GROUND WATER R	ESOURCES ESTIMATION				
Replenish able ground water resources	26.38 MCM				
Net ground water available	23.74MCM				
Ground water draft for irrigation	31.75 MCM				
Groundwater draft for domestic & industrial	0.65 MCM				
water supply					
Total ground water draft	32.41 MCM				
Stage of ground water development (%)	136.5				
Uncommitted surface runoff available for the	18.88 MCM				
Firka					
Total volume of weathered zone	12.72 MCM				
Total volume available for recharge	15.98 MCM				
ARTIFICIAL RECHARGE /	CONSERVATION MEASURES				
Structures Proposed (tentative)					
Masonry Check dam	20				
Nalla Bund	17				
Revival, repair of pond, tanks with recharge					
shaft	12				
Improving Water Efficiency /saving	0.7 MCM				
Micro irrigation system for 100 ha					
Excepted groundwater recharge	1.795 MCM				
Total expected groundwater recharge/ saving	2.495 MCM				
Tentative total cost of the project	Rs.5.995 Cr				
Expected raise in water level by recharging /	1.437 m				
saving					

Plan on Artificial Recharge to Groundwater and Water Conservation in Nainarpalayam Firka, Kallakurichi Taluk, Villupuram district, Tamil Nadu

1. Introduction

India is the largest user of groundwater in the world. Food grain security of the country is largely dependent on water resources and groundwater resources play major role in irrigation sector. Imprints of Over-Exploitation on groundwater resources are being observed as steep deepening of water levels, drying of shallow groundwater abstraction structures, ingress of salinity in fresh aquifers etc. which signal towards taking necessity of emergent action for artificial recharge and rainwater harvesting by utilizing surplus runoff and maintaining groundwater resources at sustainable stage.

In Tamil Nadu dependency on groundwater has increased many folds during the recent years and the groundwater extraction for irrigation, domestic and industries have resulted in lowering of water levels, long-term water level declining trend and even drying up of wells. In order to regulate the groundwater development, Central Ground Water Board in association with State Ground Water Departments has computed Dynamic Groundwater Resources and categorized blocks as Over Exploited, Critical, Semi Critical and Safe.

Out of 1129 firkas (assessment units) in Tamil Nadu the groundwater situation in 374 firkas overexploited, 48 firkas critical, 235 firkassemi-critical, 437 firkas safe and 35 firkas are saline. Various measures such as rainwater harvesting, artificial recharge and water use efficiency are successfully practiced by some NGOs, Central and State Govts., which need replication at larger scale in close coordination with State govt. agencies and stakeholders so that capacity building of state implementing agencies and awareness of stakeholders towards artificial recharge and rainwater harvesting can be made.

2. Objectives of the scheme

Objectives of the proposed scheme are

- To upscale recharge activities, supplement additional groundwater resources by harvesting surplus runoff, sustainability of groundwater resources at shallow depths
- Recovery of over-exploited groundwater areas by implementing artificial recharge measures in groundwater stress areas.
- Conservation, development and sustainable management of natural resources including their use.

3. Study area details

3.1 Location

The total area of Nainarpalayam firka is 152.26 sq.km and Nainarpalayam firka lies between North latitudes 11 ° 30' 10.68" to 11° 37' 5.8" and east longitudes 78° 48' 54.16" to 79° 00' 57.97". Location map of Nainarpalayam firka is given in Figure 1.

