ARTIFICIAL RECHARGE TO GROUND WATER AND WATER CONSERVATION PLAN OF NADBAI BLOCK, DISTRICT BHARATPUR, RAJASTHAN

Western Region, Jaipur January 2017

ARTIFICIAL RECHARGE TO GROUND WATER AND WATER CONSERVATION PLAN OF NADBAI BLOCK, DISTRICT BHARATPUR

	Flatt at a Glatice						
1.	Area of the Nadbai Block	446.70 sq. km.					
2.	Area identified for Artificial Recharge	281.34 sq km					
3.	Dynamic Ground Water Resources (as on 31.03.2011)						
	Net Ground Water Availability	39.32 MCM					
	Annual Ground Water Draft	70.45 MCM					
	Stage of Ground Water Development	179.16%					
4.	Volume of water to be harnessed	1.779 MCM					
	Volume of water available for recharge through RS Volume of water available for recharge through PT	1.05 MCM 					
5.	Volume of unsaturated aquifer zone available for recharge	383.19 MCM					
6.	Total number of structures to be proposed						
	Recharge structures	30 shafts in 27					
	Existing village pond with recharge shaft/ well	Nos. of existing					
		village ponds					
	Percolation Tanks	-					
	Sprinkler Irrigation	300 ha					
	Expected Annual GW recharge	0.84 MCM					
	Provision for supplemental irrigation, thus reducing GW withdrawal for irrigation	0.24 MCM					
	Total recharge/ saving of ground water	1.02 MCM					
7.	Estimated Cost	3.276 crore					
	Artificial Recharge Plan	1.50 crore					
	Sprinkler Irrigation	1.50 crore					
	Piezometer construction	0.12 crore					
	Operation and maintenance	0.156 crore					

Plan at a Glance

ARTIFICIAL RECHARGE TO GROUND WATER AND WATER CONSERVATION PLAN OF NADBAI BLOCK, DISTRICT BHARATPUR

Introduction

The **Nadbai Block**, **district Bharatpur** one of the over exploited blocks of Rajasthan and is under severe stress, as evident from the stage of ground water development, which has attained an alarming level of **179.16%**. 281.34 sq. km. area is potential zone area and thus feasible for artificial recharge.

Location of the block

The Nadbai Block of Bharatpur District covering an area of 446.70 Sq. Km. falls in central-western part of Bharatpur District and is located between North latitudes 27°03' & 27°20' and East longitudes 77°03' & 77°22'.

Surface Water Availability

As per the studies carried out by Water Resources Department (WRD), Government of Rajasthan there is very little surplus water available for further development at 75% dependability. Based on the data made available from GWD, the surplus runoff available at 75% dependability level has been worked out for the zones as part of watershed within the block. The nature of aquifer (Alluvium/ Hard rock) is also considered while computing the number of Artificial Recharge structures feasible.

Accordingly about 1.779 MCM has been considered for recharge plan in the block. Optimum utilization of rainwater runoff depends on availability of land, feasible conditions, etc. Volume of Aquifer available for Artificial Recharge is given in **Table.1**

Supply Side Management

Feasible Artificial Recharge and Water Conservation Structures

About 0.035 mcm/year surplus has been considered for each recharge shaft and 0.2 mcm/year for percolation tank wherever feasible. The areas with shallow water level (<5m) have not been considered for construction of Artificial Recharge Structures

The number of Recharge Shaft is decided based on the number of suitable ponds available within the zone. If still some surplus remained unallocated, than few Percolation tanks are proposed at suitable locations. However, in some of the blocks entire available surplus cannot be utilized due to non availability of ponds for Recharge shaft or suitable location for Percolation tanks. Zone wise number of Recharge Structures proposed to be constructed is given in **Table 2**.

