## SANGLI DISTRICT AT A GLANCE

<b>1. GENERAL INFORMATION</b>		
	Geographical Area	: 8572 Sq. Km
	Administrative Divisions	: Shirala, Walwa, Palus, Khanapur, Atpadi, Tasgaon Miraj, Kavathe Mahakal, Jath, & Khadgaon
	Villages	: 728
	Population	: 28, 22,143
	Rainfall 2021	: 801.9 mm
	Average Annual Rainfall (1998-2021)	: 629.1 mm
	Normal rainfall (1998-2021)	: 737.2 mm
	Long term rainfall Trend (1998-2021)	: 6.86 mm/year
<b>2. GEOMORPHOLOGY</b>		
	Major Physiographic unit	: Hills and Ghat, Foot hill, Plateau, Plains
	Major Drainage	: Krishna River; major tributaries of the Krishna River are namely Morna, Yerala, Manganga, Agrani, Nanni and Bor and Warna River
<b>3. LAND USE (sources: <a href="http://mahasdb.maharashtra.gov.in/district_Report">mahasdb.maharashtra.gov.in/district Report</a>)</b>		
	Forest Area	: 475.93 Sq. Km.
	Net Area Sown	: 5977 Sq. Km.
	Cultivable Area	: 768.68 Sq. Km.
<b>4. SOIL TYPE</b>		
		: Medium black to deep black soil and Lateritic soil
<b>5. PRINCIPAL CROPS</b>		
	Jawar	: 123700 ha
	Wheat	: 28600 ha
	Cereal	: 97003 ha
	Sugarcane	: 51016 ha
<b>6. IRRIGATION BY DIFFERENT SOURCES – Nos. / Potential Created (ha)</b>		
	Dugwells	: 54064/101958
	Borewells	: 246/369
	Other Minor Surface Sources	: 2842/ 41810
	Net Irrigated Area	: 144137
<b>7. GROUND WATER MONITORING WELLS (2022)</b>		
	Dugwells	: 40
	Piezometers	: Nil
<b>8. GEOLOGY</b>		
	Recent	: Alluvium
	Upper Cretaceous-Lower Eocene	: Basalt (Deccan Traps)
<b>9. HYDROGEOLOGY</b>		
	Water Bearing Formation	: Alluvium- Sand, silt and gravel

		Basalt (Deccan Traps) -Weathered, Fractured, Jointed.
	Premonsoon Depth to Water Level (2021)	: 0.30 to 15.50 mbgl
	Postmonsoon Depth to Water Level (2021)	: 0.20 to 12.20 mbgl
	Premonsoon Water Level Trend	: Rise: 0.102727 to 0.173557m/year
		Fall: 0.003846 to 0.689091 m/year
	Postmonsoon Water Level Trend	: Rise: 0.067824 to 0.162037m/year
		Fall: 0.001188 to 0.627285 m/year
<b>10. GROUND WATER EXPLORATION</b> (As on March, 2022)		
	Wells Drilled	: EW-55, OW-08
	Depth Range	: 95 to 200 mbgl
	Discharge	: Traces – 10.98 lps
	Storativity	: $1.2 \times 10^{-3}$ to $3.57 \times 10^{-3}$
	Transmissivity	: 5.0 to 180 m <sup>2</sup> /day
<b>11. GROUND WATER QUALITY</b>		
	Good and suitable for drinking and irrigation purpose, except the high EC and TDS affected locations for drinking purpose.	
<b>12. DYNAMIC GROUND WATER RESOURCES- (2020)</b>		
	Annual Extractable Groundwater Resource (MCM)	: 1304.60 (MCM)
	Total Draft (Irrigation + Domestic+ Industrial)	: 725.65 (MCM)
	Projected Demand (Domestic + Industrial)	: 32.70 (MCM)
11	Stage of Ground Water Extraction	: 55.62 %
	Overall Category	<b>Safe</b>
<b>16. MAJOR GROUND WATER PROBLEMS AND ISSUES</b>		
	Sangli district receives low rain fall as it falls in Rain Shadow Zone (dry area on the lee side of mountains). The mountains block the passage of rain-producing weather systems casting a “shadow” of dryness behind them. The drought is observed in major part of the district. High concentration of Nitrate and Fluoride in parts of Kavthe Mahankal, Jath, Khanapur and Miraj talukas. As per GEC-2020 Kavathe Mahakal taluka have been categorised as “semi-critical” where the ground water development has reached more than 70%. Major parts showing decline in water level in premonsoon and postmonsoon period.

