EXECUTIVE SUMMARY

Central Ground Water Board, an apex Organization under Ministry of Water Resources, River development and Ganga rejuvenation, Government of India, is carrying out the monitoring of ground water levels all over the country for generating a sound database so that the changes in ground water regime could be scientifically studied, analysed and strategies for its optimal utilization can be planned.

The behaviour of ground water table during the ground water year 2016-2017 in the state of Tamil Nadu and Puducherry and Karaikal regions of the Union Territory of Puducherry has been studied by monitoring a set of dug wells and purpose-built piezometers during the months of May 2016, August 2016, November 2016 and January 2017. As of January 2017, Central Ground Water Board, South Eastern Coastal Region, monitors 857 dug wells and 538 tube wells/piezometers to study the ground water scenario of the state of Tamil Nadu and Puducherry and Karaikal regions of the Union Territory of Puducherry.

The present compilation relates to the year 2016-2017. It provides information pertaining to water levels and also chemical quality of the phreatic aquifer. Thematic maps depicting the ground water scenario along with geochemical quality are furnished and discussed in this report. In addition, the fluctuations in water level and piezometric surface between different time frames have been analysed and presented. Various thematic maps presented reflect the effect of rainfall received during the period of study and the long-term behaviour of water level according to ground water recharge and draft conditions obtained in various agro-climatic zones. The data on seasonal rainfall during the year are furnished to correlate the effect of the rainfall on water levels.

In general, the water levels are deep in the month of May and a rising trend of water levels during January (Post-monsoon period) was observed. Water level fluctuation takes place during August, November and January depending on the monsoon rainfall and level of groundwater development.

During the pre-monsoon period, the depth to water levels of 5 -10 m bgl is more prevalent in the State. Shallow water levels of less than 2 m bgl are noticed in eastern and southern districts. Depth to water level 10-20 m bgl are noticed in isolated pockets in the western part of the State.

During postmonsoon period, depth to water level ranging from 0 -2 m bgl is noticed in many districts and predominantly in the eastern and southern part of the State. Depth to water level between 5-10m bgl is noticed mostly in western part of the State. Depth to water level more than 10 is noticed in Western part of the State.

Results of chemical analysis of water samples collected during May 2016 are also discussed for understanding the spatial variation of EC, Chloride, Fluoride and Nitrate concentration in the phreatic aquifer system of the state of Tamil Nadu and Puducherry and Karaikal regions of the Union Territory of Puducherry.

GROUNDWATER YEAR BOOK OF TAMIL NADU AND U. T. OF PUDUCHERRY (2016-2017)

I. INTRODUCTION

The state of Tamil Nadu has a geographical area of 1,30,058 sq. km. and is situated between N. Latitudes 08°00' and 13°30' and E. Longitudes 76°15' and 80°18'. The state is bounded by the Bay of Bengal in the east, the Indian Ocean in the south, the state of Kerala in the west and the States of Karnataka and Andhra Pradesh in the north. For administrative purposes, the state is divided into 32 districts and 385 developmental blocks. A major part of the Union Territory of Puducherry comprising Puducherry and Karaikal regions occurs as small enclaves in Tamil Nadu.

The Central Ground Water Board, South Eastern Coastal Region is monitoring the water levels in ground water monitoring wells in the state of Tamil Nadu and Puducherry and Karaikal regions of the Union Territory of Puducherry four times a year, viz. May (between 20th and 31st), August (between 20th and 31st), November (between 1st and 10th) and January (between 1st and 10th). Water samples from the Ground Water Monitoring Wells are collected once in a year i.e. during May. Besides these, monitoring of monthly water levels is being carried out at select Ground Water Monitoring Wells in Chennai Metropolitan area. **Table-1** gives the number of Ground Water Monitoring Wells tapping the phreatic aquifers and the piezometers/tube wells/bore wells tapping the deeper semi-confined to confined aquiferS during the aforesaid periods. The behaviour of water levels are analysed with reference to the rainfall pattern. The data are utilised for the assessment of ground water resource, evaluation, present status of ground water development and also for planning future development. For analytical purposes, only the data of the Ground Water Monitoring Wells tapping phreatic aquifers are considered. The data thus collected are analysed, interpreted and the Ground Water Yearbook is issued annually with interpreted data and thematic maps depicting the ground water scenario.

