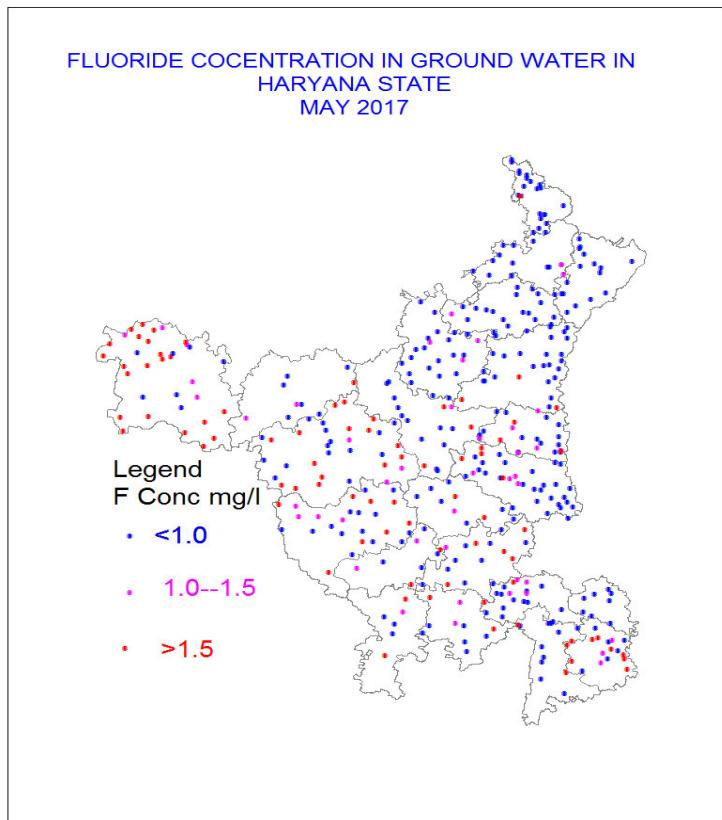

Plate

DISTRIBUTION OF NITRATE IN HARYANA(2017 - 2018)

Distribution of Fluoride

Fluoride, in small amounts in drinking water, is beneficial in reducing dental decay but when present in large amounts, has deleterious effects ranging from staining of tooth enamel to skeletal fluorosis. The fluoride contents in ground water of the State ranges from BDL to 11.61 mg/l at Kheritalwana in Mahendragarh district. Spatial distribution of fluoride indicates that fluoride is less than 1.5 mg/l in 67% samples. It is between 1.0 and 1.5 mg/l in 11% samples and is above 1.5 mg/l in the remaining 22% samples (Table). Ground waters with fluoride above 1.5 mg/l are found mostly in parts of Bhiwani, Fatehabd, Gurgaon, Hissar, Jhajjar, Jind, Karnal, Mahendergarh, Mewat, Palwal, Panipat, Rohtak, Sirsa and Sonepat districts (Plate) and are not suitable for drinking purpose. At many places, fluoride above 1.5 mg/l is observed in areas where agricultural activities are dominant. The likely causes for high fluoride in ground water are (i) leaching from phosphatic fertilizers where it is present as an impurity and (ii) depletion of calcium either due to precipitation or exchange phenomenon.

Types of waters

Considering the predominance of the cation and anion in the chemical composition of ground water, its type is determined and its relation with its occurrence in an area as well as with its salinity is studied. It is found that no discernible relationship between type of water and its occurrence in any particular area could be established. Nearly all types of waters are available in each district of the State. However, study of relation of water type with salinity of the water clearly indicates that nearly 24% ground waters of the State are fresh, have low salinity and predominance of calcium or magnesium or calcium + magnesium cations and bicarbonate as anion. Ground waters having intermediate salinity are mostly mixed cation type - HCO_3 type. At some places HCO_3 -type of waters with sodium as dominant cation are also encountered in low to moderately saline ground waters. This can be attributed either to precipitation of CaCO_3 due to loss of CO_2 or dissolution of Na-salts from the topsoil layers or to ion exchange reaction during the downward percolation of water. At some isolated locations sulphate is found to be dominant anion. In ground waters, where salinity is high; mostly Na is the dominant cation and Cl or $\text{Cl} + \text{SO}_4 + \text{NO}_3$ (Mixed anion) are dominant. permanent hardness is observed at few locations in

Hissar, Jhajjar and Bhiwani district depicted by dominance of Ca-Cl. Nevertheless, a few exceptions have also been found in these simple and well-defined types of ground waters.