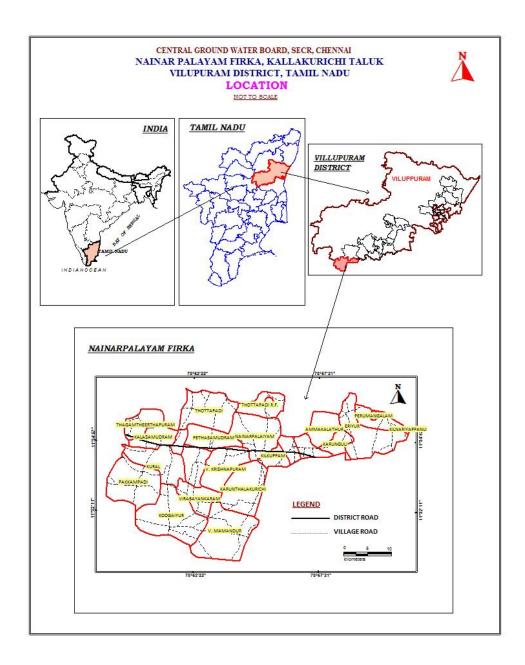

Figure 1. Location map of Nainarpalayam firka

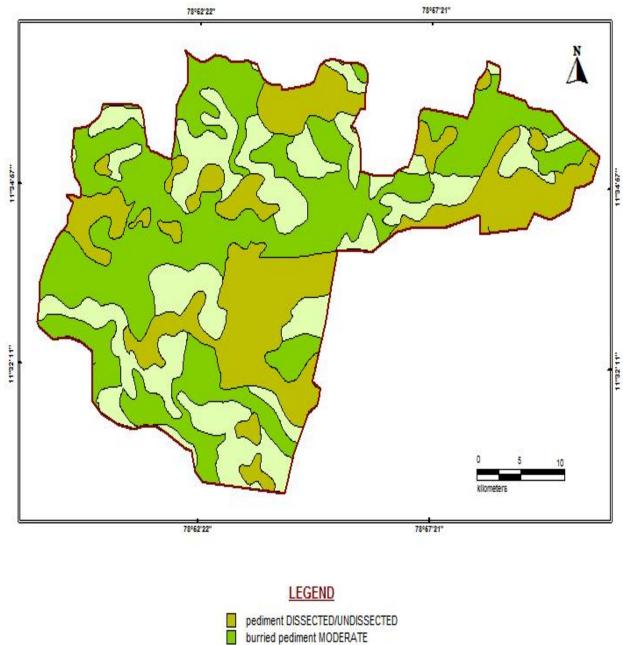

3.2 Geomorphological Set up

Geomorphologically, the area consists of buried pediment (moderate and shallow), pediment dissected landforms. In buried pediment land forms, Pediment moderate and shallow are occupied major part of the firka. These landforms are influencing the ground water recharge. (*Source: IRS, Anna university, Chennai Tamil Nadu). Geomorphological map prepared using IRS- 1D data on 1: 50,000 scale and units are as per NNRMS standard*s. The various Geomorphological units in firka is given in table 1. and shown in figure 2.

Table 1. Various geomorphological units in Nainarpalayam firka

Buried pediment - moderate
Buried pediment - Shallow

GEOMORPHOLOGY NAINARPALAYAM FIRKA, KALLAKURICHI TALUK VILLUPURAM DISTRICT

burried pediment SHALLOW

Figure 2. Geomorphology of Nainarpalayam Firka

3.3 Land use and soil

The land use pattern of the Nainarpalayam Firka is given in figure 3. Predominantly the most of the area is characterised by the wet crop, plantation and dry crop (i.,e agricultural field) and accounts for 75 % of the total area of the firka. Small pockets of salt affected units are occurs at southern portion of the firka (Source: IRS, Anna university, Chennai Tamil Nadu).