The present report discusses the regional behaviour of water levels in both shallow and deeper aquifers for the period between May 2016 and January 2017, which will enable the user agencies to plan developmental strategies. The results of the chemical analysis of water samples collected from Ground Water Monitoring Wells during May 2016 are also discussed.

The status of district-wise break-up of Ground Water Monitoring Wells is given in **Table-2** and their locations are shown in **Plate - I**. The district-wise depth to water level data of the dugwells and depth to piezometric surface of piezometres for the measurements during May 2016, August 2016, November 2016 and January 2017 are given as **Annexure - I**.

Background information on physiography, drainage, rainfall, hydrogeological conditions and ground water resources development of the state are also furnished in brief for better understanding of the behaviour of water table.

PHYSIOGRAPHY

The state of Tamil Nadu is divided into four physiographic units viz. (i) Coastal Plains, (ii) Eastern Ghats, (iii) Central Plateau and (iv) Western Ghats. The coastal plains stretch over a distance of about 998 km. from Pulicat Lake to Cape Comorin, ranging in elevation from 2 to 30 m above mean sea level. The coastal plains are further sub-divided into (a) the Coromandel Coast comprising parts of the districts of Tiruvallur, Kancheepuram and Cuddalore, (b) the alluvial plain of Cauvery delta extending over Nagappattinam, Thanjavur Thiruvarur districts and (c) the dry southern plains comprising parts of Pudukkottai, Ramanathapuram, Tuticorin, Tirunelveli and Kanyakumari districts.

The chain of flat-topped hills of Javadi, the Shevroy, the Kalrayan and the Pachamalai hills, which are joining Cardamom hills in the south, form the Eastern Ghats. These hills rise steeply above plateau level to 1160 m above mean sea level in the Javadi hills and to 1645 m above mean sea level in the Shevroy hills.

Between the Eastern and Western Ghats lies the plateau area known as the "Central Plateau" comprising the districts of Erode and Coimbatore

with elevations between 150 and 610 m above mean sea level thereby giving rise to an undulating topography. West of the region lies the broad Palghat gap between the Nilgiri and Anaimalai Hills. Between Cauvery River and the Palghat gap lies an extensive low

plateau rising gradually from 120 to 180 m above mean sea level, along the tributaries of the Cauvery River, to 365 to 455 m above mean sea level in the west.

The plateau is fringed on the west by a group of high hills known as the Western Ghats, comprising the western part of the Nilgiri, Madurai and Kanyakumari districts. On the other side of the Palghat gap, the high mountains of the Peninsula dominate. These are the Nilgiri in the north, Anaimalai Hills, Palani and Cardamom hills in the south, with a summit level of 1830 to 2440 m above mean sea level rising sharply from the plateau.

DRAINAGE

The state of Tamil Nadu is drained by several major and minor rivers. All the major rivers originate in the Western Ghats and flow eastwards. The Palar, Ponnaiyar, Cheyyar, Kortallaiyar and Araniyar are the important rivers in the north, which are ephemeral and cutting across the centre of the state is the river Cauvery. The Cauvery delta consists of a gently sloping alluvial plain covering an area of 11,600 sq. km and amongst its tributaries the Bhavani and Amaravathi rivers form the most important sources of canal irrigation in the state. Bhavani, Noyil and Amaravathi rivers originate in the hill ranges of Nilgiri and Anaimalais and flow through matured valleys across the plateau.

The important rivers flowing in the southern part of Tamil Nadu are (i) Vellar (ii) Vaigai (iii) Vaippar and (iv) Tambaraparani. Of these, Tambaraparani River is only perennial, forming a good source of canal irrigation. There are several other minor and less important rivers in the State. Besides these, there are a number of smaller rivers such as the Aliyar, Sholaiyar, Parambikulam Ar, etc. flowing westwards. Except the perennial rivers, all the rivers remain dry for a good number of months in a year. The Pulicat Lake and Kaliveli tank are the important lagoons.

The rivers of the state flow in broad and shallow valleys graded almost to their heads with only slight interruptions of profiles when they pass through the Eastern Ghats. The Western Ghats form the main watershed of the state having numerous waterfalls and Courtallam Falls (91.5 m) is one of the important waterfalls of the state.