- Annexure IX: Location of proposed Check dam in Sangli district
- Annexure X: Location of Percolation Tank in Sangli district

# **AQUIFER MAPS AND GROUND WATER MANAGEMENTPLAN, SANGLI DISTRICT, MAHARASHTRA**

## **1. INTRODUCTION**

National Aquifer Mapping (NAQUIM) has been taken up in XII five-year plans by CGWB to carry out detailed hydrogeological investigation on toposheet scale of 1:50,000. The NAQUIM has been prioritized to study Over-exploited, Critical and Semi-Critical Blocks as well as the other stress areas recommended by the State Govt. Aquifer mapping is a process wherein a combination of geological, geophysical, hydrological and chemical analyses is applied to characterize the quantity, quality and sustainability of ground water in aquifers.

The vagaries of rainfall, inherent heterogeneity & unsustainable nature of basalt aquifers, over exploitation of once copious alluvial aquifers, lack of regulation mechanism has a detrimental effect on ground water scenario of the Country in last decade or so. Thus, prompting the paradigm shift from “traditional groundwater development concept” to “modern groundwater management concept”.

Varied and diverse hydrogeological settings demand precise and comprehensive mapping of aquifers down to the optimum possible depth at appropriate scale to arrive at the robust and implementable ground water management plans. The proposed management plans will provide the “Road Map” for ensuring sustainable management and equitable distribution of ground water resources, thereby primarily improving drinking water security and irrigation coverage. Thus, the crux of NAQUIM is not merely mapping, but reaching the goal—that of ground water management through community participation. The aquifer maps and management plans will be shared with the Administration of Sangli district, Maharashtra for its effective implementation.

The activities under NAQUIM are aimed at:

- ❖ Identifying the aquifer geometry,
- ❖ Aquifer characteristics and their yield potential
- ❖ Quality of water occurring at various depths,
- ❖ Aquifer wise assessment of ground water resources
- ❖ Preparation of aquifer maps and
- ❖ Formulate ground water management plan