LANDUSE / LANDCOVER NAINARPALAYAM FIRKA, KALLAKURICHI TALUK VILLUPURAM DISTRICT

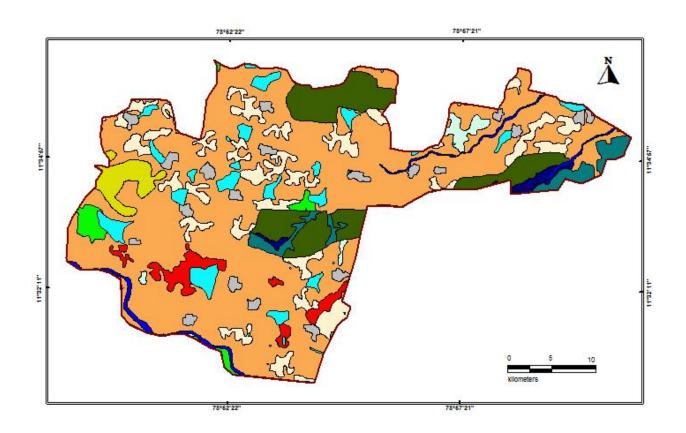

Figure 3. Landuse map of Nainarpalayam Firka

3.4 Drainage

The entire Firka area is within the Vellar river basin. Numbers of small streams originate from the hills located in the Nainarpalayam firka. Only seasonal floods inundate lower parts of the basins. Basin sub soil water is used to irrigate the lands. Tanks and surface water bodies are spread over the entire firka. The drainage pattern is the dendritic and sub- dendritic. The drainage map of Nainarpalayam firka is given in Fig 4.

DRAINAGE NAINARPALAYAM FIRKA, KALLAKURICHI TALUK VILLUPURAM DISTRICT

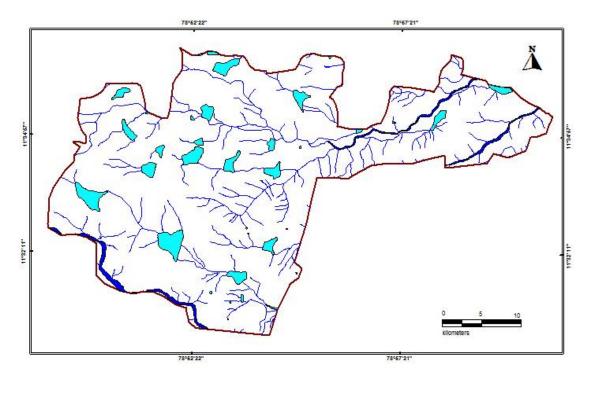

Figure 4. Drainage map of Nainarpalayam Firka

3.5 Rainfall

Nainarpalayam area falls under tropical climate with temperature in the summer months of March to May. The average temperature varies from 26 to 41° C. The humidity is also high in the order of 80%. The wind speed is high during the months of July and August. The wind speed ranges from 7.4 to 12.6 km/hr, which increases from 100 to 120 km/hr during cyclone period. Nainarpalayam Firkas receives rainfall from southwest monsoon (June – September), northeast monsoon (October – December) and non-monsoon periods (January – May). The area receives the major rainfall from northeast monsoon. Rainfall is generally heavy during low-pressure depressions and cyclones during the northeast monsoon period. The normal annual rainfall is 956 mm and the higher is towards coast i.e, east part of the firka.

Taluk	Name of Firkas	Area in sq.km	Monsoon rainfall (Jun to Dec) In m	Non monsoon rainfall (Jan – May) In m	Total Rainfall In m
Kallakurichi	Nainarpalayam	152.26	0.827	0.146	0.973

3.6 Hydrogeology

The entire firka is underlain by the Charnokite rock. Ground water is occurring in pheratic conditions in weathered and fractured Charnokite rock formation. The weathering is highly erratic and the depth of abstraction structures is controlled by the intensity of weathering and fracturing. Large diameter dug well is more common ground water abstraction structures in the area. The diameter of the dug well is in the range of 7 to 10 m and depth of dug wells range from 15 to 18 m bgl. The dug wells yield up to 1 lps in summer months and few wells remains dry. The yield is adequate for irrigation for one or two crops in monsoon period.

The depth of wells varies from 6.64 to 17 m bgl. The hydrogeological map of Nainarpalayam firka is given in Figure 5. Decadal mean water level of pre-monsoon and post monsoon are given in fig 6 a & b. The present water level in the firka is in the range of 5.00 to 12 m bgl.