Suitability for drinking

Salinity, nitrate, sulphate, fluoride, hardness and alkalinity are the parameters normally considered for evaluating the suitability of drinking water. BIS have assigned desirable and permissible concentration limits for these constituents. Based on BIS recommendations, ground water occurring in the northern and north-eastern areas of the State is suitable for drinking. However, ground water at several places in the southern and western parts of the State is not suitable for drinking either due to one or more constituent exceeding the maximum permissible limits. Waters falling under different classes of suitability for drinking uses are shown in Table and district-wise distribution of potable waters based upon EC, Cl, NO₃ & F contents are shown as bar diagram in Fig 1.

On perusal of Bar diagram, it is observed that ground water occurring in the districts of Ambala, Jhajjar, Kaithal, Karnal, Panchkula, Panipat, Sonepat and Yamunanagar are mostly suitable for drinking as more than 80% water samples are having all the above quality parameters within the permissible limits. In the districts of Bhiwani, Fatehabad, Hissar, Gurgaon, Kurukshetra Jind, Mahendergarh, Mewat and Palwal 50-80% water samples are having potable quality as per BIS 2012 standards. Ground water is mostly unsuitable for drinking due to one or more of these constituents exceeding the maximum permissible limits Faridabad, and Sirsa as these districts have less than 50% ground waters having chemical parameters within the permissible limits wth respect to the based upon EC, Cl, NO₃ & F contents are shown as percentage classification chart.