SOILS

The soils of the state can be broadly divided into three types viz. (1) Red (2) Black and (3) Alluvial soils, of which red soils are the most prominent type. Red soils are found in every district of the state but occupy major parts of the Madurai and Vellore districts. More than 63% of the areal extent of Tiruvallur, Kancheepuram, Salem, Coimbatore, Tirunelveli and Tiruchirappalli districts is covered by the red soils. Some patches of arenaceous soils are also found along the coastal line. Almost all the alluvial soils in the state are confined to the deltaic regions of the Cauvery River in Cuddalore, Nagapattinam, Tiruvarur, Thanjavur and Tiruchirappalli districts. Black soils are seen mostly in parts of Ramanathapuram, Cuddalore, Tirunelveli and Thanjavur districts.

HYDROGEOLOGY

The state of Tamil Nadu is underlain by geological formations ranging in age from Archaean to Recent. The crystalline rocks of Archaean age like granites, gneisses, charnockites, etc., are of considerable interest as they occupy nearly 73% of the total geographical area of the state. Semi consolidated and consolidated formations ranging in age from Mesozoic to Recent overlie the crystalline basement and their occurrence is confined to the east coast only. The general stratigraphic succession of the formations in the state is presented in **Table-4**.

TABLE-4: STRATIGRAPHIC SUCCESSION OF GEOLOGICAL FORMATIONS IN TAMIL NADU & U.T. OF PUDUCHERRY

ERA	AGE	STAGE	LITHOLOGY
Quaternary	Recent Pleistocene	- -	Soil, alluvium and beach sands Boulder conglomerates, older alluvium and laterites.
Tertiary	Pliocene Miocene	Karaikal beds Cuddalore Sandstone	Sands and clay with fossils, Mottled and friable sandstones, buff coloured clays and gravels.
Mesozoic	Cretaceous	Ninniyur	Arenaceous limestones and sandstones.
		Ariyalur	Sandstones and clays
		Trichirappalli	Sandstones, clays and shell limestones
		Uttattur	Basal limestones, coral clays and sandy beds
	Jurassic	Satyavedu	Ferruginous sandstones and conglomerates
		Sriperum-budur	Clays, shales and feldspathic sandstones
		- Unconformity-	
Azoic	Archaean	Archaean	Gneisses, charnockites and ultra-basic intrusives.

The crystalline complex of the Archaean age forms the oldest of the rock types in the state. Pink and grey granites are exposed in Cuddalore, Villuppuram, Coimbatore, Madurai and Tirunelveli districts. Rocks of the Khondalite group are well exposed in the southern districts of Tamil Nadu. The ultra-mafic rocks are widespread in the districts of Vellore, Dharmapuri, Coimbatore and Salem. Charnockite is more prominent in the northwestern part of Tamil Nadu and is well exposed in the hill ranges of Javadi, Shevroy, Palani and Nilgiris.

The Mesozoic era is represented by the upper Gondwanas of Jurassic age and marine beds of Cretaceous age. The Gondwana beds occur as patches spread over nearly 2001 sq. km. in Tiruvallur, Kancheepuram and Vellore districts. The Cretaceous beds are well exposed in Tiruchirappalli district. The Cretaceous beds overlie the granitic gneisses and charnockites along the western fringe and by alluvium in the north. They are also exposed in Vridhachalam area of Cuddalore district.

The important Tertiary formations in the state include the Cuddalore sandstones, Karaikal beds and Conjeevaram gravels. They occur in a wide stretch and extend from Karaikudi through Pudukkottai, Thanjavur, Cuddalore, Puducherry to Chennai. Alluvium and coastal sands in the coastal tract and in river valleys overlie them. The

Panamparai sandstones of sub-Recent age occur along the coastal tract of Tirunelveli district.

The nature of the geological formations and the structural features are the principal factors governing the occurrence and movement of ground water in any hydrogeological environment.

Ground water in the hard rocks occurs in the weathered zones ranging in thickness from less than a metre to 25 m and in the underlying fractured and sheared zones. It occurs under water table conditions at shallow levels and under semi-confined to confined conditions in the fractured, jointed and sheared zones as seen in Coimbatore, Salem, Dharmapuri, Madurai districts, etc. In the sedimentaries, ground water occurs under water table and confined conditions.

II. DEPTH TO WATER LEVEL

May 2016

A statement showing the distribution of Ground Water Monitoring wells along with depth to water level in phreatic aquifers in different depth ranges is presented in **Table-5. Plate-II** depicts the ground water scenario in May 2016. Salient features of the depth to water level scenario during May 2016 are given below.

