## **SOLAPUR DISTRICT AT A GLANCE**

<b>1. GENERAL INFORMATION</b>		
	Geographical Area	: 14,895 Sq. Km.
	Administrative Divisions (2011)	: Taluka-11; Solapur North, Malshiras, Pandharpur, Barshi, Madha, Sangole, Akkalkot, Mohol, Solapur South, Karmala and Mangalvedhe.
	Villages	: 1,146
	Population	: 43,17,756
	Average Annual Rainfall (2008-2017)	: 541.0mm
	Rainfall 2017	: 532.9 mm
	Normal rainfall (1901-1917)	: 497 to 689 mm
	Long term rainfall Trend (1901-1917)	: -17.944m/year(Mohol taluka) to 0.93 m/year (Sangola taluka)
<b>2. GEOMORPHOLOGY</b>		
	Major Physiographic unit	: Three; Valleys, Denudational Hills (Sahaydri), Highly Dissected Basaltic Plateau, Moderately Dissected Basaltic Plateau, and Moderately Dissected Basaltic Plateau
	Major Drainage	: Bhima River and major tributaries of Bhima river are Nira, Sina and Man rivers.
<b>3. LAND USE (2010-11) (sources: <a href="http://mahasdb.maharashtra.gov.in/districtReport">mahasdb.maharashtra.gov.in/districtReport</a>)</b>		
	Forest Area	: 342.00 Sq. Km.
	Non Cultivation Area	: 788.97 Sq. Km.
	Cultivation Area	: 11315.22 Sq. Km.
	GW Irrigated Area	: 1788.09 Sq. Km.
<b>4. SOIL TYPE</b>		
		: Medium to deep black soil and deep brown to red soil (Regur).
<b>5. PRINCIPAL CROPS (source: KVK, Solapur)</b>		
	Cereals	: 7619 sq. km.
	Pulses	: 872 sq. km.
	Oil Seeds	: 619 sq. km.
	Fruits	: 445.55 sq. km.
<b>6. IRRIGATION BY DIFFERENT SOURCES (2013-14) – Nos. / Potential Created (ha)</b>		
	Dugwells	: 7873 / 20809
	Tubewells/Borewells	: 324 / 1092
	Other Minor Surface Sources	: 609 / 43059
	Net Irrigated Area	: 65060 ha
<b>7. GROUND WATER MONITORING WELLS (2017)</b>		
	Dugwells	: 58
	Piezometers	: 06
<b>8. GEOLOGY</b>		
	Recent	: Alluvium
	Up Cretaceous-Lr Eocene	: Basalt (Deccan Traps)
<b>9. HYDROGEOLOGY</b>		
	Water Bearing Formation	: Alluvium- Sand & silt
		: Basalt (Deccan Traps) weathered, fractured, jointed.
	Premonsoon Depth to Water Level (May-2017)	: 4.5 to 28.5 mbgl

	Postmonsoon Depth to Water Level (Nov.-2017)	: 0.5 to 18.5 mbgl
	Premonsoon Water Level Trend (2008-2017)	Rise: 0.34 to 0.007 m/year
		Fall: 0.004 to 0.67 m/year
	Postmonsoon Water Level Trend (2008-2017)	Rise: 0.009 to 0.34 m/year
		Fall: 0.001 to 0.42 m/year
<b>10. GROUND WATER EXPLORATION</b> (As on March, 2017)		
	Wells Drilled	: EW-93, OW-8, Pz-1
	Depth Range	: 44 to 205.25 mbgl
	Discharge	: 0.025 -18.88 lps
	Storativity	: $3 \times 10^{-6}$ to $1.7 \times 10^{-3}$
	Transmissivity	: 0.8 to 130m <sup>2</sup> /day (Basalt)
<b>11. GROUND WATER QUALITY</b>		
	Good and suitable for drinking and irrigation purpose, except Nitrate and Fluoride affected locations for drinking purpose.	
	Type of Water	: Basalt- Ca-HCO <sub>3</sub>
<b>12. DYNAMIC GROUND WATER RESOURCES- (2013)</b>		
	Net Annual Ground Water Availability (ham)	: 158365.11 ham
	Total Draft (Irrigation + Domestic+ Industrial)	: 114689.728 ham
	Projected Demand (Domestic + Industrial)	: 9039.12 ham
	Stage of Ground Water Development	: 75.49 %
	Overall Category	<b>Safe</b>
<b>16. MAJOR GROUND WATER PROBLEMS AND ISSUES</b>		
	The entire district comes under the rain shadow area. Rainfall is uncertain and scanty. The average rainfall for the district is 541 mm and classified as Drought Prone area. Decadal water level trend (2008-17) reveals that during pre-monsoon period 68 % of the area and during post monsoon period, 78 % of the area are showing decline in water levels. The Basaltic rocks, due to poor storage and transmission capability, get fully saturated during monsoon and desaturated early in summer. These aquifers also drain naturally due to high ground water gradient formed by sloping and undulating topography. Wide range of problems were faced during drilling operations due to caving formation (red bole) and loss of drilling medium.

## **1 INTRODUCTION**

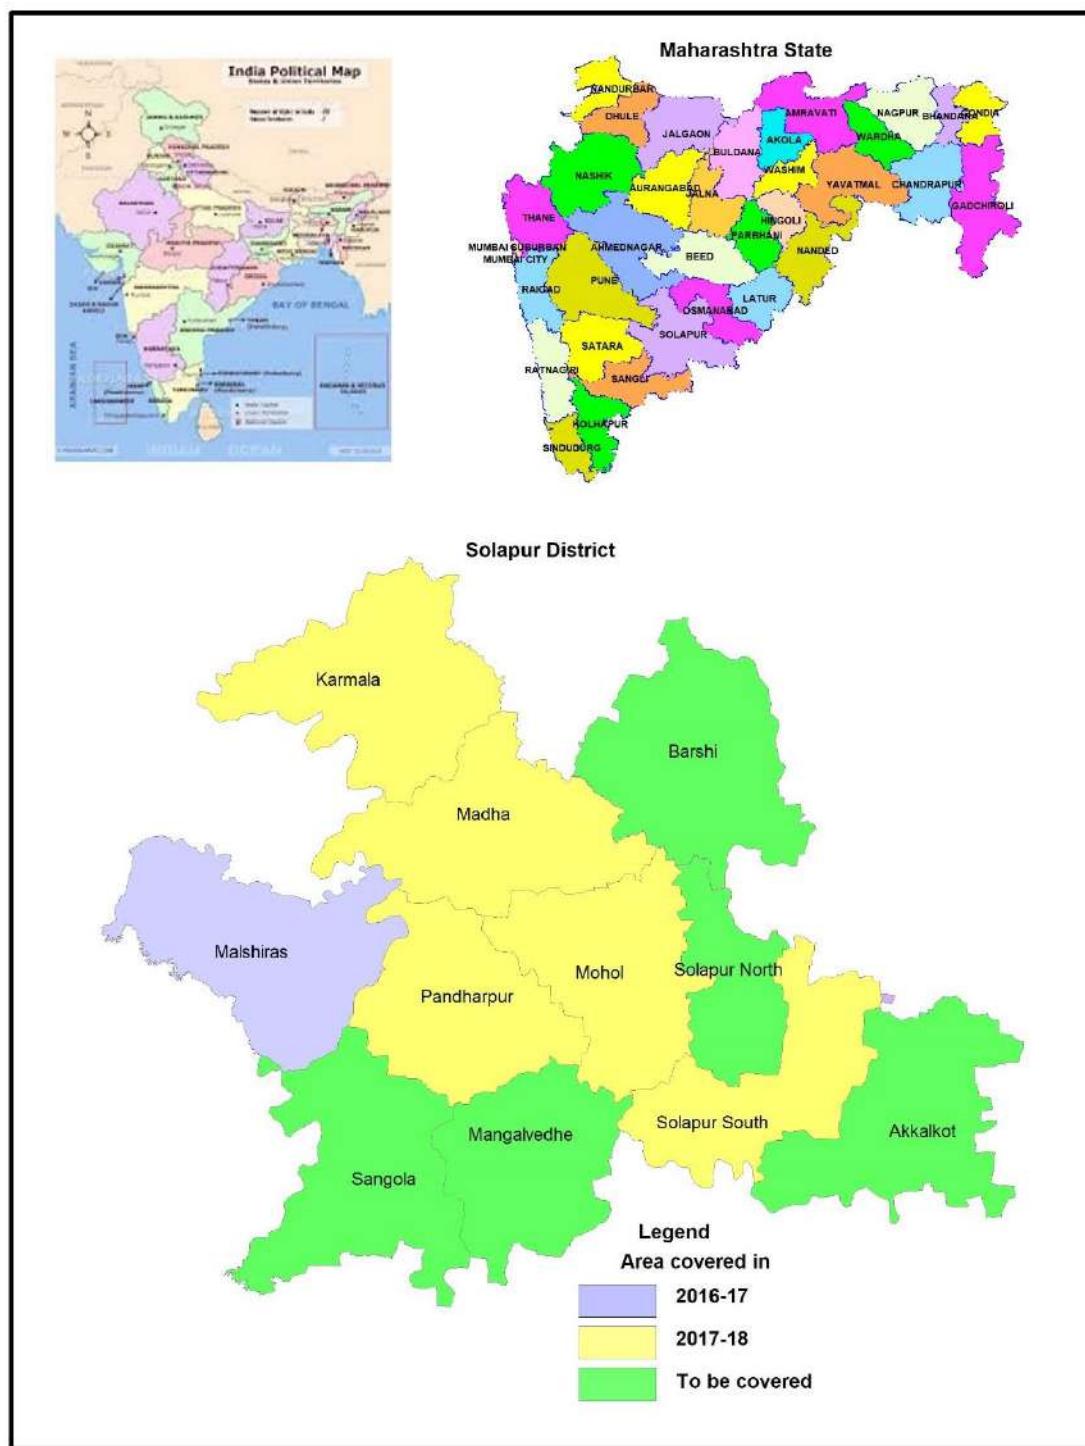

### **1.1 About the Area**

Solapur district is one of the five districts of Pune division of Maharashtra State that form the region of Western Maharashtra. It is situated in the southeastern edge of the State and lies between 17°21'N 75°10'E / 17.35°N 75.16°E - 18°19'N 76°09'E / 18.32°N 76.15°E. The total area of the district is 14895 sq. km. and falls in parts of Survey of India degree sheets 47N, 47 J, 47D, 47K & 56K. It has an average elevation of 458 metres. It is the fourth largest district in Maharashtra in terms of land area and seventh largest in terms of population. The district has the largest industry in Maharashtra for Beedi production. Solapur is situated on Deccan plateau. The district is bounded on the north east by Osmanabad district, on the south east by Karnataka state, on the south west by Sangli district, on the west by Satara district on the northwest by Pune and Ahmednagar districts.

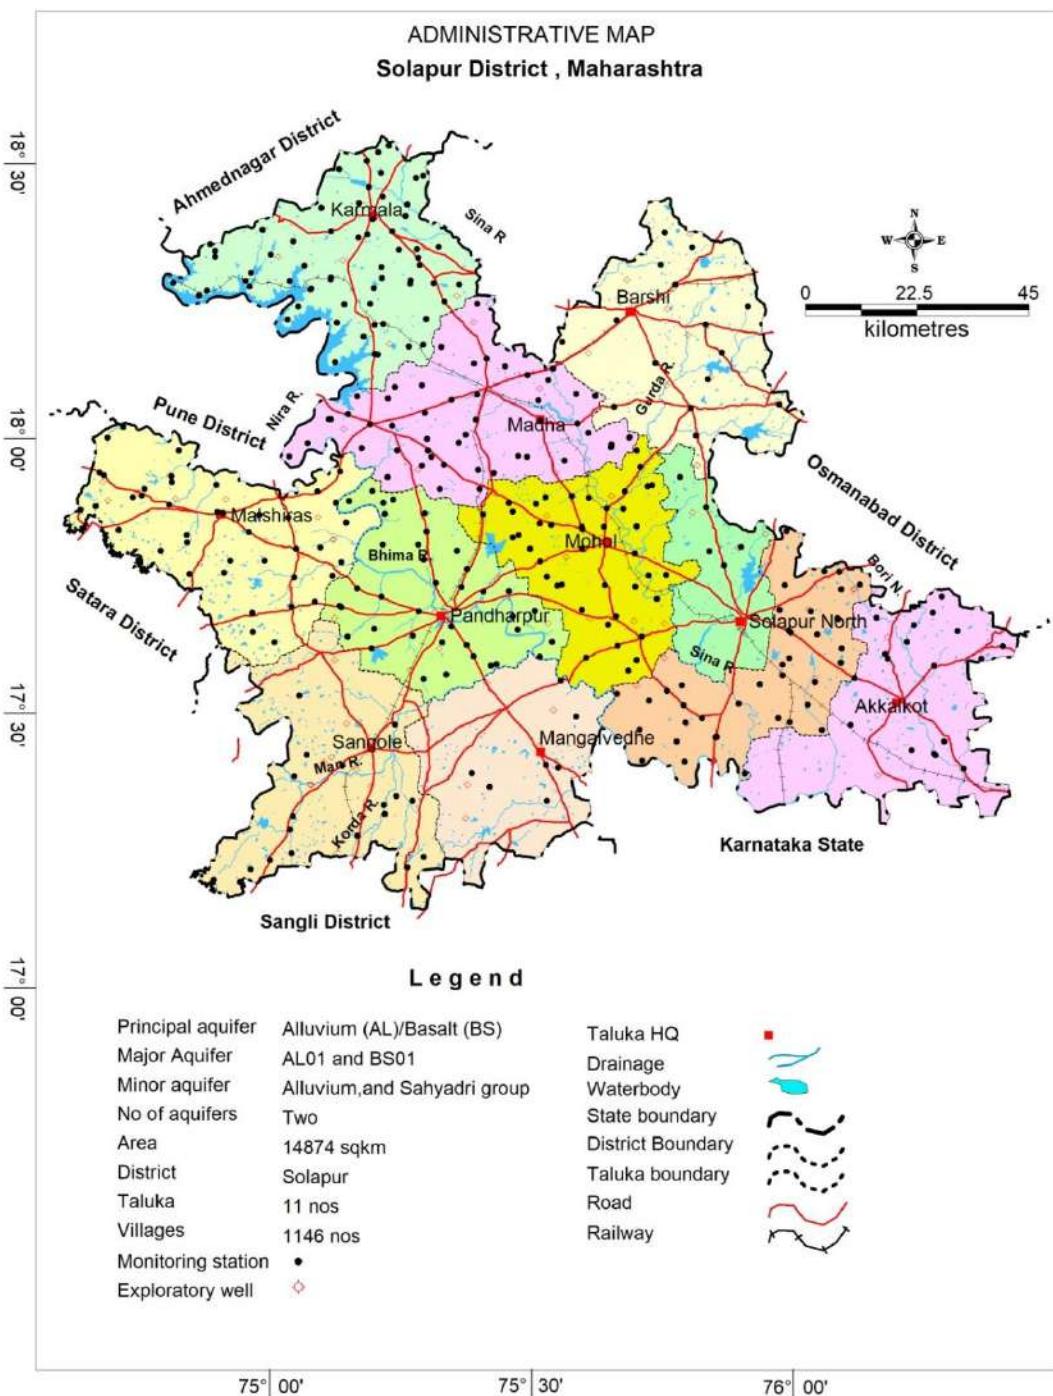

The district headquarters is located in Solapur Town. For administrative convenience, the district is divided into 11 talukas viz., Solapur North, Malshiras, Pandharpur, Barshi, Madha, Sangole, Akkalkot, Mohol, Solapur South, Karmala and Mangalvedhe. It has a total population of 4,317,756 as per 2011 census. The district has 11 towns/talukas and 1146 villages. The major part of the district comes under Bhima and Sina catchment of Krishna basin.

Since 1980, Central Ground Water Board has taken up several studies in the district. Keeping in view the current demand and supply and futuristic requirement of water, Central Ground Water Board has initiated the National Aquifer Mapping Programme (NAQUIM) in country during XII five-year plan, with a priority to study Over-exploited, Critical and Semi-Critical talukas. Hence, Solapur district has been taken up to carry out detailed hydrogeological investigations in the year 2016-17. All talukas of Solapur district are categorised as "safe" except Malshiras taluka which is categorised as "over-exploited" and Mohol is "semi-critical" as per Ground Water Resources Estimation as on March 2013. The Index map and Administrative of the study area is presented in **Fig.1.1 & 1.2**.

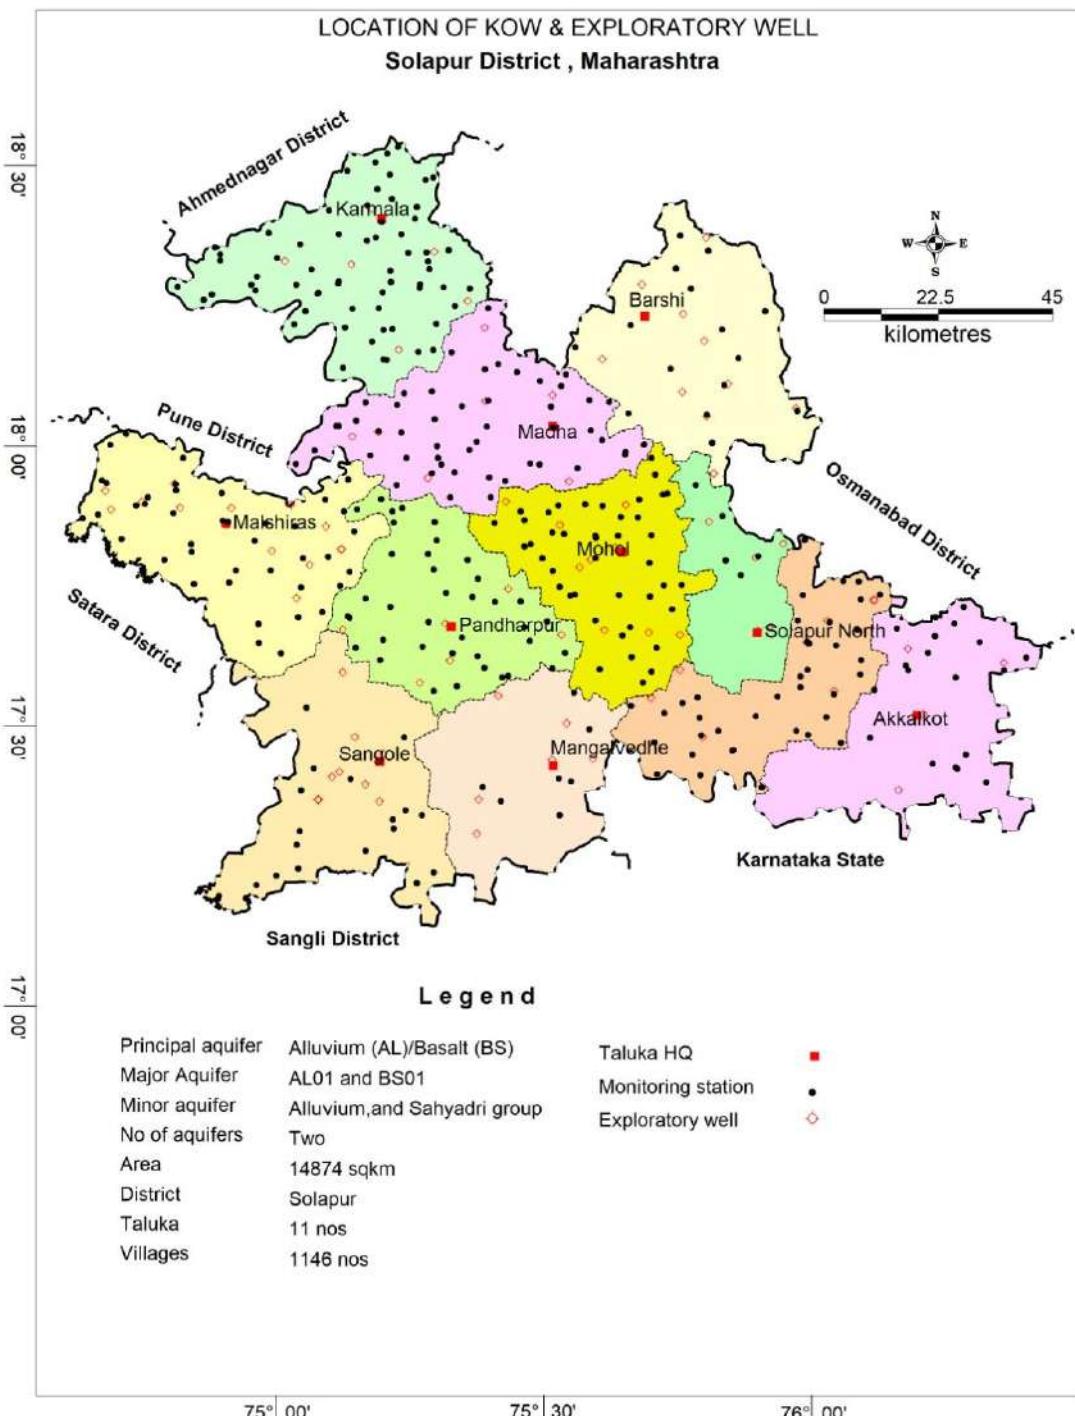

Ground water exploratory drilling in the district has been taken up in different phases since 1957. The ground water exploration has been done in hard rock areas occupied by Deccan Trap Basalt. To establish the aquifer geometry, disposition and potential of aquifers, ground water exploration down to the depth of 200 m bgl has been taken up where the data gap exists and accordingly 12 exploratory wells and 2 observation wells have been constructed during 2017-18. A total of 93 EW, 8 OW and 1 Piezometer have been constructed till March 2018. Location of exploratory wells is presented in **Fig 1.3** & salient features of ground water exploration are given in **Annexure-I**.

**Fig 1.1: Index map of Solapur District**

**Fig 1.2: Administrative map, Solapur District**

**Fig 1.3: Locations of Existing Exploratory wells, Micro level & Monitoring Wells.**

## 1.2 Geomorphology, Drainage and Soil Types

The district forms a part of the vast Maharashtra plateau which abuts against the lofty Sahyadri ranges on the west. The average ground elevation is between 450 to 600 metres above mean sea level and shows gentle slope towards south and south east. The highest elevation in the district is 720 m. amsl, observed on the NW-SE trending hill ranges near Jalbhari and the lowest elevation is 420 mamsl observed near Dharang on Bhima river bed. In general, the district exhibits undulating topography, consisting of low lying plateaux with isolated hillocks. Geomorphological map is given in **Fig 1.4**.

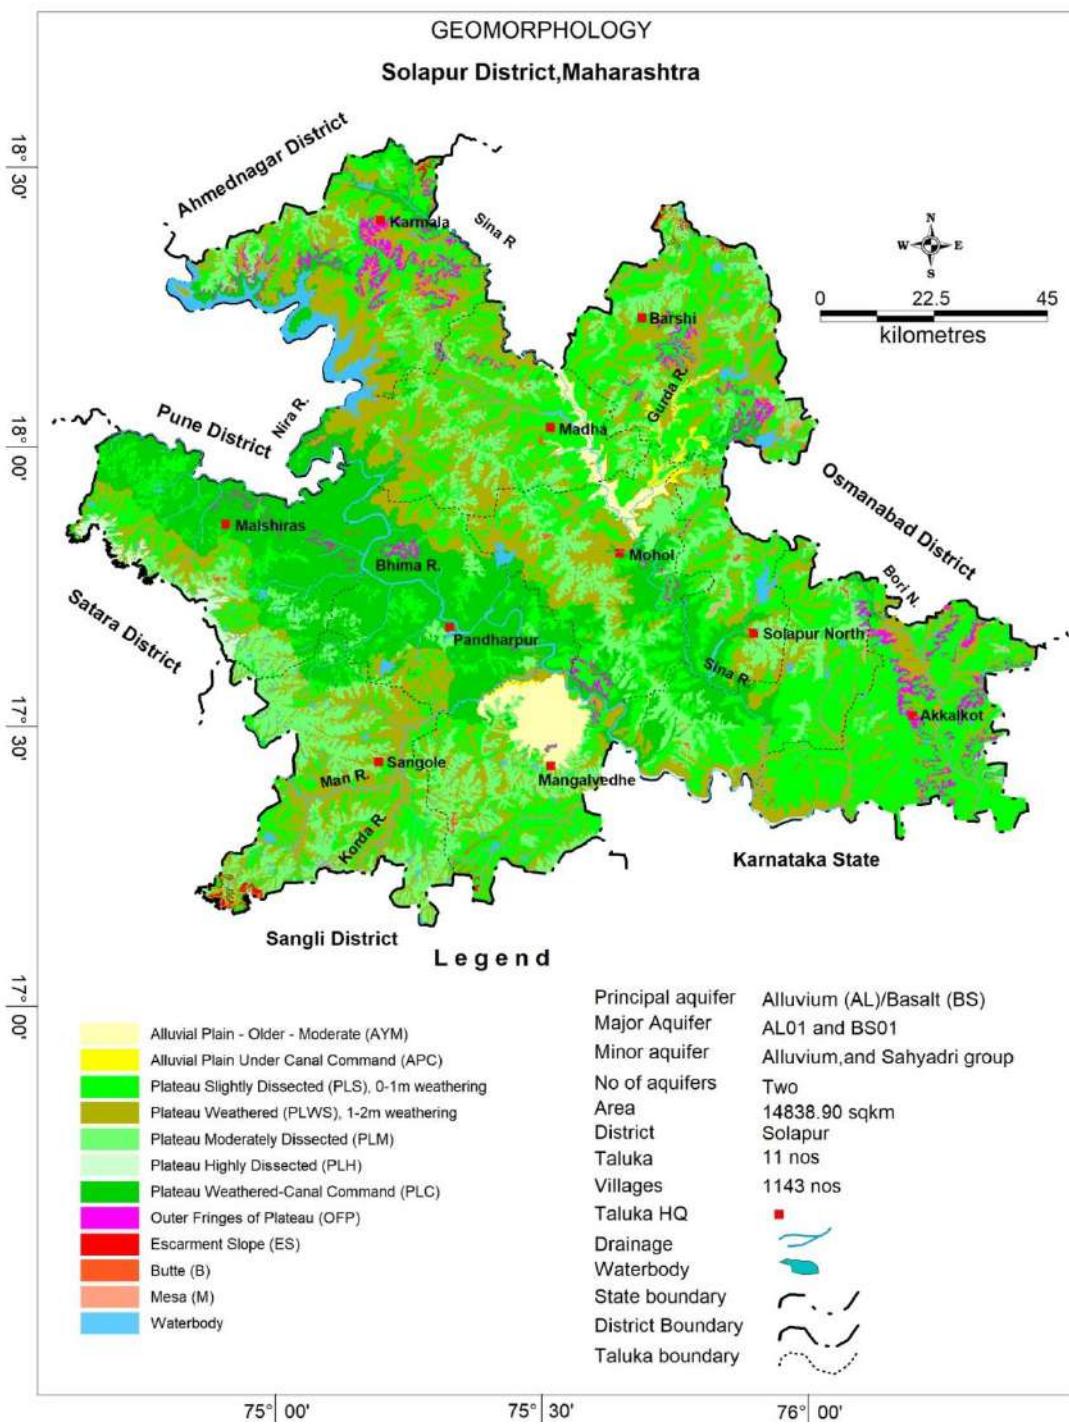

The district comes under Bhima sub-basin of Krishna basin and has flat to undulating topography. The district is typically characterized by the morphology of

Deccan basaltic flows. The elevation in the district is ranges from 420 to 720 m amsl.

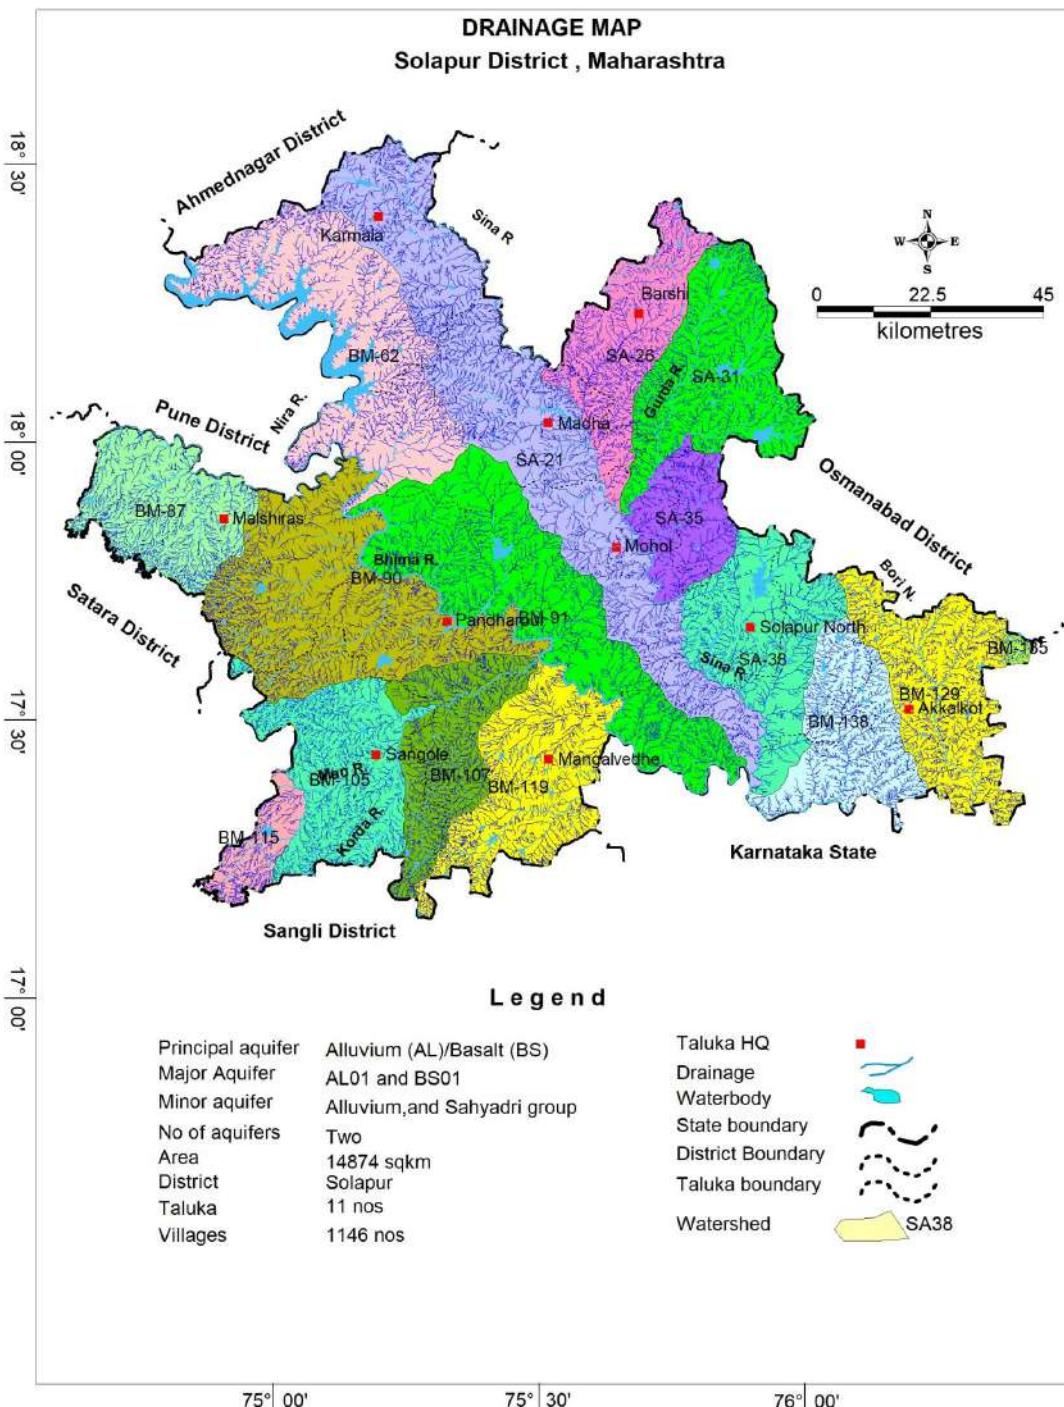

The Bhima is the main river of the District. The Nira and the Man are its chief right bank tributaries while the Sina is its main left bank tributary. The Bhima and Sina flow in a general south-easterly direction while the Nira runs east and the Man north-easterly. The major Rivers flowing in the district are the Bhima, Sina and Man. The Bhima river originates near Bhimashankar hills on Western Ghats, known as Sahyadri in Pune District and enters Solapur district near village Jinti in Karmala Taluka. Dendritic drainage has been observed only in the vicinity of major Rivers where alluvial deposits or thick soil cover is present. However, all the streams and Rivers which flow in the district is effluent in nature. All the rivers mostly have semi-dendritic drainage pattern and the drainage density is quite high. These rivers are flooded in the rainy season and are dry in the summer season. Based on geomorphological setting and drainage pattern the district is divided into 16 watersheds. Drainage map of the Solapur district is presented in **Fig 1.5**.

The soil of the Solapur district (**Fig 1.6**) is mainly derived from Deccan basalts. The soil of the district is underlain by partially decomposed basaltic rock locally known as "Murum" which overlies parent rock. The soils of the District can be broadly grouped into three kinds on the basis of colour i.e. black soils, grey soils and reddish soils. Except Karmala, the soil in the district is grey to black while in Karmala taluka half the soil is black and the remaining is red or coarse grey. The black soil here is not very deep except along the valleys. The soils exhibit varying degrees of erosion and truncated profile is a common occurrence. The soils can be broadly classified in the four main categories on the basis of depth and structure.

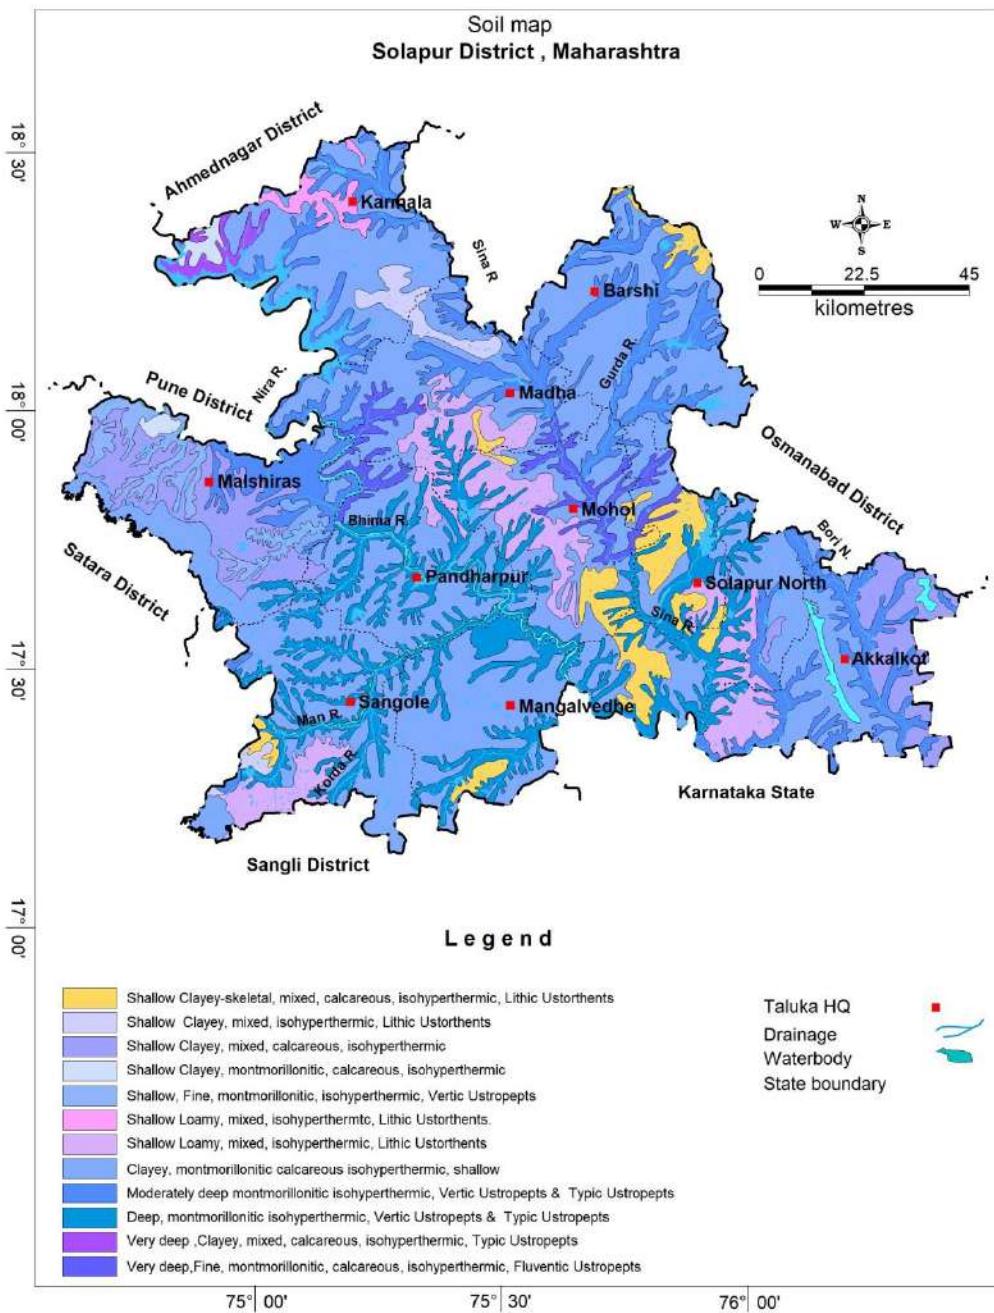

- i. Very shallow soil with depth less than 7.5 cm.
- ii. Shallow soils between 7.5-to 22.5cm depths.
- iii. Medium deep soils between 22.5 and 90 cm depths.
- iv. Deep soils with depth more than 90 cm.