Fig.1. District wise Distribution of Potable Waters in Haryana-2017

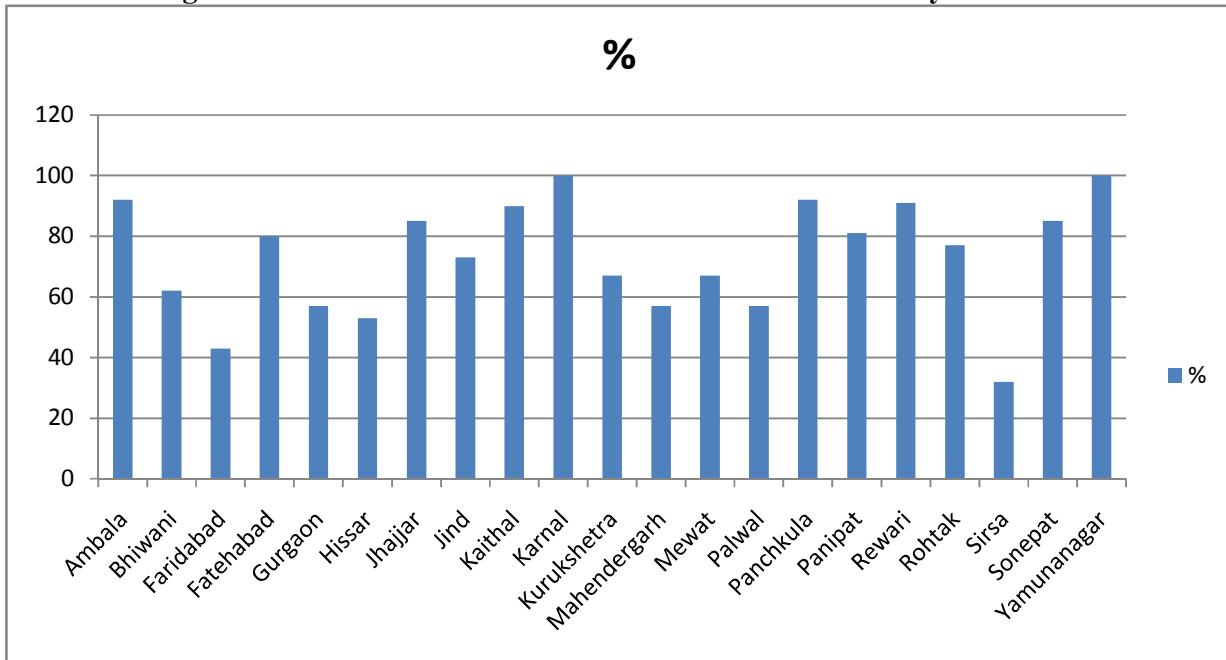

Table.3. Percentage wise classification chart for Portable water in Haryana state

Sr.No.	% wise classification	Name of the districts	Remarks
1.	>80	Ambala,Jhajjar,Kaithal,Karnal,Panchku;la Panipat,Sonipal and Yamuna Nagar	It has been classified on the based of Salinity(EC,Cl,NO ₃ & F)
2.	50-80	Bhiwani,Fatehgarh,Gurgaon,Hissar,Jind, Kurukshetra,Mahendergarh,Mewat and Palwal	
3.	<50	Faridabad and Sirsa	

Suitability for irrigation

The suitability of ground water for irrigation is assessed based on EC, SAR and RSC values of waters. The diagram, suggested by USSL staff by taking EC and SAR into consideration is widely used for determining the irrigational classes of water. Salinity in terms of EC varies widely from 242 μ S/cm at Kurlan in district Karnal and a maximum value of 25540 μ S/cm at 25°C at Phagu in district Sirsa while SAR values range from 0.20(Dhansu, district Hissar) to

40.23 (Bahu, district Rewari). Based on EC and SAR values, plot of USSL diagram indicates that most of the samples (74%) fall under C₂S₁, C₂S₂, C₃S₁, C₃S₂, C₄S₁, and C₄S₂ classes of irrigation water. Continuous use of such waters may lead to low to vary high salinity hazards, while they may not cause sodium hazards because of low SAR. The remaining 26% of water samples having C₃S₃, C₃S₄, C₄S₃, C₄S₄, and classes may lead to salinity as well as sodium hazards when used for irrigation under normal practices. However, these waters can be used for irrigation along with an appropriate quantity of gypsum.

The ground waters in the districts of Ambala, Fatehabad, Hissar, Jhajjar, Kaithal, Karnal, Kurukshetra, Panchkula, Panipat, Rohtak and Yamunanagar are mostly of C₁, C₂, C₃ salinity and S₁-S₂ sodicity classes. Such waters can be used for irrigation on soils with good permeability for growing salt tolerant or semi salt tolerant crops. Addition of small quantity of gypsum may improve the permeability of the soil and avoid the sodium hazards. Ground waters from southern and western part of Haryana comprising of districts of Bhiwani, Faridabad, Gurgaon, Jind, Mahendergarh, Rewari, Sirsa, and Sonepat fall under C₄S₁, C₄S₂, C₃S₃, C₃S₄, C₄S₂, C₄S₃ and C₄S₄ classes. Use of such waters for irrigation under normal conditions may lead to both high to very high salinity as well as sodium hazards.

Akali hazards of irrigation ground waters are estimated through the computation of Residual sodium carbonate (RSC) also known as Eaton's Index. The values of RSC of ground waters are found to vary from below zero to 19.10 meq/l (Bahu, district Rewari). A negative value indicates little risk of sodium accumulation due to offsetting levels of calcium and magnesium.

A positive value indicate that the bicarbonate and carbonate will rescue free calcium and magnesium in the soil, thereby creating room for sodium to accumulate. Based on Eaton's index, it is found that 69% of the waters are rated fit, 6.7% marginal and the remaining 24.3% unfit for irrigational uses. The distribution of ground waters in various Eaton's index and irrigation rating based on USSL classification is given in table 4.

