ARTIFICIAL RECHARGE TO GROUND WATER AND WATER CONSERVATION PLAN OF TODABHIM BLOCK, DISTRICT KARAULI, RAJASTHAN

Western Region, Jaipur October 2016

ARTIFICIAL RECHARGE TO GROUND WATER AND WATER CONSERVATION PLAN OF TODABHIM BLOCK, DISTRICT KARAULI

Plan at a Glance

1.	Area of the Todabhim Block	529.50 sq.km.						
2.	Area identified for Artificial Recharge	452.21 sq km						
3.	Dynamic Ground Water Resources (as on 31.03.2011)							
	Net Ground Water Availability	51.7431 MCM						
	Annual Ground Water Draft	110.8487 MCM						
	Stage of Ground Water Development	214.23%						
4.	Volume of water to be harnessed	0.34 MCM						
	Volume of water available for recharge through RS Volume of water available for recharge through PT	0.245 MCM -						
5.	Volume of unsaturated aquifer zone available for recharge	1067.94 MCM						
6.	Total number of structures to be proposed							
	Recharge structures Existing village pond with recharge shaft/ well	7 shafts in 7 Nos. of existing village ponds						
	Percolation Tanks	0						
	Sprinkler Irrigation	300 ha						
	Expected Annual GW recharge	0.20 MCM						
	Provision for supplemental irrigation, thus reducing GW withdrawal for irrigation	0.24 MCM						
	Total recharge/ saving of ground water	0.44 MCM						
7.	Estimated Cost	1.987 crore						
	Artificial Recharge Plan	0.35 crore						
	Water conservation measures	1.50 crore						
	Piezometer construction	0.042 crore						
	Operation and maintenance	0.095 crore						

ARTIFICIAL RECHARGE TO GROUND WATER AND WATER CONSERVATION PLAN OF NADAUTI BLOCK, DISTRICT KARAULI

Introduction

The **Todabhim Block**, **district Karauli** is one of the over exploited blocks of Rajasthan and is under severe stress, as evident from the stage of ground water development, which has attained an alarming level of **214.23%**.

Location of the block

The Nadauti Block of Karauli District covering an area of 529.50 Sq. Km. falls in northwest part of Karauli District and is located between North latitudes 26°42' & 26°60' and East longitudes 76°44' & 76°60'.

Surface Water Availability

As per the studies carried out by Water Resources Department (WRD), Government of Rajasthan there is very little surplus water available for further development at 75% dependability. Based on the data made available from GWD, the surplus runoff available at 75% dependability level has been worked out for the zones as part of watershed within the block. The nature of aquifer (Alluvium/ Hard rock) is also considered while computing the number of Artificial Recharge structures feasible.

Accordingly about 0.345 MCM has been considered for recharge plan in the block. Optimum utilization of rainwater runoff depends on availability of land, feasible conditions, etc. Volume of Aquifer available for Artificial Recharge is given in **Table.1**

Supply Side Management

Feasible Artificial Recharge and Water Conservation Structures

About 0.035 mcm/year surplus has been considered for each recharge shaft and 0.2 mcm/year for percolation tank wherever feasible. The areas with shallow water level (<5m) have not been considered for construction of Artificial Recharge Structures

The number of Recharge Shaft are decided based on the number of suitable ponds available within the zone. If still some surplus remained unallocated, than few Percolation tanks are proposed at suitable locations. However, in some of the blocks entire available surplus cannot be utilized due to non availability of ponds for Recharge shaft or suitable location for Percolation tanks. Zone wise number of Recharge Structures proposed to be constructed is given in **Table 2**.

Table 1: Volume of Aquifer available for artificial recharge

District		Block	Potential area suitable for recharge (Sq.km.)	Type of Aquifer	Area feasible for artificial recharge (Sq km)	Sp Yield		of unsaturated zone 3 m below ground level (m)	Volume of sub surface storage space available for artificial recharge (MCM)
Karauli	Todabhim	529.5	452.21	SR	452.21	0.12	22.68	19.68	1067.94

Table 2: Number of recharge structure

ZoneCode	Sub_ Basin	Type of Aquifer	Zone- Area (sq. km.)	Total Surplus (mcm)	Water Level >5m	Feasible_ RS_Prop	Feasible_ PT_Prop