**Fig 1.4: Geomorphology map**

**Fig. 1.5 Drainage map**

**Fig 1.6 Soil map, Solapur District**

### 1.3 Climate and Rainfall

Climate of the District is characterised by general dryness except during the monsoon season. The cold season, from December to about the middle of February is followed by the hot season, which lasts up to the end of May. May is the hottest month of the year. The maximum temperature may usually go up to  $34^{\circ}\text{C}$  or  $45^{\circ}\text{C}$ . June to September is the south-west monsoon season while October and November constitute the post monsoon season. The District falls under rain shadow zone of the State. The south-eastern parts of the District get slightly more rainfall than the rest of the District. The average annual rainfall (2008-2017) of the District is 541.0 mm (Fig 1.7). Most of the rainfall is received during the south-west monsoon in the months from June to September and constitute about 74 percent of the normal annual rainfall. About 17 % of the rainfall in district is received in the post monsoon season. The variation in the annual rainfall from year to year is large. Isohyet of the district for the normal rain fall is given in Fig 1.8.

- Long term rainfall analysis (1901-2017) and annual rainfall data of last ten years is given in **Table 3.1 and 3.2**.
- Based on long term rainfall analysis it is observed that:
- The normal annual rainfall in the district varies between 497 mm in Madha taluka and 689 mm in North Solapur taluka. **Table 3.1**
- The coefficient of variation of the annual rainfall from the normal rainfall has been observed between 29 and 42.
- The percentage of probability of receiving excess rainfall varies from 10 % at S. Solapur and Pandharpur talukas to 22 % at Karmala taluka.

**Table 1.1: Long-term rainfall analysis**

Taluka	Peri od	No of Yea rs	Norm al Rainf all	Std. Deviat i on	Coeffici ent of Variatio n	Rainfall Trend/Slope (mm /year)	Departures - Number of Years (% of Total Years)						
							Positi ve	Negati ve	Droughts			Normal & Excess R/F

#### 1.4 Geology

Geologically, Solapur district is divided into two parts i.e., Alluvium and Deccan Trap Basalt formations (Fig 1.9). There are 13 basaltic flows between the elevations of 420 m to 720 m amsl (Fig 1.10). The generalized geological sequence occurring in the district is given in Table 1.3.

**Table 1.3: Generalized Geological sequence, Solapur district**

Age	Group	Sub-groups	Formation	Thickness in meters	Lithology
Quaternary (Recent to Sub-Recent) <td></td> <td></td> <td>Alluvium</td> <td></td> <td>Sand, silt and clay.</td>			Alluvium		Sand, silt and clay.
Late Cretaceous to Eocene (30-60 million years)	North Sahyadri		Mahabaeshwar	32-100	Deccan Trap basalt with inter- trappeans. : Simple flows, aphyric to plagioclase microphyric
		Diveghat	Purandargad	45-90	Deccan Trap basalt with inter- trappeans. : Simple flows, aphyric to plagioclase microphyric
		Diveghat		>190	Deccan Trap basalt with inter- trappeans. : Simple/ Aa flows, aphyric
		Lonavala	Karla	15-25	Deccan Trap basalt with inter- trappeans. : Fine grained, aphyric, pahoehoe flows
			Indrayani	25-45	Deccan Trap basalt with inter- trappeans. :a thick succession of 'Aa' flows - Aphyric to sparsely phryic flows

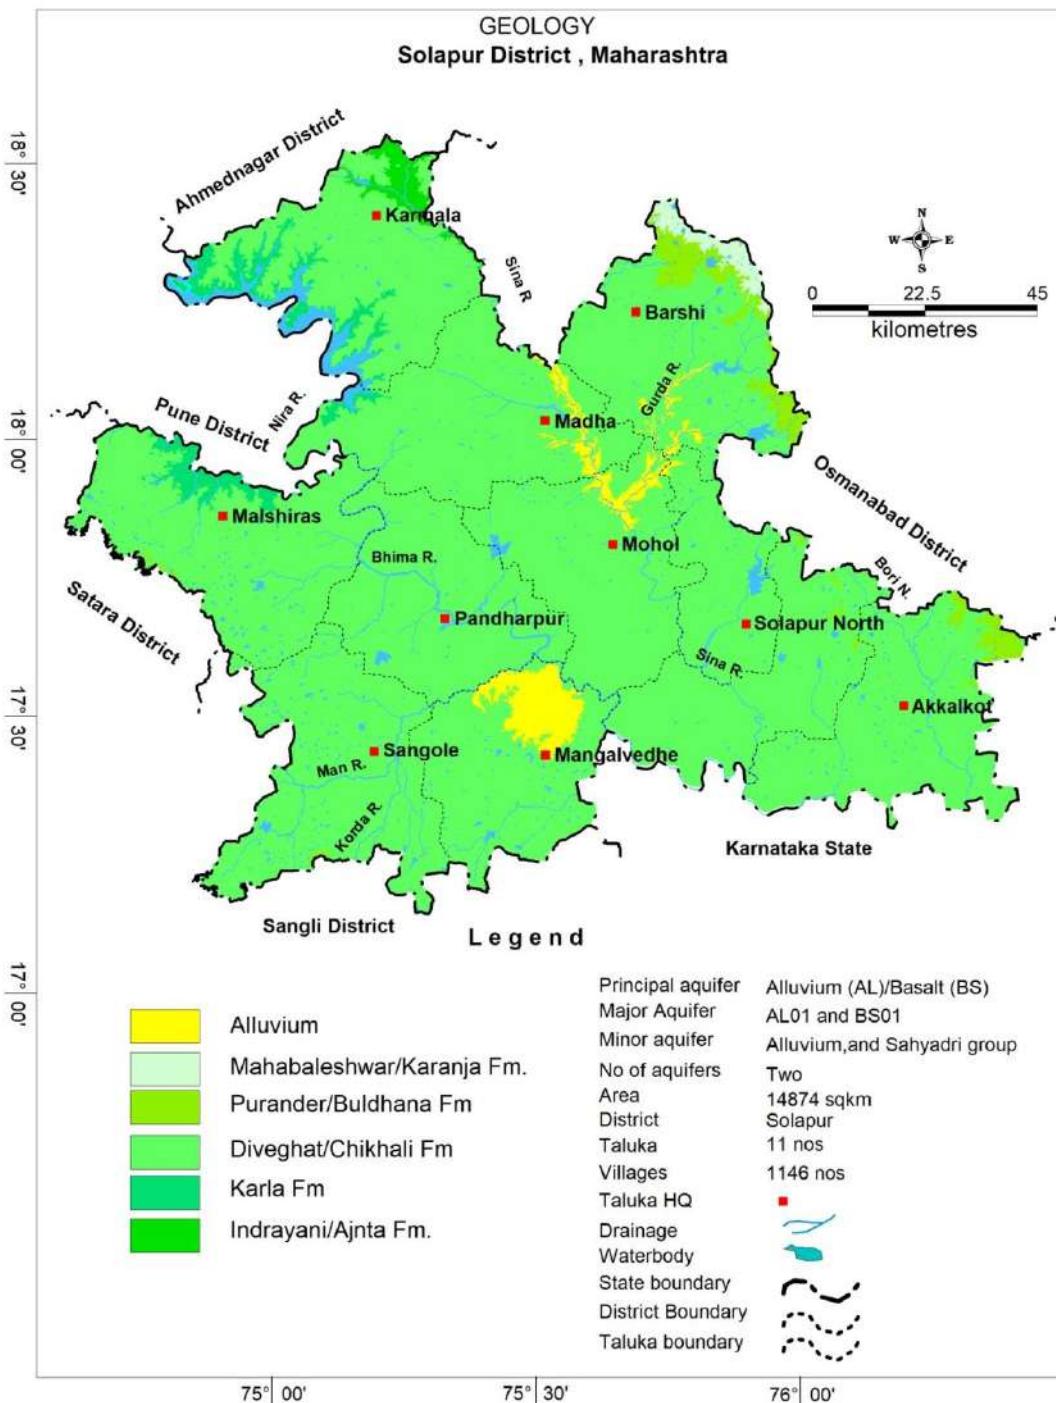

#### **1.4.1 Alluvium:**

Alluvium, belonging to the Quaternary period forms a very productive aquifer in the district. The alluvial deposits are restricted as narrow belts along the banks of major river courses like Sina and their tributaries and in Mangalvedhe taluka. The alluvium occurs in patches in paleo depressions. These shallow alluvium deposits comprise of loose or semi-consolidated medium to coarse grained sands, gravels, fine silt with admixture of clays resting over the massive, weathered or amygdaloidal zones of the basaltic lava flows.

#### **1.4.2 Deccan Trap Basalt:**

Almost the entire district is underlain by Deccan Volcanic Basalts belonging to Sahyadri Group of Late Cretaceous to Eocene age, comprises of various lava flows, which can be classified into two types as simple and compound flows. The compound flows occur at lower elevations whereas the simple flows are confined to the elevation above 680 m. The compound flows although vesicular and amygdaloidal in nature, hard and compact in their middle part. They are fractured and jointed, and show moderate degree of weathering at places. Each individual lava flow consists of lower massive part becoming vesicular /amygdaloidal towards top, ranges in their individual thickness from a few centimeters to tens of meters. The flows have wide variation in colour and texture especially when they are amygdaloidal in nature with secondary mineral infillings such as Zeolites, calcite, and Agate and Chalcedony etc. The red /green/black bole beds constituting the marker horizons

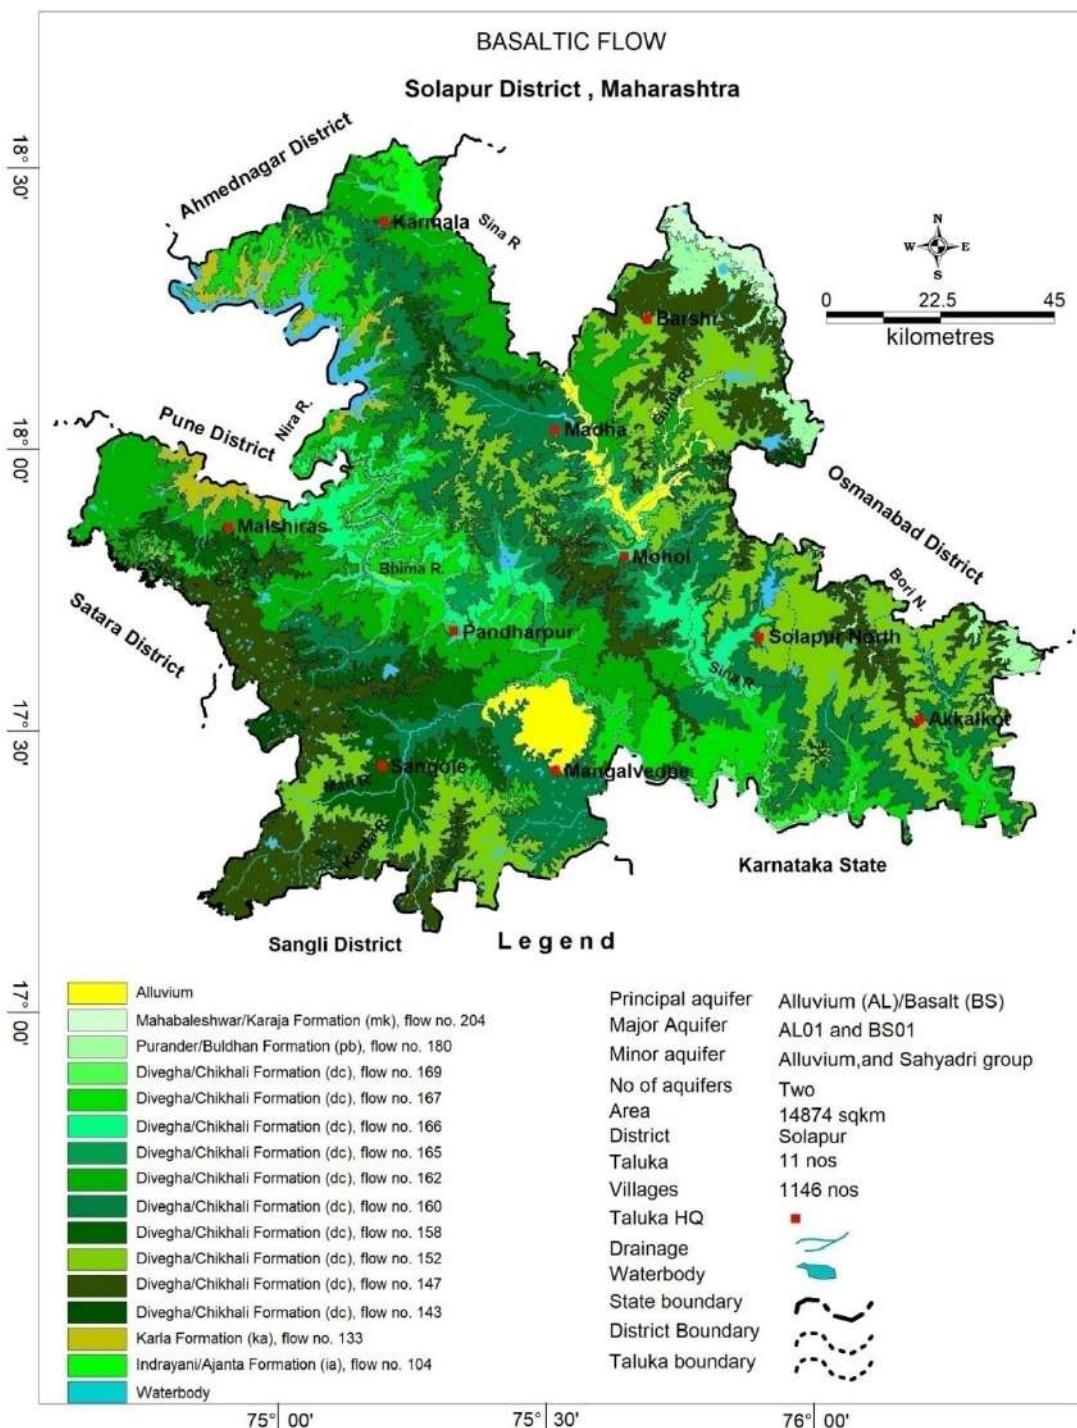

separating the two flows were discontinuous and generally inconsistent. The basalts are intruded by dykes and are found commonly in pahoehoe flows in the area. The dykes vary in thickness from one or two meters to as much as 10 meters and extend for long distances. The dykes display the joints parallel to the walls, at right angle to the walls besides horizontal ones, with chilled margins. The dykes act as barrier or as water conduits / pathways for the movement of groundwater flow depending on intensity of fracturing in the dyke rock. The location and orientation of the dykes with respect to the groundwater flow are very important.

**Fig 1.9: Geological map of Solapur district**

The oldest Lower, Indrayani Formation is characterized by the presence of compact, massive, porphyritic basalt. The phenocrysts are embedded in fine-grained groundmass. This formation is classified as Khandala Formation of Lonavala sub group based on geochemical

consideration. Indrayani Formation lava flows are, generally jointed and highly weathered, occupy the low-lying flat plain of Bhima and Sina river and give rise to moderate to good aquifers.

**Fig. 1.10: Basaltic Flow**

Karla Formation essentially comprises of compound lava flows exhibiting the pahoehoe characters. Based on geochemical characters this formation has been classified as Bushe Formation. It is comprised of aphyric or sparsely plagioclase phryic compound flows. The flows are characterized by the presence coarse grained, altered, amygdaloidal basalt and near absence of plagioclase. From the ground water point of view this formation

occupies the low-lying fiat plains and gives rise to moderate to good aquifers.

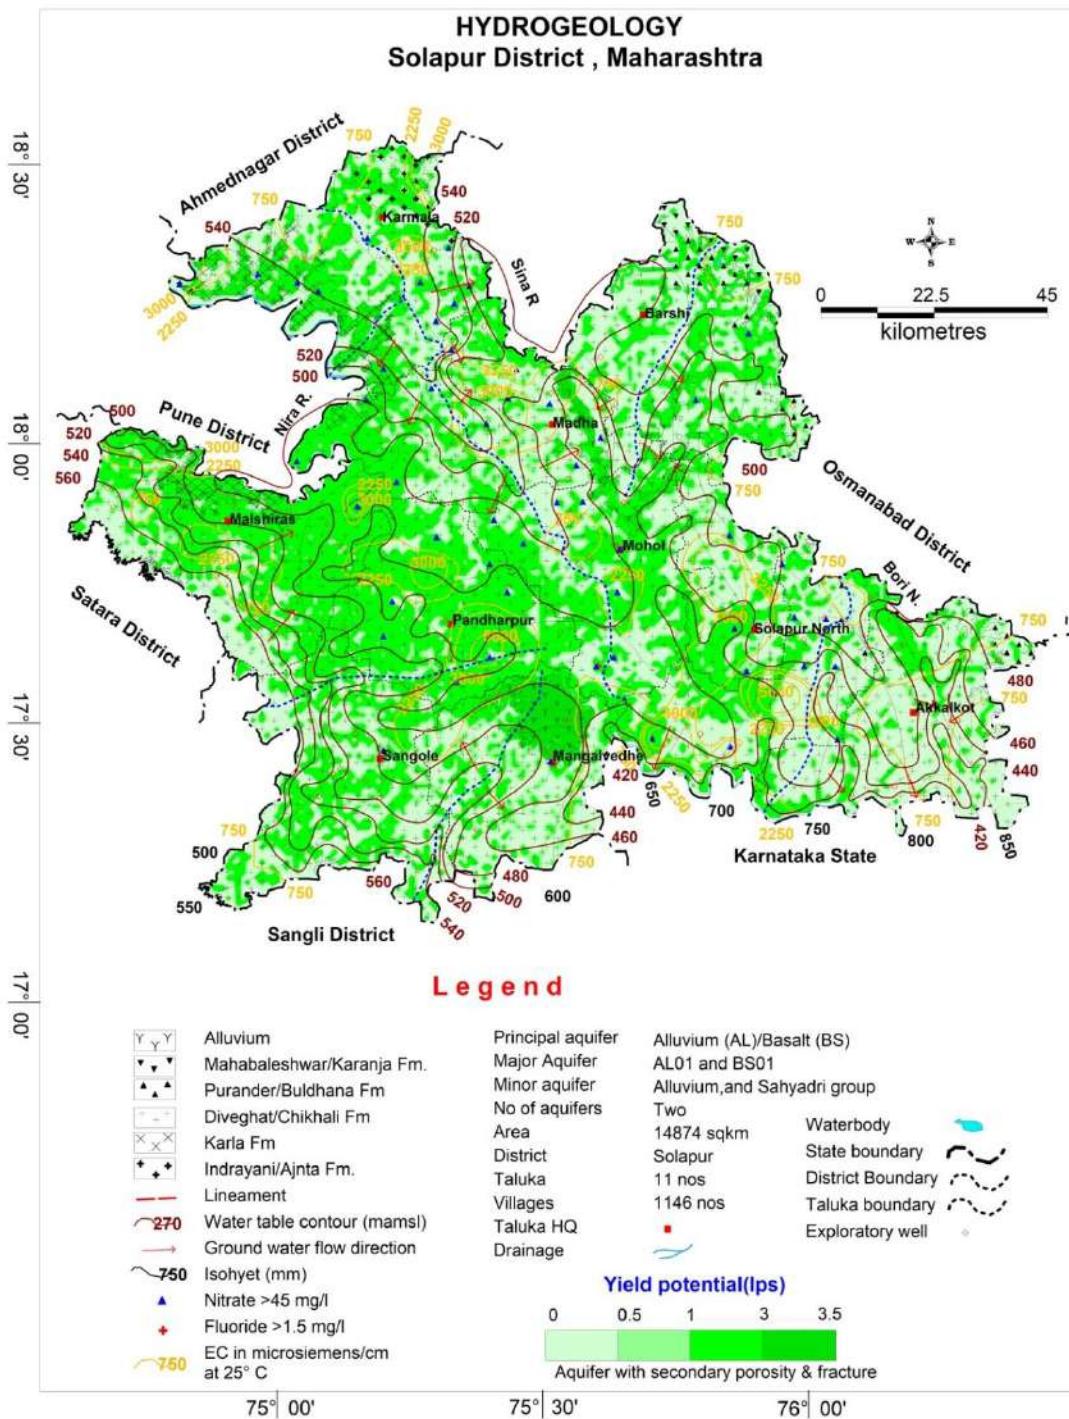

Diveghat Formation, overlying the Karla Formation is exposed on the hills and along the hill slopes above 550m from msl. It comprises mainly of simple flows of 'aa' type that are aphyric. The lava flows of this formation are characterized by presence of vesicular, plagioclase basalt with medium-grained groundmass. From hydrogeological view point these flows occur on the hilly terrain and therefore not potential for groundwater.

Purandargad is the youngeert formation characterized by the presence of aphyric to plagioclase microphyric basalt with the phenocysts embedded in a fine-grained groundmass. From hydrogeological point of view this formation is not very significant as it occupies the hills and hill slopes. This formation is not potential for the development of groundwater resources as it forms the runoff zone.

Mahabaleshwar formation comprises 4-6 *aa* flows with exposed thickness varying from 32 to 100 metre and is mainly exposed in the southern and northeastern part of the district. The unclassified basaltic flows composed mostly *aa* flows with some compound flows, the general gradient of the flows is around 1:550 to 1:800 towards SE.

## 2 HYDROGEOLOGY

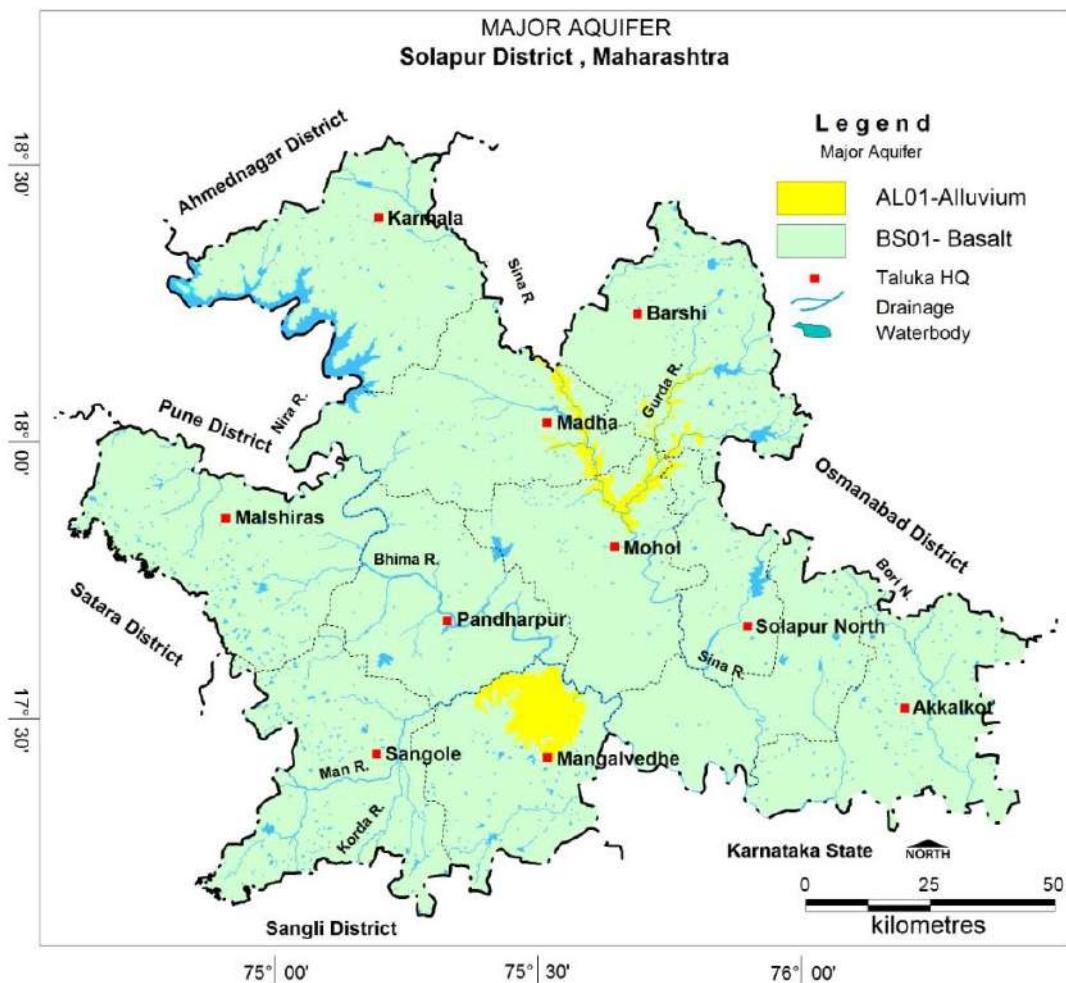

The whole district is underlain by Deccan trap basalt except the banks of the Bhima River, its tributaries and north of Mangalwedha taluka. A map depicting hydrogeological features is presented in Fig 2.1.

**Fig 2.1: Hydrogeology, Solapur district**

### 2.1 Major Aquifer Systems

Alluvium and Basalt aquifers are the main aquifers in the district. Two aquifer systems in Basalt and one in Alluvium are found to be prevailing in the district. (Fig 2.2)

**Fig 2.2: Major aquifer, Solapur district**

**Table 2.1 Aquifer wise characteristics**

Type of Aquifer	Formation	Depth range (mbgl)	SWL (mbgl)	Fracture/ weathered Zones encountered (mbgl)	Fractured/ weathered rocks Thickness (m)	Yield (m <sup>3</sup> /day)	Sustai-ability (m <sup>3</sup> /day)	Aquifer parameter (Transmissivity – m <sup>2</sup> /day)	Sy/S	Suitability for drinking/ irrigation
<b>Aquifer-I</b>	Alluvium	20-60	4.1 – 23.5	Upto 60	15 to 30	60 to 200 m <sup>3</sup> /day	1 to 5 Hours	1.25-207	0.06-0.1	Yes , suitable for both
<b>Aquifer-I</b>	Deccan Trap- Weathered/ Fractured Basalt	8.9-30	4.1 – 23.5	Upto 30	5 to 15	10 to 100 m <sup>3</sup> /day	1 to 3 Hours	30 -80	0.019-0.028	Yes , suitable for both
<b>Aquifer-II</b>	Jointed/ Fractured Basalt	30 to 196	9.0-55	Upto 196	0.5 to 12	Upto 3.0 lps	0.5 to 3 hour	25 - 210	$3 \times 10^{-6}$ and $1.7 \times 10^{-3}$	Yes, suitable for both, except High EC

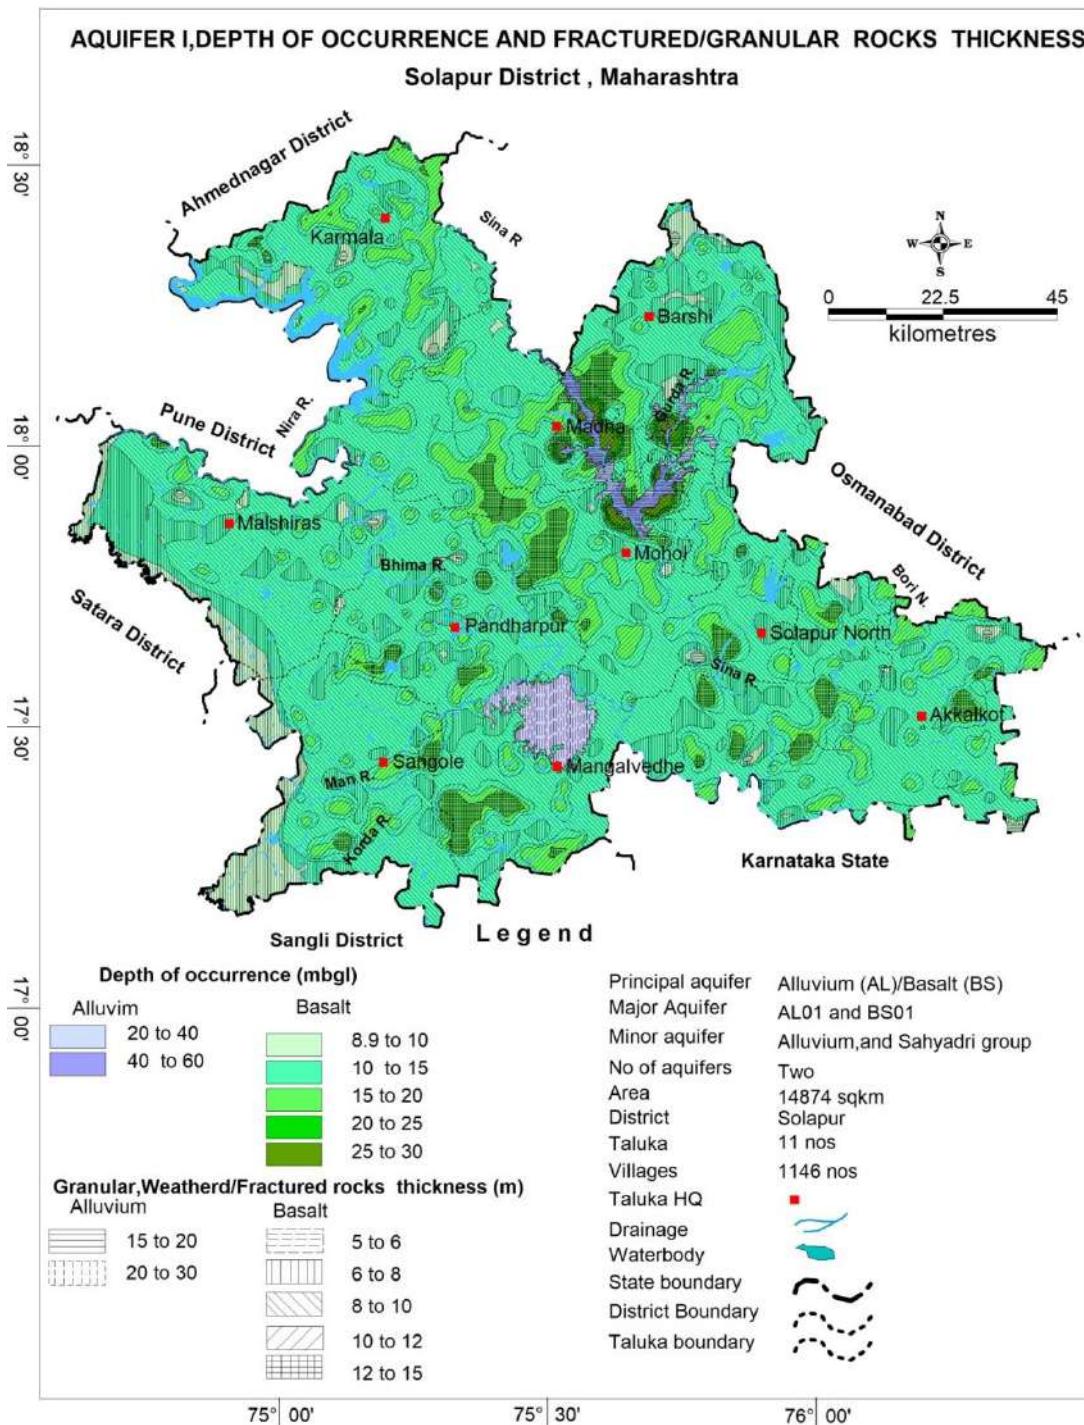

### 2.1.1 Deccan trap basalt

Hydrogeologically, Deccan Trap basalts are inhomogeneous rock formations. The

ground water occurrence and movement is restricted to only weathered/vesicular and jointed /fractured parts of the rock formations. The basalt consists of multiple aquifers and exhibits a wide variation in the joint/fracture intensity. The yield of the wells depends upon the permeability and transmissivity of the aquifer, which in turn depends upon the presence of the interconnected pore space (either primary or secondary or both) available for storage of water. The ground water potential areas are generally localized in basalt due to wide variation in secondary porosity. Generally ground water occurs under phreatic/unconfined to semi-confined conditions. Shallow Aquifer is generally tapped by dug wells of 10 to 30 m depth with water levels ranging from 4.1 to 23.5 m bgl and yield varies from 10-100 m<sup>3</sup>/day. The deeper Aquifer is being tapped by borewells with depth ranging from 40 to 205 mbgl and the water level from 9 to 55 mbgl. Based on Ground Water Exploration data, aquifer-wise characteristics are given in **Table 2.1**. Maps depicting depth of occurrence, fractured/granular rock thickness and aquifer-wise yield potential maps are shown in **Fig 2.3, Fig 2.4, Fig 2.5 and Fig 2.6**.

### 2.1.2 Alluvium

Alluvial deposits occur along the river banks in very thin and isolated pockets, consisting of upper layer of silty material underlain by a layer of coarse material like sand, gravel with admixture of clayey material. The coarser material is found in lenses and form good water bearing horizon while finer material like clay and silty material do not permit movement of ground water. The thickness of alluvial deposits varies from few meters to 20 to 60 mbgl in the Solapur district.