Table 4. District wise Irrigation Rating of Well Waters of Haryana.

S.N.	District	EATON's INDEX			USSL Classification	
		(RSC in meq/l)				
		Safe	Marginal	Unsafe		
		<1.25	1.25-2.5	>2.5

2	Bhiwani	25	1	6	C ₂ S ₁ , C ₃ S ₁ , C ₃ S ₂ , C ₃ S ₃ , C ₄ S ₁ , C ₄ S ₂ , C ₄ S ₄	
3	Faridabad	5	1	1	C ₃ S ₁ , C ₄ S ₁ , C ₄ S ₂ ,	
4	Fatehabad	7	0	3	C ₂ S ₁ , C ₃ S ₁ ,	
5	Gurgaon	13	2	6	C ₃ S ₁ , C ₄ S ₂ , C ₄ S ₃ ,	
6	Hissar	31	0	4	C ₂ S ₁ , C ₃ S ₁ , C ₃ S ₂ , C ₄ S ₁ , C ₄ S ₂ , C ₃ S ₃	
7	Jhajjar	12	0	3	C ₃ S ₁ , C ₃ S ₂ , , C ₄ S ₁ , C ₄ S ₂	
8	Jind	11	2	4	C ₂ S ₁ , C ₃ S ₁ , C ₄ S ₁ , C ₄ S ₂ ,	
9	Kaithal	14	2	6	C ₂ S ₁ , C ₃ S ₁ , C ₃ S ₂ , C ₄ S ₂ , C ₄ S ₃ , C ₄ S ₄	
10	Karnal	14	11	4	C ₂ S ₁ , C ₃ S ₁ , , C ₃ S ₂ , C ₄ S ₂ , C ₄ S ₃	
11	Kurukshetra	5	7	8	C ₂ S ₁ , C ₃ S ₁ ,	
12	Mahendergarh	6	0	1	C ₃ S ₁ , C ₄ S ₁ , C ₄ S ₂	
13	Mewat	10	0	0	C ₂ S ₁ , C ₃ S ₁ , C ₄ S ₁ , C ₄ S ₂ , C ₄ S ₄	
14	Palwal	12	2	6	C ₃ S ₁ , C ₃ S ₂ , C ₄ S ₁ , C ₄ S ₂ , C ₄ S ₃ ,	
15	Panchkula	16	3	5	C ₂ S ₁ , C ₃ S ₁ ,	
16	Panipat	14	3	4	C ₂ S ₁ , C ₃ S ₁ , C ₃ S ₂	
17	Rewari	9	0	1	C ₁ S ₁ , C ₂ S ₁ , C ₃ S ₁	
18	Rohtak	10	1	0	C ₂ S ₁ , C ₃ S ₁ , C ₄ S ₁ , C ₄ S ₃	
19	Sirsa	26	3	4	C ₃ S ₁ , C ₃ S ₃ , C ₄ S ₁ , C ₄ S ₂ , C ₄ S ₄	
20	Sonepat	28	3	3	C ₁ S ₁ , C ₂ S ₁ , C ₃ S ₁ , C ₄ S ₁	
21	Yamunanagar	15	2	1	C ₂ S ₁ , C ₃ S ₁	

Suitability for Industries

Industries, in general, use water for variety of works depending upon the nature and size of the industry. As such specifications for suitability of water for industries vary widely depending upon the process in each industry. Therefore, chemical quality of water and its suitability could not be discussed due to diversified nature of industries.

Temporal Variation

The temporal changes in ground water quality are studied by considering important parameters such as salinity (EC), chloride, nitrate and fluoride contents of waters. The percent well waters falling in desirable, permissible and unsuitable classes of BIS-2012 standards during 2017 are compared with percent well waters in same classes during 2012. Table shows increase or decrease of percent well water falling in various suitability classes for drinking purposes.