### **1.1 About the Area**

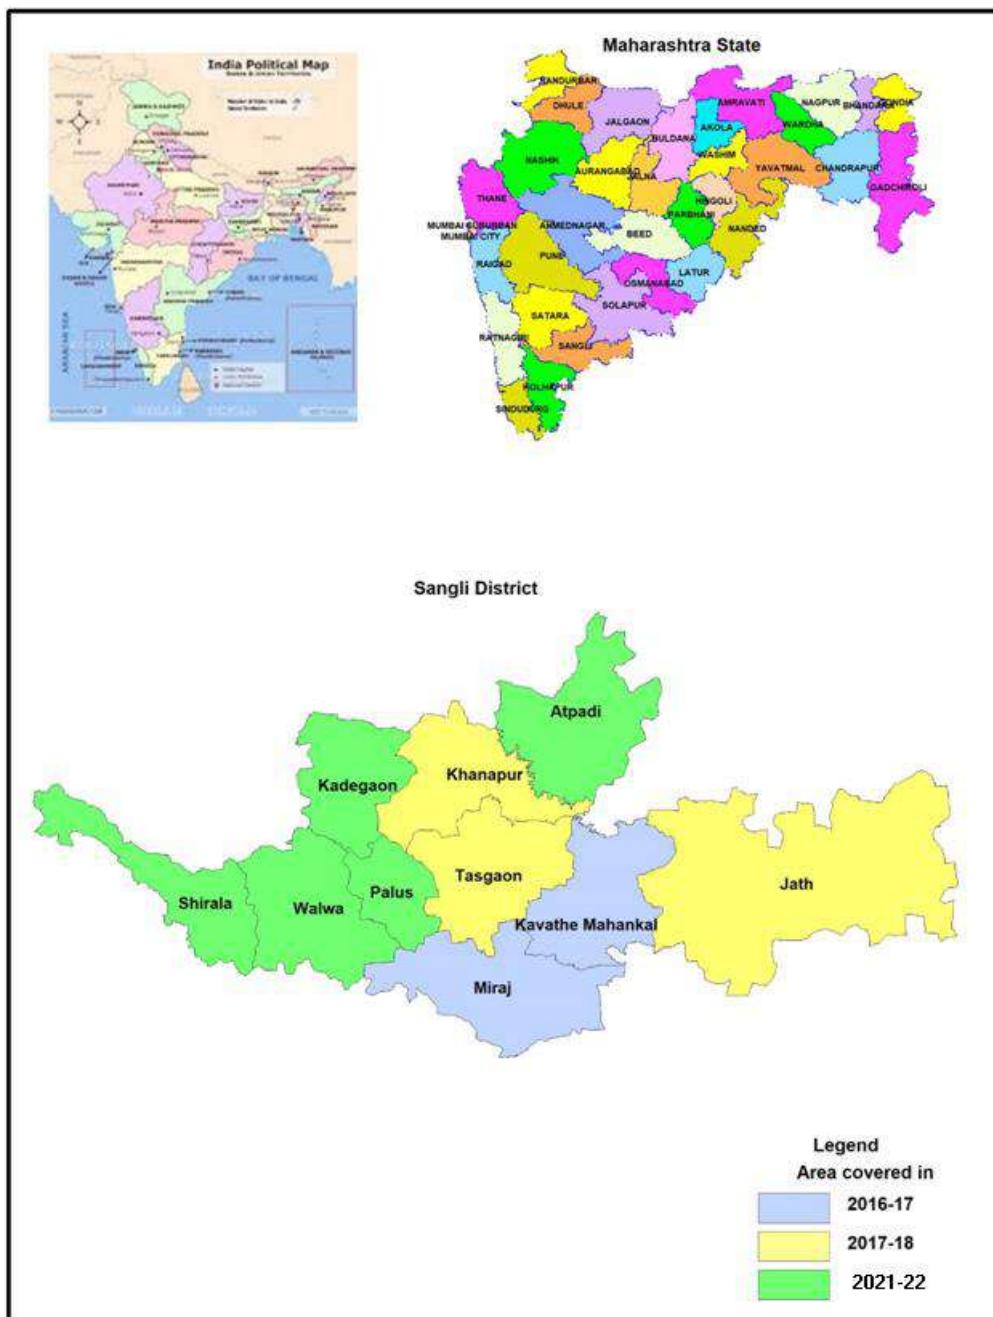

Sangli district is one of the thirty-six districts of Maharashtra State. It is situated in the Southern part of the State adjoining Karnataka and lies between north latitudes  $16^{\circ}43'$  and  $17^{\circ}38'$  and east longitude  $73^{\circ}41'$  and  $75^{\circ}41'$  having an area of 8572 sq. km covering parts of survey of India degree sheet Nos 47 K,47 L,47 O and 47P.

The district is bounded by Satara and Solapur districts in north and Kolhapur and Belgaum districts (Karnataka) in south. On the east it is bounded by Bijapur district of Karnataka state and in the west by coastal district of Ratnagiri. The east west extent of district is 205 km and the extent along north south is 96 km.