**Fig 2.3: Aquifer I, Depth of occurrence and fractured rock thickness**

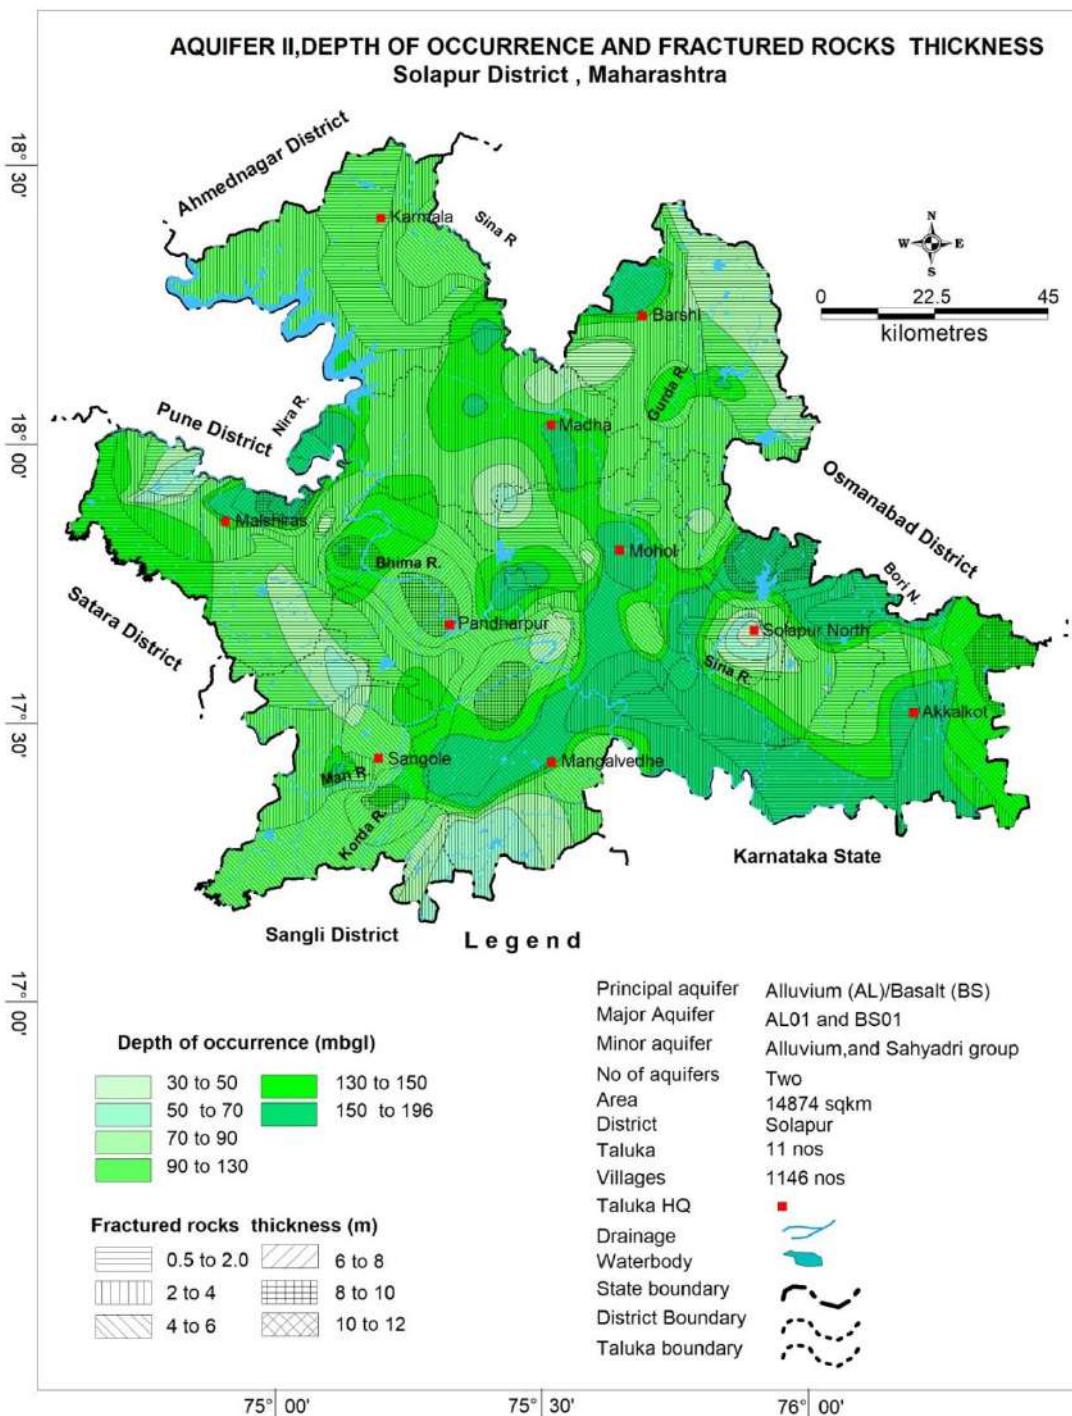

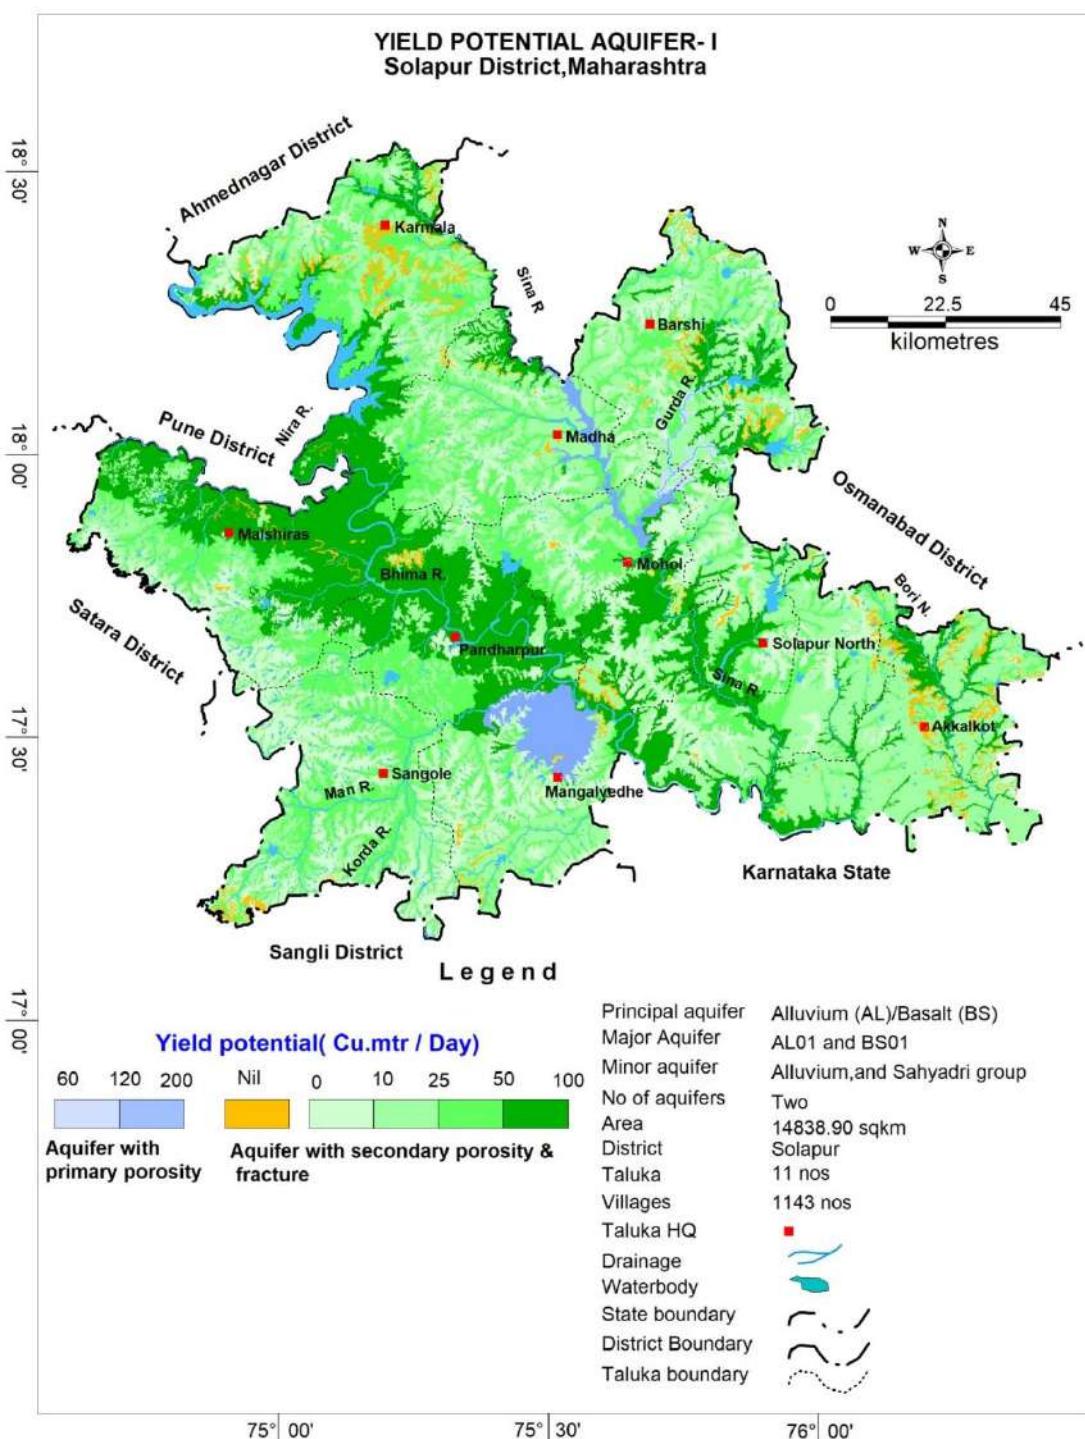

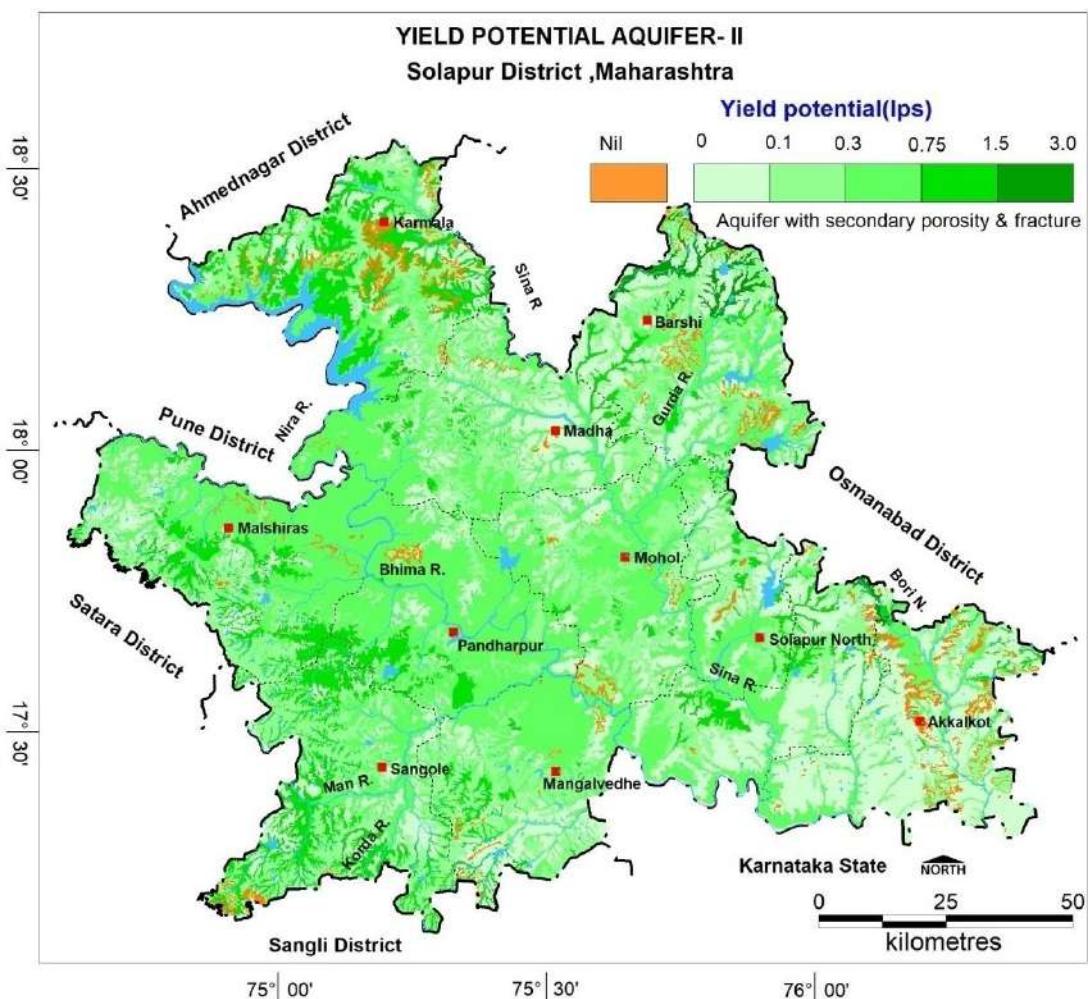

Fig 2.4: Aquifer II, Depth of occurrence and fractured rock thickness

**Fig 2.5: Yield potential Aquifer - I**

**Fig 2.6: Yield potential Aquifer – II**

## 2.2 Aquifer Parameters

Aquifer parameters are available from ground water exploration carried out in the district as well as from the pumping tests carried out on dugwells in Basaltic and Alluvial terrain. The specific capacity of the wells tapping Deccan Trap Basalt ranges between 1.6 and 5 lps/m of draw down and the transmissivity ranges from 1.25 to 207 m<sup>2</sup>/day. The specific capacity of dugwells tested in alluvial aquifer ranges between 1.1 and 10 lps/m of drawdown. During the pumping tests conducted on the exploratory wells in Alluvium, the transmissivity was found to vary from 30 to as high as 210 m<sup>2</sup>/day. The storage coefficient varied between  $3 \times 10^{-6}$  and  $1.7 \times 10^{-3}$ .

## 2.3 3-D and 2-D Aquifer Disposition

Based on the existing data, aquifer disposition in 3D, Fence diagram, and few hydrogeological sections have been prepared along section lines shown in **Fig 2.7 to 2.13** to understand the subsurface disposition of aquifer system.

### 3 WATER LEVEL SCENARIO

#### 3.1 Depth to water level (Shallow Aquifer-I)

The Depth to water level depends on the hydrogeological properties the rock formations, level of ground water development and topography of the area. Generally, it rises during the monsoon period and gradually decline in water level after monsoon till the next monsoon is arrived in the district. Central Ground water Board, Central Region has established 58 ground water monitoring stations in the entire district and periodically monitors it 4 times in a year, i.e. January, May (Premonsoon), August and November (Postmonsoon). Pre-monsoon and post monsoon water levels along with fluctuation during 2017 and long-term water level trends (2008-2017) are given in **Annexure-II**. Apart from this, under Naquim studies 160 key observation wells were also established and monitored during the year 2017 (**Annexure-III**). Ground water Surveys and Development Agency (GSDA), Govt. of Maharashtra also monitored 199 wells in the entire district. These data have been used for the preparation of depth to water level maps of the district.

### 3.1.1 Depth to Water Level – Pre-monsoon (May-2017)

The depth to water levels in Solapur district during May 2017 ranges between 4.1 mbgl (Khatgaon, Karmala taluka) and 23.5 mbgl (Maslechaudhary, Mohol taluka and Tanali, Pandharpur). The depth to water levels less than 5 mbgl is represented as localized point values and not prominent in the district. The depth to Water levels between 5-10 mbgl is observed in most part of the district and covers about 50% of the area. The depth to Water levels between 10-20 mbgl is observed in central part and east west elongated patch covering parts of Madha, Mohol, Pandharpur, North Solapur and South Solapur talukas. The depth to Water levels between 10-20 mbgl is also observed as small pockets in Karmal, Malshiras, Sangola, Mangalwedha and Barshi talukas. This zone covers about 35% of the district area. The depth to Water levels more than 20 mbgl is observed in small pockets around in central part of the district. The premonsoon depth to water level map is depicted in Fig. 3.1.

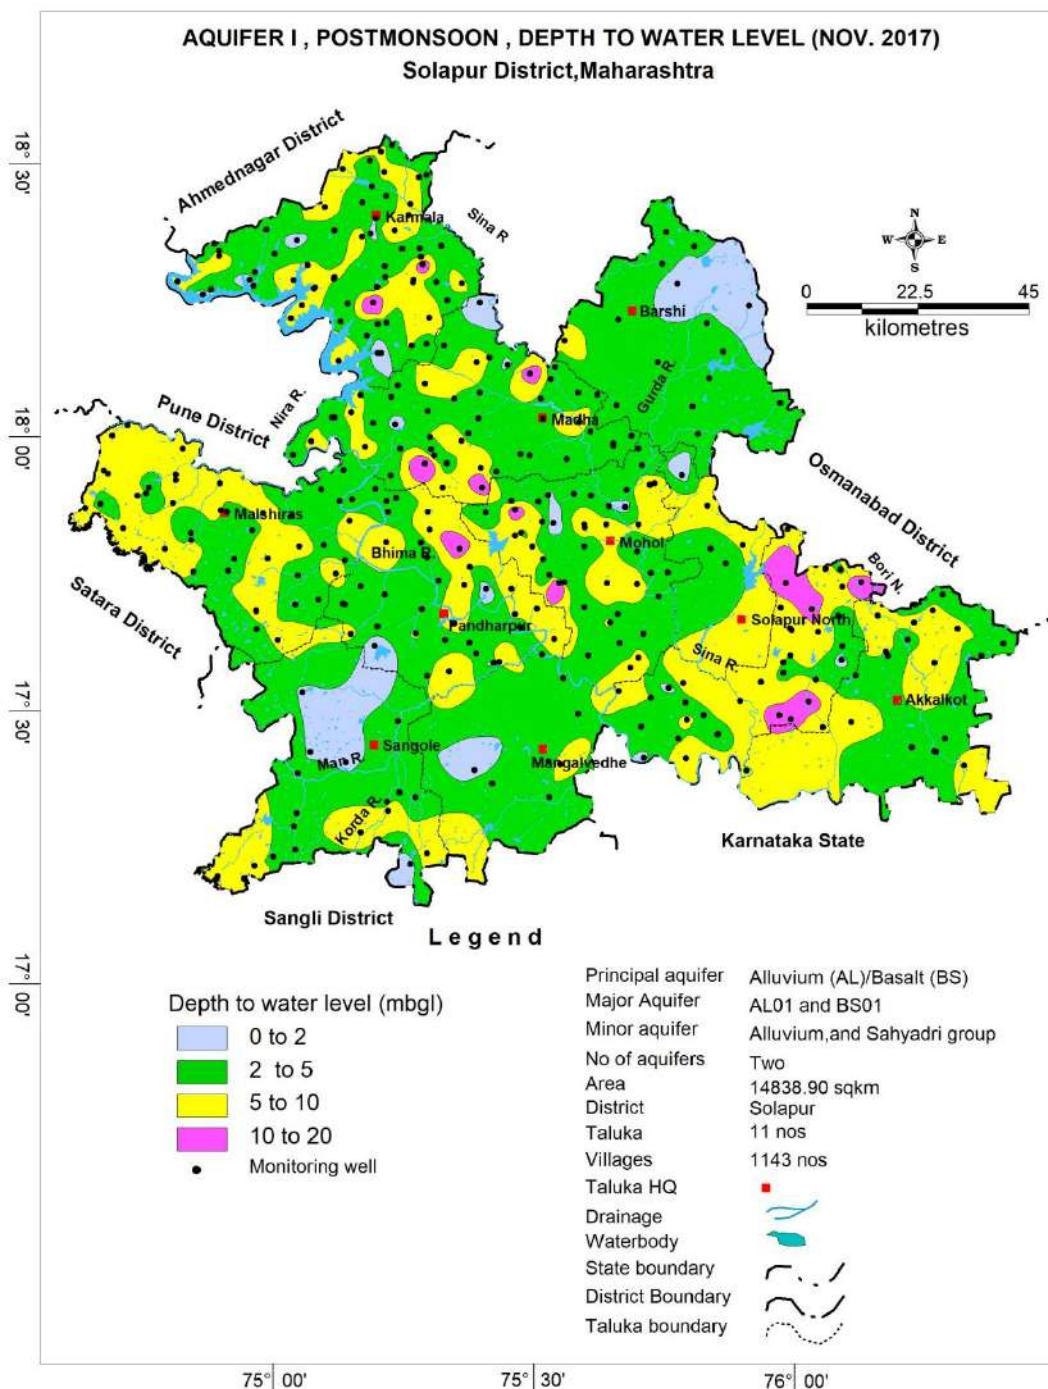

**Fig 3.1: Pre monsoon DTWL shallow aquifer (May 2017)**

### 3.1.2 Depth to Water Level – Post monsoon (Nov-2017)

The depth to water levels in Solapur district during Nov. 2017 ranges between 0.5 (Kuslamb, Barshi taluka and Kavitgaon, Karmala taluka) and 18.5 mbgl (Takali Shikandar, Mohol taluka). Shallow water levels within 2 m bgl are observed in north east part of Barshi, central and north east part of Sangola and small patches observed in Mangalwedha, Madha, Mohol and Karmala talukas. The depth to water levels between 2-5 mbgl is observed in major parts of the district covering Akkalkot, Mangalwedha, Madha, Mohol, karmala, Pandharpur, Barshi and malshiras talukas. It consists of about 60% area of the district. The depth to water levels between 5-10 mbgl is observed in most of the north Solapur , south Solapur, north west of Malshiras talukas and elongate patches in parts of Pandharpur, Madha, Sangola, Mohol, Karmala and north

of Akkalkot talukas. The depth to water levels above 10 mbgl is observed in small patches of north Solapur, south Solapur, Pandharpur, Madha and Karmala talukas. The post monsoon depth to water level map is shown in **Fig 3.2.**

**Fig 3.2: Post monsoon DTWL shallow aquifer (Nov 2017)**

### 3.1.3 Seasonal Water Level Fluctuation (May 2017 Vs Nov. 2017)

It is observed that minimum water level fluctuation was measured at Medhapur, Pandharpur taluka (0.20 m) while maximum water level fluctuation was measured at Wadachiwadi, Madha taluka (18 m). Rise in water level has been observed in entire district in the range of Rise 0-2, 2-4, 4-6 and >6 m. No decline in water level was observed in the District (**Fig. 3.3.**)

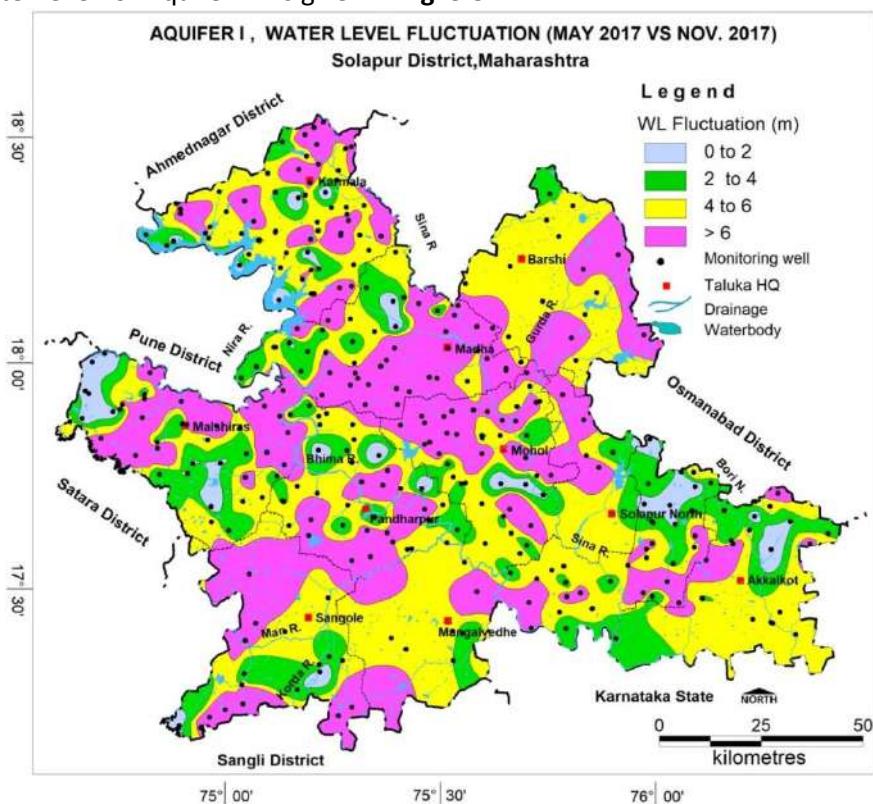

### 3.2 Depth to water level (Deeper Aquifer-II)

#### 3.2.1 Premonsoon Depth to Water Level (May-2017)

The pre-monsoon depth to water levels, during May 2017, range from 8.00 (Kaldar, Sangola taluka) to > 55.00 mbgl (Musti and Kumbhari, South Solapur taluka). The depth to water level less than 10 mbgl is observed in isolated parts of Karmala and Barshi talukas. The major parts of district show depth to water level between > 50 mbgl. The depth to water level between 10 and 30 mbgl is observed in major parts of Sangola, Karmala and Mohol Taluka. The premonsoon depth to water level for Aquifer –II is given in **Fig. 3.4** and the details are presented in **Annexure-IV**.

#### 3.2.2 Postmonsoon Depth to Water Level (Nov.-2017)

In Aquifer-II, the post monsoon depth to water levels in Solapur District during Nov. 2017 range between 2.00 (Chara, Barshi taluka) and 50.5 mbgl (Naganur, Akkalkot taluka). Depth to water level less than 10 m bgl has been observed in the southern and south-central part of the district and in parts of Karmala, Barshi, Sangola and Mohol talukas. The major part of the district shows deeper water levels ranging between 10 and 20 mbgl. The deepest water level of more than 40 mbgl is observed in the southern parts of Akkalkot and Madha talukas. The post monsoon depth to water level for Aquifer –II is given in **Fig. 3.5**.

**Fig 3.3: Water level fluctuation (May 2017 vs Nov 2017)**

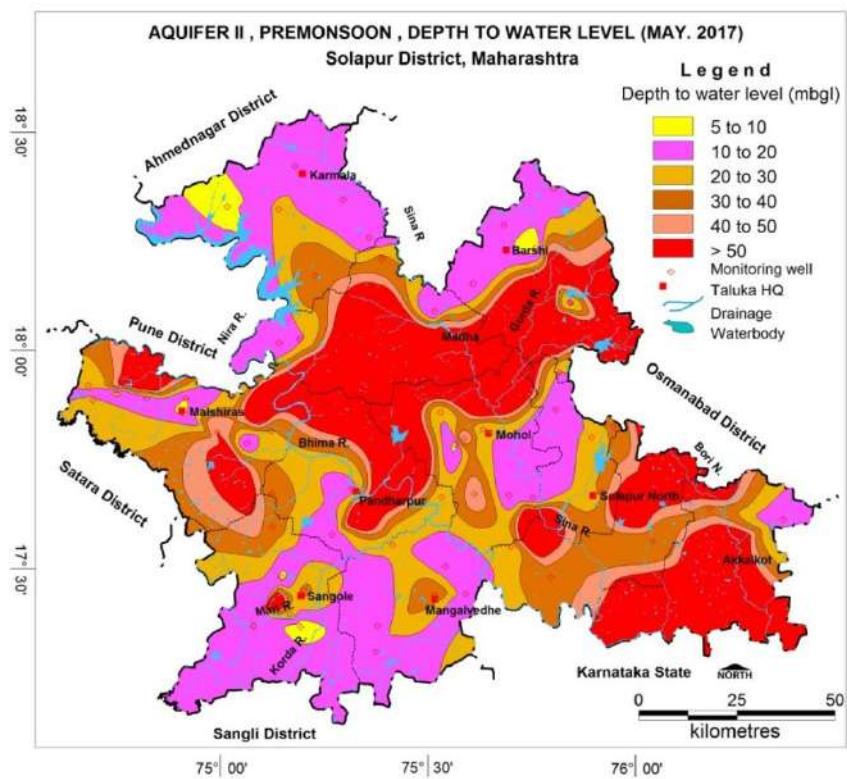

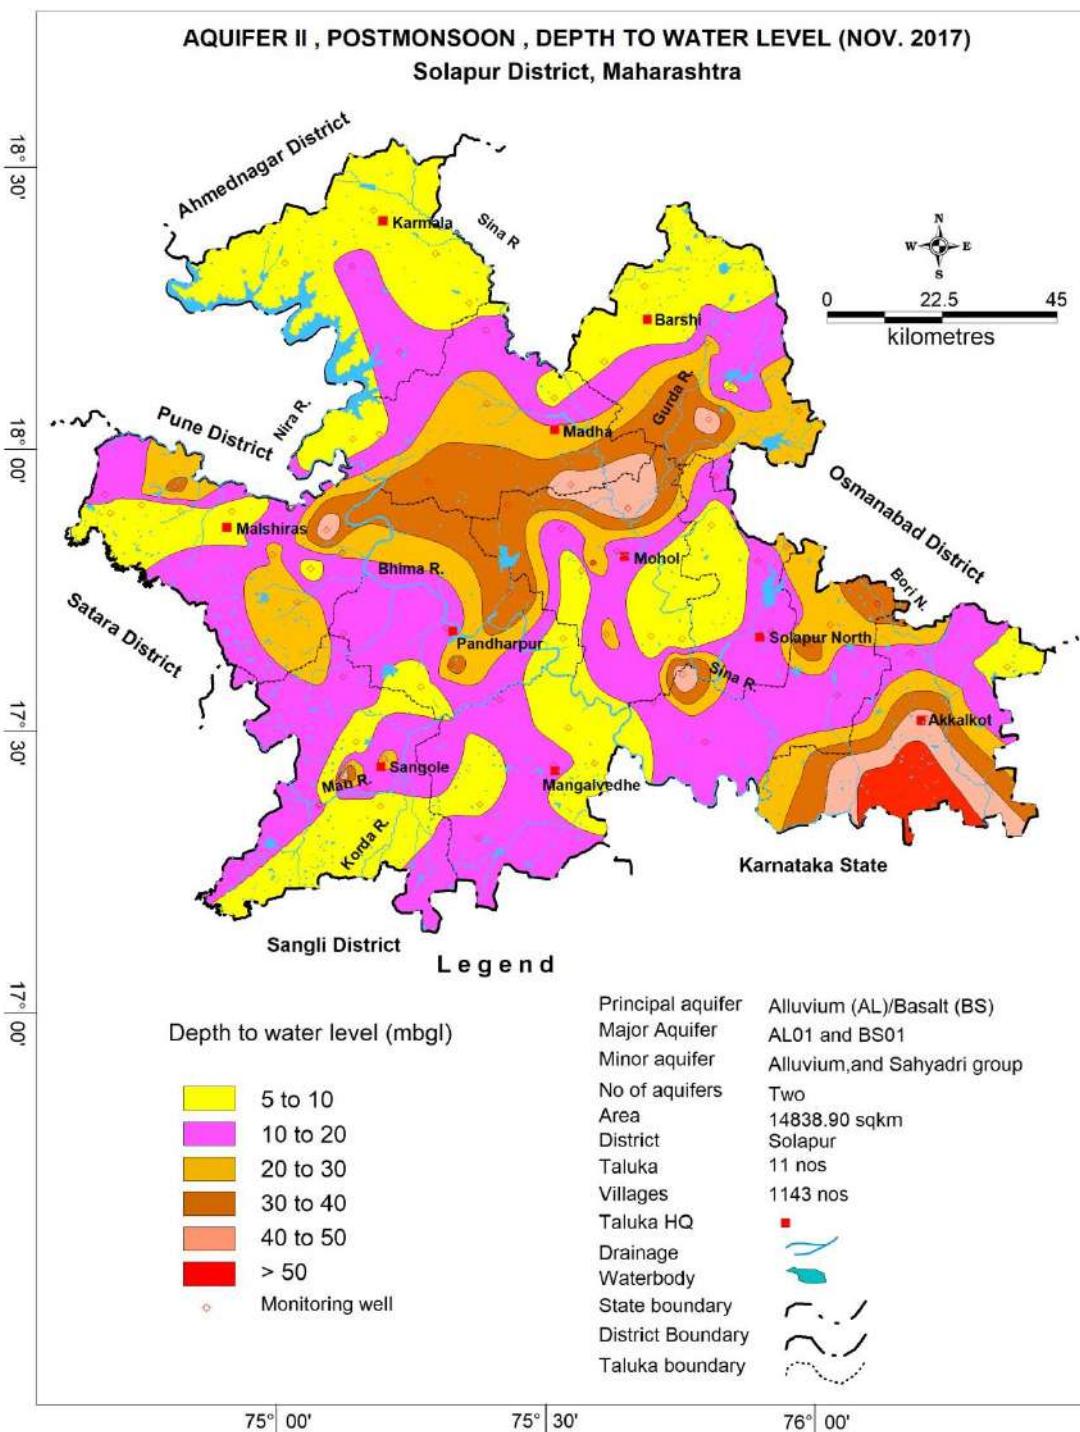

Fig 3.4: DTWL deeper aquifer (May. 2017)

**Fig 3.5: DTWL deeper aquifer (Nov. 2017)**

### 3.3 Water Level Trend (2008-2017)

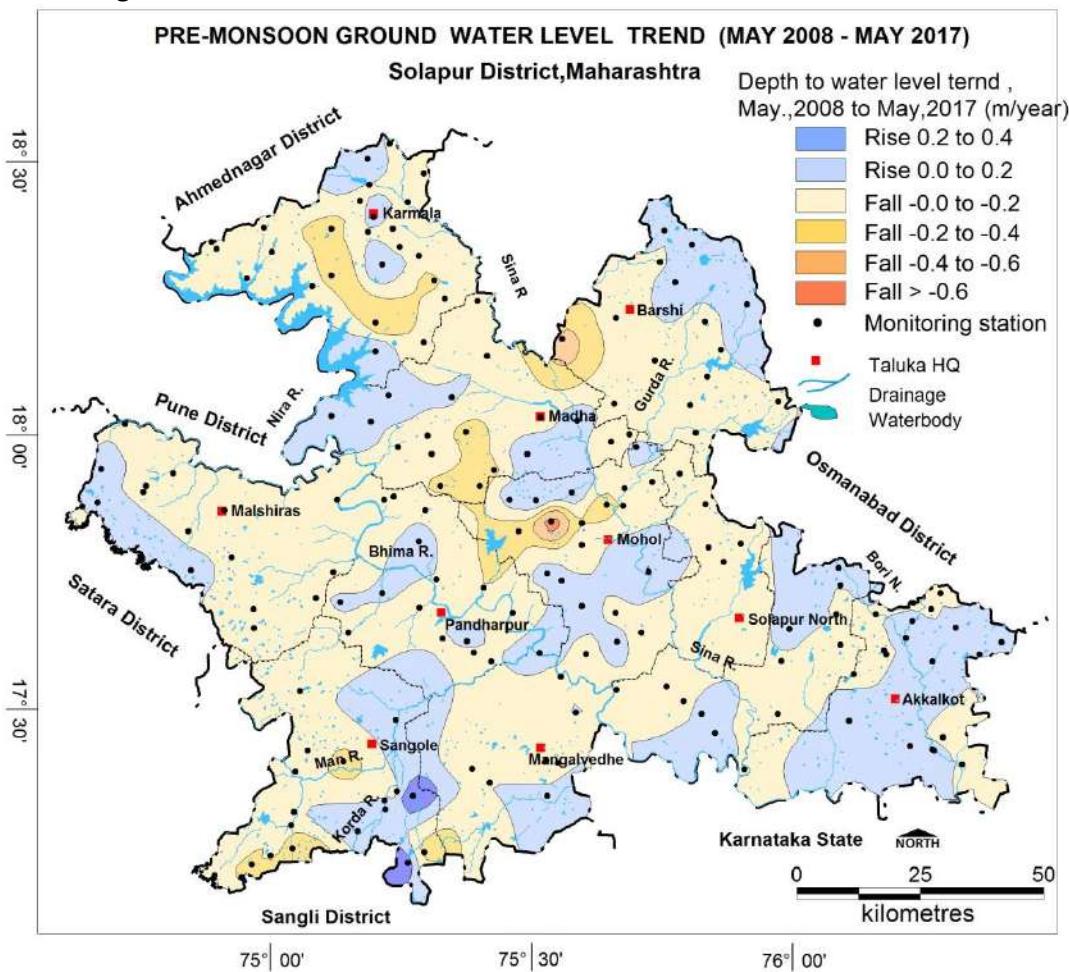

#### 3.3.1 Pre-monsoon water levels trend

In Solapur district, pre-monsoon rise in water levels trend has been recorded at 56 stations and ranges from 0.007 (Rajapur, Sangola taluka) to 0.34 m/year (Ajanale, Sangola taluka) while falling trend was observed in 121 stations varying from 0.004 (Dontri, Soalpur taluka) to 0.67 m/year (Hivare, Mohol taluka). During pre-monsoon, declining water level trend has been observed in about 10191sq km area during 2008-17, i.e., 68.4% of the area. Significant decline more than 0.20 m/year has been observed in 876 sq km, i.e., 5.8 % area covering major part of Karmala, Madha and Mohol talukas. Rise in water level trend has been observed in central

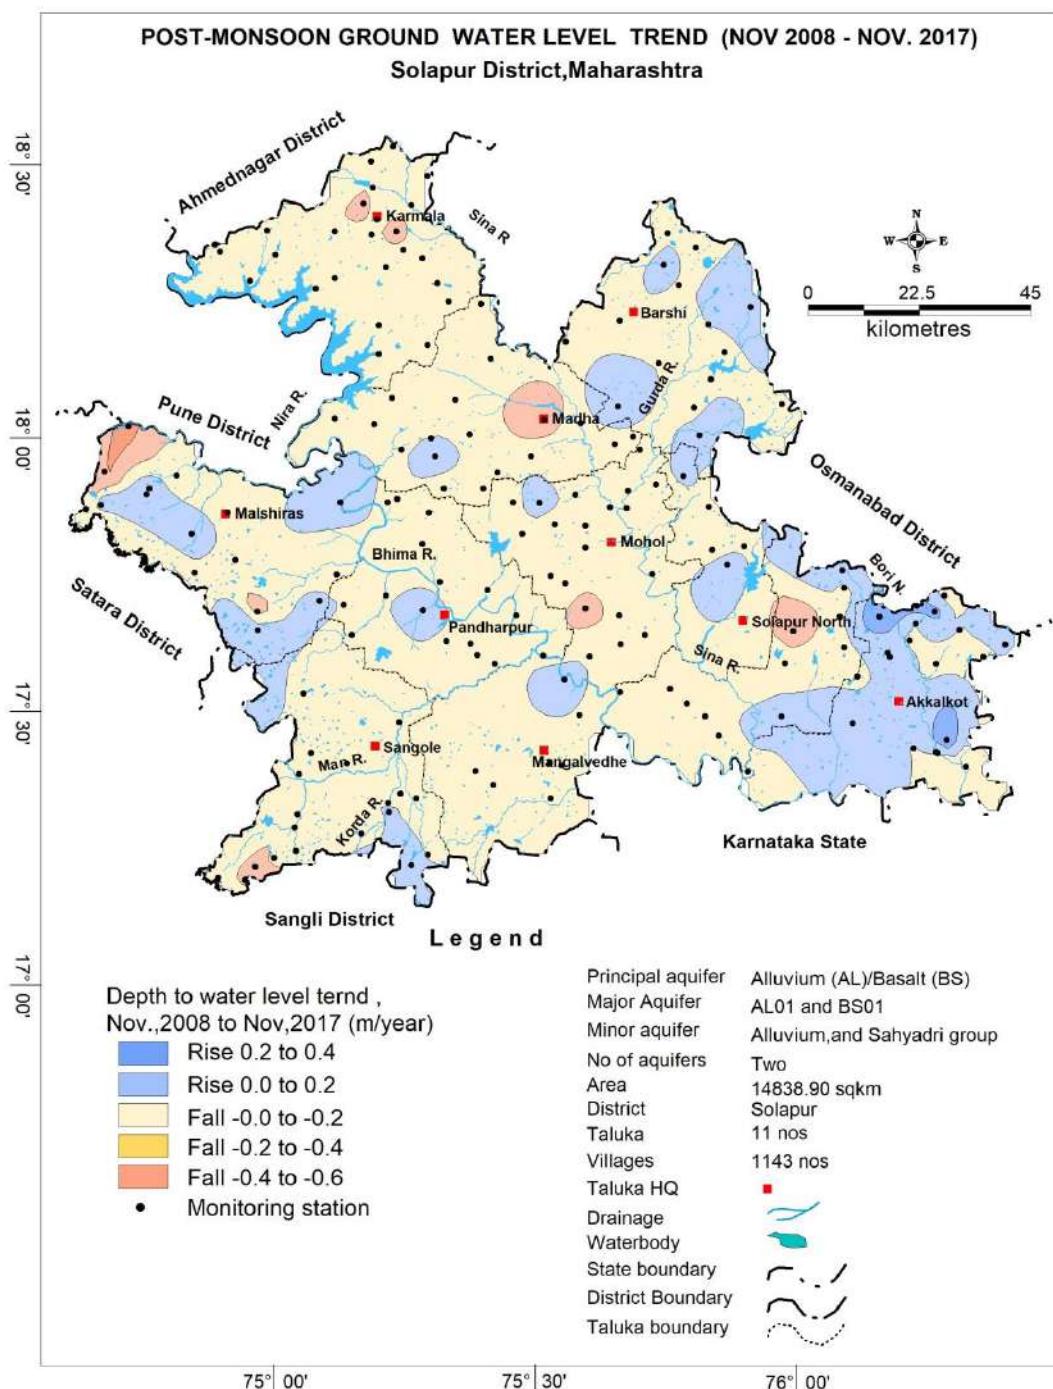

part of the district covering major part of Madha, Barshi and Akkalkot talukas. Premonsoon trend map is presented in Fig 3.6.

### 3.3.2 Post-monsoon water levels trend

In Solapur district, post monsoon rise in water levels trend has been recorded at 29 stations and it ranges between 0.009 (Natepute, Malshiras taluka) to 0.34 m/year (Basalegaon, Akkalkot taluka) while falling trend was observed in 148 stations varying from 0.001 (Chikharde, Barshi taluka) to 0.42 m/year (Kurbavi, Malshiras taluka). Rising water level trend has been observed in part of Akkalkot and Barshi Taluka Fall in water level trend has been observed in the major parts of the district. Significant decline more than 0.20 m/year has been observed in 439 sq km area Fig 3.7

**Fig 3.6: Premonsoon decadal water level trend (May 2008-May 2017)**

**Fig.3.7: Postmonsoon decadal trend (2008-17)**

### 3.4 Hydrograph Analysis

The variation in short term and long-term water level trends may be due to variation in natural recharge due to rainfall and withdrawal of groundwater for various agricultural activity, domestic requirements and industrial needs. The analysis of hydrographs show that the annual rising limbs in hydrographs indicate the natural recharge of groundwater regime due to monsoon rainfall, as the monsoon rainfall is the only natural source of water for recharge to the ground water regime (**Fig 3.8 to 3.12**) However, continuous increase in the groundwater draft is indicated by the recessionary limb.