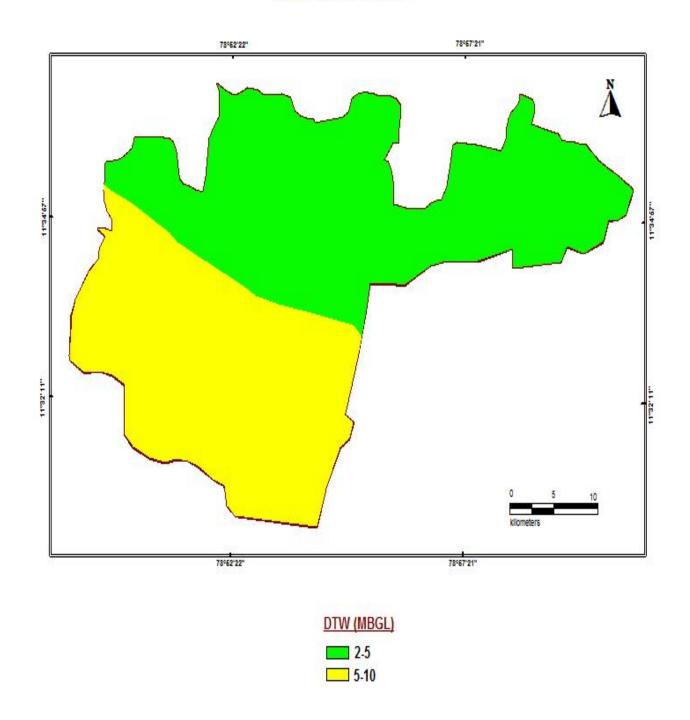

Figure 6 b. Post-monsoon water level in Nainarpalayam firka (Decadal)

3.7 Dynamic Ground water Resources

The ground water resources have been computed jointly by Central Ground Water Board and State Ground Water Resources Data Centre (PWD, WRO, Govt. of Tamil Nadu) as on 31st March 2011. The computation has been done using GEC1997 methodology. The salient features of the computations are furnished in table 2.

Firka	GW WORTHY AREA	REPLENISH ABLE GROUND WATER RESOURCES	NET GROUND WATER AVAILABLE	GROUND WATER DRAFT FOR IRRIGATION	GROUNDWAT ER DRAFT FOR DOMESTIC & INDUSTRIAL WATER SUPPLY	TOTAL GROUN D WATER DRAFT	STAGE OF GROUND WATER DEVELOPM ENT (%)	CATEGORY
	(Sq.Km)			(In MCM)			%	
Nainarp alayam	152.26	26.38	23.74	31.75	0.65	32.41	136.51	OVER EXPLOITED

able 2. Dynamic Ground water resources estimation of Nainarpalayam firka
--

4. Spatial Data Integration

The potential area for groundwater recharge is highly influenced by Geology, Geomorphology, Land use /land cover, Drainage, Surface Water Body, Weathered Thickness and first fractured Depth in the area. In order to ascertain the suitable area for groundwater recharge in firka, spatial data integration of have been attempted using index overlay model in GIS environ. In this model, above seven layers have been integrated by assigning weightage for the theme having scale of 1-100 and sub-classes of the theme between 1 & 10 scales. The resultant map has been reclassified into four classes(High-low integrated values) indicating the suitable area for artificial recharge and given in fig-7 and described below.

ZONE	% OF AREA COVERAGE	SIGNIFICANCE [*]		
Very high	8	Suitable for all major recharge		
		structures like Percolation pond		
		and stop dam, check dam etc.,		
High	19	Suitable for all major recharge		
		structures like stop dam, check		
		dam etc.,		
Moderate	48	Suitable for all major recharge		
		structures like earthen check		
		dam, Boulder check dam and		
		Nala bund etc.,		
Poor	25	Hilly/Forest /Catchment area		

^{*}However, the filed verification is required to confirm above potential area for groundwater recharge.