Table 1: Volume of Aquifer available for artificial recharge

District	Block			Aquifer	Area feasible for artificial recharge (Sq km)	Sp Yield	DTW (mbgl) NOV 2013	of unsaturated zone 3 m below ground level (m)	Volume of sub surface storage space available for artificial recharge (MCM)
Bharatpur	Nadbai	446.7	281.34	SR	281.34	0.1	16.62	13.62	383.19

Table 2: Number of recharge structure

ZoneCode	Sub_ Basin	Type of Aquifer	Zone- Area (sq. km.)	Total Surplus (mcm)	Water Level >5m	Feasible_ RS_Prop	
Banganga_Banganga_003_RJ0605_AL	Banganga	SR	4.595	0.003	Ν	0	0

				1.779		30	0

Recharge Shaft

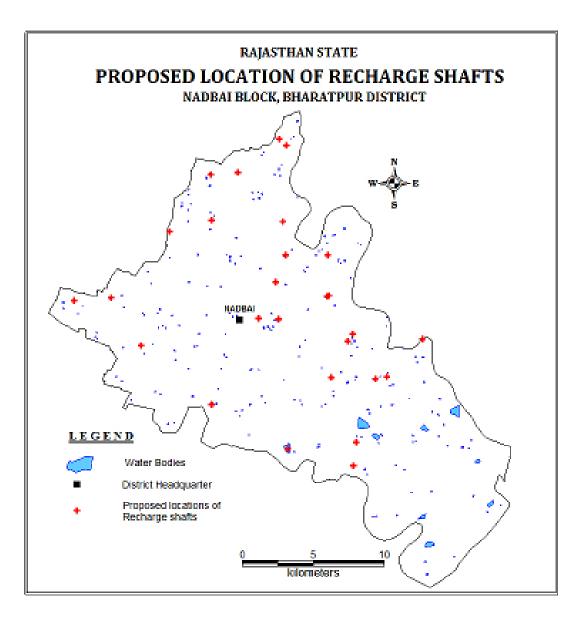

It is proposed to construct Recharge Shaft in existing ponds. The selected ponds should be atleast 3m deep and shallow ponds will be deepened accordingly. It is proposed that the inlet for the Recharge Shaft should be atleast 1m above bed of pond so that the pond retains adequate water for use by villagers.

. The tentative location of villages for construction of recharge shaft/well in existing village pond and their cost estimates are shown in Fig 1 and Table 3.

S.No.	Village	Long	Lat	Watershed	No of Shafts	Unit cost (Rs in lac)	Total cost (Rs in lac)
1	Enchera	77.207	27.333	Banganga_Banganga_008_RJ0605_AL	1	5	5
2	Enchera	77.212	27.329	Banganga_Banganga_008_RJ0605_AL	1	5	5

Fig: 1: Tentative location of Recharge Shaft

Demand Side Management

Efficient Irrigation:

In Flood/ furrow irrigation method more than 50% of applied water is wasted through seepage to deeper levels, local inundation causes loss through evaporation and it leaches out the nutrients from the plants. While through drip and sprinkler irrigation method, wastage through irrigation loses could be minimized. Ground water usage can be minimized drastically by using HDPE pipes. Initially the scheme can be proposed to be started in 300 ha area, which is worst affected showing deepest water level and declining trends. The area is to be finalized based on land holdings, willingness of farmers and No Objection certificate from the land owner.

Impact Assessment and Monitoring

Assessment of impact of the artificial recharge schemes implemented is essential to assess the efficacy of structures constructed. It helps in identification of cost-effective recharge mechanisms for optimal recharge into the ground water system. It also helps to make necessary modifications in site selection, design and construction of structures in future.

It is proposed to construct 20 piezometers, at suitable locations for monitoring of water levels, in the vicinity of proposed recharge structure.

Revival, Repair of Water Bodies

The existing ponds and tanks with time loose their storage capacity as well as the natural ground water recharge through these water bodies has also become negligible due to siltation and encroachment by farmers for agriculture purposes. There are several such villages where ponds/ tanks are in dilapidated condition. These existing village tanks, which are normally silted and damaged, can be modified to serve as recharge structure in case these are suitably located to serve as percolation tanks. Through desilting, coupled with providing proper waste weir, the village tanks can be converted into recharge structure.

Financial Outlay of the Plan

The total estimated cost of the Plan is Rs. 3.276 cr. The tentative cost estimates of the various activities of the Plan are shown in Table 4 & 5. The unit rates are as followed by the Govt. of Rajasthan (BSR).

	Cost of Percolation Tank in Rs in crs (Unit cost Rs 0.4 cr)	
Soft rock – 1.50	-	1.50