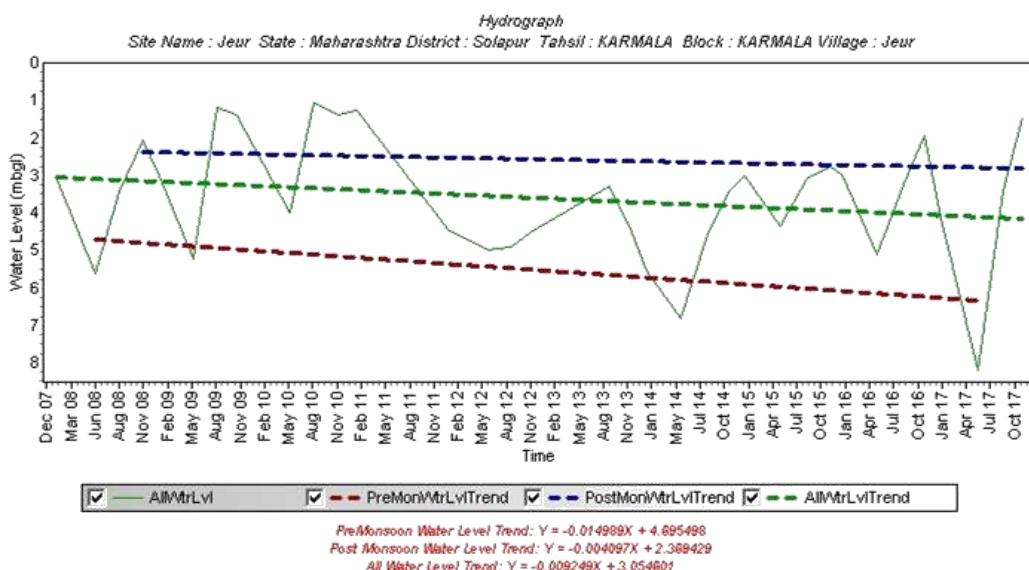

Fig 3.8: Hydrograph (2007-17), Jeur,Karmala Taluka

**Fig 3.12: Hydrograph (2007-17), Malshiras, Malshiras Taluka, SOLAPUR district**

## 4 GROUND WATER QUALITY

Water sampling is being done every year from GWM wells during pre-monsoon period (May). The data gap analysis has been carried out to find out the adequacy of information on water quality and identified additional locations, 90 for shallow and 15 for deeper aquifers. Ground water quality data of 99 monitoring wells of CGWB and GSDA representing shallow aquifer and 104 samples data from earlier studies representing shallow aquifer have been utilised to decipher the quality scenario of shallow aquifer. 189 exploratory wells tubewells / borewells of CGWB and GSDA and 119 exploratory well data from earlier studies representing deeper aquifer have been utilised to decipher the quality scenario of deeper aquifer. The aquifer wise ranges of different chemical constituents present in ground water are given in **Table 4.1**. The details of ground water quality analysis of Aquifer-I and Aquifer-II are given in **Annexure-VI** and **Annexure-VI** respectively.

**Table 4.1: Aquifer wise ranges of chemical constituents in Solapur district**

Constituents	Shallow aquifer		Deeper aquifer	
	Min	Max	Min	Max
pH	6.5	9.2	6.5	9.5
EC	298	10000	375	2910
TDS	191	6400	200	1885

Constituents	Shallow aquifer		Deeper aquifer	
	Min	Max	Min	Max
TH	40	2560	25	960
Calcium	8	926	0	245
Magnesium	0	501	0	109
Potassium	0.03	78.45	0	8.3
Sodium	3.9	796	0	400
Bi-carbonate	19.5	658	11	403
Chloride	70	1550	0	440
Sulphate	3	1260	0	752
Nitrate	0	879	0	220
Fluoride	0	1.5	0	12

## 4.1 Electrical Conductivity (EC)

### 4.1.1 Distribution of Electrical Conductivity in Shallow Aquifer:

The EC in shallow aquifer varies between 298 (Musti, South Solapur taluka) and 10000  $\mu\text{S}/\text{cm}$  (Akole kathi, North Solapur taluka). Out of 189 samples collected from dug wells, 14 samples are having EC in range of 2250 to 3000  $\mu\text{S}/\text{cm}$  and only 17 samples have shown EC > 30000  $\mu\text{S}/\text{cm}$ . It is observed that the concentration of high EC > 2250  $\mu\text{S}/\text{cm}$  has been observed in patches in Pandharpur, North and south Solapur taluka and small parts of Madha and Malshiras taluka. The distribution of electrical conductivity in shallow aquifers is shown in **Fig: 4.1** and analytical data is presented in **Table 4.2**.

### 4.1.2 Distribution of Electrical Conductivity in Deeper Aquifer:

The concentration of EC in deep aquifer varies between 375 (Shelgone, Barshi taluka) and 2910  $\mu\text{S}/\text{cm}$  (Alagi, Akkalkot taluka). Out of 119 samples collected from tube wells/bore wells, 5 samples are having EC more than 2250  $\mu\text{S}/\text{cm}$ . It is observed that the concentration of high EC more than 2250 has been observed in parts of South Solapur and Akkalkot talukas. The distribution of electrical conductivity in deeper aquifers is shown in **Fig: 4.2** and analytical data is presented in **Table 4.2**.

**Table 4.2: Aquifer wise Electrical conductivity data**

S.No.	EC ( $\mu\text{S}/\text{cm}$ )	shallow aquifer		Deeper Aquifer	
		No. of samples	% of samples	No. of samples	% of samples
1	< 250	0	0.00	0	0
2	>250-750	27	16.07	49	41.18
3	>750-2250	110	65.48	65	54.62
4	2250-3000	14	8.33	5	4.20
5	3000-5000	12	7.14	0	0
6	5000	5	2.98	0	0
Total samples		168	100	119	100

## 4.2 Nitrate:

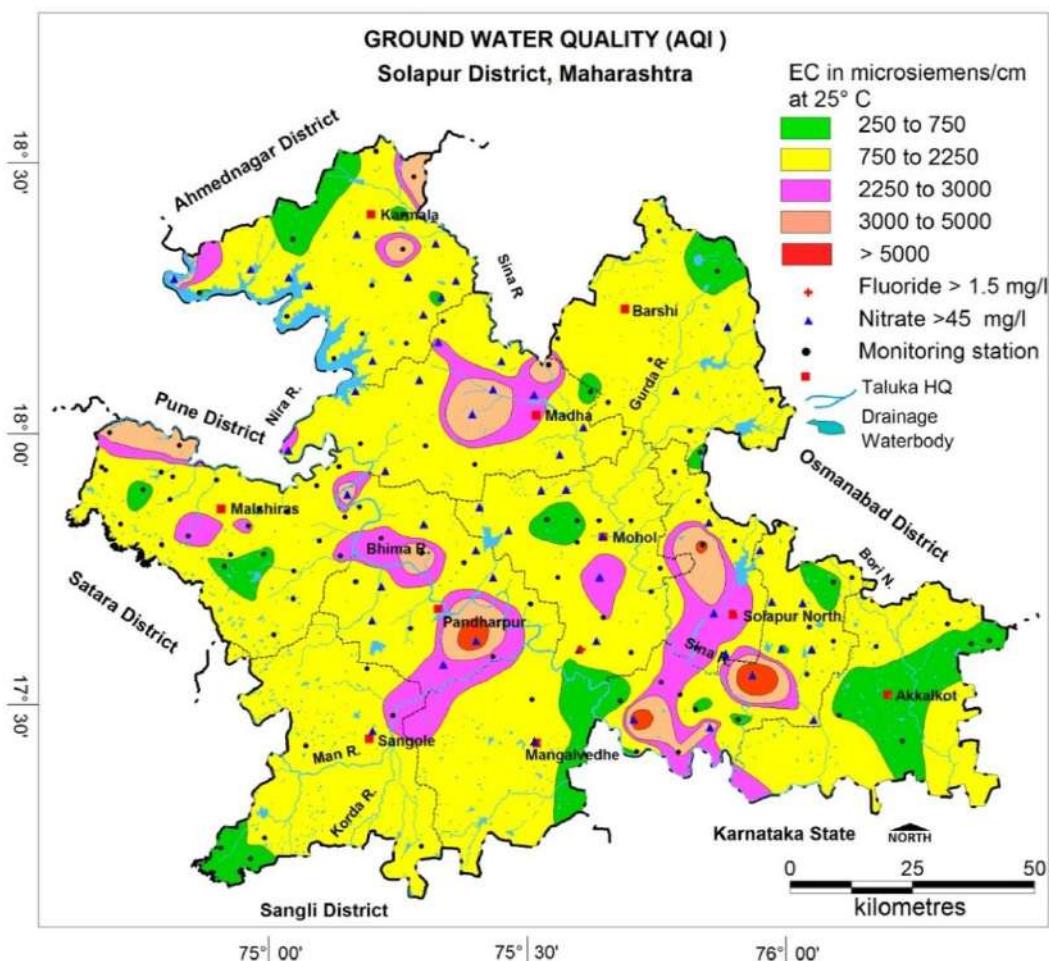

Nitrogen in the form of dissolved nitrate nutrient for vegetation, and the element is essential to all life. The major contribution in ground water is from sewage, waste disposal, nitrate fertilizer and decaying of organic matter. In Solapur district nitrate concentration varies between 0 to 879 mg/l. As per BIS (2012) the desirable limit is 45 mg/l. In shallow aquifer, 189 samples were analysed, out of this 54 water samples show the nitrate concentration exceeded the desirable limit of 45 mg/l. The high concentration of Nitrate may be due to domestic waste and sewage in the urban and rural parts of district. In deeper aquifer, 119 wells analysed, out of this 15 water samples show that the nitrate concentration exceeded the desirable limit of 45 mg/l. The deeper aquifer are also affected by nitrate contamination, it may be due to percolation of nitrate contaminants from the ground surface as there are no other reasons for nitrate contamination in deeper aquifers. Aquifer wise nitrate concentration is given in **Table 4.3**.

### 4.3 Fluoride:

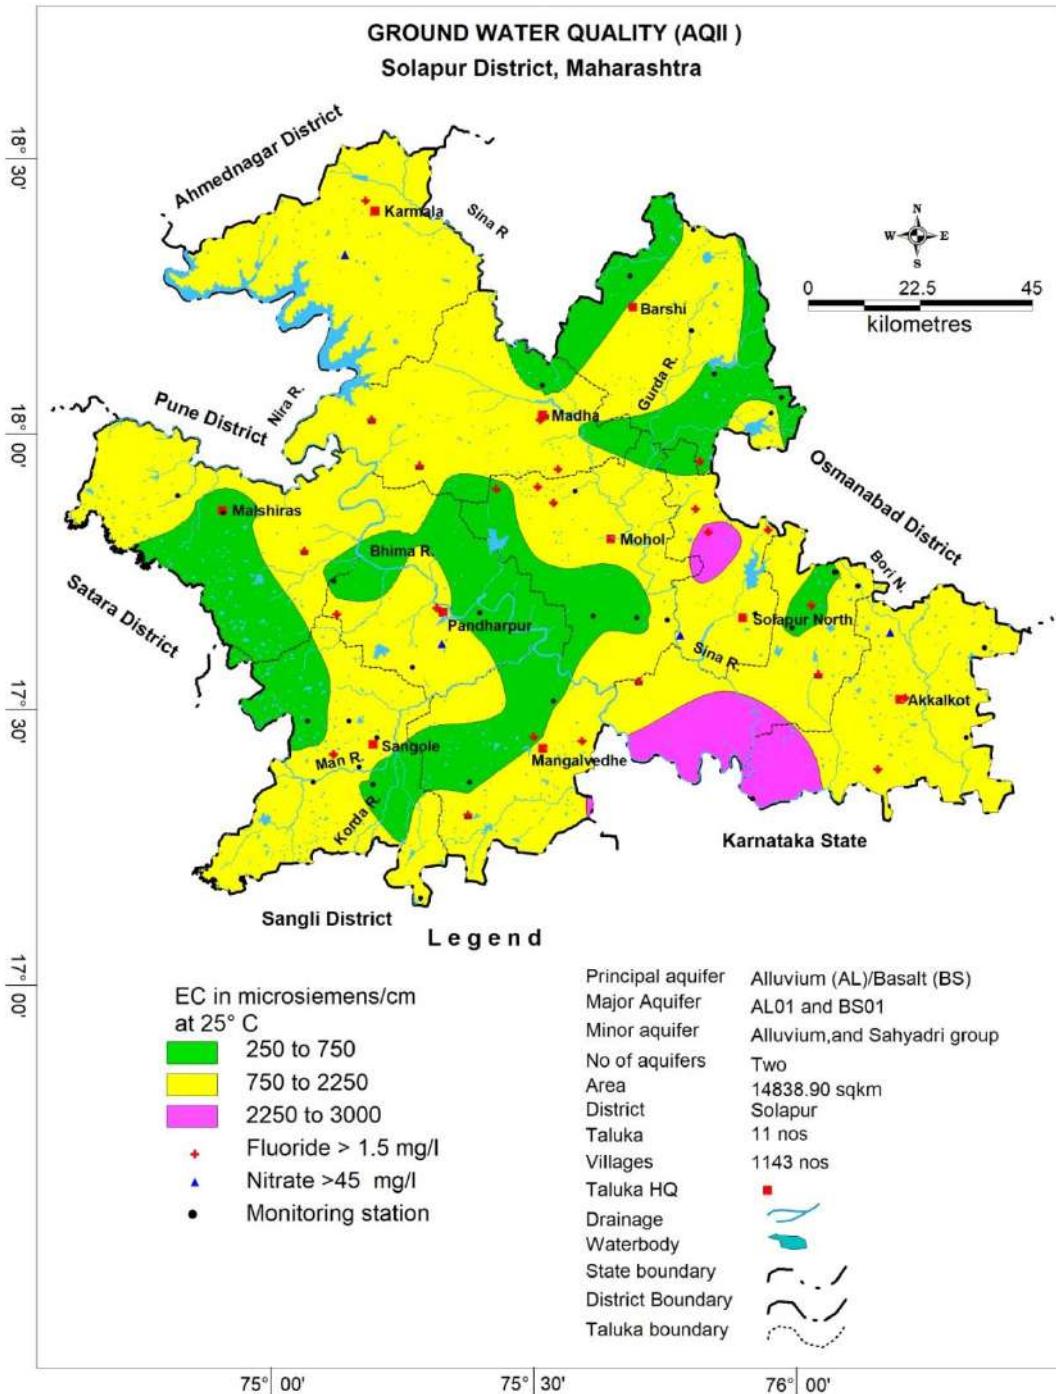

In shallow aquifer, concentration of fluoride ranges from 0.01 to 1.5 mg/l. out of 169 samples analyzed, only 6 samples show fluoride concentration more than 1 mg/l in shallow aquifer. In Deeper Aquifer, concentration of fluoride ranges from 0.22 to 12 mg/l out of 95 samples analysed, 53 samples show fluoride concentration more than 1 mg/l. In Deeper aquifer, the highest concentration of fluoride is found in Madha, South Solapur and North Solapur Talukas, it may due to the lithological reason only. Aquifer wise fluoride concentration is given in table 4.3.

**Table 4.3: Aquifer wise nitrate and Fluoride concentration in Solapur district**

Taluka	No <sub>3</sub> > 45 mg/l		fluoride > 1 mg/l	
	No of samples Shallow Aquifer	No of samples Deeper Aquifer	No of samples Shallow Aquifer	No of samples Deeper Aquifer
AKKALKOT	0	1	0	2

**Fig. 4.1: Ground water quality, Aquifer-I**

**Fig. 4.2: Ground water quality, Aquifer-II**

#### 4.4 Suitability of ground water for drinking purpose

In shallow aquifer, 6.41 % samples are having TDS concentration more than maximum permissible limit (MPL) and 55.13 % of samples have TDS concentration above the Desirable limit (DL) but below the MPL. The water from such area is not fit for drinking purpose if directly consumed without treatment. It is also seen that about 1 to 31 % samples are beyond the maximum permissible limit for the parameters like TH, Ca, Mg, Cl,  $\text{SO}_4$  and  $\text{NO}_3$  indicating that the water is not suitable for drinking purpose. Concentration of Chemical constituents in shallow Aquifer is given in **Table 4.4**.

In Deeper aquifer, 7.56 % samples are having TDS concentration more than the Desirable limit (DL) but below the MPL. The water from such area is not fit for drinking purpose if directly

consumed without treatment. It is also seen that about 2 to 15 % samples are beyond the maximum permissible limit for the parameters like TH, Ca, Mg, Cl, SO<sub>4</sub> and NO<sub>3</sub> indicating that the water is not suitable for drinking purpose. Concentration of Chemical constituents in shallow Aquifer is given in **Table 4.5.**

**Table 4.4: Concentration of Chemical constituents in shallow Aquifer**

Parameter	Drinking water Standards (IS-10500-2012)		Total no of ground water samples	Shallow aquifer						
				Samples (<DL)		Samples (DL-MPL)		Samples (>MPL)

#### 4.5 Suitability of ground water for irrigation

The water used for irrigation is an important factor in productivity of crop, its yield and quality of irrigated crops. The quality of irrigation water depends primarily on the presence of dissolved salts and their concentrations. The Electrical Conductivity (EC), Sodium Absorption Ratio (SAR) and Residual Sodium Carbonate (RSC) are the most important quality criteria, which influence the water quality and its suitability for irrigation.

#### **4.5.1 Electrical Conductivity (EC)**

The number of dissolved ions in the water is best represented by the parameter electrical conductivity. The classification of water for irrigation based on the EC values is given in **Table 4.6** and discussed as follows:-

**Low Salinity Water (EC: 100-250  $\mu\text{S}/\text{cm}$ ):** This water can be used for irrigation with most crops on most soils with little likelihood that salinity will develop.

**Medium Salinity Water (EC: 250 – 750  $\mu\text{S}/\text{cm}$ ):** This water can be used if moderate amount of leaching occurs. Plants with moderate salt tolerance can be grown in most cases without special practices for salinity control.

**High Salinity Water (EC: 750 – 2250  $\mu\text{S}/\text{cm}$ ):** This water cannot be used on soils with restricted drainage.

Even with adequate drainage, special management for salinity control may be required and plants with good salt tolerance should be selected.

**Very High Salinity Water (EC: >2250  $\mu\text{S}/\text{cm}$ ):** This water is not suitable for irrigation under ordinary condition. The soils must be permeable, drainage must be adequate, irrigation water must be applied in excess to provide considerable leaching and very salt tolerant crops should be selected.

**Table 4.6: Classification of Ground water for Irrigation based on EC values**

S.No.	EC ( $\mu\text{S}/\text{cm}$ )	shallow aquifer		Deeper Aquifer	
		No. of samples	% of samples	No. of samples	% of samples
1	< 250	0	0.00	0	0
2	>250-750	27	16.07	49	41.18
3	>750-2250	110	65.48	65	54.62
4	2250-3000	14	8.33	5	4.20
5	3000-5000	12	7.14	0	0
6	5000	5	2.98	0	0
Total samples		168	100	119	100

In shallow aquifer, maximum numbers of samples fall under the category of medium to high salinity type of water. In deeper Aquifer, also maximum numbers of samples fall under the category of medium to high salinity type of water. The areas where very high salinity prevails ( $>2250 \mu\text{S}/\text{cm}$ ) ground water can be used for irrigation for very high salt tolerant crops and with proper soil and crop management practices

#### **4.5.2 Sodium Absorption Ratio (SAR)**

Since Calcium and Magnesium will replace Sodium more readily than vice versa, the ratio reflects the Sodium hazard. The SAR indicates the relative activity of the Sodium ions in exchange reactions with the soil. The main problem with high sodium concentration is its effect on soil permeability; hardening of soil & water irrigation system. Sodium also contributes directly to the total salinity of the water and may be toxic to sensitive crops such as fruit trees. The higher value of SAR indicates soil structure damage. In shallow aquifer, out of 189 samples analyzed and 187 samples are having SAR less than 10 and 2 samples are having SAR value more than 10. In deeper aquifer, out of 119 samples 113 samples are having SAR value less than 10 and only one sample having SAR more than 18. The classification of ground water samples based on SAR values for its suitability for irrigation purpose is shown in **Table 4.7**.

**Table 4.7: Classification of Ground water for Irrigation based on SAR values**

Characteristics	Quality	SAR value					
		< 10	10-18		18-26		> 26
		Good		Good to Permissible		Doubtful	Bad (Unsuitable)
	Total No of GW samples	Samples	Samples		Samples	Samples	
		No	%	No	%	No	%
Shallow Aquifer	189	187	98.94	2	1.07	0	0.00
Deeper Aquifer	119	113	94.96	5	4.42	1	0.88
<b>Total</b>	<b>308</b>	<b>300</b>	<b>97.40</b>	<b>7</b>	<b>2.33</b>	<b>1</b>	<b>0.33</b>
						<b>0</b>	<b>0</b>

#### **4.5.3 Residual Sodium Carbonate (RSC):**

Residual Sodium Carbonate (RSC) is considered to be superior to SAR as a measure of sodicity particularly at low salinity levels. Calcium reacts with bi-carbonate and precipitate as  $\text{CaCO}_3$ . Magnesium salt is more soluble and so there are fewer tendencies for it to precipitate. When calcium and magnesium are lost from the water, the proportion of sodium is increased resulting in the increase in sodium hazard. This hazard is evaluated in terms of RSC. The classification of ground water samples based on RSC values for its suitability for irrigation purpose is shown in **Table 4.8**.

**Table 4.8: Classification of Ground water for Irrigation based on RSC values**

Characteristics	Total No of GW samples	RSC values (meq/L)					
		< 1.25		1.25-2.50		> 2.50	
		Good		Doubtful		Bad (Unsuitable)	
	No. of Samples	%	No. of Samples	%	No. of Samples	%	
Shallow Aquifer	189	172	91.01	7	4.07	10	5.81
Deeper Aquifer	119	115	96.64	4	3.48	0	0.00
<b>Total</b>	<b>308</b>	<b>287</b>	<b>93.18</b>	<b>11</b>	<b>3.83</b>	<b>10</b>	<b>3.48</b>

In shallow aquifer, it is observed that out of 189 samples only 17 samples show RSC values more than 1.25 meq/L indicating that the ground water of the area is not suitable for irrigation while in deeper aquifer, out of 119 samples only 4 samples show RSC more than 1.25 meq/L indicating that the ground water of the area is not suitable for irrigation.

## **5 GROUND WATER RESOURCES**

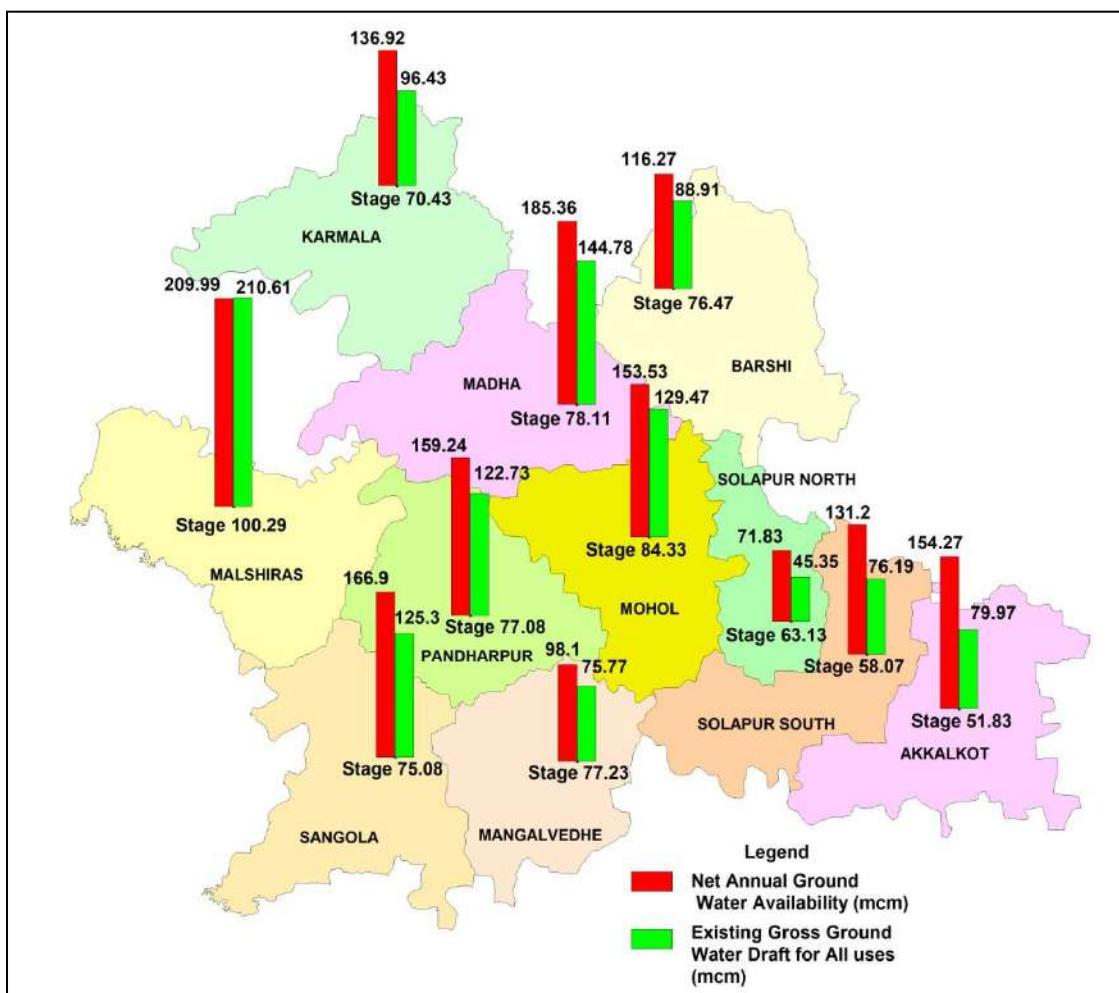

### **5.1 Ground Water Resources – Aquifer-I**

Central Ground Water Board and Ground Water Survey and Development Agency (GSDA) have jointly estimated the ground water resources of Solapur district based on GEC-97 methodology. Taluka wise ground water resources are given in **Table 5.1**, and graphical representations of the resources on the map are shown in **Fig. 5.1**.

**Table 5.1: Ground water resources, Aquifer-I (Shallow aquifer), Solapur district (2013)**

Sr No.	Administrative Unit	Command / Non-Command / Total	Net Annual Ground Water Availability	Existing Gross Ground Water Draft for irrigation	Existing Gross Ground Water Draft for domestic and industrial water supply	Existing Gross Ground Water Draft for All uses	Provision for domestic and industrial requirement supply to 2025	Net Ground Water Availability for future irrigation development	Stage of Ground Water Development %

**Fig 5.1: Ground Water Resources, Solapur district**

Ground Water Resources estimation was carried out for 14838.9 sq. km. area out of which 1972.86 sq. km. is under command and 12866.04 sq. km. is non-command. About 56.1 sq. km. area has hilly area and that area is not considered for resource estimation. As per the estimation, the net annual ground water availability comes to be 1583.65 MCM. The gross draft for all uses is estimated at 1195.52 MCM with irrigation sector being the major consumer having a draft of 1146.89 MCM. The domestic and industrial water requirements are worked at 48.63 MCM. The net ground water availability for future irrigation is estimated at 395.16 MCM. Stage of ground water development varies from 51.83 % (South Solapur) to 100.29% (Malshiras). The overall stage of ground water development for the district is 75.49%. Taluka wise assessments indicate that all the talukas in the district fall under "Safe" category, except Malshiras (Overexploited) and Mohol which is semi-critical.

## 5.2 Ground Water Resources – Aquifer-II

The ground water resources of Aquifer-II (Basalt) were also assessed to have the correct quantification of resources so that proper management strategy can be framed. The total resources of aquifer-II have been estimated as 348.20 MCM. Taluka wise summarized Ground Water Resources of Aquifer-II is given in **Table 5.2**.

**Table 5.2: Taluka wise summarized Ground Water Resources of Aquifer-II (Deeper aquifer)**

## 6 GROUND WATER RELATED ISSUES

### 6.1 Declining Water Levels

The ground water exploitation has resulted in decline of water levels over the period of time. In premonsoon season, declining water level trend has been observed in about 10191sq km area during 2008-17, i.e., 68.4% of the geographical area. Significant decline more than 0.20 m/year has been observed in 876 sq km, i.e., 5.8 % area covering major part of Karmala, Madha and Mohol talukas. In post monsoon season, fall in water level trend has been observed in the major parts of the district. Significant decline more than 0.20 m/year has been observed in 439 sq km area (**Fig. 6.1**).

**Fig 6.1** Premonsoon water level trend

**Fig 6.2 Postmonsoon water level trend**

## 6.2 Low Rainfall and Droughts

The entire district comes under the rain shadow area. Rainfall is uncertain and scanty. The average rainfall for the district is 541 mms and classified as Drought Prone areas Based on the rainfall trend analysis from 2006 to 2017 it is observed that the except 3 talukas of Solapur district experience low and declining rainfall trend (Fig 6.3 to Fig 6.5).

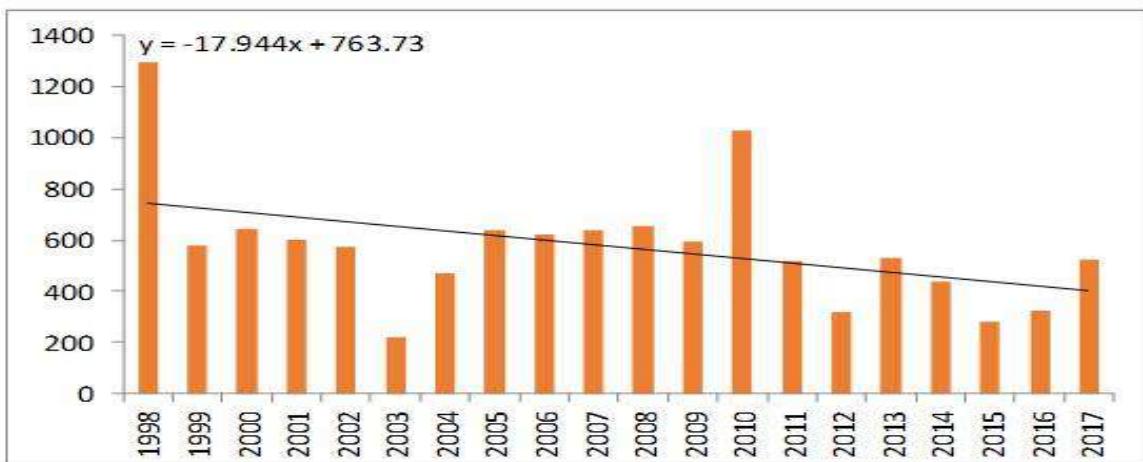

Fig. 6.3: Rainfall Trend (1998-17), Mohol taluka

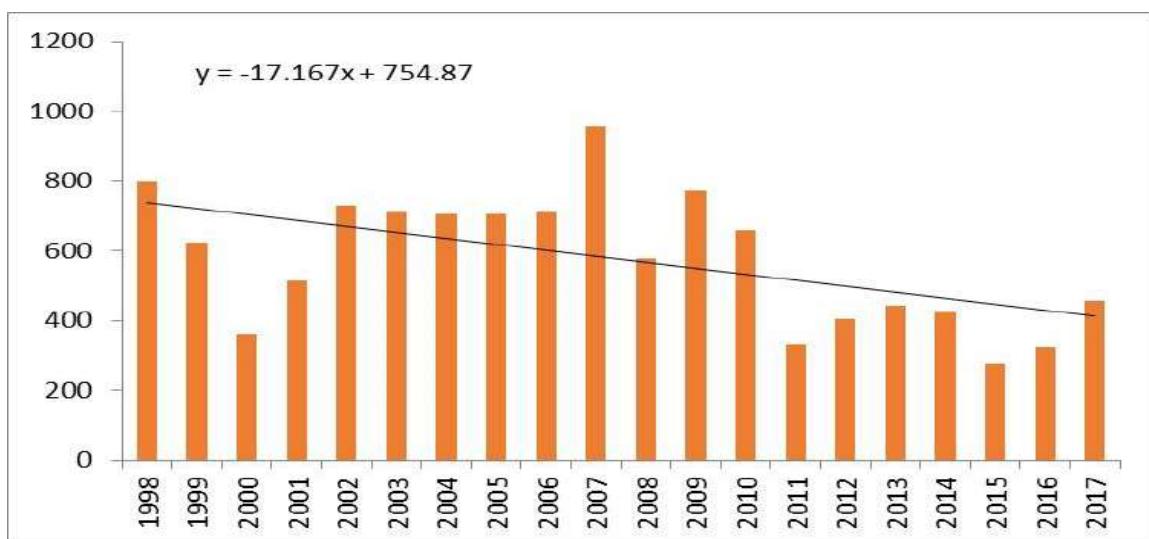

Fig. 6.4: Rainfall Trend (1998-17), Mangalvedhe taluka

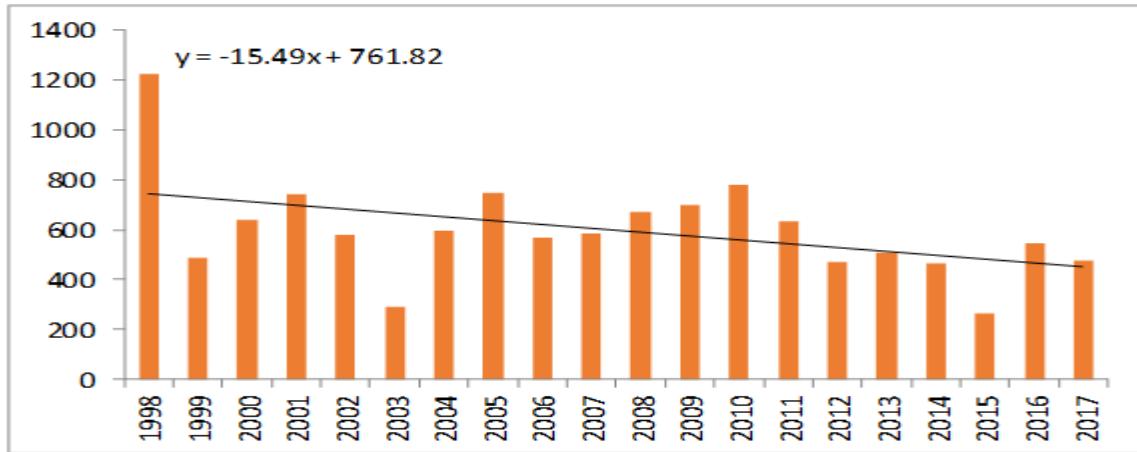

Fig. 6.5: Rainfall Trend (1998-17), South Solapur taluka

### 6.3 Caving and air loss during drilling:

Red boles, black boles, the intertrappean beds, have collapsible nature when they are saturated. The weathered/highly fractured saturated formation at the contact zones also collapse as a result of which drill rods assembly gets stuck up. This sometimes leads to loss of circulation of fluid there by compounding the problems further. The thickness ranging from 8 to 10 m. The water bearing zones encountered fills up the bore well and that infuses

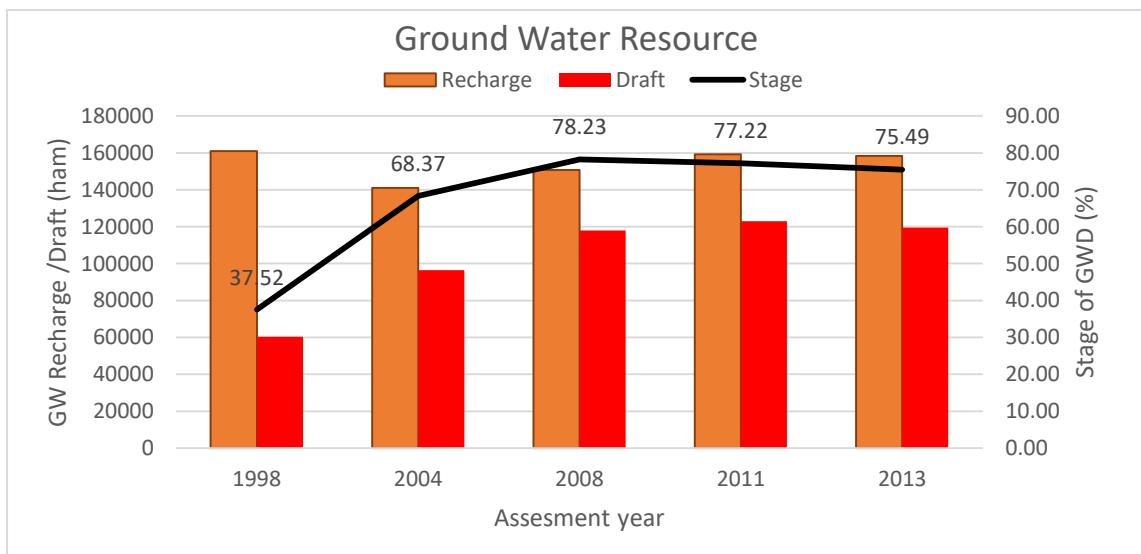

the bore beds in the succession resulting in the collapse of the bore beds. The casing or cement sealing of the red bore is not possible below 100 m bgl, as the present rig is equipped to lower casing down to 100 m bgl depth. Loss of air in jointed and fractured Basalt was observed during drilling. The problem can be solved by sealing the zones by lowering casing or by cement sealing. This process may often damage the potential aquifer zones if not carried out meticulously with proper equipment.

#### **6.4 Low Ground Water Storage Potential**

Low ground water potential areas have been identified in 7878 sq km (about 52.9 %) in the Solapur District, where yield remains less than 25 m<sup>3</sup>/day, mostly due to limited depth of weathering and fractures in Aquifer-I (Basalt). Limited aquifer potential of Aquifer-II (Basalt) is seen in about 13191 sq km (about 88 %) of the Solapur district, having yield potential less than 1.0 lps. Sustainability of both the aquifers is limited and the wells normally sustain pumping of 0.5 to 3 hours.

#### **6.5 Continues Increase in Draft, and Stage of Ground Water Development**

The stage of ground water development has increased over the period of time from 1998 to 2013 from 37.52 % to 75.49 % (**Fig. 6.6**). The main reason for ground water overdraft is intensive irrigation for cash crop. Overall draft for these talukas has increased from 604.14 MCM in 1998 to 1195.52 MCM in 2013.

**Fig. 6.6: Ground Water Resources, 1998-2013, Solapur district**

### **7 GROUND WATER MANAGEMENT PLAN**

The management plan has been proposed to manage the ground water resources and to arrest further decline in water levels. The management plan comprises two components namely supply-side management and demand side management. The supply side Management is proposed based on surplus surface water availability and the unsaturated thickness of aquifer whereas the demand side management is proposed by use of micro irrigation techniques and change in cropping pattern.

## 7.1 SUPPLY SIDE MANAGEMENT

The supply side management of ground water resources can be done through the artificial recharge of surplus runoff available within river sub basins and micro watersheds. Also, it is necessary to understand the unsaturated aquifer volume available for recharge. The unsaturated volume of aquifer was computed based on the area feasible for recharge, unsaturated depth below 5mbgl and the specific yield of the aquifer. The **Table 7.1** gives the district wise volume available for the recharge.