1. A perusal of the water level data reveals that the depth to water level ranged from ground level (Nagapattinam districts) to 50.92 m bgl (Villupuram District) in Tamil Nadu and UT of Puducherry.
2. Water levels in the hilly tracts of Salem, Dindigul, Erode, Nilgiri, Vellore and Tiruvannamalai districts varied from 0.78 (Nilgiris district) to 43.10 m bgl (Erode district).
3. The salient feature of the analysis is that the depth to water level over major part of the State covering the coastal plain and central midland lies within 10 m bgl in 83% of wells analysed, while 21% of wells show depth to water level more than 10 m bgl.
4. Depth to water level of less than 2 m bgl has been recorded in nine percentage of wells analysed and noted as isolated pockets in Chennai, Coimbatore, Cuddalore, Dharmapuri(Undivided), Dindigul, Kancheepuram, Kanyakumari, Nagapattinam, Namakkal, Nilgiris, Perambalur(Undivided), Pudukkottai, Ramanathapuram, Salem, Sivaganga, Theni, Tiruvarur, Tiruchirapalli, Tirunelveli, Tiruvallur, Tuticorin, Vellore and Villupuram districts of Tamil Nadu and Karaikal and Puducherry regions of U.T.of Puducherry.

FLUCTUATION BETWEEN DECADAL MEAN WATER LEVEL & WATER LEVEL

The fluctuation of water level recorded during the particular period with respect to decadal mean indicate the impact of ground water development and ground water recharge during the decade. Positive fluctuation indicates improved recharge over and above ground water development and negative fluctuation indicate increased ground water development over and above the recharge.

Mean Water Levels For The Period May 2006-2015 & May 2016:

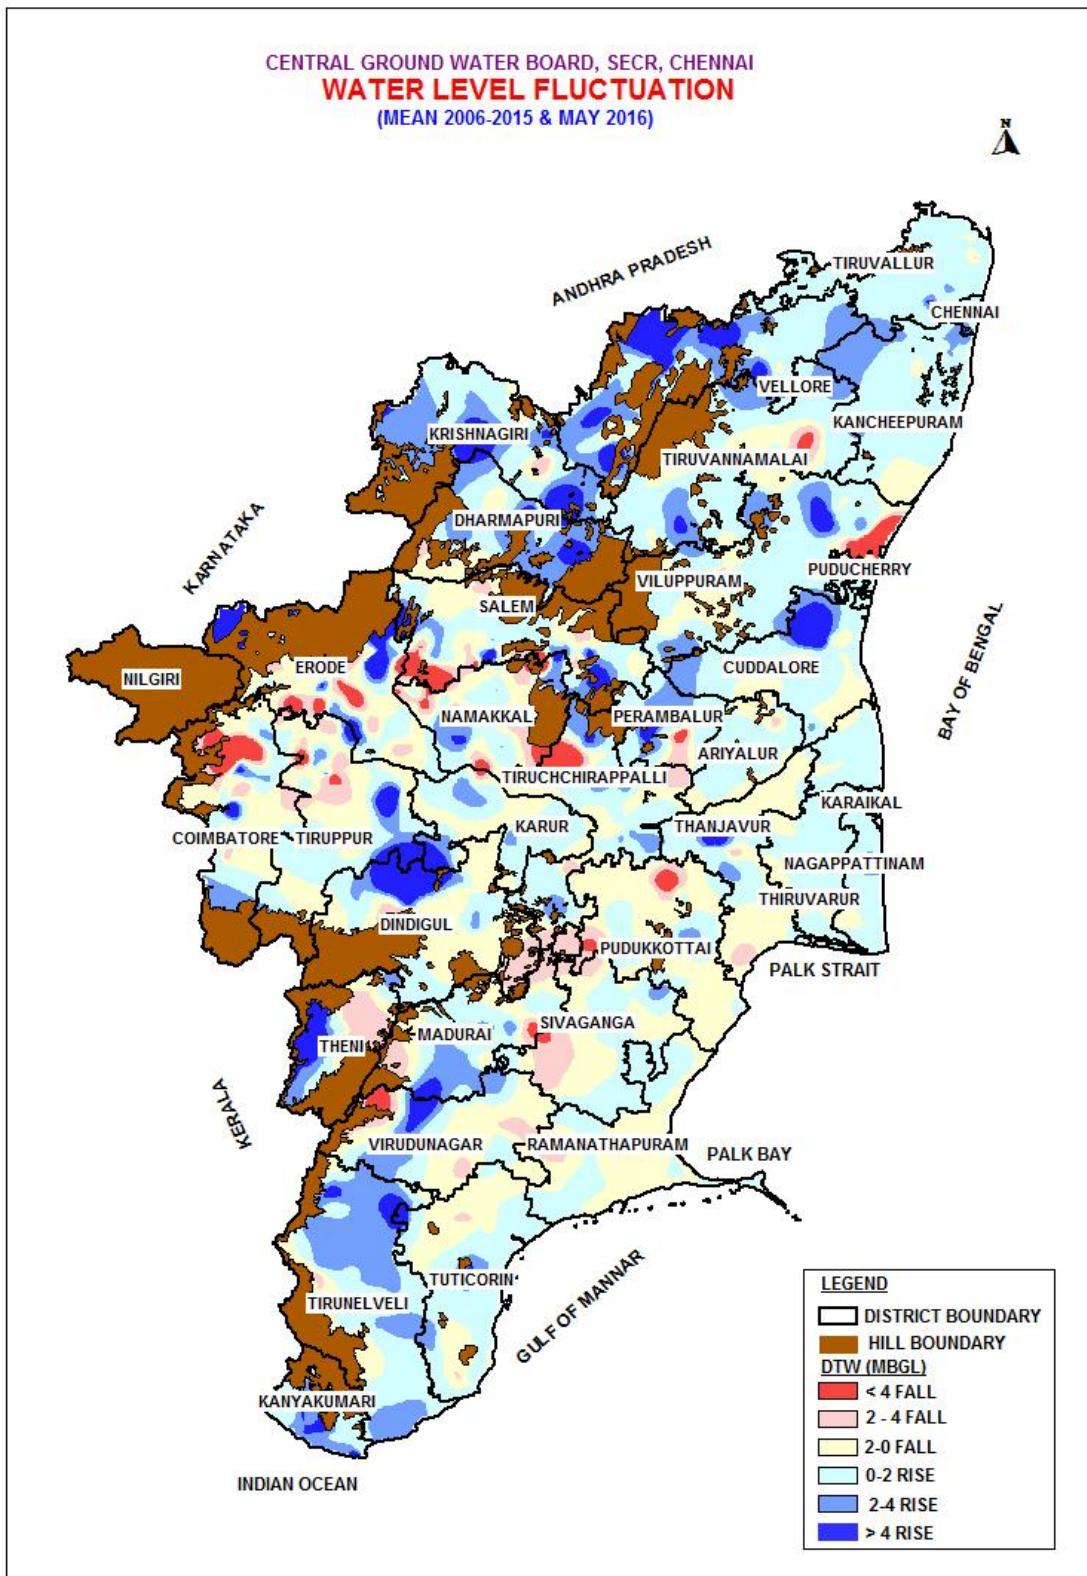

The water level data for May 2016 were compared with mean water level for the period May 2006-2015. The district-wise distribution of Ground water monitoring wells falling in different ranges of water level fluctuation is presented in **Table-14** and **Plate-VII**. A comparison of water level shows a rise in 64% and a fall in 36% of the wells.

IV. HYDROCHEMISTRY

The quality of shallow ground water in Tamil Nadu state has been evaluated by sampling and analysis of water sample collected from Ground Water Monitoring wells. About 769 Ground Water Monitoring wells were monitored for water quality during May 2016 representing pre-monsoon water quality. The district wise chemical analysis data of the samples are given in the Annexure-II. The summarized results of ground water quality ranges are given in **Table-18**.

Table-18: Ground water quality of SECR, during May-2016

S. No.	Parameters	Range	No. Of sample	Percentage
1	Electrical Conductivity ($\mu\text{s}/\text{cm}$ at 25°C)	< 750	103	13.40
		751- 2250	411	53.44
		2251- 3000	100	13.00

4	Nitrate (mg/l)	<45	489	63.60
		> 45	280	36.40

Distribution of electrical conductivity is shown in **Plate-XI**. In general the ground water quality in the state is fresh in about 13 % of the Ground Water Monitoring wells as indicated by the EC value less than $750 \mu\text{s}/\text{cm}$ at 25°C . In about 53 % of the Ground Water Monitoring wells, the EC varies between $751 - 2250 \mu\text{s}/\text{cm}$ at 25°C and 13 % of Ground Water Monitoring wells are between $2251-3000 \mu\text{s}/\text{cm}$ at 25°C indicating that the ground water is slightly mineralized and about 20 % of Ground Water Monitoring wells the EC is more than $3000 \mu\text{s}/\text{cm}$ at 25°C indicating that the ground water is highly mineralized. The highest value $28100 \mu\text{s}/\text{cm}$ at 25°C was observed in Mimisal, Pudukottai district. The details of well showing EC more than $3000 \mu\text{s}/\text{cm}$ at 25°C is given in **Table-19**.