AREA SUITABLE FOR ARTIFICIAL RECHARGE NAINARPALAYAM FIRKA, KALLAKURICHI TALUK VILLUPURAM DISTRICT

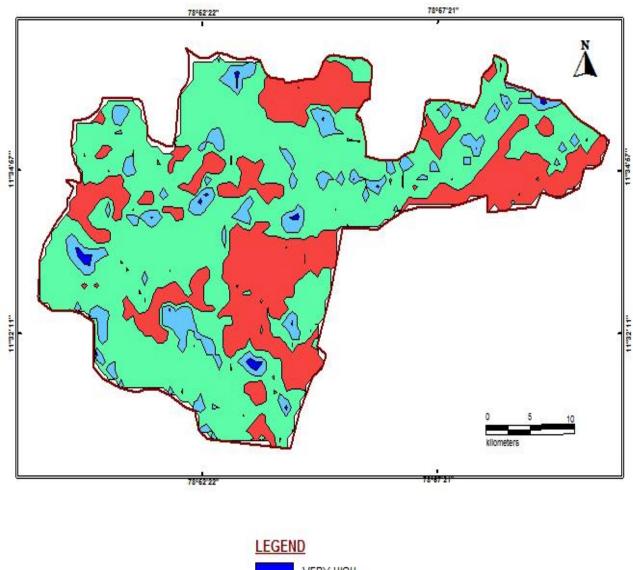

Figure 7showing the recharge worthy area Nainarpalayam firka

5. Planning for groundwater recharge /conservation

5.1 Justification of the artificial recharge & conservation measures

- The Nainarpalayam firkas is with high stage of groundwater development i.e, 136.51 % and with sufficient amount of uncommitted surface runoff/flow of 18.89 MCM.
- The total weathered zone available beneath the ground in the firka is 12.72 MCM. Further there is scope of 15.98 MCM available for recharge considering the water level fluctuation in the firka area.
- The Nainarpalayam firka consists of number of surface water bodies /lakes which are well connected by the drainage. Revival and Recharge of these ponds will enhance the sustainability of the ground water abstraction structures.
- However, most of the ground water developments for agricultural purposes are met through dug-cum bore well and bore wells only. Hence, there is sufficient scope of recharge.
- Model generated in the Nainarpalayam areas reveals that more than 70 % of areas are suitable for recharge.
- In Nainarpalayam firka more than 75 % area is characterised by the agricultural activities, there is sufficient scope for the water conservation measures for enhance the crop production and better ground water development.

5.2 Availability of surplus surface water for artificial recharge or conservation

The uncommitted surface flow for Nainarpalayam firka is estimated as per the norms followed by State Ground & Surface Water Resources data centre, PWD, Taramani, Chennai (Aug 2015). The available of surplus surface water for Nainarpalayam firka is 18.89 MCM.

5.3 Proposed interventions including tentative location of artificial recharge /conservation measures

On basis of above description the following three type of approach have been made to propose artificial recharge or conservation structures.

- a. Artificial recharge
- b. Water conservation measure
- c. Water Efficiency

5.3.1 Artificial recharge

The details of artificial recharge structure proposed along with justification are given below.

5.3.1.1 Check dam/Nala bund

Nainarpalayam firka area is covered by the seasonal nallahs/drains which carry heavy discharge during monsoon period debauched into the water bodies within a short duration. It is proposed that such seasonal nala will be identified and the rain water will be harnessed through construction of series of check dams, nala bund and gabion structures so as to harness this water

thereby increasing the resident period of the water in these channels and to increase the soil moisture content. As per the integrated model prediction around 25 % of the firkas areas are suitable for these structures. It is proposed to construct 20 Check dam and 17 Nala bunds. The tentative location of these 37 ARs are given below and shown in Plate 1. The size and location of these structures are tentative and details field survey is essential to ascertain the exact size and location.