**Table 7.1: Area feasible and volume available for Artificial Recharge**

Taluka	Geographical Area (sq. km.)	Area feasible for recharge (Sq km)	Unsaturated Volume (MCM)
Karmala	1659.83	1229.39	2458.78
Madha	1559.33	1484.36	2968.72
Mohol	1360.46	1228.42	2456.84
Pandharpur	1290.1	1052.92	2105.84
S. Solapur	1084.15	963.365	1926.73
Malshiras	1528.01	498.16	996.32
<b>Total</b>	<b>8481.88</b>	<b>6456.615</b>	<b>12913.23</b>

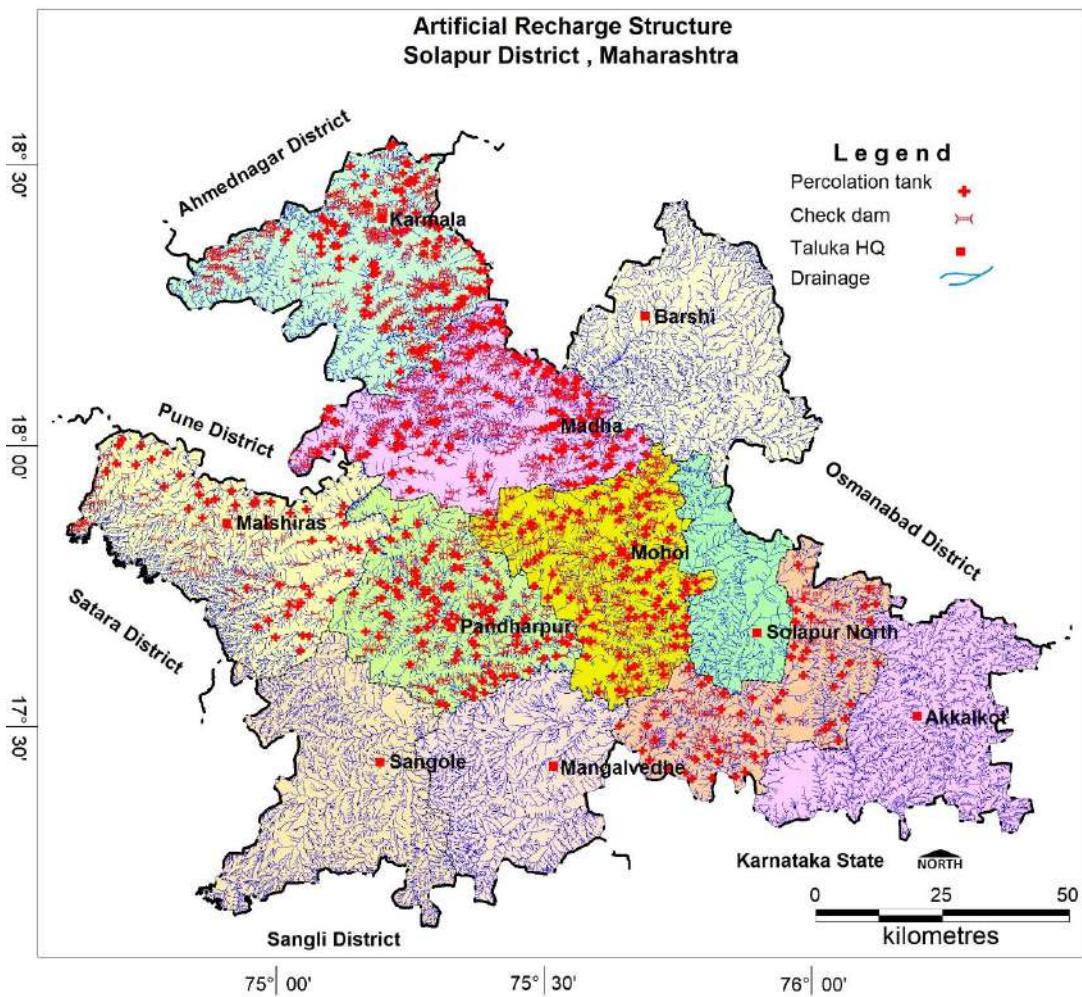

The total unsaturated volume available for artificial recharge is 12913.23 MCM and it ranges from 996 MCM in Malshiras taluka to 2968 MCM in Madha taluka. The available surplus runoff can be utilized for artificial recharge through construction of percolation tanks and Check dams at suitable structures. The number of recharge percolation tanks, and check dams are decided based on the depth to water level and drainage available in the district.

Thus, after taking into consideration all the factors, only 139.93 MCM of surplus water can be utilised for recharge, which is given in table 10.2. This surplus water can be utilized for constructing 1177 check dams and 523 percolation tanks and at suitable sites. The number of feasible artificial recharge structures was calculated by considering 0.20 MCM per percolation tanks and 0.03 MCM per check dam. This intervention should lead to recharge @ 75% efficiency of about 104.93 MCM/year. Tentative locations of these structures are given in **Fig. 7.1** and details also given in **Annexure VI**.

The rainwater harvesting in urban areas can be adopted in 25% of the household with 50 Sq. m roof area. A total of 2.36 MCM potential can be generated by taking 80% runoff coefficient. The estimated cost for rainwater harvesting through rooftop is calculated as Rs. 156.64 crore. Hence, this technique is not economically viable and therefore it is not recommended.

**Table 7.2: Proposed Recharge Structures**

Taluka	Geographical Area (Sqkm)	Area feasible for recharge (sq. km.)	Unsaturated Volume (MCM)	Surplus water available for AR (MCM)	Proposed number of structures		Total Volume of Water expected to be recharged@ 75 % efficiency (MCM)		Total recharged @ 75 % efficiency (MCM)
					PT	CD	PT	CD	
Karmala	1659.83	1229.39	2458.78	30.12	105	304	15.75	6.84	22.59

**Fig 7.1: Proposed Artificial Recharge structures**

## 7.2 DEMAND SIDE MANAGEMENT

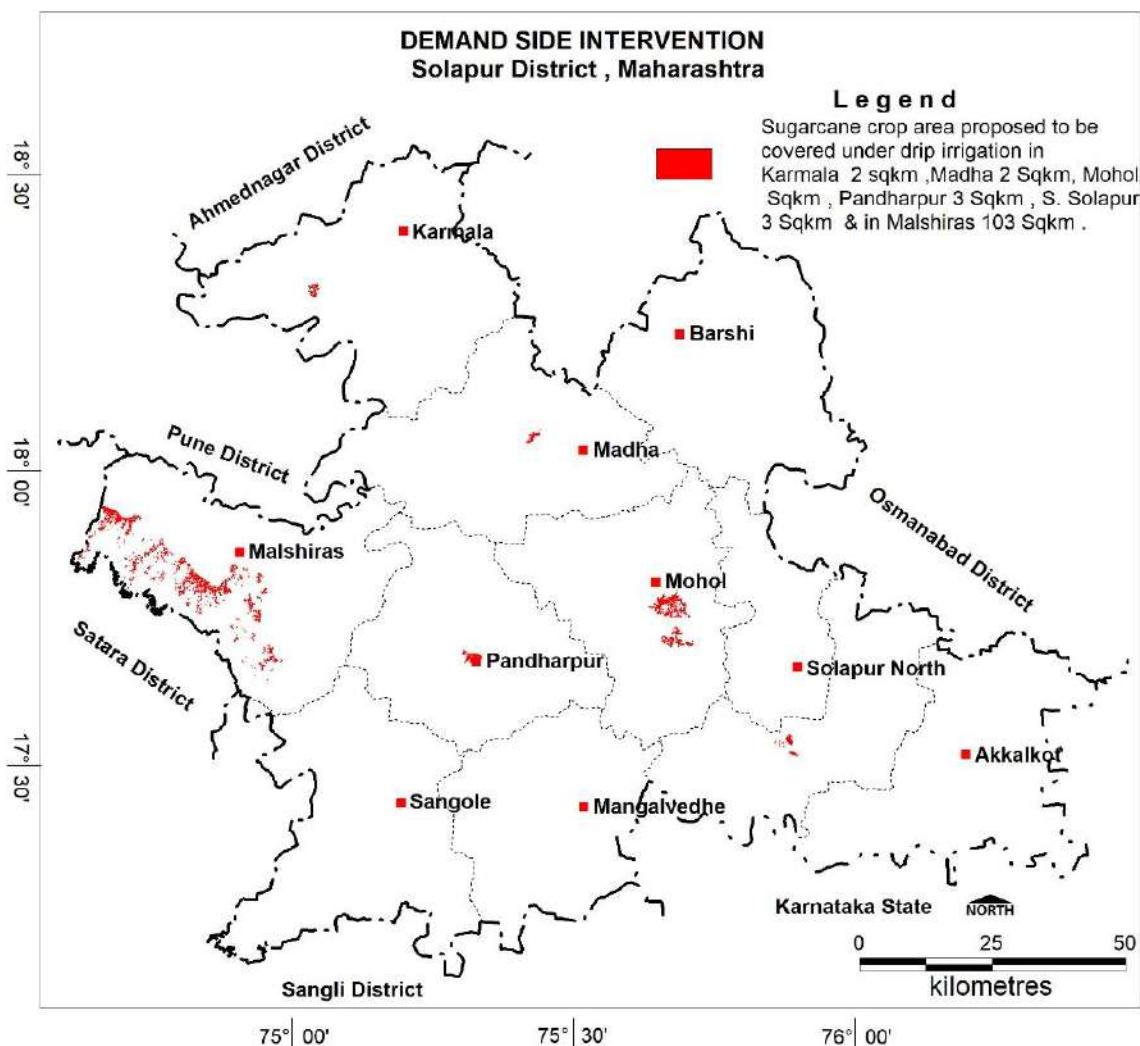

The Demand Side Management is proposed in areas where the Stage of Ground Water Development is relatively high and adopting micro-irrigation techniques for water intensive crops to save water. **Fig 7.2** depicts the proposed demand side interventions of 8481.88 Sq Km (Karmala, Madha, Mohol, Pandharpur, South Solapur and Malshiras Blocks of Solapur District) area.

The micro-irrigation techniques are proposed to be adopted in 129 Sq. Km area in Karmala, Madha, Mohol, Pandharpur, South Solapur and Malshiras Blocks of Solapur District by saving a total of 73.53 MCM as given **Table 7.3**. No change in cropping patterns is proposed in any of the blocks.

**Table 7.3: Proposed Recharge Structures**

Taluka	Geographical Area (Sqkm)	Remaining Ground water irrigated Sugarcane crop area sqkm	Sugarcane crop area is ground water irrigated, 100 % ground water irrigated proposed to be covered under Drip (sq.km.) #### **7.4 Development Plan:**

The ground water development plan is recommended to bring the stage of development upto 70% .Balance ground water resources available for ground water development after the stage of is brought up to 70% after implementing above measures is 50.15 MCM. The development plan is proposed to bring stage of ground water development up to 70 % and details are given in **Table 7.5** and **Fig 7.3**.

**Table 7.5 Development plan**

Taluka	Net Ground water availability (MCM)	Ground water resources after supply side management (MCM)	Ground water Draft after demand side management (MCM)	Expected stage of Development %	Balance GWR available for GW Development after STAGE OF GWD is brought to 60% (MCM)	Proposed No. of DW @1.5 ham for 90% of GWR Available)	Proposed No. of BW @1.5 ham for 10% of GWR Available)	Additional Area (sq.km.) proposed to be brought under assured GW irrigation with av. CWR of 0.65 m after 70% stage of GWD is achieved (Sq.Km)
Karmala	136.93	159.52	95.29	59.74	16.374	982	109	25.19

## 8 SUM UP

A thorough study was carried out based on data gap analysis, data generated in-house, data acquired from State Govt. departments and GIS maps prepared for various themes. All the available data was brought on GIS platform and an integrated approach was adopted for the preparation of taluka wise aquifer maps and aquifer management plans of Solapur district.

Solapur district is one of the five districts of Pune division of Maharashtra State that form the region of Western Maharashtra, with a geographical area of 14895 sq. km. The district headquarters is located at Solapur Town. For administrative convenience, the district is divided into 11 talukas viz., Solapur North, Malshiras, Pandharpur, Barshi, Madha, Sangole, Akkalkot, Mohol, Solapur South, Karmala and Mangalvedhe. It has a total population of 4,317,756 as per 2011 census. The district has 11 towns/talukas and 1167 villages. The major part of the district comes under Bhima and Sina basin.

Physiographically the district shows a hilly and undulating terrain, with altitude ranging between 420 and 720 m above MSL. The average rainfall is about 541 mm. The district falls in drought prone areas, receives rainfall of 500 to 600 mm.

Deccan Trap Basalt of upper Cretaceous to lower Eocene age is the major rock formation in the district, whereas only a very narrow belt confined to the banks of rivers is underlain by Recent Alluvium. Alluvium and Basalt form main aquifers in the district. Two aquifer Systems in Basalt and one shallow aquifer in Alluvium (limited to river banks) are found to be prevailing in the district. Deccan basalts are hydrogeologically in-homogeneous rocks. The weathered and jointed /fractured parts of the rock, as also permeable inter-flow beds constitute the zone of ground water storage and flow.

The specific capacity of the wells tapping Deccan Trap Basalt ranges between 1.6 and 5 lps/m of draw down and the transmissivity ranges from 1.25 to 207 m<sup>2</sup>/day. The specific capacity of dugwells tested in alluvial aquifer ranges between 1.1 and 10 lps/m of drawdown. During the pumping tests conducted on the exploratory wells in Alluvium, the transmissivity was found to vary from 30 to as high as 210 m<sup>2</sup>/day. The storage coefficient varied between  $3 \times 10^{-6}$  and  $1.7 \times 10^{-3}$ .

The depth to water levels in Solapur district during May 2017 ranges between 4.1 mbgl (Khatgaon, Karmala taluka) and 23.5 mbgl (Maslechaudhary, Mohol taluka and Tanali, Pandharpur). The depth to water levels of less than 5 mbgl is represented as localized. The depth to Water levels between 5-10 mbgl is observed in most part of the district and covers about 50% of the area. The depth to Water levels between 10-20 mbgl is observed in central part and east west elongated patch covering parts of Madha, Mohol, Pandharpur, North Solapur and South Solapur talukas. The depth to Water levels between 10-20 mbgl is also observed as small pockets in Karmala, Malshiras, Sangola, Mangalwedha and Barshi talukas. This zone covers about 35% of the district area. The depth to Water levels more than 20 mbgl is observed in small pokets around in central part of the district. The depth to water levels in Solapur district during Nov. 2017 ranges between 0.5 (Kuslamb, Barshi taluka and Kavitgaon, Karmala taluka) and 18.5 mbgl (Takali Shikandar, Mohol taluka). Shallow water levels within 2 m bgl are observed in north east part of Barshi, central and north east part of Sangola and small patches observed in Mangalwedha, Madha, Mohol and Karmala talukas. The depth to water levels between 2-5 mbgl is observed in major parts of the district covering Akkalkot, Mangalwedha, Madha, Mohol, Karmala, Pandharpur, Barshi and malshiras talukas. The depth to water levels between 5-10 mbgl is observed in most of the north Solapur , south Solapur, north west of Malshiras talukas and elongate patches in parts of Pandharpur, Madha, Sangola, Mohol, Karmala and north of Akkalkot talukas. The depth to water levels above 10 mbgl is observed in small patches of north Solapur, south Solapur,

Pandharpur, Madha and Karmala talukas.

As per Ground Water Resource Estimation (2013) of Solapur district, the net annual ground water availability is 1583.65 MCM. The gross draft for all uses is estimated at 1195.52 MCM with irrigation sector being the major consumer having a draft of 1146.89 MCM. The domestic and industrial water requirements are worked at 48.63 MCM. The net ground water availability for future irrigation is estimated at 395.16 MCM. Stage of ground water development varies from 51.83 % (South Solapur) to 100.29% (Malshiras). The overall stage of ground water development for the district is 75.49%. Taluka wise assessments indicate that all the talukas in the district fall under "Safe" category, except Malshiras (Overexploited) and Mohol which is semicritical. The total resources of aquifer-II have been estimated as 348.20 MCM. In Deeper Aquifer-II (Jointed/Fractured Basalt), yield is low (less than 2.5 lps), the transmissivity varies from 18 to 89 m<sup>2</sup>/day. The storage coefficient varied between 0.00034 and 6.37 x10<sup>-4</sup>.

The EC in shallow aquifer varies between 298 (Musti, South Solapur taluka) and 10000 µS/cm (Akole kathi, North Solapur taluka). Out of 189 samples collected from dug wells, 14 samples are having EC in range of 2250 to 3000 µS/cm and only 17 samples have shown EC > 3000 µS/cm. It is observed that the concentration of high EC >2250 µS/cm has been observed in patches in Pandharpur, North and south Solapur taluka and small parts of Madha and Malshiras taluka. The concentration of EC in deep aquifer varies between 375 (Shelgone, Barshi taluka) and 2910 µS/cm (Alagi, Akkalkot taluka). Out of 119 samples collected from tube wells/bore wells, 5 samples are having EC more than 2250 µS/cm It is observed that the concentration of high EC more than 2250 has been observed in parts of South Solapur and Akkalkot talukas

Taluka wise aquifer management plans have been prepared for Aquifer I (Weathered and jointed fractured Basalt) and Aquifer II (jointed and fractured basalt), with the objective of bringing the current stage of ground water development up to 70% by adopting supply side and demand interventions, for the six talukas (out of 11 talukas of Solapur District), namely, Karmala, Madha, Malshiras, Mohol, Pandharpur and South Solapur talukas, where aquifer mapping has been completed till 2017-18. The management plan has been proposed to manage the ground water resources and to arrest further decline in water levels. The management plan comprises two components namely supply-side management and demand side management. The supply side Management is proposed based on surplus surface water availability and the unsaturated thickness of aquifer whereas the demand side management is proposed by use of micro irrigation techniques. Change in cropping pattern towards less water-intensive irrigation crops has not been proposed in the area as cash crop cultivation drives the economy of the region. The supply side interventions include utilizing 139.93 MCM of Surplus runoff water by a proposal to construct 523 Percolation Tanks and 1177 Check Dams. This supply side intervention should lead to recharge (@ 75% efficiency) of about 104.93 MCM/year. The demand side interventions include proposal to bring 100 % ground water irrigated Sugarcane crop area (129 sq.km.) is proposed to be covered under Drip Irrigation. Volume of water expected to be saved is estimated as 73.53 MCM (Sugarcane Surface Flooding irrigation req- 2.45 m. Drip Req. - 1.88 m, WUE- 0.57 m).

Balance ground water resources available for ground water development is 50.15 MCM after the stage of ground water development is brought down to 70% after implementing demand side management, which can bring additional 77.16 sq. km. area under assured ground water irrigation.

These interventions also need to be supported by regulation of deeper aquifer and hence it is recommended to regulate/ban deeper tubewells/borewells of more than 60 m depth in these talukas, so that the deeper ground water resources are protected for future

generation and also serve as ground water sanctuary in times of distress/drought. IEC activities and capacity building activities need to be aggressively propagated to establish the institutional framework for participatory ground water management.

# PROPOSED MANAGEMENT PLAN

Augmentation by AR –  
104.93MCM

Aquifer I Resources –  
Dy- 976.27 MCM  
In storage- 0.14

Aquifer II  
Resources –

## **9 AQUIFER MAPS AND GROUND WATER MANAGEMENT PLAN, KARMALA BLOCK, SOLAPUR DISTRICT, MAHARASHTRA**

<b>1. SALIENT FEATURE</b>	
<b>1.1. Introduction</b>	
Block Name	Karmala
Geographical Area (Sq. Km.)	1659.83
Hilly Area (Sq. Km)	0
Saline Area (Sq. Km.)	0
Population (2011)	254489
Climate	Tropical Monsoon
<b>1.2 Rainfall Analysis</b>	
Annual Rainfall (2017) (mm)	568.3 mm
Decadal Average Annual Rainfall (2008-17) (mm)	544.7 mm
Normal Rainfall (mm)	577.5 mm
Long Term Rainfall Analysis (1901-2017)	Rising Trend 0.552 mm/year Probability of Normal/Excess Rainfall- 50% & 50%. Probability of Drought (Moderate/Severe)-: 18 % Moderate & 10 % Severe.

**Rainfall Trend Analysis (1901 To 2017) EQUATION OF TREND LINE:  $y = 0.5522x + 545.99$**

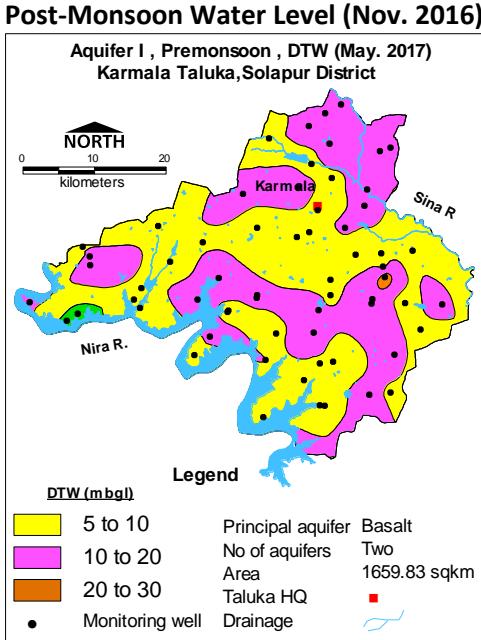

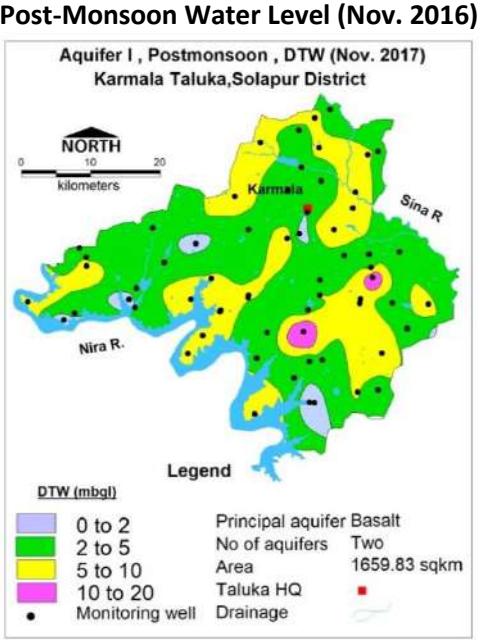

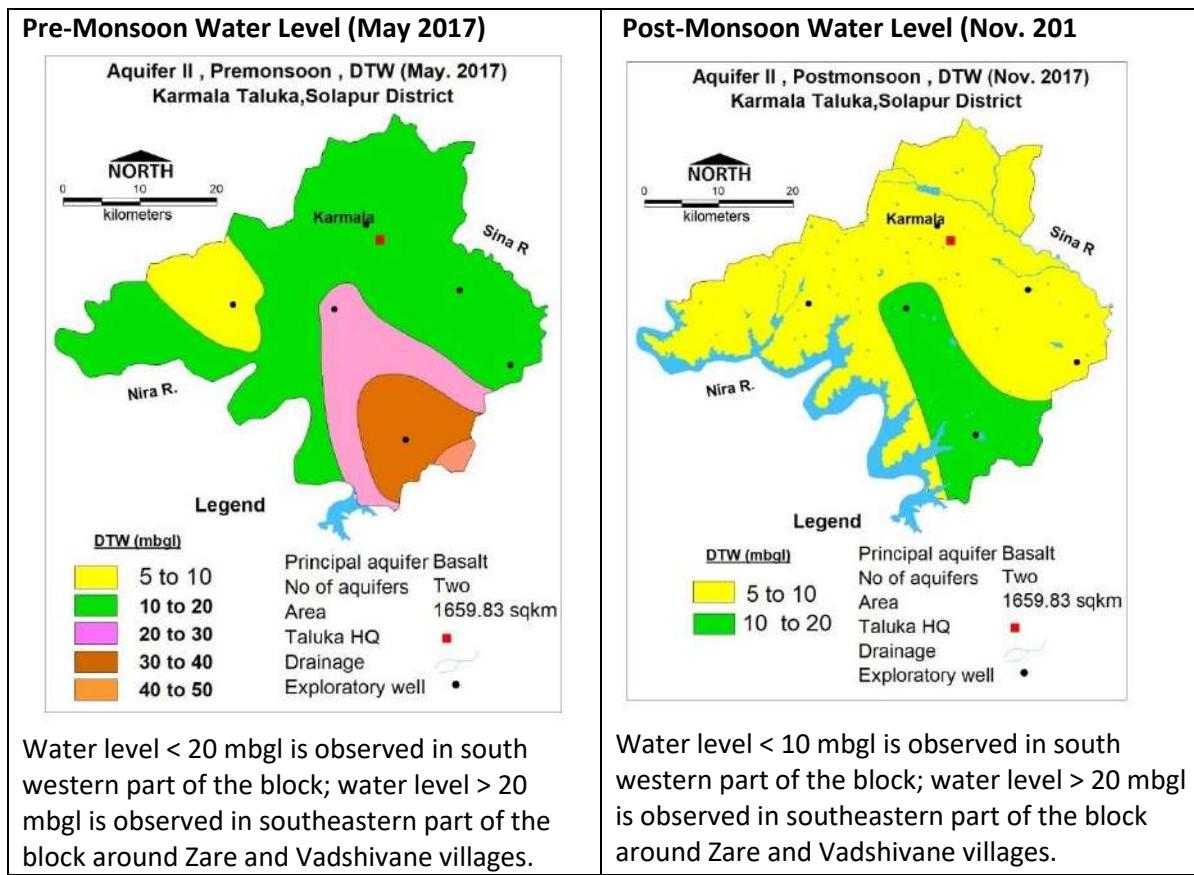

### **1.3. Geomorphology Soil & Geology**

<b>Geomorphic Unit</b>	Undissected to highly Dissected plateau with weathered thickness ranging from 0 to 1 m.small patch faalls in command area.
<b>Soil</b>	In general, they are clayey loam in texture and fairly high in calcium carbonate, high porosity but low permeability, thus having low to moderate infiltration capacity. Based on physical characteristics the soils of the area have been classified into three major groups: Medium black soil, Red Sandy soils and Shallow black soils
<b>Geology</b>	Alluvium: sand/ silt and clay alternating beds Age: Recent to Sub-recent Deccan Traps (Basalt) Age: Upper Cretaceous to Lower Eocene

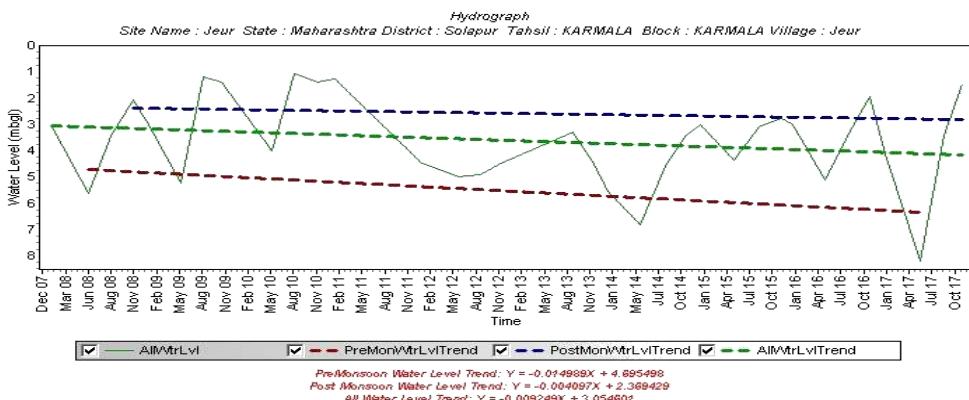

### **1.4. Hydrology & Drainage**

Bigger Minor Irrigation Project (>100 Ha.)	<b>Completed:</b> -16 MI Tanks
Minor Irrigation	<b>Completed:</b> -71 VT, 7 PT, 55 KT weirs & 46 DB

<b>Project (&lt;100 Ha.)</b>		
<b>Drainage</b>	The area is drain by Sina river, Nira rivers and its tributaries, flow from NW to SE direction, divide also in same direction.	
<b>1.5. Land Use, Agriculture, Irrigation &amp; Cropping Pattern</b>		
Geographical Area (Sq. Km.)		1659.83
Forest Area (Sq. Km.)		59.48
Net Sown Area (Sq. Km.)		1185.3
Double Cropped Area (Sq. Km.)		29.79
Gross Cropped Area (Sqkm)		1215.09
Cultivable Area (Sq. Km.)		1384.79
<b>Area under Irrigation (Sq. Km.)</b>		
Ground Water		164.42
Surface Water		46.65

Chilli		2.83
Mango		6.85
Onion		9.31
Sunflower		35.36
<b>1.6. Water Level Behaviour</b>		
<b>1.6.1. Phreatic Aquifer-Water Level</b>		
<b>Post-Monsoon Water Level (Nov. 2016)</b>  <p>Aquifer I , Premonsoon , DTW (May. 2017) Karmala Taluka,Solapur District</p> <p>NORTH kilometers</p> <p>Legend</p> <p>DTW (mbgl)</p> <ul style="list-style-type: none"> <li>5 to 10 Principal aquifer Basalt</li> <li>10 to 20 No of aquifers Two</li> <li>20 to 30 Area 1659.83 sqkm</li> <li>Monitoring well Taluka HQ</li> <li>Drainage</li> </ul>	<b>Post-Monsoon Water Level (Nov. 2016)</b>  <p>Aquifer I , Postmonsoon , DTW (Nov. 2017) Karmala Taluka,Solapur District</p> <p>NORTH kilometers</p> <p>Legend</p> <p>DTW (mbgl)</p> <ul style="list-style-type: none"> <li>0 to 2 Principal aquifer Basalt</li> <li>2 to 5 No of aquifers Two</li> <li>5 to 10 Area 1659.83 sqkm</li> <li>10 to 20 Taluka HQ</li> <li>Monitoring well Drainage</li> </ul>	
Water level less than 10 mbgl has been observed in major part of the taluka, while water level in the range of 10 to 20 mbgl is close to divide; deeper water level more than 20 mbgl has been observed at Sade village.	Water Level less than 10 mbgl has been observed in northern, north-western and southern parts of the block while water level in the range of 10 to 20 mbgl is observed in at Lavhe and Sade villages.	
<b>1.6.2. Semi-Confined/Confined Aquifer-Water Level</b>		

### 1.7. Hydrograph

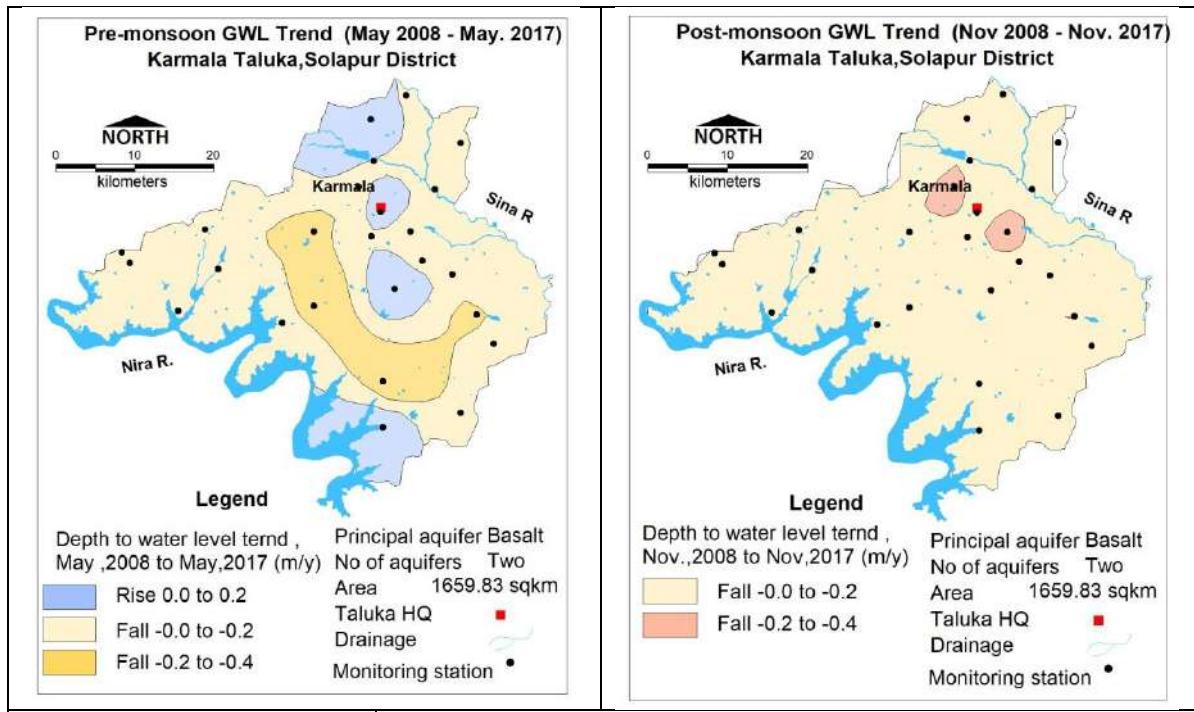

Hydrograph shows Pre-monsoon rising trend @ 0.38 m/year

Hydrograph shows Post-monsoon rising trend @ 0.135 m/year

### 1.8 . Water Level Trend (2008-2017)

1.8.1 Pre-Monsoon trend	1.8.1 Post-Monsoon trend
Rising 0.12 to 0.17 m/year	Rising 0.03 m/year
Falling 0.01 to 0.39 m/year	Falling 0.001 to 0.398 m/year
Declining trend up to 0.2 m/year is observed in almost entire block; decline in water level >0.2 m/year has been observed in northern part of the block. Rising water level trend has been observed in small part in northern and southern parts and isolated part in western part of the block.	Declining trend up to 0.2 m/year is observed in almost entire block; significant decline in water level > 0.2 m/year has been observed in northern part of the block.
<b>Premonsoon Water level Trend (2007-17)</b>	<b>Postmonsoon Water level Trend (2007-17)</b>

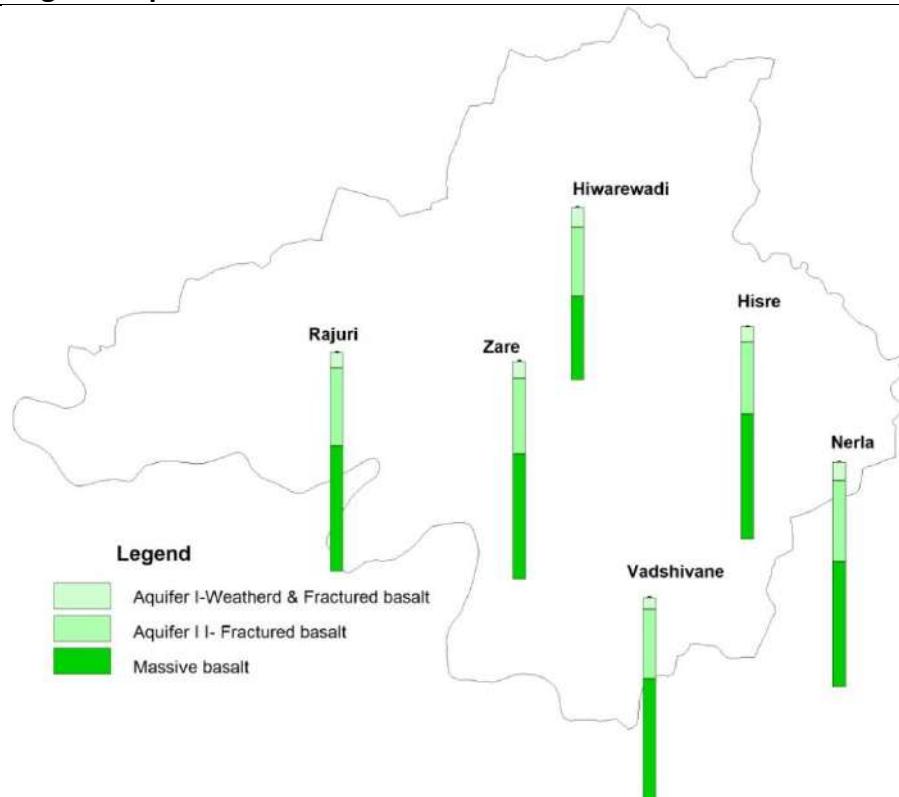

<b>2. GROUND WATER ISSUE</b>	Over - Exploitation Declining WL Limited Aquifer Potential Water Scarcity - lean period

### 3. AQUIFER DISPOSITION

<b>3.1. Number of Aquifers</b>	Basalt-Aquifer-I (Sahllow Aquifer)	Basalt –Aquifer-II, (Deeper Aquifer)
--------------------------------	---------------------------------------	---

### 3.2. Lithological Disposition

### 3.3. Cross Sections

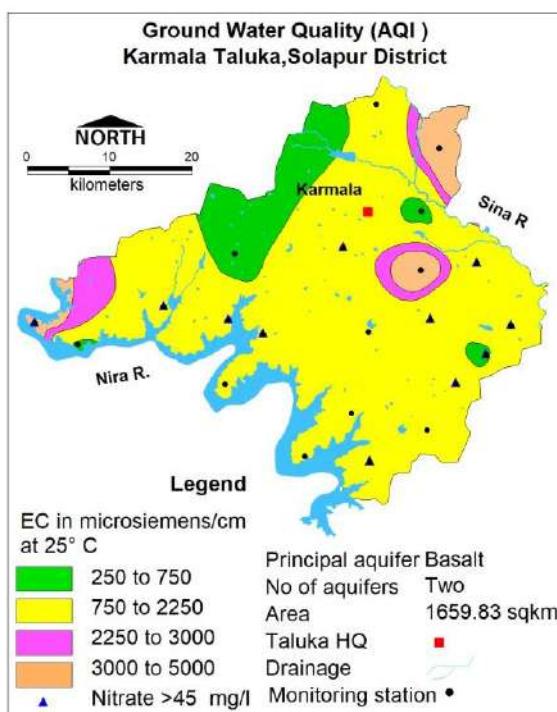

#### 4.4. Aquifer Characteristics

Major Aquifers	Basalt (Deccan Traps)	Basalt (Deccan Traps)
Type of Aquifer	Aquifer-I (Shallow/Phreatic)	Aquifer-II (Deeper/ Semiconfined /confined)
Depth of Occurrence (mbgl)	8 - 30	90 - 196
Thickness of weathered / fractured rocks (m)	5 - 15	1.25 - 5
Yield	10 - 100 m <sup>3</sup> /day	0-3 lps
Specific yield (Sy)	0.02	0.0025
Storativity (S)		0.0000154
Transmissivity (T) (m <sup>2</sup> /day)	T: 5-20 m <sup>2</sup> /day	T: 30-70 m <sup>2</sup> /day

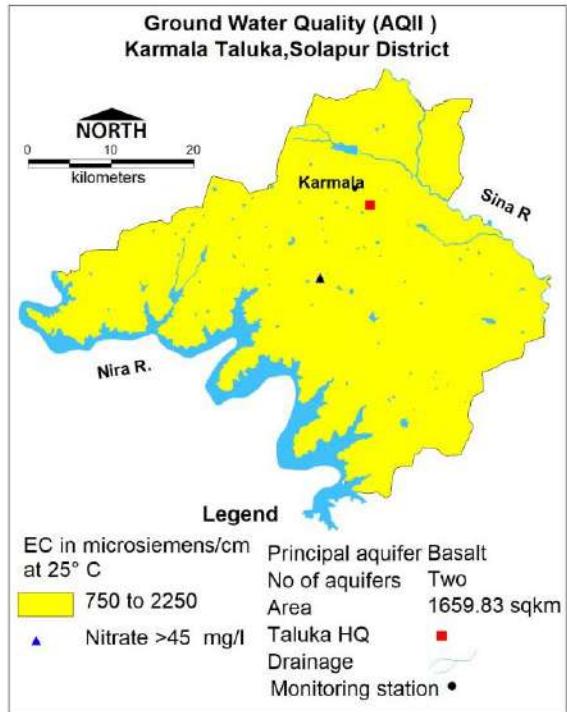

### 4. GROUND WATER QUALITY

#### 4. 1 Phreatic Aquifer (Aquifer-I)

In general the water quality of shallow aquifer in Karmala taluka is potable and good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from

#### 4.2 Semiconfined/Confined Aquifer (Aquifer II)

In general the water quality of deep aquifer in Karmala taluka is potable and very good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Zarei EW &

Hivare, Sade, Deolali, Sogaon, Parewadi, Kedgaon, Nerle, Varkute and Pathurdi. Very high salinity prevails ( $>2250 \mu\text{S}/\text{cm}$ ), which is not suitable for drinking, domestic, industrial as well as irrigation purposes. Ground water can be used for drinking only after treatment and for irrigation for very high salt tolerant crops and with proper soil and crop management practices.	Fluorid more than 1.5 mg per litre was detected in water sample fromHiwarewadi EW.