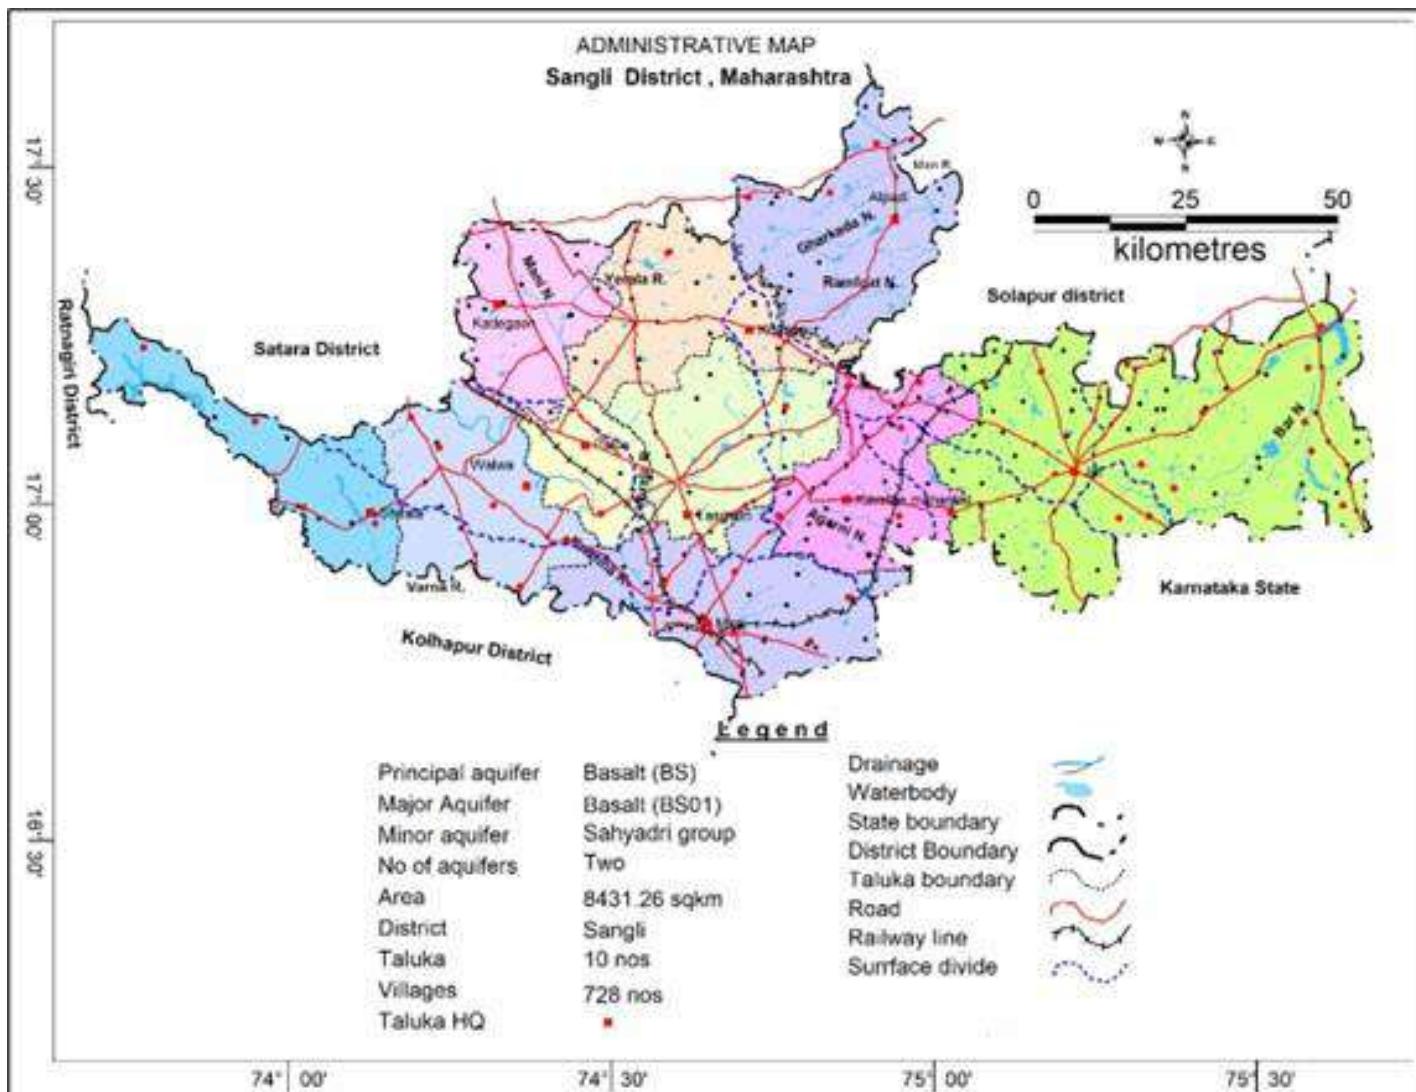

The district headquarters is located at Sangli city. It comprises of 10 talukas viz Shirala, Walwa, Palus, Khanapur, Atpadi, Jath, Kadegaon, Tasgaon, Miraj and Kavathe Mahakal. There are 8 towns and 728 villages in the district out of which only 3 villages are not habited. The

district has 1 Municipal Corporation, 4 Municipalities, 10 Panchayat Samities and 705 Gram Panchayats. The district is mainly an agricultural district falling in Krishna River basin. The Industrial development in the district is mainly restricted to Sangli-Miraj-Madhawagar urban complex; however, the district is devoid of major industries except few agro based industries.