S. NO.	LONGITUDE	LATITUDE	TYPE OF ARS
1	78.843	11.594	Check Dam
2	78.829	11.544	Check Dam
3	78.835	11.541	Check Dam
4	78.879	11.529	Check Dam
5	78.884	11.569	Check Dam
6	78.916	11.581	Check Dam
7	78.904	11.586	Check Dam
8	78.926	11.591	Check Dam
9	78.930	11.588	Check Dam
10	78.935	11.576	Check Dam
11	78.912	11.539	Check Dam
12	78.900	11.518	Check Dam
13	78.901	11.516	Check Dam
14	78.874	11.517	Check Dam
15	78.966	11.585	Check Dam
16	78.981	11.601	Check Dam
17	78.987	11.603	Check Dam
18	78.999	11.589	Check Dam
19	78.965	11.600	Check Dam
20	78.875	11.591	Check Dam

Tentative location of proposed 20 Check dam in Nainarpalayam firka

Tentative location of proposed 17 Nalla bund in Nainarpalayam firka

SL.NO	LONGITUDE(DD)	LATITUDE (DD)	TYPE OF ARS
1	78.845	11.584	Nala Bund
2	78.857	11.584	Nala Bund
3	78.825	11.546	Nala Bund
4	78.841	11.527	Nala Bund
5	78.871	11.518	Nala Bund
6	78.870	11.538	Nala Bund
7	78.868	11.533	Nala Bund
8	78.875	11.534	Nala Bund
9	78.896	11.526	Nala Bund
10	78.907	11.535	Nala Bund
11	78.880	11.563	Nala Bund
12	78.920	11.594	Nala Bund
13	78.958	11.598	Nala Bund
14	78.977	11.600	Nala Bund
15	78.980	11.606	Nala Bund

16	78.978	11.613	Nala Bund
17	79.004	11.591	Nala Bund

5.3.1.3. Revival, repair of water bodies

The existing ponds and tanks in loose their storage capacity as well as the natural ground water recharge through these water bodies has also become negligible due to siltation and encroachment by farmers for agriculture purposes. There are several such villages where ponds/ tanks are in dilapidated condition. These existing village tanks which are normally silted and damaged can be modified to serve as recharge structure in case these are suitably located to serve as percolation tanks. Through desilting, coupled with providing proper waste weir, the village tanks can be converted into recharge structure. Several such tanks are available in the area which can be modified for enhancing ground water recharge. Studies, however, are needed to ascertain whether the village tanks are suitably located to serve as recharge structures. The locations of about 12 existing ponds/tanks have been identified with latitude and longitude given below and marked on Plate 1. The above 12 tanks/ponds could be taken up for the renovation with recharge shaft.

SI. No.	LONGITUDE	LATITUDE	STRUCTURE	ACTION
1	78.855	11.592	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
2	78.872	11.589	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
3	78.953	11.588	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
4	78.915	11.578	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
5	78.900	11.565	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
6	78.894	11.546	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
7	78.910	11.546	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
8	78.895	11.544	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
9	78.914	11.528	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
10	78.880	11.521	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
11	78.888	11.517	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT
12	78.887	11.510	TANK / RESERVOIR	DESILTTAION AND RECHARGE SHAFT

Tentative location of proposed de-siltation of pond/tanks with recharge shaft Nainarpalayam firka.

5.3.2 Water conservation measure

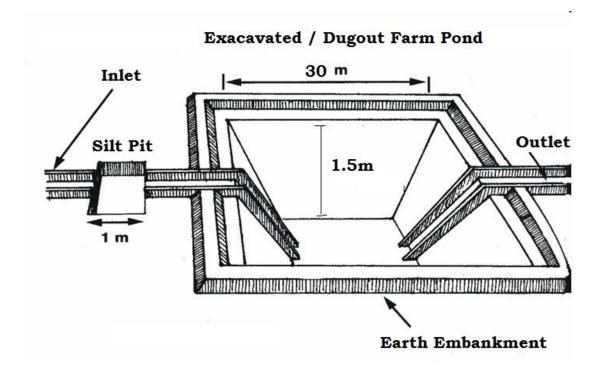

5.3.2.1 Farm Pond

A farm pond is a large dug out in the earth, usually square or rectangular in shape, which harvests rainwater and stores it for future use. It has an inlet to regulate inflow and an outlet to discharge excess water. The pond is surrounded by a small bund, which prevents erosion on the banks of the pond. The size and depth depend on the amount of land available, the type of soil, the farmer's water requirements, the cost of excavation, and the possible uses of the excavated earth. Water from the farm pond is conveyed to the fields manually, by pumping, or by both methods.