## **10 AQUIFER MAPS AND GROUND WATER MANAGEMENT PLAN, MADHA BLOCK, SOLAPUR DISTRICT, MAHARASHTRA**

<b>1. SALIENT INFORMATION</b>	
<b>1.1. Introduction</b>	
Block Name	<b>Madha</b>
Geographical Area (Sq. Km.)	1559.33
Hilly Area (Sq. Km.)	0.00
Saline Area (Sq. Km.)	0.00
Population (2011)	324027.00
Climate	Tropical Monsoon
<b>1.2 Rainfall Analysis</b>	
Annual Rainfall (2017)(mm)	617.8 mm
Decadal Average Annual Rainfall (2007-17) (mm)	595.5 mm
Normal Rainfall (mm)	497.2 mm
Long Term Rainfall Analysis(1901-2017)	Rising Trend 0.346 mm/year Probability of Normal/Excess Rainfall-48% & 52%. Probability of Drought (Moderate/Severe)-: 21 % Moderate & 1 % Severe and Acute 1%.
<b>Rainfall Trend Analysis (1901 To 2017) EQUATION OF TREND LINE: <math>y = 0.3461x + 577.52</math></b>	
<b>1.3. Geomorphology Soil &amp; Geology</b>	
<b>Geomorphic Unit</b>	Alluvial Plain of Sina River and Plateau ,Undissected to Moderately Dissected (PLM) with weathered thickness ranging from 0 to 1 m.
<b>Soil</b>	In general they are clayey loam in texture and fairly high in calcium carbonate, high porosity but moderate to low permeability, thus having low to moderate infiltration capacity. Based on physical characteristics the soils of the area have been classified into three major groups: Medium black soil, Red Sandy soils and Shallow black soils
<b>Geology</b>	Alluvium : sand/ silt and clay alternating beds Age: Recent to Sub-recent Deccan Traps (Basalt) Age: Upper Cretaceous to Lower Eocene
<b>1.4. Hydrology, Soil &amp; Drainage</b>	
Bigger Minor Irrigation Project (>100 Ha.)	<b>Completed:</b> -1 major & 15 MI Tanks
Minor Irrigation Project (<100 Ha.)	<b>Completed:</b> -82 VT, 7 PT, 62 KT weirs & 71 DB

<b>Drainage</b>	The area is drain by Sina river, Nira rivers and its tributaries,flow from NW to SE direction,divide also in same direction.
-----------------	--

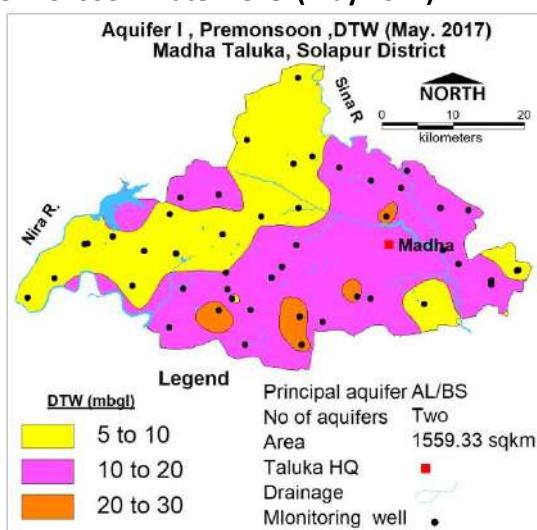

### **1.5. Land Use, Agriculture, Irrigation & Cropping Pattern**

Geographical Area (Sq. Km.)	1559.33
Forest Area (Sq. Km.)	25.84
Net Sown Area (Sq. Km.)	1086.58
Double Cropped Area (Sq. Km.)	59.64
Gross Cropped Area (Sqkm)	1146.22
Cultivable Area (Sq. Km.)	1455.68
<b>Area under Irrigation (Sq. Km.)</b>	
Ground Water	223.73
Surface Water	192.16
<b>Principal Crops(Reference year 2013-14)</b>	<b>Area (Sq.km.)</b>
Wheat	70.02
Jawar	3.15
Bajra	22.05
Maize	20.73
Tur	12.5
Sugarcane	43.95
Chilli	4.82
Mango	3.58
Onion	9.5
Sunflower	25.07

### **1.6. Water Level Behaviour**

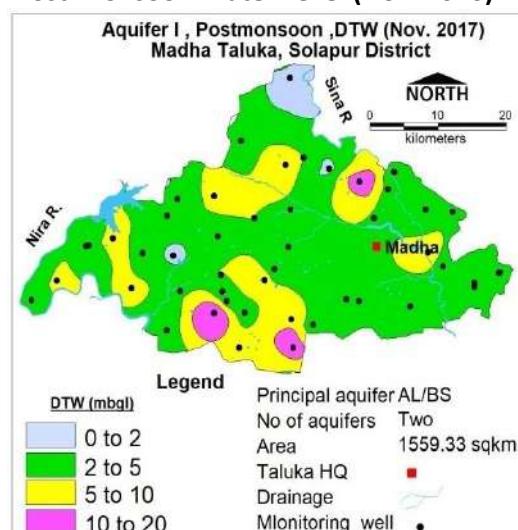

#### **1.6.1. Phreatic Aquifer-Water Level**

##### **Pre-Monsoon Water Level (May 2017)**

Water level less than 10 mbgl has been observed in northern and western parts of the block while water level in the range of 10 to 20 mbgl is observed in major part of the block; deeper water level more than 20 mbgl has been observed in isolated patch in south eastern parts.

##### **Post-Monsoon Water Level (Nov. 2016)**

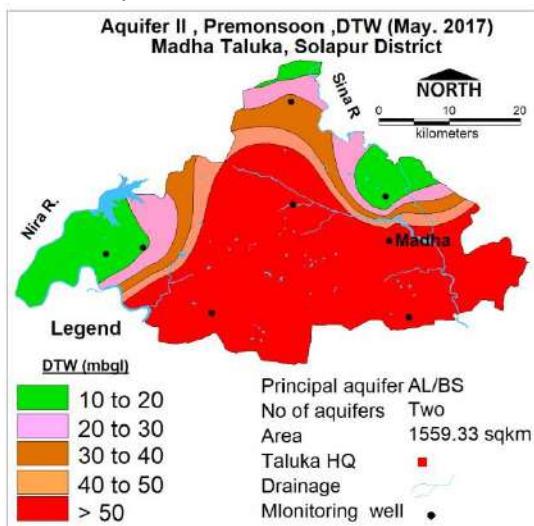

Water Level less than 5 mbgl has been observed in northern, north-western and southern parts of the block while water level in the range of 5 to 10 mbgl is observed in as isolated patch of the block; deeper water level more than 10 mbgl has been observed at Paritewadi and Mhaisgaon.

### 1.6.2. Semi-Confined/Confined Aquifer-Water Level

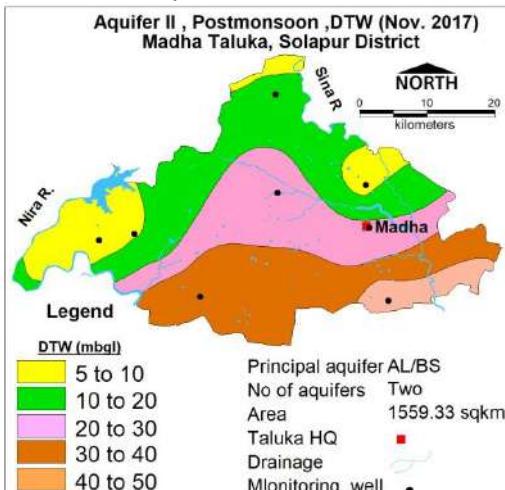

#### Pre-Monsoon Water Level (May 2017)

Water level > 50 mbgl is observed in major part of the block; shallow water level is observed in northern part of the block

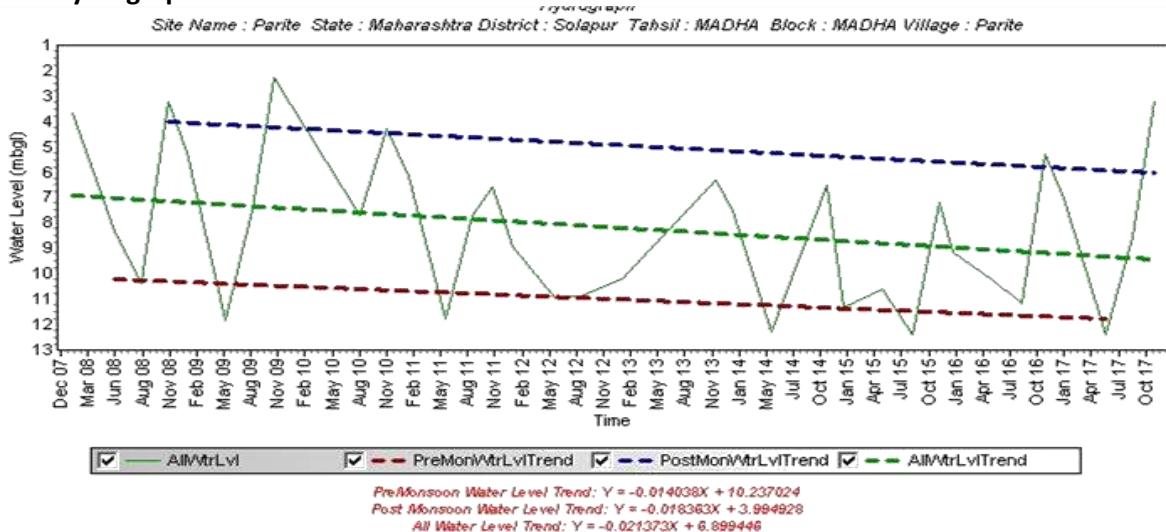

#### Post-Monsoon Water Level (Nov. 2017)

Water level >20 mbgl is observed in north eastern and south-western parts of the block; while 10 to 20 mbgl is observed in north western part of the block.

### 1.6. Hydrograph

Hydrograph shows Pre-monsoon rising trend @ 0.38 m/year

Hydrograph shows Post-monsoon rising trend @ 0.135 m/year

#### 1.8. Water Level Trend (2008-2017)

##### 1.8.1 Pre-Monsoon trend

Rising 0.0129 to 0.144m/year

Falling 0.008 to 0.55 m/year

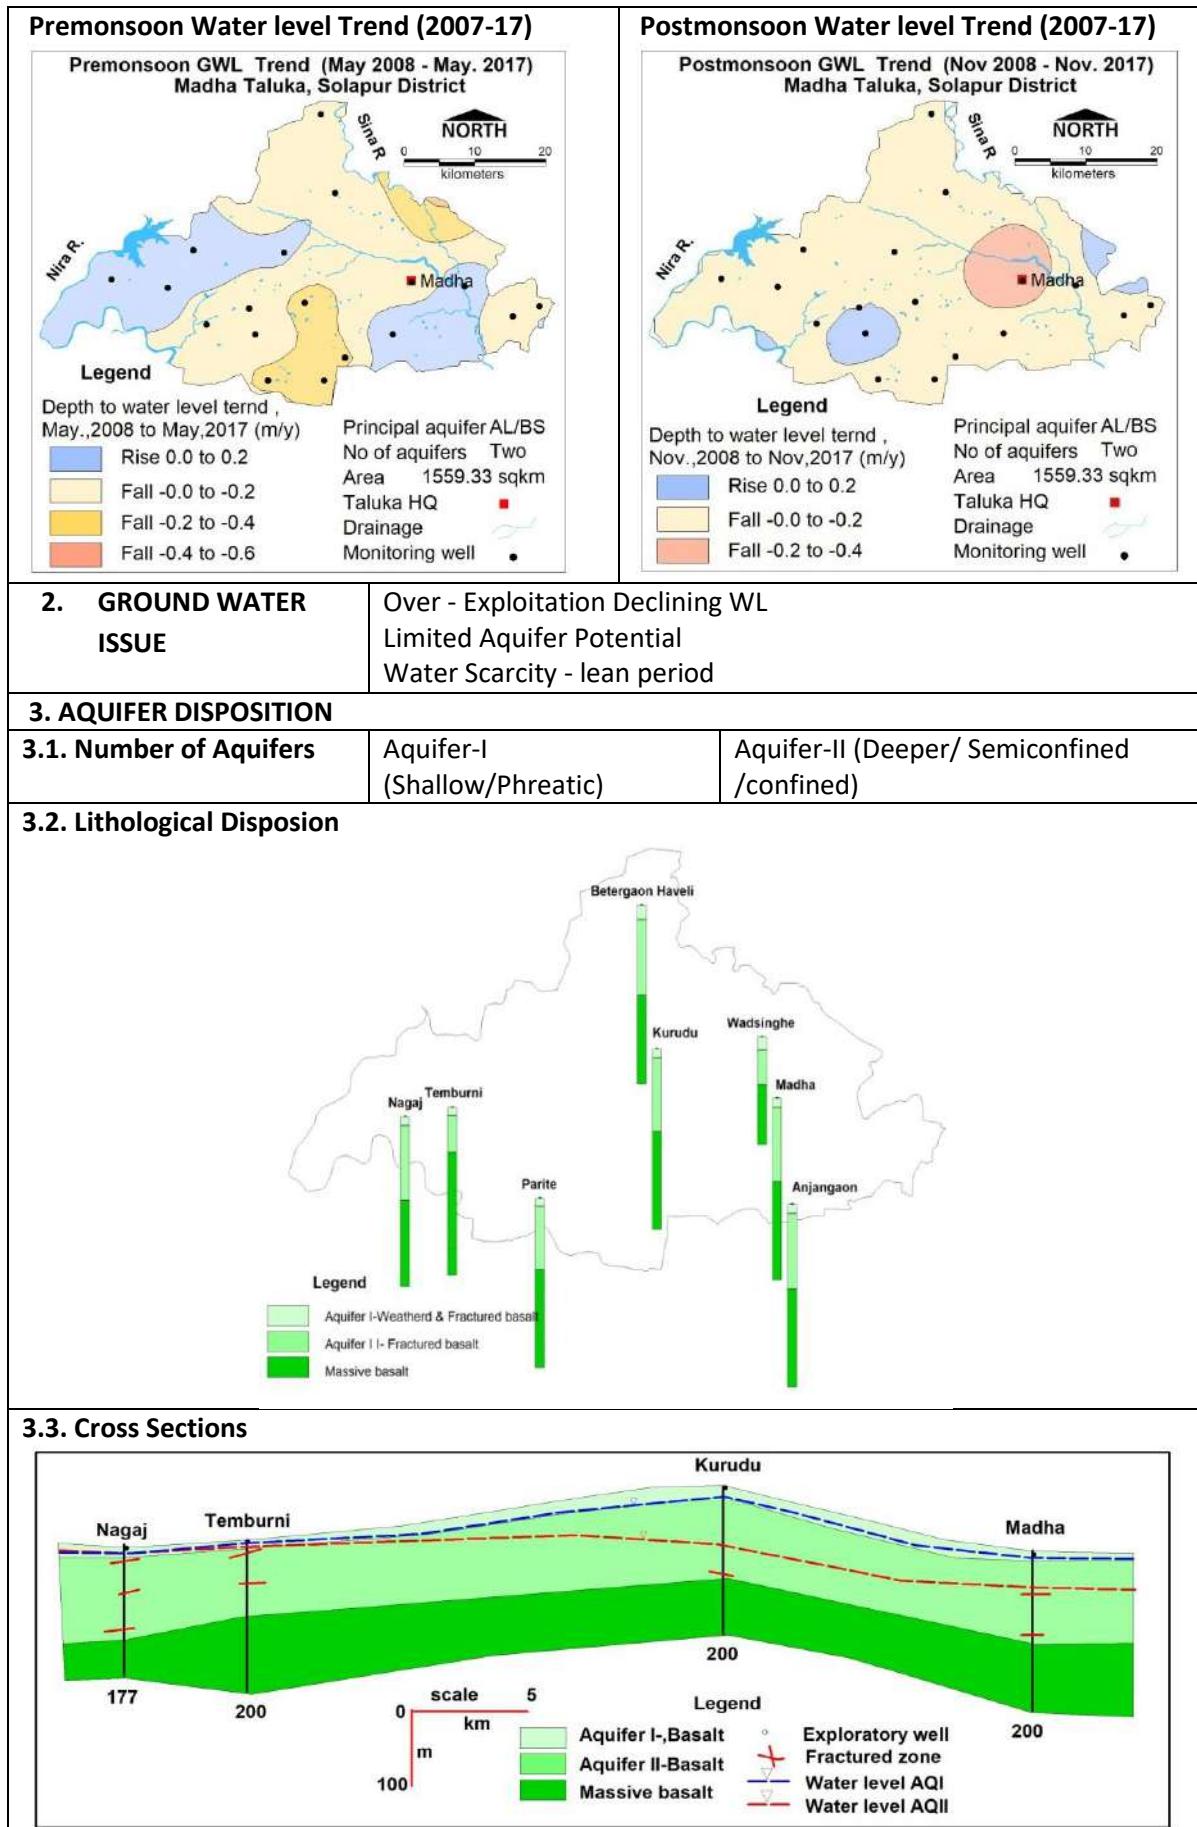

Declining trend up to 0.2 m/year is observed in major part of the block; decline in water level >0.2 m/year has been observed in eastern part of the block. Rising water level trend has been observed in small part in northern and southern parts and isolated part in western part of the block.

##### 1.8.2 Post-Monsoon trend

Rising 0.19 m/year

Falling 0.001 to 0.38 m/year

Declining trend up to 0.2 m/year is observed in almost entire block; significant decline in water level > 0.2 m/year has been observed around Madha town. Rising water level trend has been observed in southern part and in isolated parts in western part of the block.

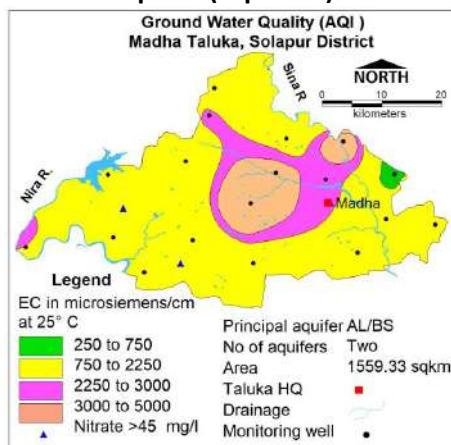

### **3.4. Aquifer Characteristics**

Major Aquifers	Basalt (Deccan Traps)	
Type of Aquifer	Aquifer-I (Phreatic)	Aquifer-II (Semiconfined/confined)
Depth of Occurrence (mbgl)	8 - 30	50 - 196
Thickness of weathered/fractured rocks (m)	5 - 15	1.25 - 7
Yield	10 - 100 m <sup>3</sup> /day	.1-1.5 lps
Specific yield (Sy)	0.02	0.0025
Storativity (S)		0.0000154
Transmissivity (T) (m <sup>2</sup> /day)	T: 10-25 m <sup>2</sup> /day	T: 30-40 m <sup>2</sup> /day

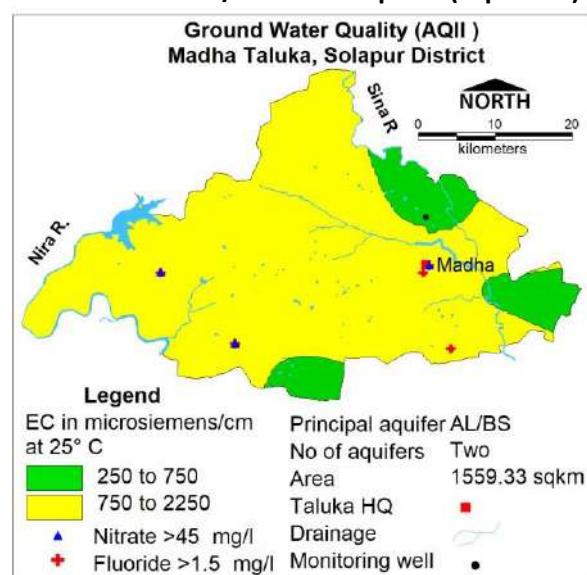

### **4. GROUND WATER QUALITY**

#### **4.1 Phreatic Aquifer (Aquifer-I)**

In general the water quality of shallow aquifer in Madha taluka is potable and good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Ghoti, Laul, Manegaon, Anjangaon, Akulgaon, Badalewadi, Shiral Tembhurni, very high salinity prevails ( $>2250 \mu\text{S}/\text{cm}$ ), which is not suitable for drinking, domestic, industrial as well as irrigation purposes. Ground water can be used for drinking only after treatment and for irrigation for very high salt tolerant crops and with proper soil and crop management practices.

#### **4.2 Semiconfined/Confined Aquifer (Aquifer II)**

In general the water quality of deep aquifer in Madha taluka is potable and very good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Madha, Tembhurni, and Parite EW & Fluorid more than 1.5 mg per litre was detected in water sample from Madha EW. .

## **11 AQUIFER MAPS AND GROUND WATER MANAGEMENT PLAN, MALSHIRAS BLOCK, SOLAPUR DISTRICT, MAHARASHTRA**

<b>1. SALIENT INFORMATION</b>	
<b>1.1. Introduction</b>	
Block Name	Malshiras
Geographical Area (Sq. Km.)	1528.01
Hilly Area (Sq. Km)	35.02
Saline Area (Sq. Km.)	0
Population (2011)	485645
Climate	Tropical Monsoon
<b>1.2 Rainfall Analysis</b>	
Annual Rainfall (2017)(mm)	530.9 mm
Decadal Average Annual Rainfall (2007-17) (mm)	524.9 mm
Normal Rainfall (mm)	530 mm
Long Term Rainfall Analysis(1901-2017)	Rising Trend 0.738 mm/year Probability of Normal/Excess Rainfall- 48% & 52%. Probability of Drought (Moderate/Severe)-: 24 % Moderate ,6 % Severe & Actute 1%.
Rainfall Trend Analysis (1901 To 2017) EQUATION OF TREND LINE: $y = 0.7382x + 486.98$	
<b>1.3. Geomorphology Soil &amp; Geology</b>	
Geomorphic Unit	Plateau Undissected to highly Dissected, Plateau Weathered-Canal Command (PLC).with weathered thickness ranging from 0 to 2 m.
Soil	In general, they are clayey loam in texture and fairly high in calcium carbonate, high porosity but moderate to low permeability, thus having low to moderate infiltration capacity. Based on physical characteristics the soils of the area have been classified into three major groups: Medium black soil, Red Sandy soils and Shallow black soils
Geology	Alluvium: sand/ silt and clay alternating beds, Age: Recent to Sub-recent Deccan Traps (Basalt) Age: Upper Cretaceous to Lower Eocene
<b>1.4. Hydrology &amp; Drainage</b>	
Bigger Minor Irrigation Project (>100 Ha.)	<b>Completed:</b> -3 MI Tanks
Minor Irrigation Project (<100 Ha.)	<b>Completed:</b> -98 VT, 7 PT, 81KT weirs & 80 DB
Drainage	The area is drain by Nira rivers and its tributaries, flow from NW to SE direction, drainage density high in southern boundary of taluka.

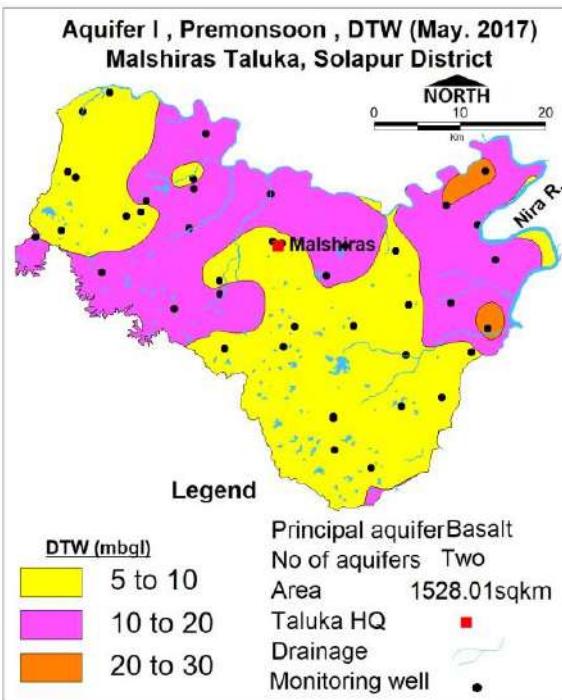

### **1.5. Land Use, Agriculture, Irrigation & Cropping Pattern**

Geographical Area (Sq. Km.)	1528.01
Forest Area (Sq. Km.)	3.44
Net Sown Area (Sq. Km.)	942.27
Double Cropped Area (Sq. Km.)	40.33
Gross Cropped Area (Sqkm)	982.6
Cultivable Area (Sq. Km.)	1579.98
<b>Area under Irrigation (Sq. Km.)</b>	
Ground Water	314.8
Surface Water	260.51
<b>Principal Crops(Reference year 2013-14)</b>	<b>Area (Sq. Km.)</b>
Wheat	61.7
Jawar	7.28
Bajra	42.74
Maize	20.7
Tur	11.03
Sugarcane	99.65
Chilli	1.13
Mango	3.79
Onion	9.97
Sunflower	38.34

### **1.6. Water Level Behaviour**

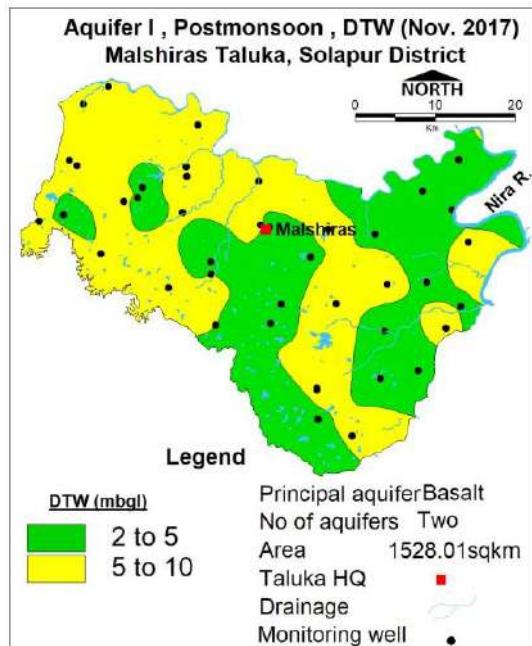

#### **1.6.1. Phreatic Aquifer-Water Level**

##### **Pre-Monsoon Water Level (May 2017)**

Water level less than 10 mbgl has been observed in major part of the taluka, while water level in the range of 10 to 20 mbgl is close to divide in southern parts and central part; deeper water level more than 20 mbgl has been observed at Dasur and Sangam village.

##### **Post-Monsoon Water Level (Nov. 2016)**

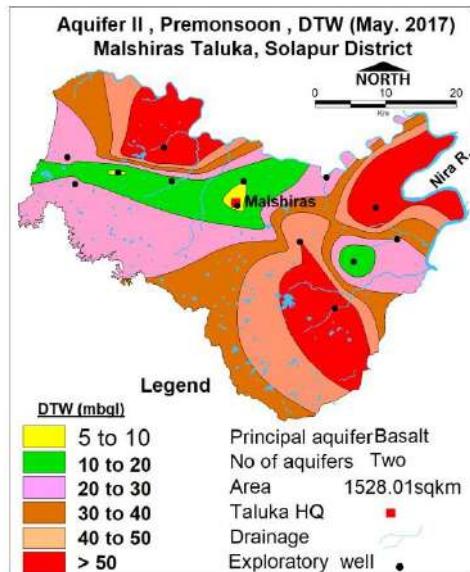

Water Level less than 5 mbgl has been observed in north-eastern and southern parts of the block while water level in the range of 5 to 10 mbgl is observed in major part of the block;

### 1.6.2. Semi-Confining/Confined Aquifer-Water Level

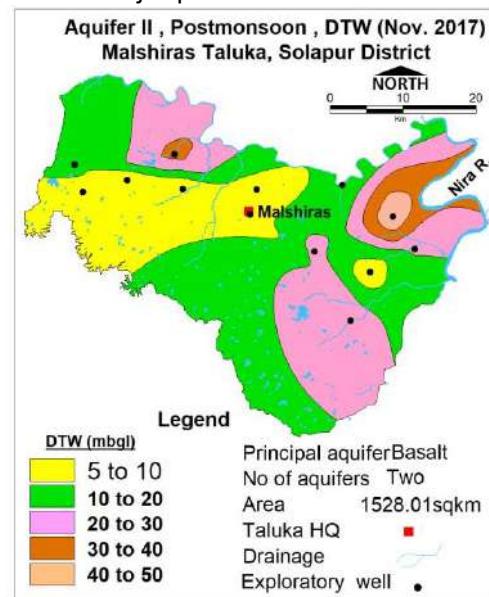

#### Pre-Monsoon Water Level (May 2017)

Water level > 20 mbgl is observed in major part of the block; water level in the range of 10 to 20 mbgl is observed in central part of the block

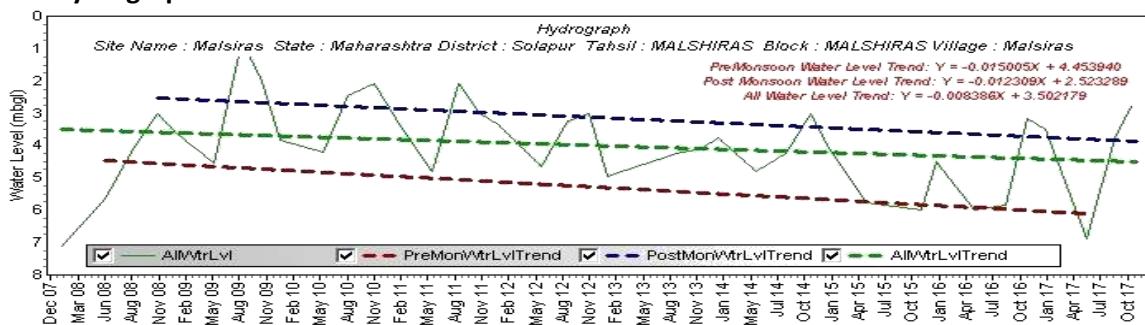

#### Post-Monsoon Water Level (Nov. 2017)

Water level <10 mbgl is observed in north eastern and south-western parts of the block; >10 mbgl is observed in major part of the block

### 1.7. Hydrograph

Hydrograph shows Pre-monsoon rising trend @ 0.38 m/year

Hydrograph shows Post-monsoon rising trend @ 0.135 m/year

### 1.8. Water Level Trend (2008-2017)

#### 1.8.1 Pre-Monsoon trend

Rising 0.01 to 0.12 m/year

Falling 0.009 to 0.14 m/year

#### 1.8.2 Post-Monsoon trend

Rising 0.009 to 0.18 m/year

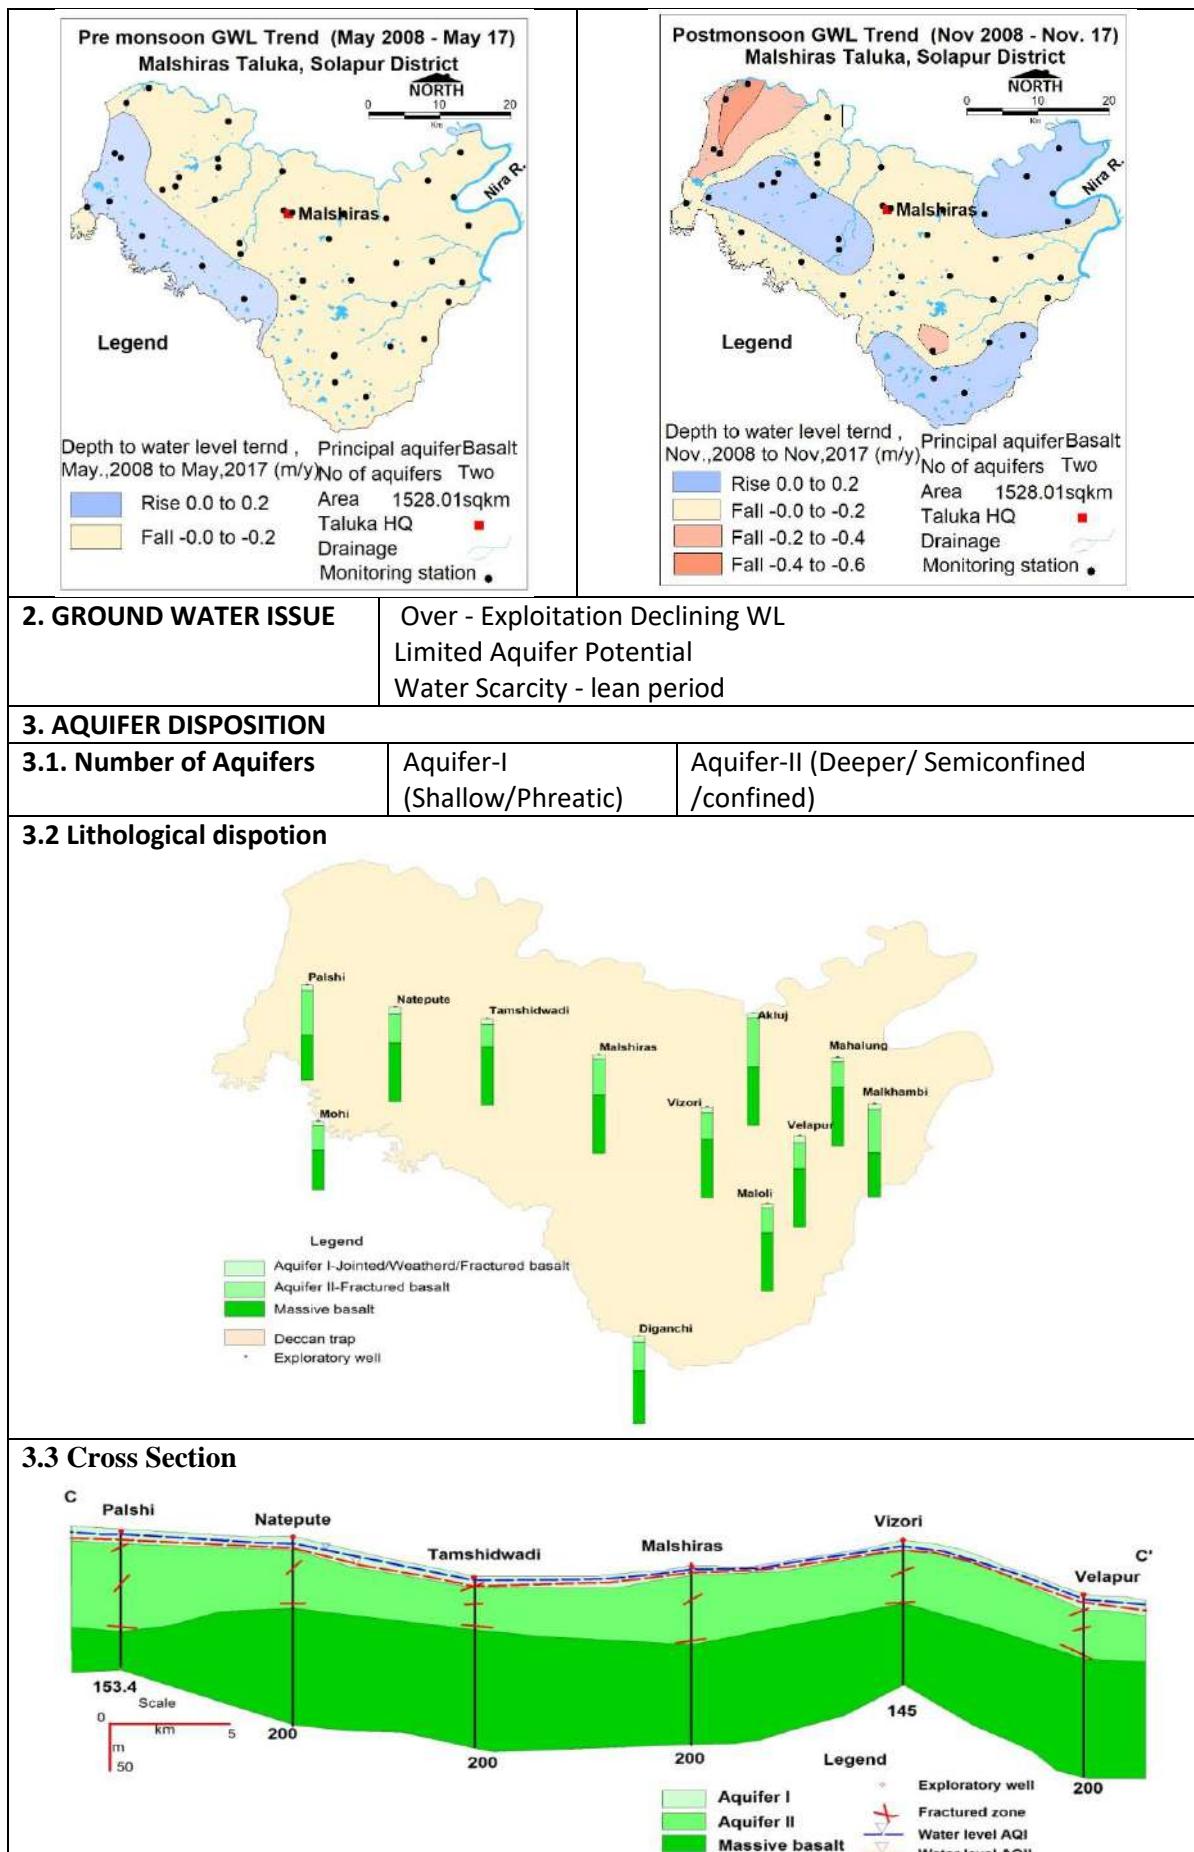

Falling 0.02 to 0.42 m/year

#### Premonsoon Water level Trend (2007-17)

Declining trend up to 0.2 m/year is observed in almost entire block; Rising water level trend has been observed in small part in southern parts of the block.