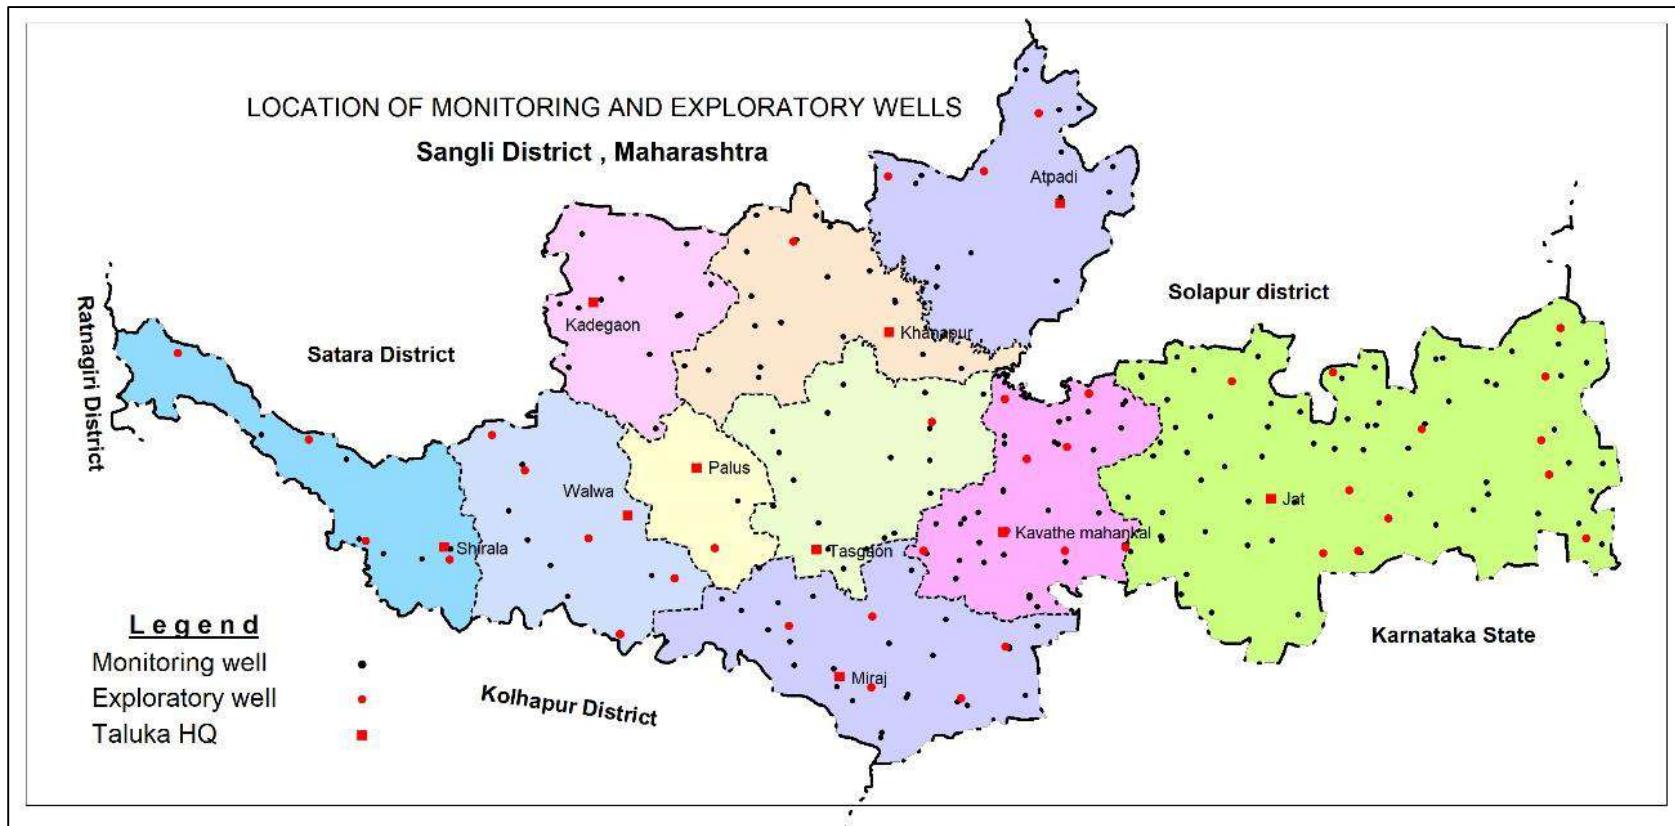

Sangli district has been taken up under NAQUIM study during the year 2021-22. The total area of the district is 8572 km. The Kavthe mahankal Block is categorised as Semi-critical and rest of the Blocks are categorized as safe as per Ground Water Resources Estimation as on March 2020. The Administrative and Index map of the study area is presented in **Figure.1.1 (a&b)**.