V. CONCLUSIONS

The behaviour of ground water table during May 2016 to January 2017 in Tamil Nadu State and Puducherry and Karaikal regions of U.T of Puducherry has been studied by monitoring the dug wells tapping phreatic aquifers. The data on water levels were analysed in detail and salient features are as under.

1. 83% of wells have recorded depth to water level within 10 m bgl during premonsoon period (May 2016), whereas during post-monsoon period (January 2017), about 71% of wells recorded water levels less than 10 m bgl.
2. 79% of wells have recorded depth to water level within 10m bgl during August 2016 and 75% during November.
3. 23% of wells have recorded rise in water levels and 77% of wells have recorded fall in water levels during Jan 2017 (post monsoon) in comparision to May 2016 (pre-monsoon).
4. 64% of wells have recorded rise in water levels and 36% of wells recorded fall in water levels during May 2016 in comparision to decadal mean.
5. 11% of wells have recorded rise in water levels during January 2017 with respect to respective decadal means.
6. 89% of wells have recorded fall in water levels during January 2017 with respect to respective decadal means.
7. In general the ground water quality in the state is fresh in about 13 % of the Ground Water Monitoring wells as indicated by the EC value less than 750 $\mu\text{s}/\text{cm}$ at 25°C. In about 53 % of the Ground Water Monitoring wells, the EC varies between 751 -2250 $\mu\text{s}/\text{cm}$ at 25° C and 13 % of Ground Water Monitoring wells are between 2251-3000 $\mu\text{s}/\text{cm}$ at 25° C indicating that the ground water is slightly mineralized and about 20 % of Ground Water Monitoring wells the EC is more than 3000 $\mu\text{s}/\text{cm}$ at 25°C indicating that the ground water is highly mineralized
8. The chloride content is less than 250 mg/l in about 56 % of the sample analyzed and 38 % of the sample are between 251 – 1000 mg/l and 5% shows more than 1000mg/l.
9. The Fluoride content is less than 1.5 mg/l in about 89 % of the sample analyzed and about 10 % of the sample shows more than 1.5 mg/l, which are from the districts of Coimbatore, Dharmapuri, Dindigul, Erode, Namakkal, Perambalur,Pudukottai, Ramanathapuram, Salem, Tirunelveli, Sivaganga, Theni, Tuticorin Thiruvannamalai, vellore and Virudhunagar.
10. The Nitrate content is less than 45mg/l in about 63 % of the sample analyzed and and 36 % of sample shows more

than 45 mg/l which are from the district of Chennai, Coimbatore, Cuddalore, Dharmapuri, Dindigul, Erode, Kancheepuram Kanyakumari, Madurai, Namakkal, Pudukkottai, Ramanathapuram, Salem, Sivagangai, Thiruvallur, Thiruvannamalai, Villupuram, Theni, Thirunelveli, Tuticorin and Virudhunagar.

ACKNOWLEDGEMENTS

The authors express their gratitude to. Shri.A.Subburaj, Suptdg. Hydrogeologist and H.O.O, Central Ground Water Board, South Eastern Coastal Region, Chennai, for his constant encouragement throughout the task of compilation and analysis of voluminous data. They express their gratitude to him for the keen interest evinced by him in the report as also for the suggestions offered by him vis-à-vis some aspects for improving their lucidity, which have enhanced not only the form but also the contents of the final report. The authors also profusely thank the hard and arduous work put in by various field officers who diligently collected data and water samples from the field, which forms the base for this report. The authors profoundly thank the huge contribution made by the Officers and staff of the Water Quality Laboratory who have analysed the large number of water samples and interpreted the analysis results thereof. The authors would be failing in their duty if they do not acknowledge the unstinting cooperation offered by their various colleagues who have contributed in a major way in bringing out this report.