#### Postmonsoon Water level Trend (2007-17)

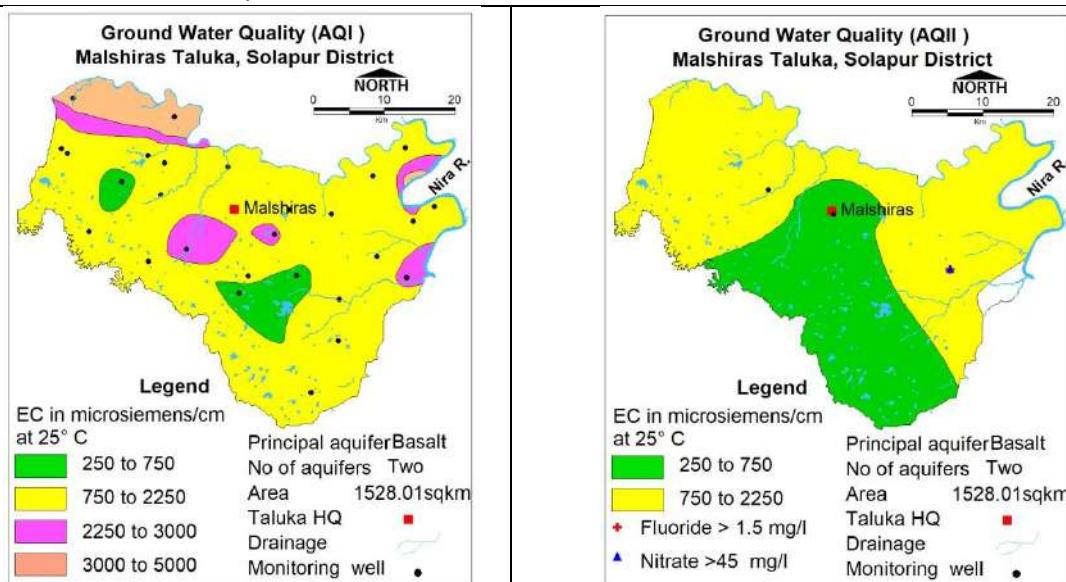

Declining trend up to 0.2 m/year is observed in major part of the block; significant decline in water level > 0.2 m/year has been observed in eastern part of the block. Rising water level trend has been observed in southern part and in isolated parts in western part of the block.

### **3.4. Aquifer Characteristics**

Major Aquifers	Basalt (Deccan Traps)	
Type of Aquifer	Aquifer-I (Phreatic)	Aquifer-II (Semiconfined/confined)
Depth of Occurrence (mbgl)	8 - 30	90 - 196
Thickness of wearherd/fractured rocks (m)	5 - 15	1.25 - 5
Yield	10 - 100 m <sup>3</sup> /day	0.1 - 0.7 lps
Specific yield (Sy)	0.02	0.005
Storativity (S)		0.00057
Transmissivity (T) (m <sup>2</sup> /day)	T: 20-25 m <sup>2</sup> /day	T: 30-50 m <sup>2</sup> /day

### **4. GROUND WATER QUALITY**

**4.1 Phreatic Aquifer (Aquifer-I) :** In general the water quality of shallow aquifer in Malshiras taluka is potable and good for drinking, domestic, industrial as well as irrigation purposes. Very high salinity prevails (>2250 µS/cm), which is not suitable for drinking, domestic, industrial as well as irrigation purposes. Ground water can be used for drinking only after treatment and for irrigation for very high salt tolerant crops and with proper soil and crop management practices.

**4.2: Semiconfined/Confined Aquifer (Aquifer II) :** In general the water quality of deep aquifer in Malshiras taluka is potable and very good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Velapur EW & Fluorid more than 1.5 mg per litre was detected in water sample from Velapur EW..

### **5. GROUND WATER RESOURCE**

#### **5.1. Aquifer-I/ Phreatic Aquifer (Basalt & Alluvium)**

Ground Water Recharge Worthy Area (Sq. Km.)	1492.99
Total Annual Ground Water Recharge (MCM)	221.04
Natural Discharge (MCM)	11.05
Net Annual Ground Water Availability (MCM)	209.99
Existing Gross Ground Water Draft for irrigation (MCM)	204.47
Existing Gross Ground Water Draft for domestic and industrial water supply (MCM)	6.14

Existing Gross Ground Water Draft for All uses (MCM)							210.61
Provision for domestic and industrial requirement supply to 2025(MCM)							8.91
Net Ground Water Availability for future irrigation development (MCM)							22.34
Stage of Ground Water Development (%)							100.29
Category							O.E.

### **5.2 Aquifer-II Semiconfined/Confined Aquifer (Basalt)**

Area (Sqkm)	Mean thickness (m)	Piezometric head (m. above bottom of confining layer)	Sy	S	Resource above confining layer (mcm)	Resource in confining aquifer (mcm)	Total Resource (mcm)
1610.172	2.46	60	0.005	0.00019	18.35596	19.80512	38.16108

## **6.0. GROUND WATER RESOURCE ENHANCEMENT**

### **6.1. Supply Side Management**

Net Available Resource (MCM)	209.9919
Gross Annual Draft (MCM)	210.6102
Agricultural Supply -GW	204.4727
Agricultural Supply -SW	
Domestic Supply - GW	6.1374
Domestic Supply - SW	1.5343
Total Supply	212.1445
Area of Block (Sq. Km.)	1492.99
Area suitable for Artificial recharge(Sq. Km)	498.16

Type of Aquifer	Hard Rock	Soft Rock
Area feasible for Artificial Recharge(WL >5mbgl) (Sq. Km.)	498.16	
Volume of Unsaturated Zone (MCM)	996.32	
Average Specific Yield	0.02	0.07
Volume of Sub surface Storage Space available for Artificial Recharge (MCM)	19.9264	0
Surplus water required (MCM)	26.502112	
Surplus water Available (MCM)	12.20492	0
Proposed Structures	Percolation Tank (Av. Gross Capacity-100 TCM*2 fillings = 200 TCM)	Check Dam (Av. Gross Capacity-10 TCM * 3 fillings = 30 TCM)
Number of Structures	48	86
Volume of Water expected to be conserved / recharged @ 75% efficiency (MCM)	7.2	1.935
<b>RTRWH Structures – Urban Areas</b>		<b>Economically not viable &amp; Not Recommended</b>
Households to be covered (25% with 50 m <sup>2</sup> area)	24890	
Total RWH potential (MCM)	0.6533625	
Rainwater harvested / recharged @ 80% runoff coefficient	0.52269	

## 6.2. Demand Side Management

### Micro irrigation techniques

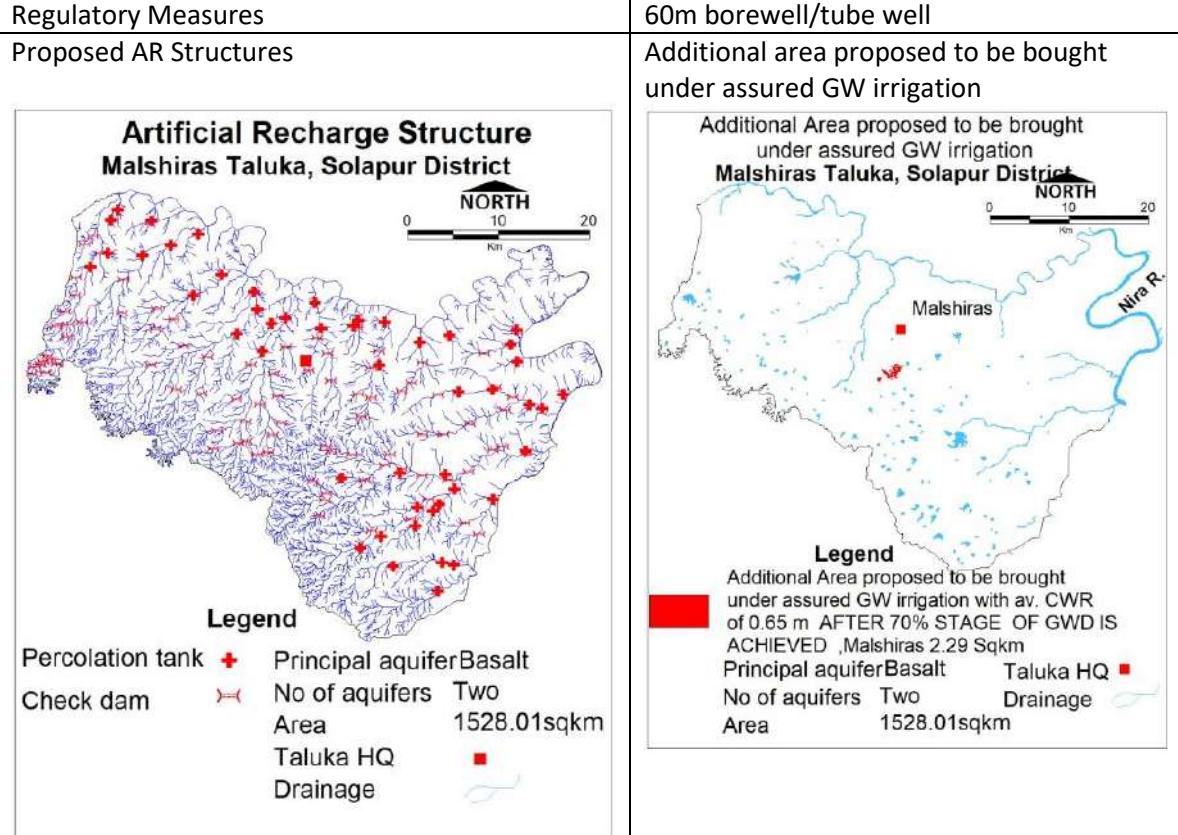

Sugarcane crop area (33.04), about 20 sqkm area is ground water irrigated ,100 % ground water irrigated ( 20 sqkm) proposed to be covered under Drip (sq.km.)	103
Volume of Water expected to be saved (MCM). Surface Flooding req- 2.45 m. Drip Req. - 1.88, WUE- 0.57 m	58.71
Proposed Cropping Pattern change	
Irrigated area under Water Intensive Crop(ha)	Not proposed
Water Saving by Change in Cropping Pattern	Nil

### 6.3. EXPECTED BENEFITS

Net Ground Water Availability (MCM)	209.9919
Additional GW resources available after Supply side interventions (MCM)	9.135
Ground Water Availability after Supply side intervention	219.1269
Existing Ground Water Draft for All Purposes (MCM)	210.6102
GW draft after Demand Side Interventions (MCM)	151.9002
Present stage of Ground Water Development (%)	100.2944
Expected Stage of Ground Water Development after interventions (%)	69.3206
Other Interventions Proposed, if any	
Alternate Water Sources Available	Nil

### 6.4. DEVELOPMENT PLAN

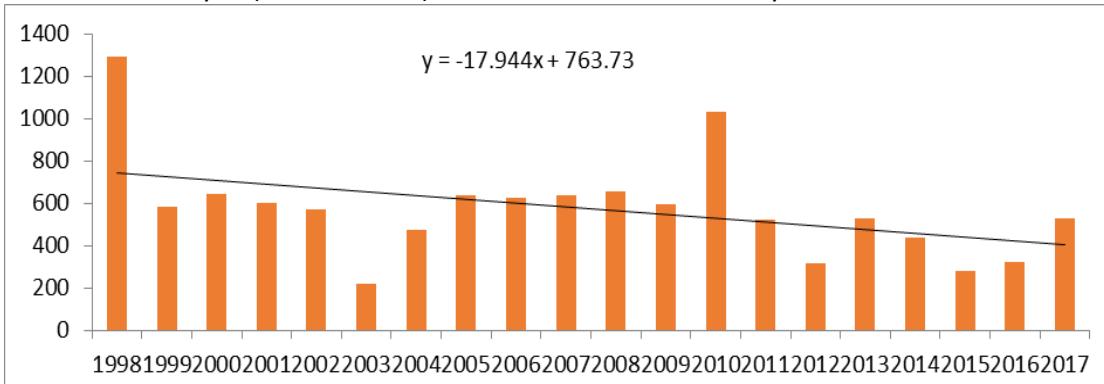

Volume of water available for GWD to 60% (MCM)	1.4886
Proposed Number of DW( @ 1.5 ham for 90% of GWR Available for development)	89
Proposed Number of BW( @ 1.5 ham for 10% of GWR Available for development)	10
Additional Area (sq.km.) brought under assured GW irrigation with av. CWR of 0.65 m	2.2901

## **12 AQUIFER MAPS AND GROUND WATER MANAGEMENT PLAN, MOHOL BLOCK, SOLAPUR DISTRICT, MAHARASHTRA**

<b>1. SALIENT INFORMATION</b>	
<b>1.1. Introduction</b>	
Block Name	Molol
Geographical Area (Sq. Km.)	1360.46
Hilly Area (Sq. Km)	0
Saline Area (Sq. Km.)	0
Population (2011)	276920
Climate	Tropical Monsoon
<b>1.2 Rainfall Analysis</b>	
Annual Rainfall (2017)(mm)	526.3 mm
Decadal Average Annual Rainfall (2007-17) (mm)	522 mm
Normal Rainfall (mm)	575 mm
Long Term Rainfall Analysis(1998-2017)	Rising Trend 0.479 mm/year Probability of Normal/Excess Rainfall- 50% & 50%. Probability of Drought (Moderate/Severe)-: 2 % Moderate & 1 % Severe.

Rainfall Trend Analysis (1901 To 2017) EQUATION OF TREND LINE:  $y = -17.944x + 763.73$

### **1.3. Geomorphology Soil & Geology**

<b>Geomorphic Unit</b>	Alluvial Plain of Sina River and Plateau (Undissected to highly Dissected) with weathered thickness ranging from 0 to 1 m.
<b>Soil</b>	In general, they are clayey loam in texture and fairly high in calcium carbonate, high porosity but moderate to low permeability, thus having low to moderate infiltration capacity. Based on physical characteristics the soils of the area have been classified into three major groups: Medium black soil, Red Sandy soils and Shallow black soils
<b>Geology</b>	Alluvium: sand/ silt and clay alternating beds Age: Recent to Sub-recent Deccan Traps (Basalt) Age: Upper Cretaceous to Lower Eocene

### **1.4. Hydrology & Drainage**

Bigger Minor Irrigation Project (>100 Ha.)	<b>Completed:</b> -7 MI Tanks
Minor Irrigation Project (<100 Ha.)	<b>Completed:</b> -351 1VT, 66 KT weirs & 43 DB
<b>Drainage</b>	The area is drain by Sina rivers and its tributaries, flow from NW to SE direction in central part of the taluka

### **1.5. Land Use, Agriculture, Irrigation & Cropping Pattern**

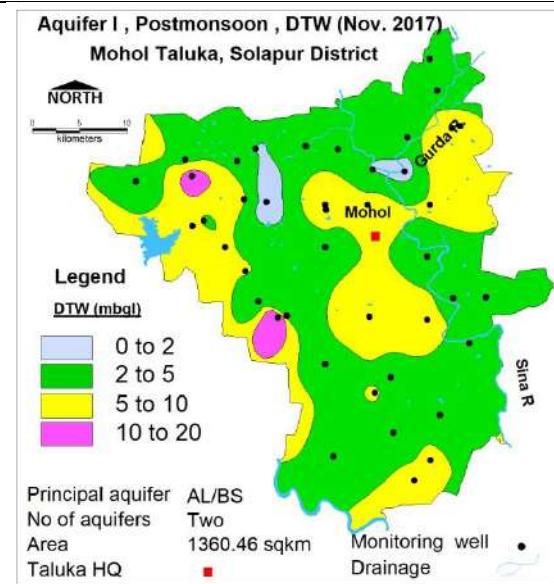

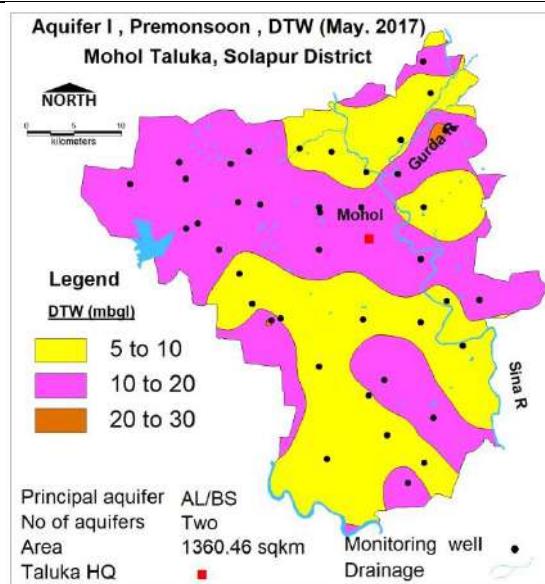

Geographical Area (Sq. Km.)	1360.46
Forest Area (Sq. Km.)	15.91
Net Sown Area (Sq. Km.)	910.92
Double Cropped Area (Sq. Km.)	32.76
Gross Cropped Area (Sqkm)	943.68
Cultivable Area (Sq. Km.)	1206.53
<b>Area under Irrigation (Sq. Km.)</b>	
Ground Water	191.8
Surface Water	65.73
Principal Crops Reference year 2013-14)	Area (Sq. Km.)
Wheat	50.56
Jawar	1002.61
Bajra	7.34
Maize	27.45
Tur	12.09
Sugarcane	48.71
Chilli	1.39
Mango	2.99
Onion	4.99
Sunflower	20.43

### **1.6. Water Level Behaviour**

#### **1.6.1. Phreatic Aquifer-Water Level**

**Pre-Monsoon (May-2017)-** Water level in the range of 10 -20 mbgl has been observed in major part of the taluka, while water level less than 10 mbgl observed in northern and southern part of the taluka.

**Post-Monsoon (November-2017)-** Water Level less than 5 mbgl has been observed in northern, north-western and southern parts of the block while water level in the range of 5 to 10 mbgl is observed as isolated patch

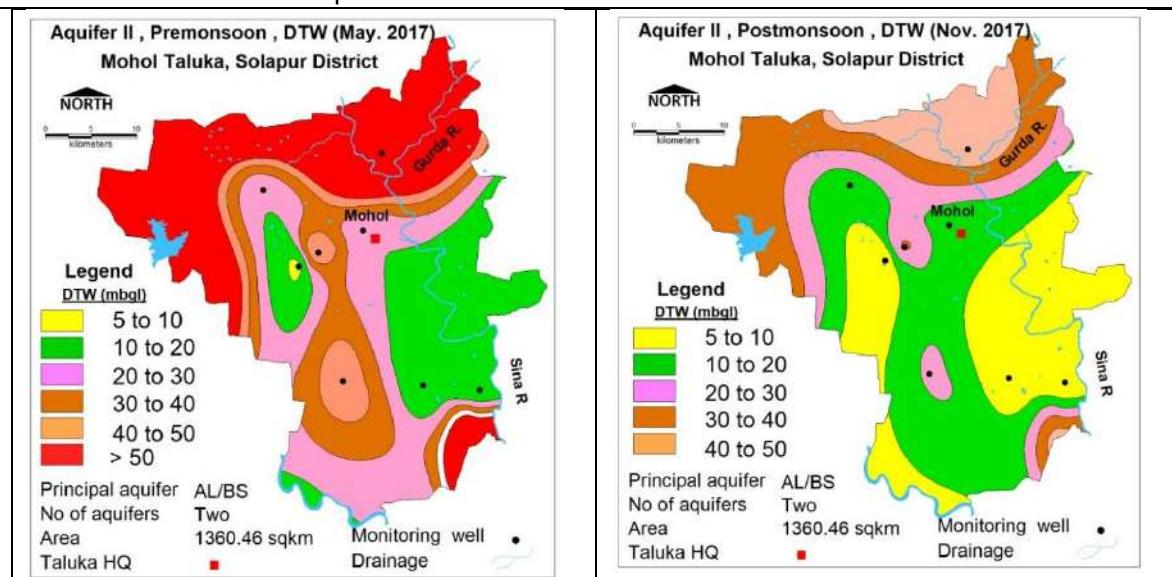

#### **1.6.2. Semi-Confined/Confined Aquifer-Water Level**

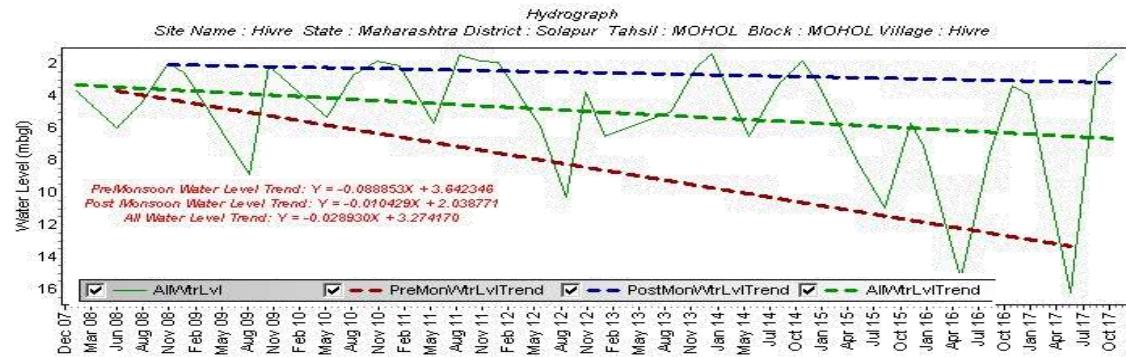

**Pre-Monsoon (May-2016)-** Water level > 20 mbgl is observed in south western part of the block; water level between 10 to 20 mbgl is observed in northeastern part of the block.

**Post-Monsoon (November-2017)-** Water level <10 mbgl is observed in north eastern and south-

western parts of the block; 10 to 20 mbgl is observed in major part of the block while >20 mbgl is observed in north western part of the block.

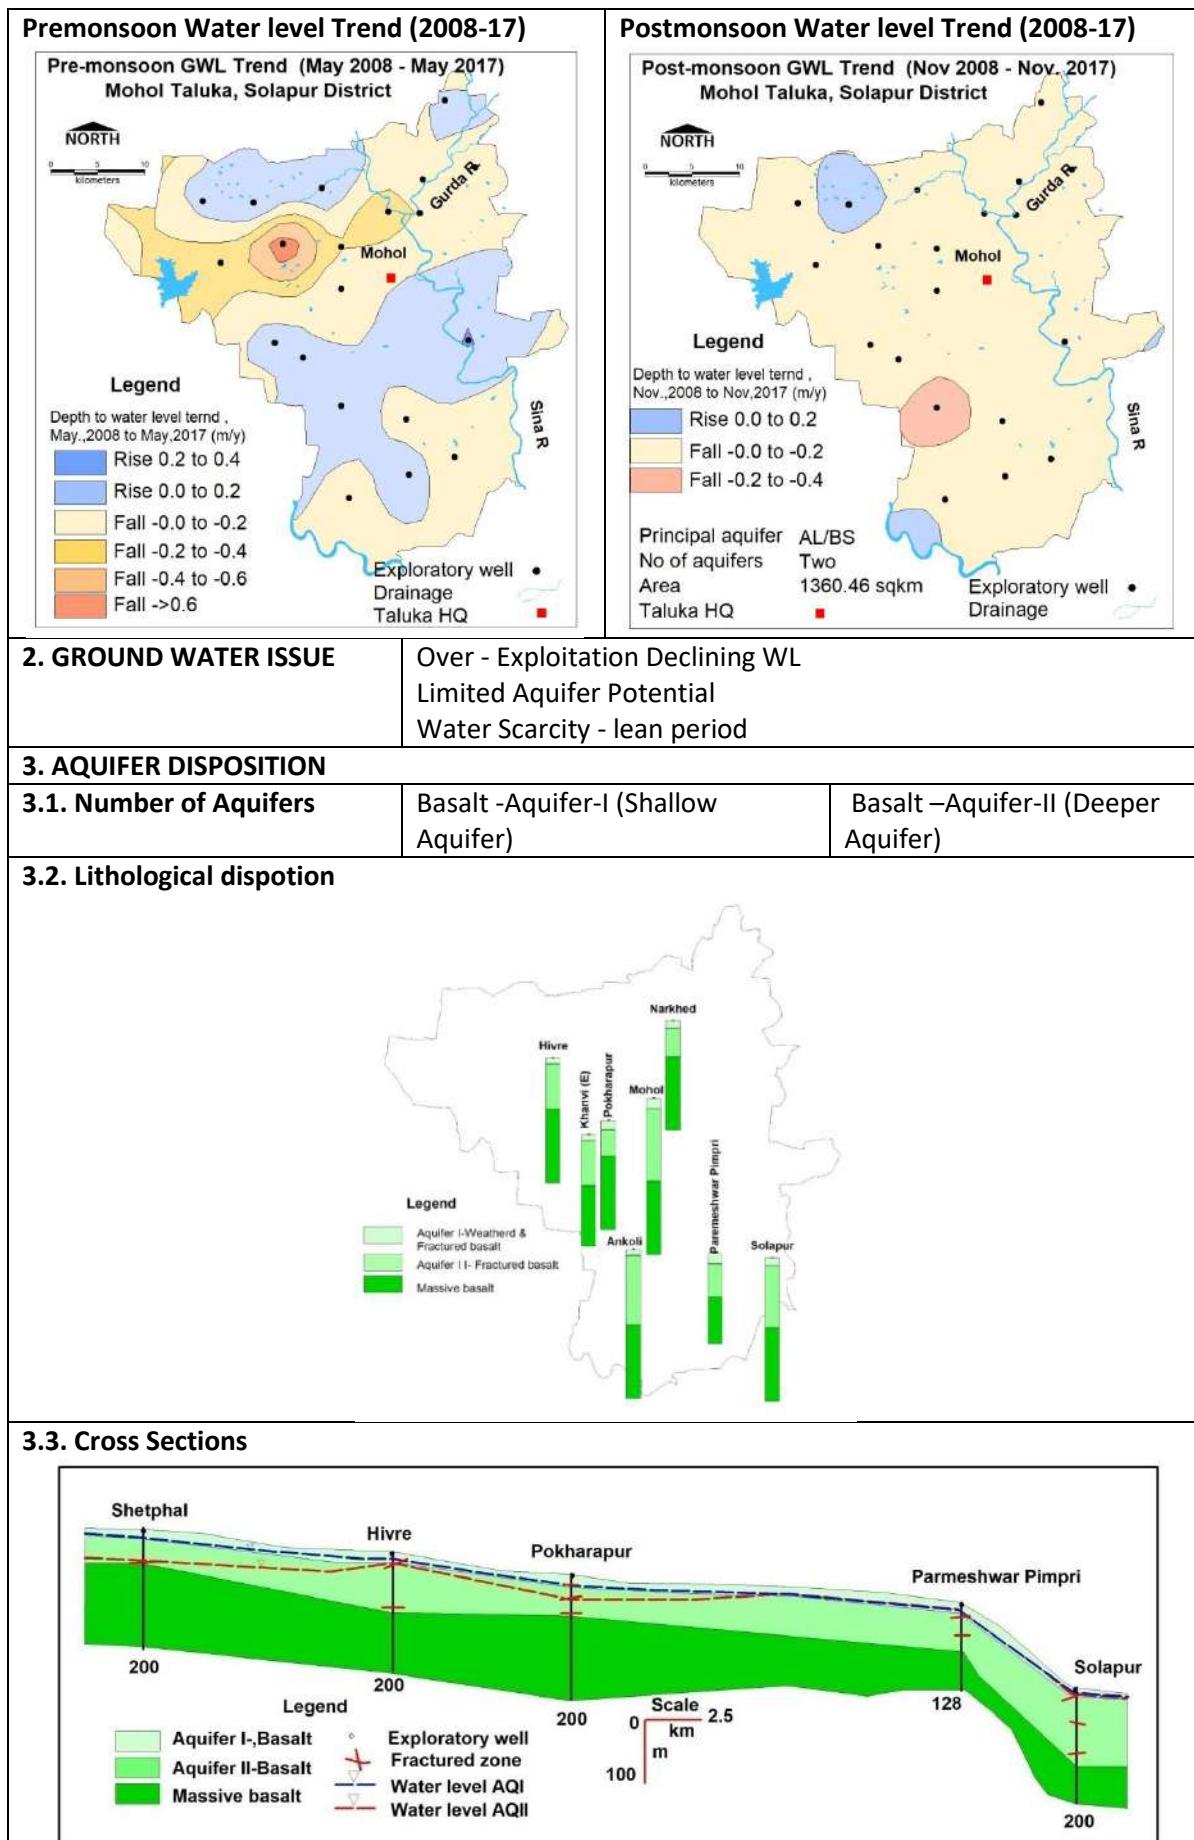

### 1.7. Hydrograph

Hydrograph shows Pre-monsoon rising trend @ 0.38 m/year	Hydrograph shows Post-monsoon rising trend @ 0.135 m/year
---	---

### 1.8. Water Level Trend (2008-2017)

1.8.1 Pre-Monsoon trend	1.8.2 Post-Monsoon trend
Rising 0.0016 to 0.2 m/year	Rising 0.1 m/year
Falling 0.015 to 0.67 m/year	Falling 0.009 to 0.268 m/year
Declining trend up to 0.2 m/year is observed in 50% area of block; decline in water level >0.2 m/year has been observed in eastern part of the block. Rising water level trend has been observed in small part in northern and southern parts and isolated part in western part of the block.	Declining trend up to 0.2 m/year is observed in 50% area of block; decline in water level >0.2 m/year has been observed in eastern part of the block. Rising water level trend has been observed in small part in northern and southern parts and isolated part in western part of the block.

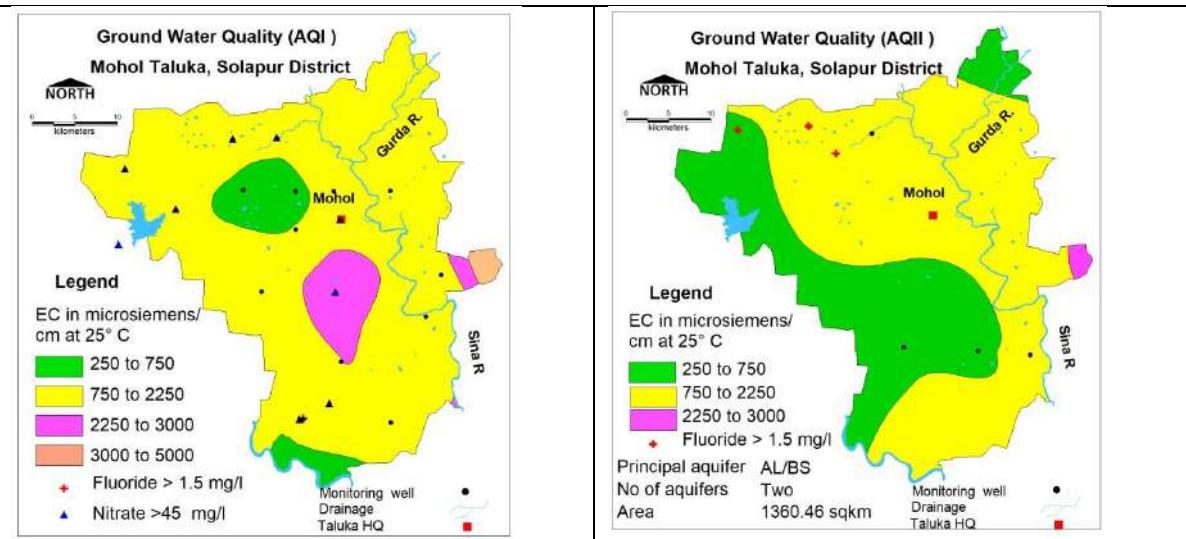

### **3.4. Aquifer Characteristics**

Major Aquifers	Basalt (Deccan Traps)	
Type of Aquifer	Aquifer-I (Phreatic)	Aquifer-II (Semiconfined/confined)
Depth of Occurrence (mbgl)	8 - 30	50 - 196
Thickness of weathered/ fractured rocks (m)	5 - 15	1.25 - 5
Yield	10 - 100 m <sup>3</sup> /day	0.1 - 1.5 lps
Specific yield (Sy)	0.02	0.0025
Storativity (S)		0.00057
Transmissivity (T) (m <sup>2</sup> /day)	T: 15-30 m <sup>2</sup> /day	T: 30-60 m <sup>2</sup> /day

### **4. GROUND WATER QUALITY**

**4.1 Phreatic Aquifer (Aquifer-I)** In general the water quality of shallow aquifer in Mohol taluka is potable and good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Ashti, Teoti, Mohol, Angar, Sohale Ichgaon, Fluorid more than 1.5 mg per litre was detected in water sample from Ichgaon . very high salinity prevails (>2250 µS/cm), which is not suitable for drinking, domestic, industrial as well as irrigation purposes. Ground water can be used for drinking only after treatment and for irrigation for very high salt tolerant crops and with proper soil and crop management practices.

**4.2: Semiconfined/Confined Aquifer (Aquifer II )** : In general the water quality of deep aquifer in Mohol taluka is potable and very good for drinking, domestic, industrial as well as irrigation purposes. Fluorid more than 1.5 mg per litre was detected in water sample from Mohol, Shetphal and Narkhed EW.

### **5. GROUND WATER RESOURCE**

#### **5.1. Aquifer-I/ Phreatic Aquifer (Basalt & Alluvium)**

Ground Water Recharge Worthy Area (Sq. Km.)	1360.46
Total Annual Ground Water Recharge (MCM)	161.95
Natural Discharge (MCM)	8.42
Net Annual Ground Water Availability (MCM)	153.53
Existing Gross Ground Water Draft for irrigation (MCM)	124.67
Existing Gross Ground Water Draft for domestic and industrial water supply (MCM)	4.80
Existing Gross Ground Water Draft for All uses(MCM)	129.47
Provision for domestic and industrial requirement supply to 2025(MCM)	8.35
Net Ground Water Availability for future irrigation development (MCM)	29.42
Stage of Ground Water Development (%)	84.33
Category	SAFE

Onion	4.39
Sunflower	28.06

### 1.6. Water Level Behaviour

#### 1.6.1. Phreatic Aquifer-Water Level

**Pre-Monsoon (May-2017)-** Water level less than 10 mbgl has been observed in major parts of the block while water level in the range of 10 to 20 mbgl is observed in northern part of the block; deeper water level more than 20 mbgl has been observed in isolated patch around Talani village.

**Post-Monsoon (November-2017)-** Water Level less than 5 mbgl has been observed in major parts of the block while water level in the range of 5 to 10 mbgl is observed in northern part of the block; deeper water level more than 20 mbgl has been observed at Medhapur.

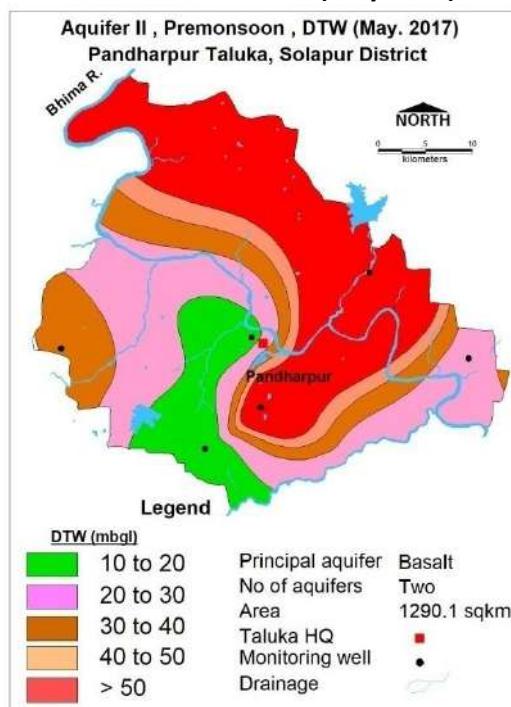

### 1.6.2. Semi-Confining/Confined Aquifer-Water Level

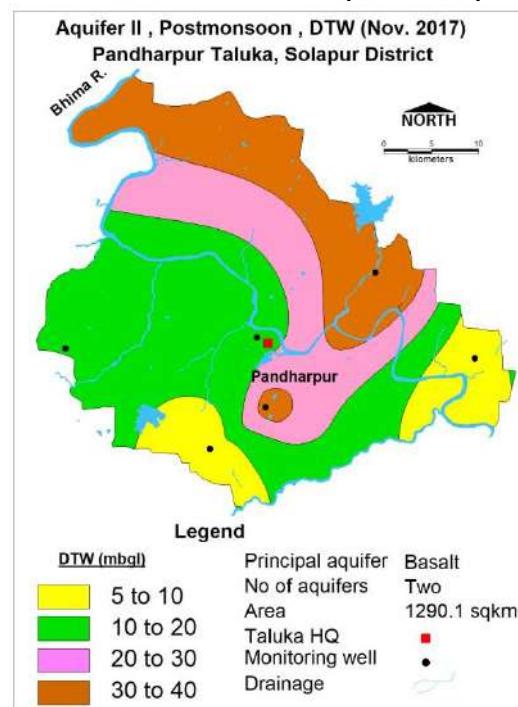

**Pre-Monsoon (May-2016)**- Water level > 20 mbgl is observed in south western part of the block; water level between 20 to 30 mbgl is observed in major part of the block while water level >30 mbgl is observed in northern and eastern parts of the block.