Advantages of Farm Ponds

- They provide water to start growing crops, without waiting for rain to fall.
- They provide irrigation water during dry spells between rainfalls. This increases the yield, the number of crops in one year, and the diversity of crops that can be grown.
- Bunds can be used to raise vegetables and fruit trees, thus supplying the farm household with an additional source of income and of nutritious food.
- Farmers are able to apply adequate farm inputs and perform farming operations at the appropriate time, thus increasing their productivity and their confidence in farming.
- They check soil erosion and minimize siltation of waterways and reservoirs.
- They supplies water for domestic purposes and livestock
- They promote fish rearing.
- They recharge the ground water.
- They improve drainage.
- The excavated earth has a very high value and can be used to enrich soil in the fields, levelling land, and constructing farm roads

As per the Land use classification of the firka, majority of the area is covered by the agricultural field. Hence it is proposed to construct 100 farm ponds as per the specification of AED, Govt. of Tamil Nadu ($30 \times 30 \times 1.5$ m).

5.3.2.2. Micro Irrigation System (Sprinkler/ drip/ HDPE pipes)

Micro irrigation is defined as the frequent application of small quantities of water directly above and below the soil surface; usually as discrete drops, continuous drops or tiny streams through emitters placed along a water delivery line

In flood/furrow irrigation method more than 50% of applied water is wasted through seepage to deeper level, localized inundation causes loss through evaporation and it leaches out the nutrients from the plant. While through drip & sprinkler irrigation wastage of irrigational water could be minimized. The studies on different crops, has revealed that irrigation water is saved drastically.

The conveyance losses (mainly seepage & evaporation) can be saved up to 25 to 40% through utilization of HDPE pipes. Initially the scheme is proposed to be implemented in worst affected areas showing deepest water levels and significant declining trends.

It is proposed to take up micro irrigation system in 100 ha. The cost estimation for this component has been taken from SOR of Agricultural Engineering Department (AED), Govt. of Tamil Nadu. Tentative locations of proposed micro irrigation are shown in Plate 1.