Table 5 : Periodic Variation in Suitability Classes of Well Waters of Haryana

Parameter	Class	% of Samples						Periodic Variation 2012-17
		2012 (n= 331)	2013 (n=320)	2014 (n=358)	2015 (n=334)	2016 (414)	2017 (409)	
Salinity as EC (in $\mu\text{S}/\text{cm}$ at 25°C)	<750	29	37	25	27	30	24	+6
	750-3000	50	48	55	54	48	52	+2
	>3000	21	15	20	19	22	24	+3
Chloride as Cl (in mg/l)	<250	64	65	62	64	65	65	+1
	250 - 1000	28	29	31	29	28	29	+1
	>1000	8	6	7	7	7	6	-2
Nitrate as NO_3 (in mg/l)	< 45	69	77	72	71	73	77	+8
	> 45	31	23	28	29	27	23	-8
Fluoride as F (in mg/l)	<1.0	62	70	70	72	66	67	+5
	1.0 - 1.50	15	12	9	9	12	11	-4
	>1.50	23	18	21	19	22	22	-1

n=number of samples

It is evident from the table above that there is a not much change in the quality of ground water, based on the parameters considered, from 2012 to 2017. The ground water quality based on salinity and chloride content does not show any discernible change in percent of samples falling above the permissible level. A slight improvement (2%) has been observed in groundwater quality with respect to Chloride (2%) and Nitrate (8%) from 2012 to 2017.

On comparing the percent wells of 2016 and 2017 for portability and considering a change of $\pm 1\%$ as constant, it is observed that, in general, there is increase in salinity and Fluoride content.

There is not much change in chloride concentration while a slight improvement in water quality is observed with respect of nitrate concentration. The cause of deterioration of ground water quality may be anthropogenic as no natural source for fluoride and nitrate is found the state.

Ground Water Quality in respect of Heavy metals:

Abstain of Heavy metals in ground water is also periodically monitored by CGWB and as per studies carried out during 2017, some elements such as Fe, Mn, Zn, Cu, Se, Sn, Mo are essential in trace amounts for growth and development of living organisms as well as plants. Nevertheless, these are hazardous in large amounts. In addition, some metals like Pb, As, Cd, Hg, Cr, Be, Ba, are hazardous even in small amounts. The minimum and maximum Concentration of Heavy Metals has been despite in Table 5:

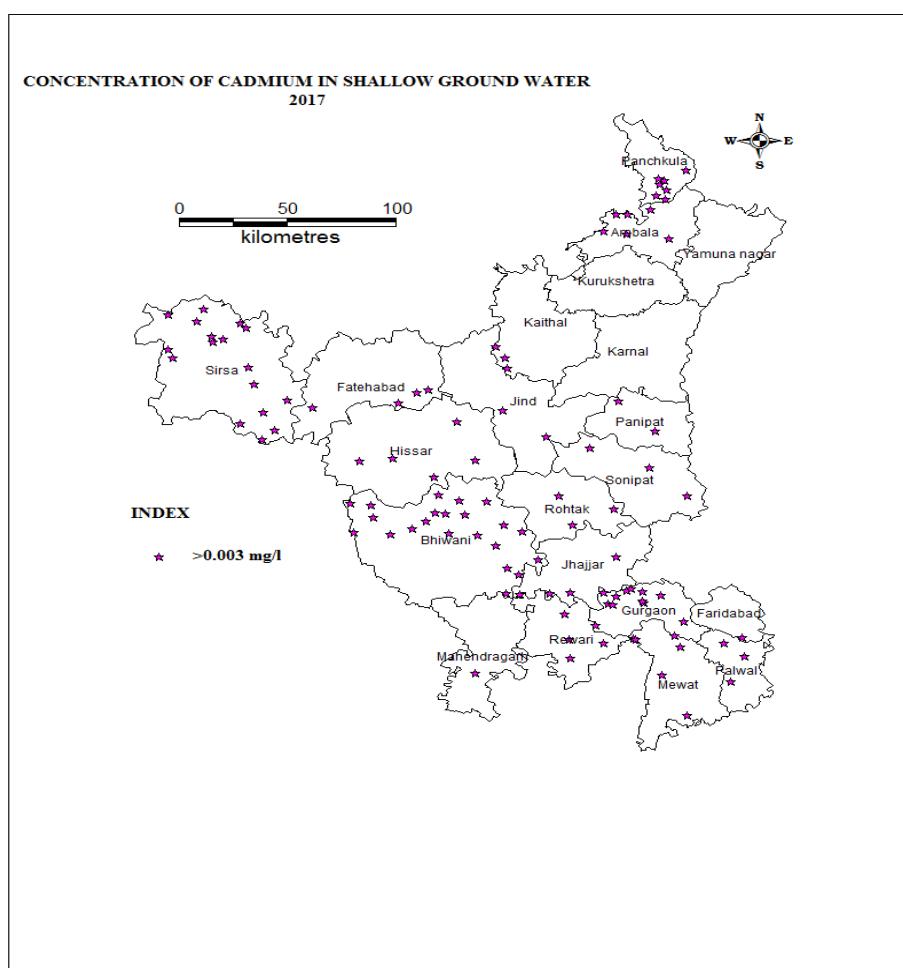

Table-6 : Range of Heavy Metals in Groundwater of Punjab State

Cadmium:

The concentration of cadmium in shallow ground water in Haryana State 76% Water Samples are within the permissible limit and 24% water samples has been observed above permissible limit as per BIS Limit 0.003mg/l. The highest value has abstain in Sui(0.060mg/l),Bhiwani district and affected districts are namely Bhiwani, Gurgaon, Hissar, Jhajjar,Mewat, Palwal,Panchkula,Rewari,Rohtak and Sirsa. Concentration of Cadmium above permissible limit 0.003mg/l Shown in Fig.