**Post-Monsoon (November-2017)**- Water level <20 mbgl is observed in north eastern and south-western parts of the block; 10 to 20 mbgl is observed in northwestern part of the block while >20 mbgl is observed in north western part of the block.

#### Pre-Monsoon Water Level (May 2017)

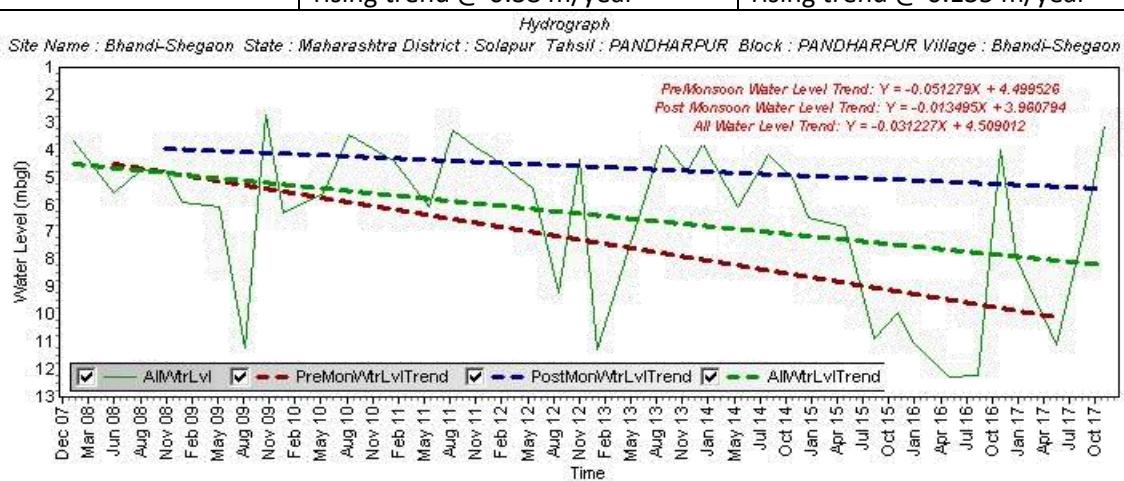

#### Post-Monsoon Water Level (Nov. 2017)

#### 1.7. Hydrograph

Hydrograph shows Pre-monsoon rising trend @ 0.38 m/year

Hydrograph shows Post-monsoon rising trend @ 0.135 m/year

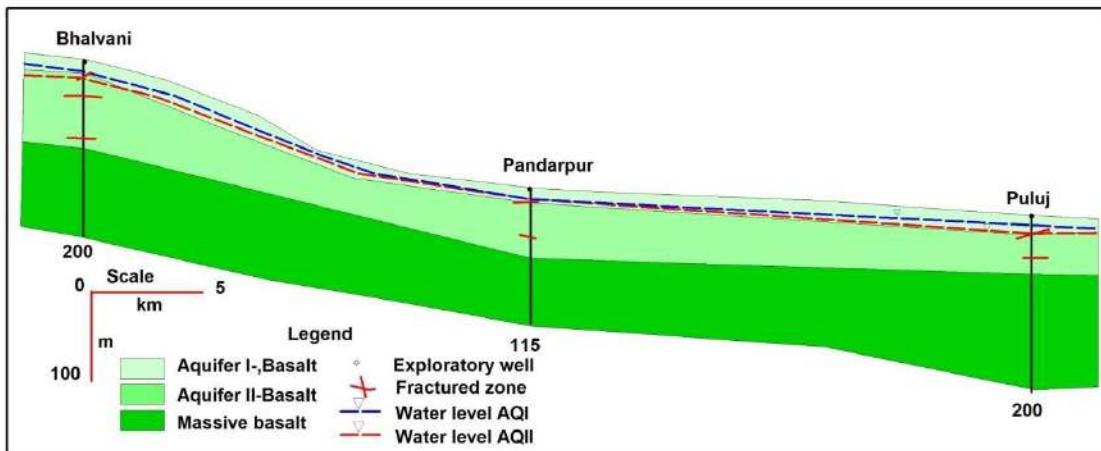

#### 1.8. Water Level Trend (2008-2017)

Pre-Monsoon trend	Post-Monsoon trend
Rising 0.014 to 0.11 m/year	Rising 0.009 m/year
Falling 0.02 to 0.2 m/year	Falling 0.0037 to 0.1 m/year
Declining trend up to 0.2 m/year is observed in almost entire block; decline in water level >0.2 m/year small patch has been observed in	Declining trend up to 0.2 m/year is observed in major part of the block; Rising water level trend has been observed in central & southern in

northern part of the block. Rising water level trend has been observed in small part in northern and southern parts and isolated part in western part of the block.	isolated part of the block.

Transmissivity (T) (m <sup>2</sup> /day)	T: 5-30 m <sup>2</sup> /day	T: 40 - 60 m <sup>2</sup> /day

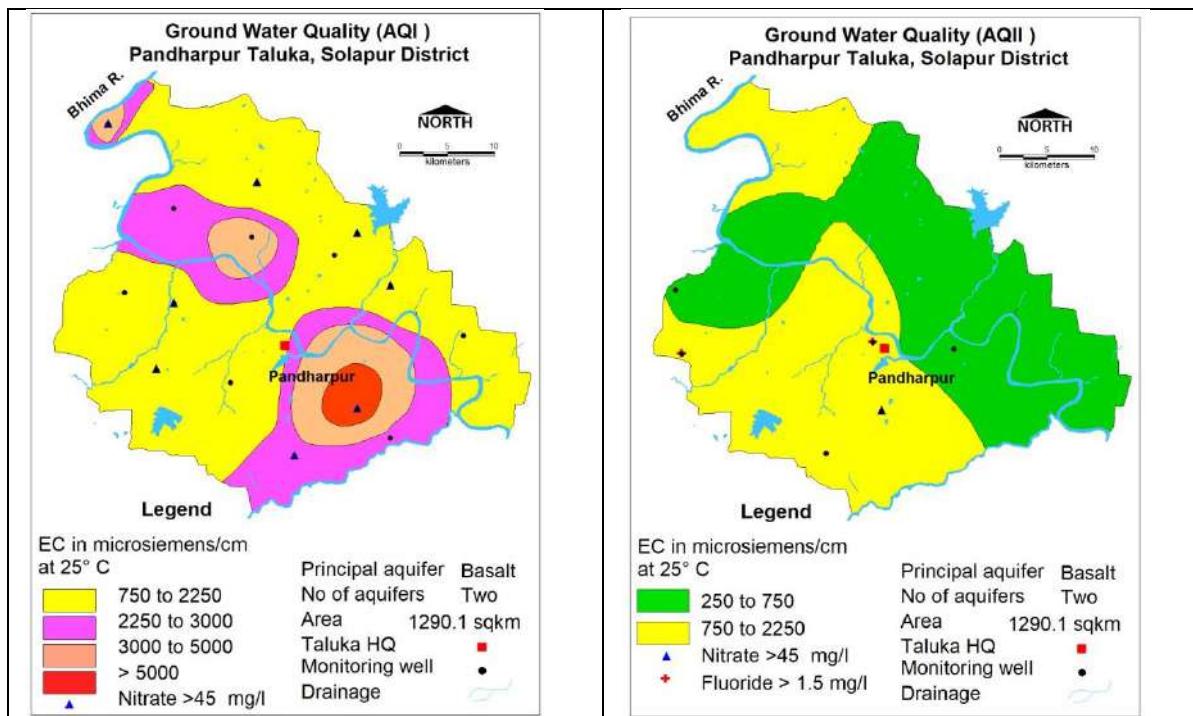

### 4. GROUND WATER QUALITY

**3.1 Phreatic Aquifer (Aquifer-I) :** In general the water quality of shallow aquifer in Karmala taluka is potable and good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Palshi, Bhose, Rople, Talni, Ranzani, and Rople. very high salinity prevails ( $>2250 \mu\text{S}/\text{cm}$  at Ranzani), which is not suitable for drinking, domestic, industrial as well as irrigation purposes. Ground water can be used for drinking only after treatment and for irrigation for very high salt tolerant crops and with proper soil and crop management practices.

**3.2: Semiconfined/Confined Aquifer (Aquifer II ) :** In general the water quality of deep aquifer in Karmala taluka is potable and very good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Kasegaon EW & Fluorid more than 1.5 mg per litre was detected in water sample from Bhalwani and Pandharpur EW.

**Phreatic Aquifer (Aquifer-I)**

**Semiconfined/Confined Aquifer (Aquifer II )**

## 5. GROUND WATER RESOURCE

### 5.1. Aquifer-I/ Phreatic Aquifer (Basalt & Alluvium)

Ground Water Recharge Worthy Area (Sq. Km.)	1294.37
Total Annual Ground Water Recharge (MCM)	167.84
Natural Discharge (MCM)	8.60
Net Annual Ground Water Availability (MCM)	159.24
Existing Gross Ground Water Draft for irrigation (MCM)	118.63
Existing Gross Ground Water Draft for domestic and industrial water supply (MCM)	4.11
Existing Gross Ground Water Draft for All uses (MCM)	122.74
Provision for domestic and industrial requirement supply to 2025(MCM)	7.99
Net Ground Water Availability for future irrigation development (MCM)	37.90
Stage of Ground Water Development (%)	77.08
Category	SAFE

### 5.2 Aquifer-II Semiconfined/Confined Aquifer (Basalt)

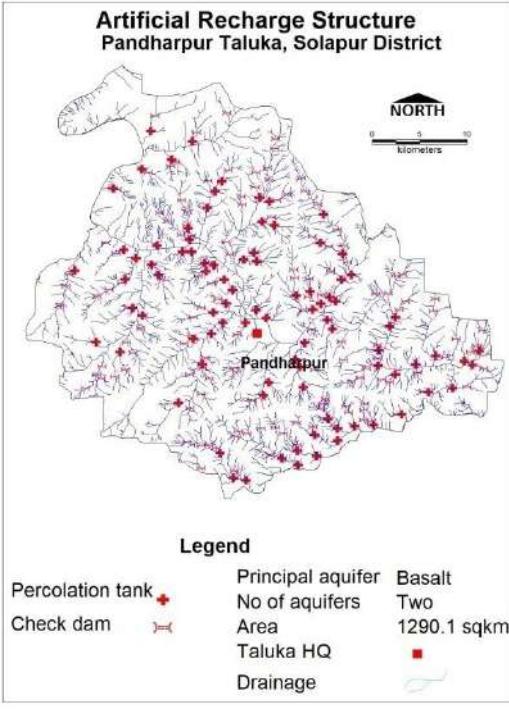

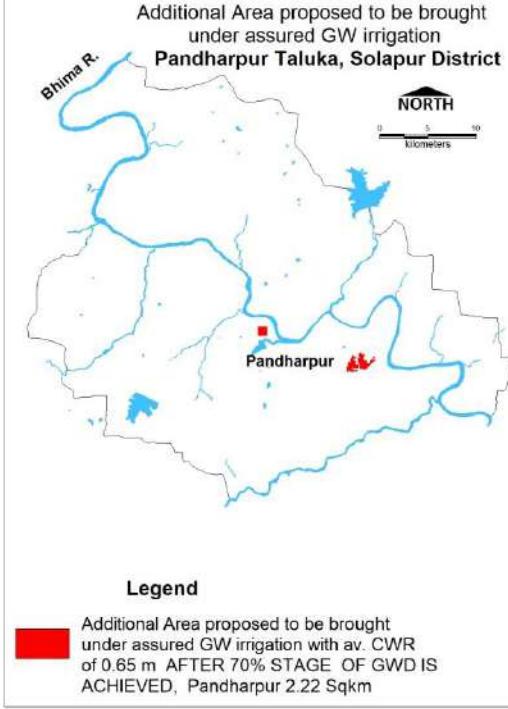

Area (Sqkm)	Mean thickness (m)	Piezometric head (meter above bottom of confining layer)	Sy	S	Resource above confining layer (mcm)	Resource in confining aquifer (mcm)	Total Resource (mcm)
1297.116	5	60	0.005	2.66E-05	2.070197	32.4279	34.4981

## 6.0. GROUND WATER RESOURCES

### 6.1. Supply Side Management

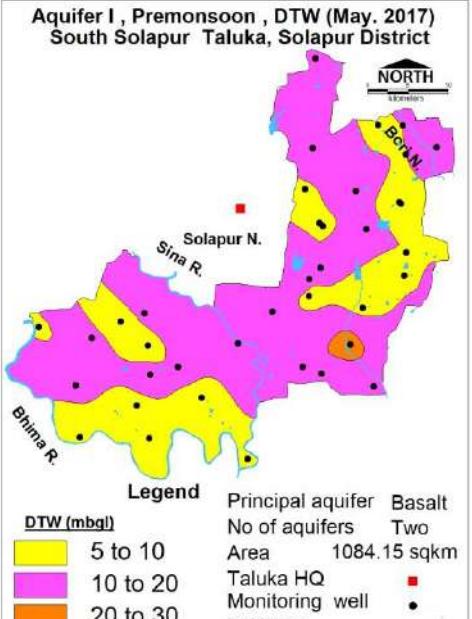

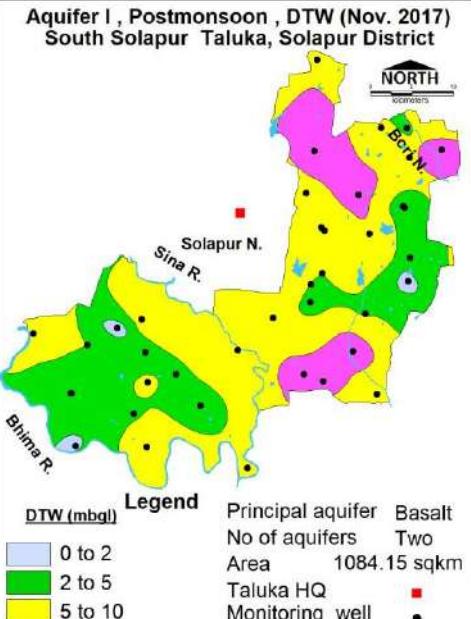

Net Available Resource (MCM)	159.24
Gross Annual Draft (MCM)	122.74
Agricultural Supply -GW	118.63
Agricultural Supply -SW	
Domestic Supply - GW	4.11
Domestic Supply - SW	1.03
Total Supply	123.76
Area of Block (Sq. Km.)	1294.37

Area suitable for Artificial recharge (Sq. Km)		900.00	
Type of Aquifer		Hard Rock	
Area feasible for Artificial Recharge (WL >5mbgl) (Sq. Km.)		900.00	
Volume of Unsaturated Zone (MCM)		1800.00	
Average Specific Yield		0.02	
Volume of Sub surface Storage Space available for Artificial Recharge (MCM)		36.00	
Surplus water required (MCM)		47.88	
Surplus water Available (MCM)	22.05	16.54	
Proposed Structures	Percolation Tank (Av. Gross Capacity-100 TCM*2 fillings = 200 TCM)	Check Dam (Av. Gross Capacity-10 TCM * 3 fillings = 30 TCM)	
Number of Structures	90.00	135.00	
Volume of Water expected to be conserved / recharged @ 75% efficiency (MCM)	13.50	3.04	
<b>RTRWH Structures – Urban Areas</b>			
Households to be covered (25% with 50 m <sup>2</sup> area)	22160.00	<b>Economically not viable &amp; Not Recommended</b>	
Total RWH potential (MCM)	0.56		
Rainwater harvested / recharged @ 80% runoff co-efficient	0.45		
<b>6.2. Demand Side Management</b>			
<b>Micro irrigation techniques</b>			
Sugarcane crop area (33.04), about 20 sqkm area is ground water irrigated, 100 % ground water irrigated ( 20 sqkm) proposed to be covered under Drip (sq.km.)		2.00	
Volume of Water expected to be saved (MCM). Surface Flooding req- 2.45 m. Drip Req. - 1.88, WUE- 0.57 m		1.14	
Proposed Cropping Pattern change			
Irrigated area under Water Intensive Crop(ha)		Not proposed	
Water Saving by Change in Cropping Pattern		Nil	
<b>6.3. EXPECTED BENEFITS</b>			
Net Ground Water Availability (MCM)		159.24	
Additional GW resources available after Supply side interventions (MCM)		16.54	
Ground Water Availability after Supply side intervention		175.78	
Existing Ground Water Draft for All Purposes (MCM)		122.74	
GW draft after Demand Side Interventions (MCM)		121.60	
Present stage of Ground Water Development (%)		77.08	
Expected Stage of Ground Water Development after interventions (%)		69.18	
Other Interventions Proposed, if any			
Alternate Water Sources Available		Nil	
<b>6.4. DEVELOPMENT PLAN</b>			
Volume of water available for GWD to 60% (MCM)		1.45	
Proposed Number of DW( @ 1.5 ham for 90% of GWR Available for		87.00	

development)	
Proposed Number of BW( @ 1.5 ham for 10% of GWR Available for development)	10.00
Additional Area (sq.km.) brought under assured GW irrigation with av. CWR of 0.65 m	2.23
<b>Regulatory Measures</b>	<b>60m borewell/tube well</b>
<b>Proposed AR Structures</b>  <p><b>Artificial Recharge Structure Pandharpur Taluka, Solapur District</b></p> <p><b>Legend</b></p> <ul style="list-style-type: none"> <li>Percolation tank +</li> <li>Check dam</li> <li>Principal aquifer Basalt</li> <li>No of aquifers Two</li> <li>Area 1290.1 sqkm</li> <li>Taluka HQ</li> <li>Drainage</li> </ul>	<b>Additional area proposed to be bought under assured GW irrigation</b>  <p><b>Additional Area proposed to be brought under assured GW irrigation Pandharpur Taluka, Solapur District</b></p> <p><b>Legend</b></p> <ul style="list-style-type: none"> <li>Additional Area proposed to be brought under assured GW irrigation with av. CWR of 0.65 m AFTER 70% STAGE OF GWD IS ACHIEVED, Pandharpur 2.22 Sqkm</li> </ul>

## **14 AQUIFER MAPS AND GROUND WATER MANAGEMENT PLAN, SOUTH SOLAPUR BLOCK, SOLAPUR DISTRICT, MAHARASHTRA**

<b>1. SALIENT INFORMATION</b>																																											
<b>1.1. Introduction</b>																																											
Block Name	S Slopaour																																										
Geographical Area (Sq. Km.)	1194.63																																										
Hilly Area (Sq. Km)	0.00																																										
Saline Area (Sq. Km.)	0.00																																										
Population (2011)	260897.00																																										
Climate	Tropical Monsoon																																										
<b>1.2 Rainfall Analysis</b>																																											
Annual Rainfall (2017)(mm)	473.70																																										
Decadal Average Annual Rainfall (2007-17) (mm)	552.3 mm																																										
Normal Rainfall (mm)	599.2 mm																																										
Long Term Rainfall Analysis(1998-2017)	Falling Trend -15.49 mm/year Probability of Normal/Excess Rainfall- 45% & 55%. Probability of Drought (Moderate/Severe)- 0 % Moderate & 2 % Severe.																																										
Rainfall Trend Analysis (1901 To 2017) EQUATION OF TREND LINE: $y = -15.49x + 761.82$																																											
<table border="1"> <caption>Data points estimated from Rainfall Trend Analysis chart</caption> <thead> <tr> <th>Year</th> <th>Rainfall (mm)</th> </tr> </thead> <tbody> <tr><td>1998</td><td>1200</td></tr> <tr><td>1999</td><td>500</td></tr> <tr><td>2000</td><td>650</td></tr> <tr><td>2001</td><td>750</td></tr> <tr><td>2002</td><td>580</td></tr> <tr><td>2003</td><td>300</td></tr> <tr><td>2004</td><td>600</td></tr> <tr><td>2005</td><td>750</td></tr> <tr><td>2006</td><td>580</td></tr> <tr><td>2007</td><td>600</td></tr> <tr><td>2008</td><td>680</td></tr> <tr><td>2009</td><td>700</td></tr> <tr><td>2010</td><td>800</td></tr> <tr><td>2011</td><td>650</td></tr> <tr><td>2012</td><td>480</td></tr> <tr><td>2013</td><td>520</td></tr> <tr><td>2014</td><td>480</td></tr> <tr><td>2015</td><td>300</td></tr> <tr><td>2016</td><td>550</td></tr> <tr><td>2017</td><td>480</td></tr> </tbody> </table>		Year	Rainfall (mm)	1998	1200	1999	500	2000	650	2001	750	2002	580	2003	300	2004	600	2005	750	2006	580	2007	600	2008	680	2009	700	2010	800	2011	650	2012	480	2013	520	2014	480	2015	300	2016	550	2017	480

2017	480																																										
<b>1.3. Geomorphology, Soil &amp; Geology</b>																																											
Geomorphic Unit	Plateau Undissected to highly Dissected, with weathered thickness ranging from 0 to 1 m. Major parts of the taluka covered with Plateau Slightly Dissected (PLS), 0-1m weathering																																										
Soil	In general they are clayey loam in texture and fairly high in calcium carbonate, high porosity but moderate to low permeability, thus having low to moderate infiltration capacity. Based on physical characteristics the soils of the area have been classified into three major groups: Medium black soil, Red Sandy soils and Shallow black soils																																										
Geology	Alluvium : sand/ silt and clay alternating beds Age: Recent to Sub-recent Deccan Traps (Basalt) Age: Upper Cretaceous to Lower Eocene																																										
<b>1.4. Hydrology &amp; Drainage</b>																																											
Bigger Minor Irrigation Project	Completed: -3 MI Tanks																																										

(>100 Ha.)																																					
Minor Irrigation Project (<100 Ha.)	<b>Completed:</b> -801VT, 56 KT weirs & 43 DB																																				
Drainage	The central part of taluka is drain by Sina rivers and its tributaries, flow from NW to SE direction and northern part drain by Bori river The taluka falls in Bhima subbasin.																																				
<b>1.5. Land Use, Agriculture, Irrigation &amp; Cropping Pattern</b>																																					
Geographical Area (Sq. Km.)	1194.63																																				
Forest Area (Sq. Km.)	18.27																																				
Net Sown Area (Sq. Km.)	915.73																																				
Double Cropped Area (Sq. Km.)	39.51																																				
Gross Cropped Area (Sqkm)	955.24																																				
Cultivable Area (Sq. Km.)	1149.78																																				
<b>Area under Irrigation (Sq. Km.)</b>																																					
Ground Water	111.58																																				
Surface Water	4.42																																				
<b>Principal Crops(Reference year 2013-14)</b>																																					
Wheat	56.92																																				
Jawar	677.37																																				
Bajra	7.85																																				
Maize	12.66																																				
Tur	6.41																																				
Sugarcane	35.72																																				
Chilli	2.78																																				
Mango	4.36																																				
Onion	4.50																																				
Sunflower	36.26																																				
<b>1.6. Water Level Behaviour</b>																																					
<b>1.6.1. Phreatic Aquifer-Water Level</b>

Water level in the range of 10 -20 mbgl has been observed in major part of the taluka, while	Water Level less than 5 mbgl has been observed in northeastern and southern parts																																				

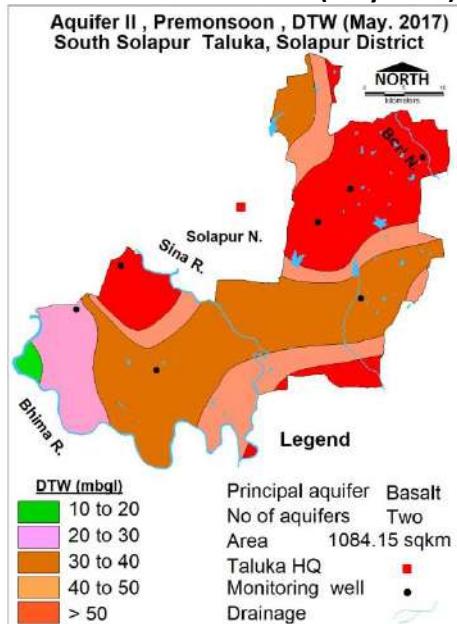

<p>water level less than 10 mbgl observed in northern and southern part of the taluka.</p>	<p>of the block while water level in the range of 5 to 10 mbgl is observed in major part of the block; deeper water level more than 20 mbgl has been observed as isolated.</p>
--	--

#### 1.6.2. Semi-Confining/Confined Aquifer-Water Level

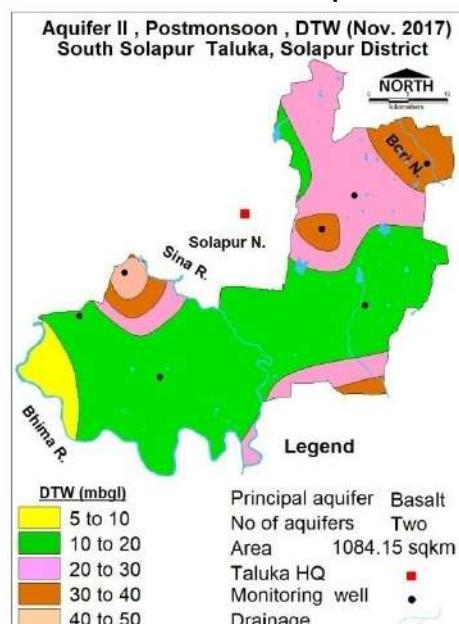

**Pre-Monsoon (May-2017)-** Water level > 20 mbgl is observed in south western part of the block; deeper water level between 40 to >50 mbgl is observed in northern part of the block .

**Post-Monsoon (November-2017)-** Water level <10 mbgl is observed in southwestern parts of the block; 10 to 20 mbgl is observed in major part of the block while >20 mbgl is observed in northern part of the block.

#### Pre-Monsoon Water Level (May 2017)

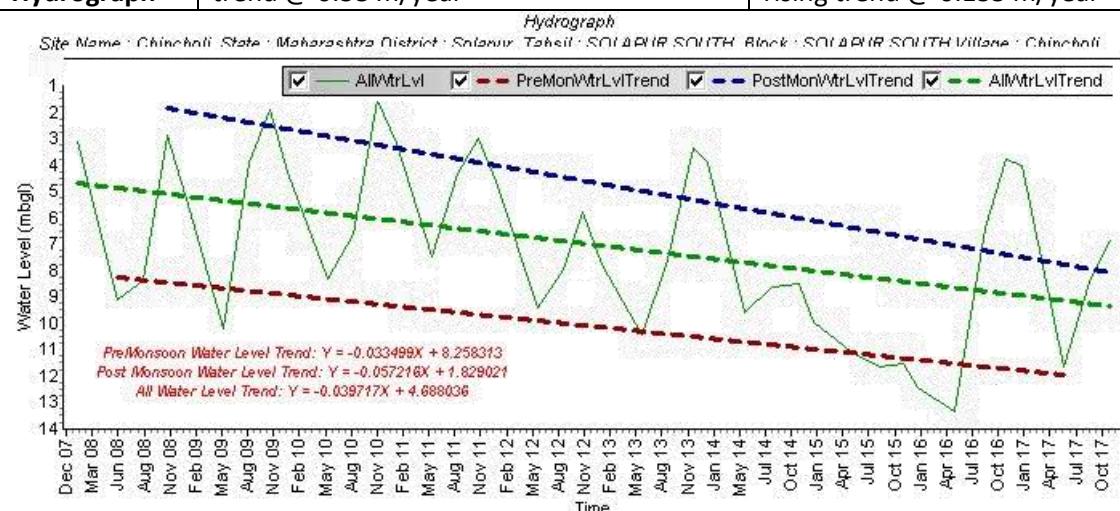

#### Post-Monsoon Water Level (Nov. 2017)

#### 1.7. Hydrograph

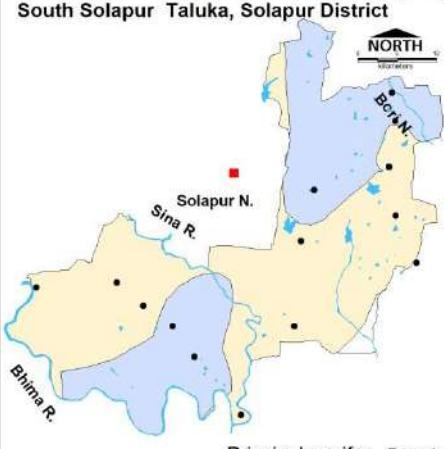

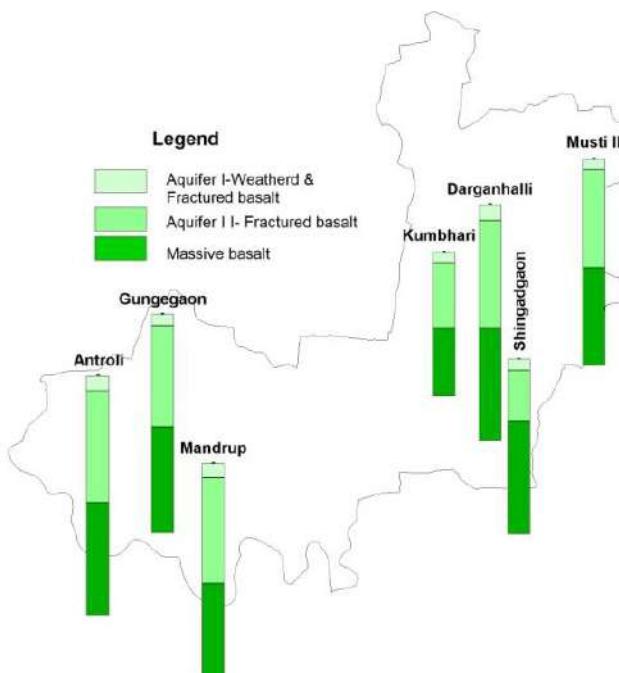

Hydrograph shows Pre-monsoon rising trend @ 0.38 m/year

Hydrograph shows Post-monsoon rising trend @ 0.135 m/year

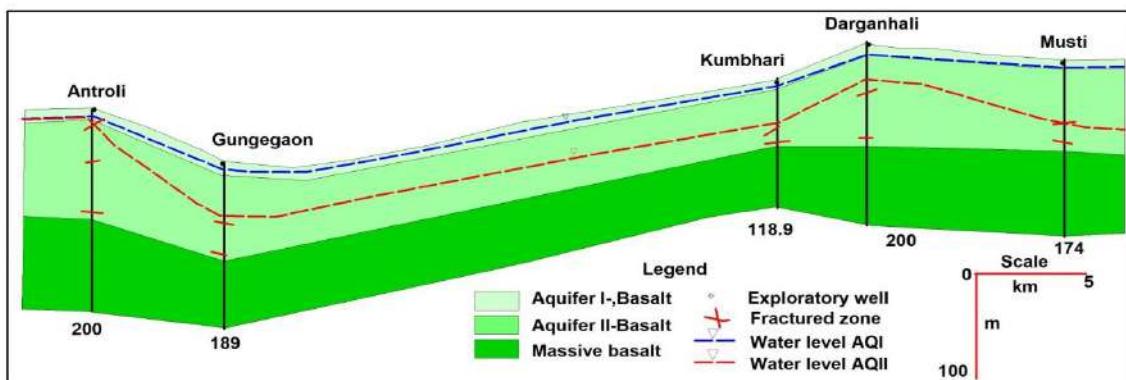

#### 1.8. Water Level Trend (2008-2017)

<p>Pre-Monsoon trend</p>	Rising 0.03 to 0.196 m/year
	Falling 0.004 to 0.176 m/year
	Declining trend up to 0.2 m/year is observed in about 50% area of block; Rising water level trend has been observed in southern part and in isolated parts in northern part of the block.

<b>Post-Monsoon trend</b>	Rising 0.07 to 0.15 m/year
	Falling 0.005 to 0.3 m/year
	Declining trend up to 0.2 m/year is observed in major part of block; Rising water level trend has been observed in southern part and in isolated parts in northern part of the block.
<b>Premonsoon Water level Trend (2007-17)</b>	<b>Postmonsoon Water level Trend (2007-17)</b>
<b>Pre-monsoon GWL Trend (May 2008 - May.17)</b> South Solapur Taluka, Solapur District  <p><b>Legend</b></p> <ul style="list-style-type: none"> <li>Principal aquifer Basalt</li> <li>No of aquifers Two</li> <li>Area 1084.15 sqkm</li> <li>Taluka HQ ■</li> <li>Monitoring well •</li> <li>Drainage</li> </ul>	<b>Post-monsoon GWL Trend (Nov 2008 - Nov.17)</b> South Solapur Taluka, Solapur District  <p><b>Legend</b></p> <ul style="list-style-type: none"> <li>Depth to water level trend , Nov.,2008 to Nov.,2017 (m/y)</li> <li>Rise 0.0 to 0.2</li> <li>Fall -0.0 to -0.2</li> <li>Fall -0.2 to -0.4</li> <li>Principal aquifer Basalt</li> <li>No of aquifers Two</li> <li>Area 1084.15 sqkm</li> <li>Taluka HQ ■</li> <li>Monitoring well •</li> <li>Drainage</li> </ul>
<b>2. GROUND WATER ISSUE</b>	Low ground water development, Limited Aquifer Potential Water Scarcity - lean period
<b>3. AQUIFER DISPOSITION</b>	
<b>3.1. Number of Aquifers</b>	Aquifer-I-Basalt (Shallow Aquifer)
<b>3.2. Lithological Desposition</b>	

### 3.3. Cross Sections

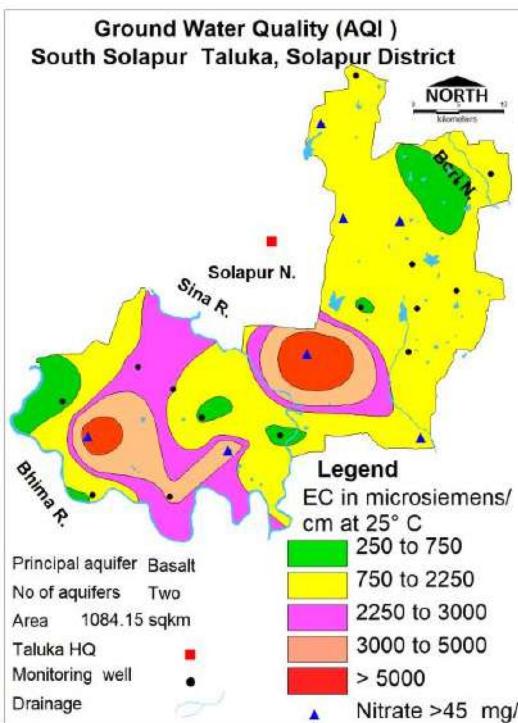

### 3.4. Aquifer Characteristics

Major Aquifers	Basalt	Basalt
Type of Aquifer	Aquifer-I (Phreatic)	Aquifer-II (Semiconfined/confined)
Depth of Occurrence (mbgl)	8 - 30	60 - 196
Thickness of wearherd /fractured rocks (m)	5 - 15	1.25 - 11
Yield	10 - 100 m <sup>3</sup> /day	0.1 - 1.5 lps
Specific yield (Sy)	0.018- 0.02	0.0025
Storativity (S)		0.0000154
Transmissivity (T) (m <sup>2</sup> /day)	T: 5-20 m <sup>2</sup> /day	T: 30-70 m <sup>2</sup> /day

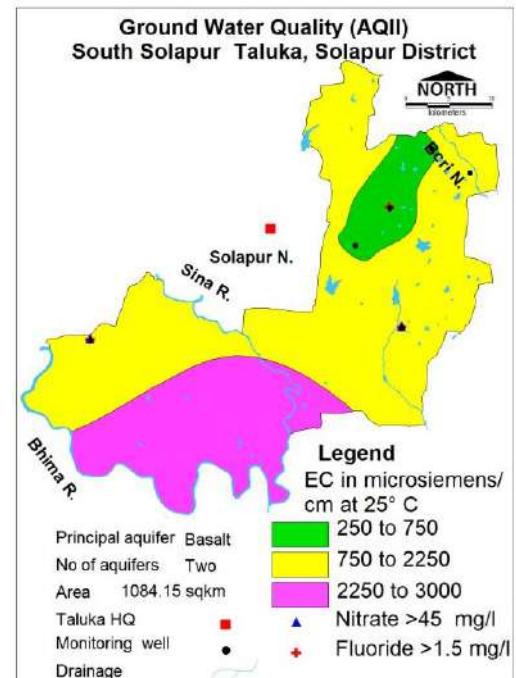

## 4. GROUND WATER QUALITY

### 4.1 Phreatic Aquifer (Aquifer-I)

In general the water quality of shallow aquifer in Karmala taluka is potable and good for drinking, domestic, industrial as well as irrigation purposes. Nitrate more than 45 mg per litre was detected in water sample from Hatgi, Chincholi, Hatur, Kanbas, Telgaon

### 4.2: Semiconfined/Confined Aquifer (Aquifer II)

In general the water quality of deep aquifer in South Solapur taluka is potable and very good for drinking, domestic, industrial as well as irrigation purposes. Fluorid more than 1.5 mg per litre was detected in water sample from Manarup, Anthroli and Darganhalli EW.

Mulegaon, Ule and Darganhalli very high salinity prevails (>2250 $\mu\text{S}/\text{cm}$ at Hatur and Telgaon ), which is not suitable for drinking, domestic, industrial as well as irrigation purposes. Ground water can be used for drinking only after treatment and for irrigation for very high salt tolerant crops and with proper soil and crop management practices.	
---	--

## 5. GROUND WATER RESOURCE

### 5.1. Aquifer-I/ Phreatic Aquifer (Basalt)

Ground Water Recharge Worthy Area (Sq. Km.)	1194.63
Total Annual Ground Water Recharge (MCM)	138.11
Natural Discharge (MCM)	6.91
Net Annual Ground Water Availability (MCM)	131.21
Existing Gross Ground Water Draft for irrigation (MCM)	72.53
Existing Gross Ground Water Draft for domestic and industrial water supply(MCM)	3.66
Existing Gross Ground Water Draft for All uses(MCM)	76.19
Provision for domestic and industrial requirement supply to 2025(MCM)	7.18
Net Ground Water Availability for future irrigation development (MCM)	51.52
Stage of Ground Water Development (%)	58.07
Category	SAFE

### 5.2 Aquifer-II - Semiconfined/Confined Aquifer (Basalt)

Area (Sqkm)	Mean thickness (m)	Piezometric head (meter above bottom of confining layer)	Sy	S	Resource above confining layer (mcm)	Resource in confining aquifer (mcm)	Total Resource (mcm)