LOCATION OF ARTIFICIAL RECHARGE STRUCTURES NAINARPALAYAM FIRKA, KALLAKURICHI TALUK VILLUPURAM DISTRICT

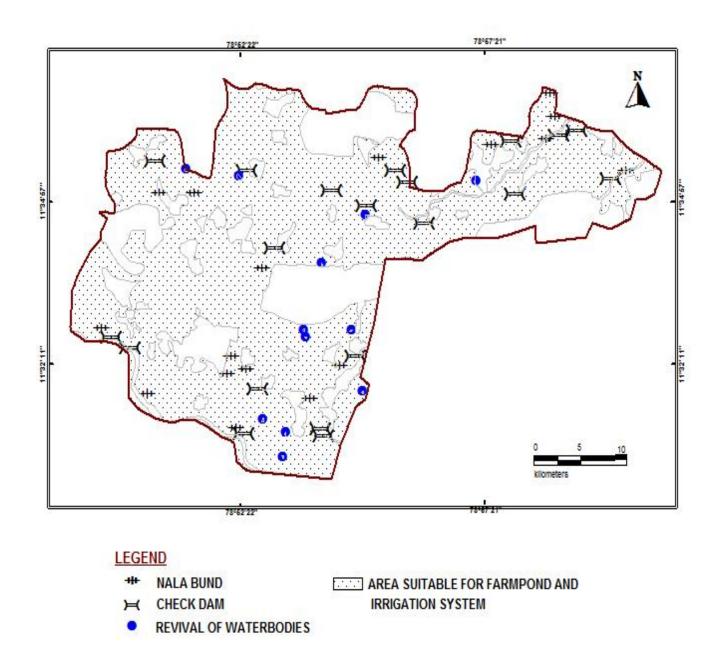

Plate 1. Location map showing the proposed AR Structures in Nainarpalayam firka

6. Tentative Cost Estimation

A tentative number of feasible structures, its cost and expected annual groundwater recharge / water saving is given in the table 7. The unit rates are as followed by the PWD, Govt. of Tamil Nadu (Sources : Schedule of rates, Govt. of Tamil Nadu 2015).

Feasible Artificial Recharge & Water Conservation structures/ activities	Tentative Design	quantity (in nos. or area in sq. m)	Total volume (cu.m)	Tentative unit cost (in Rs. lakh)	Total tentative cost (in Rs. lakh)	Expected Annual GW recharge / saving (cu.m)
activities	Recha	arge Struct	ures/ Activitie	<u> </u>		
Masonry Check dams (5 Fillings)	Crest- 10 -15 m; Height- 1 m to 1.5 m	20	340000	9	180	272000
Nala bunds/ Gabion (4 Fillings)	Width: 5 to 15 m	17	51000	2.0	34	40800
Revival, repair of water bodies (3 fillings)	(~150mx150mx 1.5m)	12	1215000	12	144	
Recharge shaft with the pond /tanks	Recharge shaft of 1.5m dia with 2m depth with filter media in lower 1m, Bore dia 10" Casing 6" Depth 30m	12		2	24	972000
	Wa	ter Conserv	vation Activitie	es		
Farm Pond (in ha) (5 filling)	(30 m x 30m x 1.5 m)	100 unit	600000	1	100	510000
Sprinkler/ drip/ HDPE pipes	For 1 ha with 5 m interval HDPE pipe	100 ha	1000000	0.6 /ha	60	700000
				Sub total	542	2494800
Impact assessment and O & M						
Piezometers Up	Piezometers Up to 50 m bgl – 5 nos. @ 0.6 lakh					

Table 7. Showing the Cost Estimation of proposed Artificial Recharge Structures

Total cost of the project	545	
O & M - 5 % of total cost of the scheme	27.25	
Impact assessment to be carried out by the implementing agencies @ 5 % of total cost	27.25	
GRAND TOTAL	599.50	

Note:

 \succ The type, number and cost of structure may vary according to site, after the ground truth verification

CD, PC – the storage of Check dams and percolation ponds is also proposed for irrigating the surrounding areas for enhancing the ground water recharge as well as effective utilisation of the artificial recharge structures.

7. Implication modalities

The implementation of the scheme will be done by the line department of the state selected by the respective State authority. Further, it is to add that more than 50 % MGNREGA works related to water conservation/sustainable management, accordingly a convergence guideline has been made between National Rural Employment Guarantee Act (NREGA) (Ministry of Rural Development) & Programmes of Water Resources (MoWR, RD & GR). The district Villupuram is one among the list of districts identified for Convergence between NREGS and schemes of MoWR. The details of permissible works under convergence are envisaged in the Joint Convergence Guideline.

a.) Time schedule

Steps	1 st Quarter	2th Quarter	3 rd Quarter	4 th Quarter	5 th Quarter	6 th Quarter	7 th Quarter	8 th Quarter
 Identification of line department /implementing 								
agency and preparation of DPR								
 Approval of scheme and release of sanction of funds 								
 Implementation of ARS 								

Phase = one quarter or 3 months or equivalent to financial quarter

b.) Operation and maintenance

In all projects Impact assessment has to be carried out to ensure that projects is economically viable, socially equitable and environmentally sustainable by inter-related socioeconomic, cultural and human-health impacts, both beneficial and adverse. Accordingly it is proposed to have impact assessment at the rate of 5 % of the total cost of the project for 5 years from the completion of artificial recharge.