				0.34		7	0

Recharge Shaft

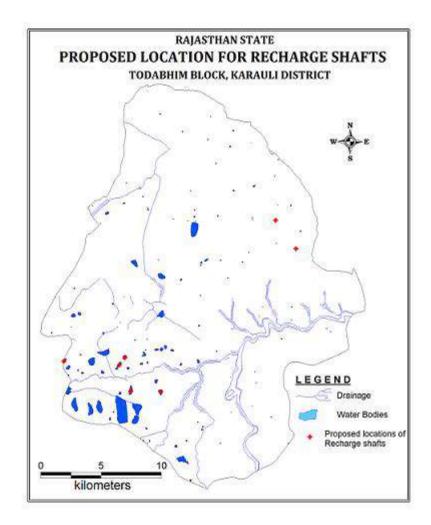

It is proposed to construct Recharge Shaft in existing ponds. The selected ponds should be atleast 3m deep and shallow ponds will be deepened accordingly. It is proposed that the inlet for the Recharge Shaft should be atleast 1m above bed of pond so that the pond retains adequate water for use by villagers.

The tentative location of villages for construction of recharge shaft/well in existing village pond and their cost estimates are shown in Fig 1 and Table 3.

Table 3: Tentative locations of village for village pond with recharge shaft

S No	Village	Long	Lat	Watershed	No of Shaf ts	Unit cost (Rs in lac)	Total cost (Rs in lac)
1	Rajoli	76.798	26.795	Gambhir_Gambhir_002_RJ2305_AL	1	5	5
2	Rajoli	76.794	26.790	Gambhir_Gambhir_002_RJ2305_AL	1	5	5
3	Barh						
	Mahasinghpura	76.828	26.770	Gambhir_Gambhir_002_RJ2305_AL	1	5	5

Demand Side Management

Efficient Irrigation:

In Flood/ furrow irrigation method more than 50% of applied water is wasted through seepage to deeper levels, local inundation causes loss through evaporation and it leaches out the nutrients from the plants. While through drip and sprinkler irrigation method, wastage through irrigation loses could be minimized. Ground water usage can be minimized drastically by using HDPE pipes. Initially the scheme can be proposed to be started in 300 ha area, which is worst affected showing deepest water level and declining trends. The area is to be finalized based on land holdings, willingness of farmers and No Objection certificate from the land owner.

Impact Assessment and Monitoring

Assessment of impact of the artificial recharge schemes implemented is essential to assess the efficacy of structures constructed. It helps in identification of cost-effective recharge mechanisms for optimal recharge into the ground water system. It also helps to make necessary modifications in site selection, design and construction of structures in future.

It is proposed to construct 7 piezometers, at suitable locations for monitoring of water levels, in the vicinity of proposed recharge structure.

Revival, Repair of Water Bodies

The existing ponds and tanks with time loose their storage capacity as well as the natural ground water recharge through these water bodies has also become negligible due to siltation and encroachment by farmers for agriculture purposes. There are several such villages where ponds/ tanks are in dilapidated condition. These existing village tanks, which are normally silted and damaged, can be modified to serve as recharge structure in case these are suitably located to serve as percolation tanks. Through desilting, coupled with providing proper waste weir, the village tanks can be converted into recharge structure.

Financial Outlay of the Plan

The total estimated cost of the Plan is Rs. 1.987 cr. The tentative cost estimates of the various activities of the Plan are shown in Table 4 & 5. The unit rates are as followed by the Govt. of Rajasthan (BSR).

Table 4: Cost of the recharge structures

Cost Recharge Shaft Rs in	Cost of Percolation Tank in	Cost of Sprinkler irrigation
crs (Unit cost Rs 0.05 cr for	Rs in crs (Unit cost Rs 0.4 cr)	in Rs (Unit cost 0.005
alluvium and Rs 0.026 cr for		cr/ha)
hard rock)		
Soft rock – 0.35	-	1.5

Table 5: Tentative cost of different activities

Feasible Artificial Recharge & Water Conservation structures/ activities	Tentative Design	Quantity (in nos. or area in ha)	harvested	Tentati ve unit cost (in Rs lakh)	Total tentative cost (in Rs lakh)	Expected Annual GW recharge/ conservation (mcm) @ 0.8 mcm/structure		
		Recharge	Structures/	Activiti	es			
Recharge shaft	Alluvium – Depth 80m, Dia: 10-12" with filter pit	7	0.25	5	35	0.20