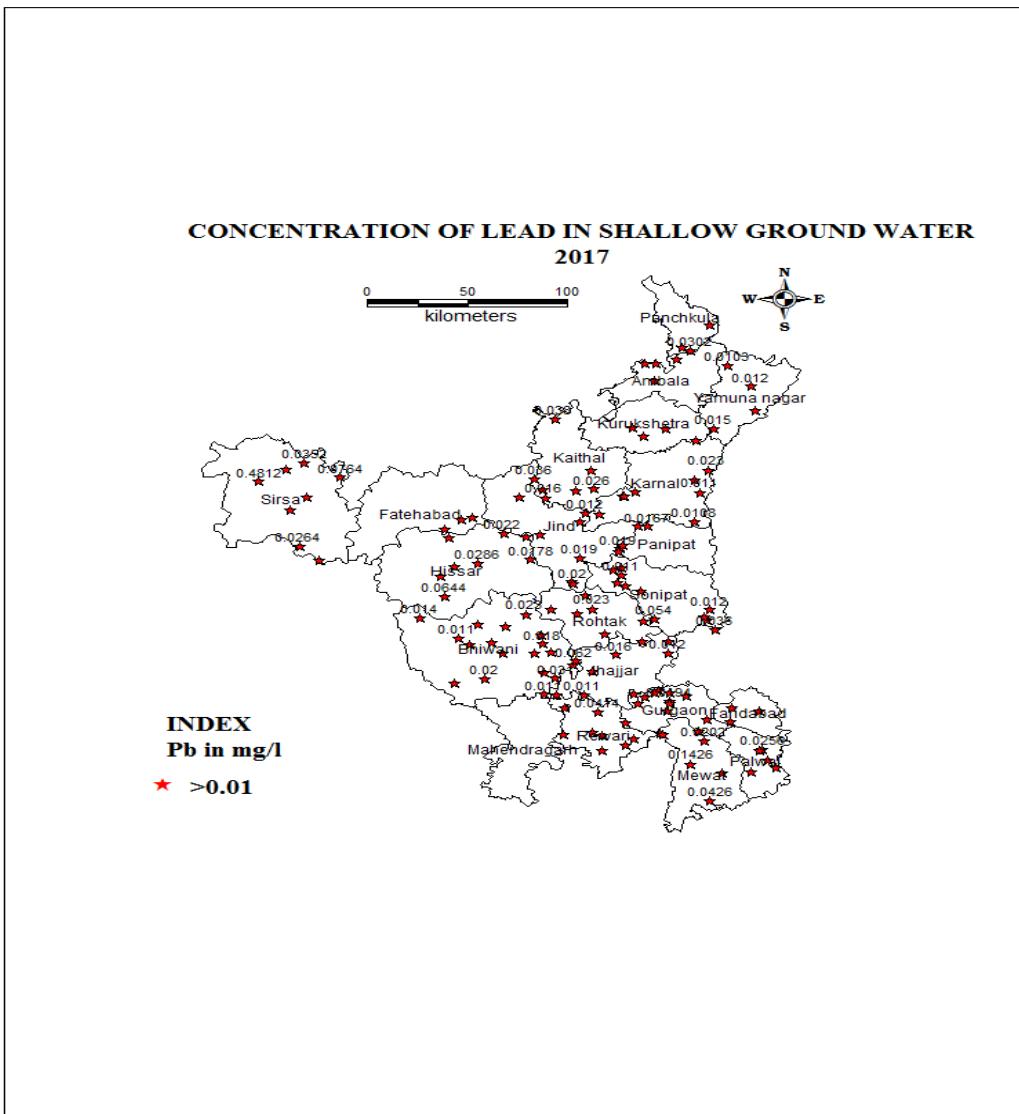

Copper: Copper concentration is generally below 1.5mg/l as BIS limits in groundwater of the State. Two GWMWs are found values more than the permissible limit e.g Golpura,Raipur Rani(3.108mg/l),Panchkula and Rasaliya Khera,Dabwali in Sirsa district of Haryana.

Manganese: Manganese above 0.3mg/l with higher concentration being reported from Ambala, Hissar, Kurukshetra, Mewat, Rohtak, Sonepat and Yamuna Nagar . Sporadic cases of highest manganese value have been reported in Khanahmedpur(2.0331mg/l), Barara, Ambala district. Concentration of Mn above permissible limit 0.003mg/l Sown in Fig.

Lead: Low concentration of Lead (66.5%) has been reported in entire districts of Haryana state but 33.5% samples of shallow aquifers of the districts have Lead above 0.01mg/l. Concentration of lead above permissible limit 0.01mg/l Sown in Fig.

Zinc: Concentration value of zinc have been observed within the permissible limit in entire districts of Haryana State.

Arsenic: Highest concentration of arsenic has been recorded in groundwater in Balana, Ambala (0.0475 mg/l)and Laxmanpura,(0.040)Bhiwani district. Other locations either BDL or less than the permissible limit(0.01mg/l).

Conclusions & Recommendations

On perusal of above carried study, it can be concluded that in Haryana

1. Chemical quality in shallow ground water occurring in northern and northeastern parts is suitable for drinking as well as for irrigation.
2. Shallow ground water occurring in central parts has intermediate quality and is permitted for drinking use in case there is no alternative source. However, it is suitable for irrigation on well-drained soil for salt tolerant crops such as wheat, maize, barley etc.
3. Quality of shallow ground water occurring in southern and western parts is not suitable for drinking as well as for customary irrigation. The reason for unsuitability for drinking uses is high concentrations of either salinity or nitrate or fluoride. The reason for rejection for irrigation uses is high salinity coupled with high SAR and RSC more than 2.5 meq/l. However, these waters can be used for irrigation in conjunction with surface water.
4. Heavy metals contents are analysed for Cd, Cu, Mn ,Pb ,Zn and As. The concentration of Cadmium, Manganese and Lead in shallow ground waters are 76%, 95.2% and 66.5% water samples in Haryana State are observed within the permissible limit. Arsenics are found more than the permissible limit in the two locations only e.g. Balana, Ambala (0.0475 mg/l) and Laxmanpura, (0.040) Bhiwani districts.