**Figure.1.1 (a) Index Map, Sangli District**

**Figure 1.1 (b): Administrative map, Sangli District**

**Fig. 1.2 : Locations of Existing Exploratory wells and Ground Water Monitoring Wells**

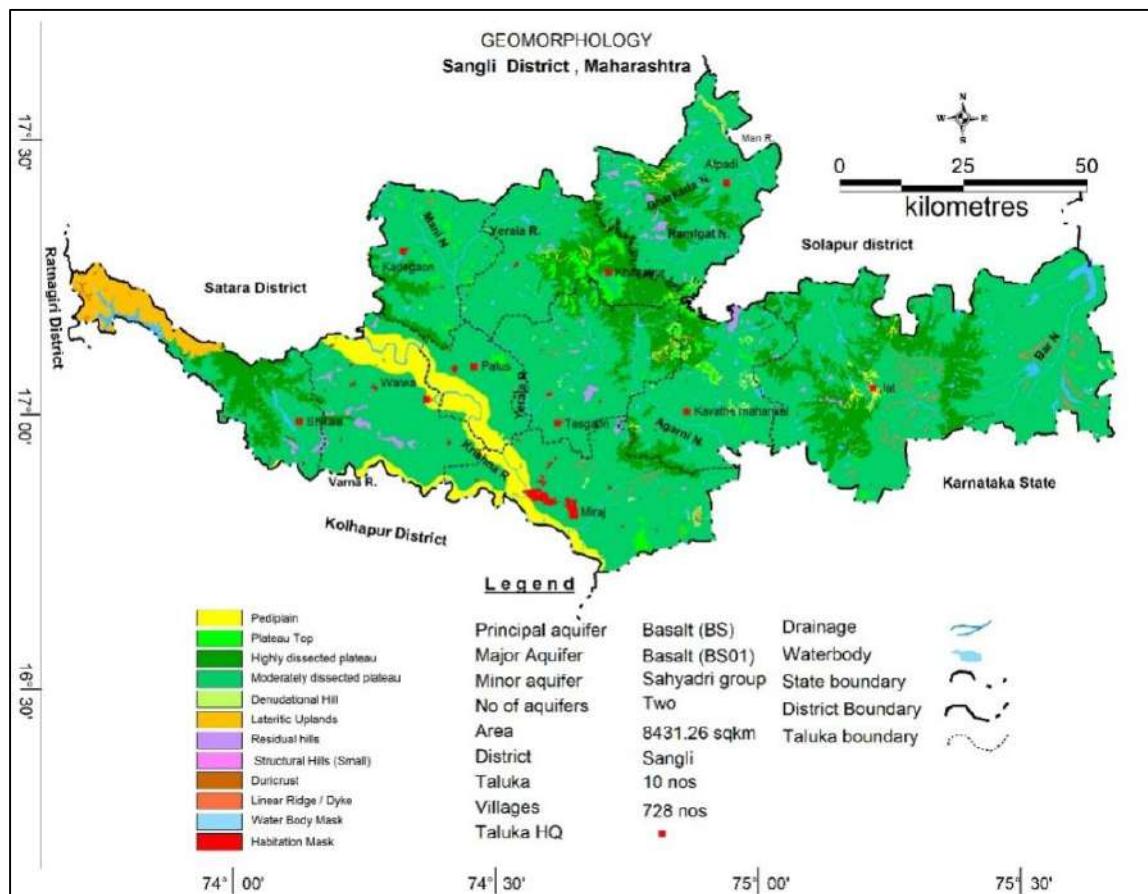

Ground water exploratory drilling in the district has been taken up in different phases since 1957. To establish the aquifer geometry, disposition and potential of aquifers, ground water exploration down to the depth of 200 m bgl has been taken up where the data gap exists and accordingly exploratory wells and observation wells have been constructed during 2021-22. Salient Features of Ground Water Exploration are given in **Annexure -I**, Location of Exploratory wells and monitoring wells is presented in **fig 1.2**.

## 1.2 Geomorphology, Geology, Drainage and Soil Types

The district falls in Krishna basin and has undulating topography. The elevation in the district ranges between 476 and 1104 a msl. The district is located in the Deccan Plateau and extends west to east from Western Ghat section in Shirala taluka to relatively flatter area of eastern Jath taluka. The land forms present are erosional broad valley separating flat topped remnant hills, displaying characteristic step like appearance. The area of the district can be broadly divided into four physiographic units namely,

- I) Highly dissected Plateau
- II) Moderately dissected Plateau
- III) Pediplain
- IV) Lateritic Uplands

The Highly dissected Plateau form the ridges and spurs of the Western Ghats and extend through western parts of Shirala taluka North western part of Yerala and Tasgaon

**Figure 1.3 : Geomorphology**

taluka, Khanapur taluka and minor parts of Jath taluka. Moderately dissected Plateau covers 85% of the whole district. The other hill ranges extend from north to south, south east, covering eastern parts of Khanapur, Tasgaon and Kavathe Mahakal talukas, and

western parts of Atpadi and Jath talukas. These form part of Mahadeo-Khanapur ranges. Geomorphology of the area is presented in **fig 1.3**

The hill ranges are blanked by relatively lower elevation foothill zones, characterised by sloping rolling topography, gradually merging in to the plains, extending along the river valleys. The ground elevation in the foot hills generally very from 476 to 550 m amsl. The width at foot hill varies from place to place. The pediplain topography occurs in and around the main Krishna River and Varna river. Also the lateritic uplands are seen in the western fringe of Shirala Taluka.

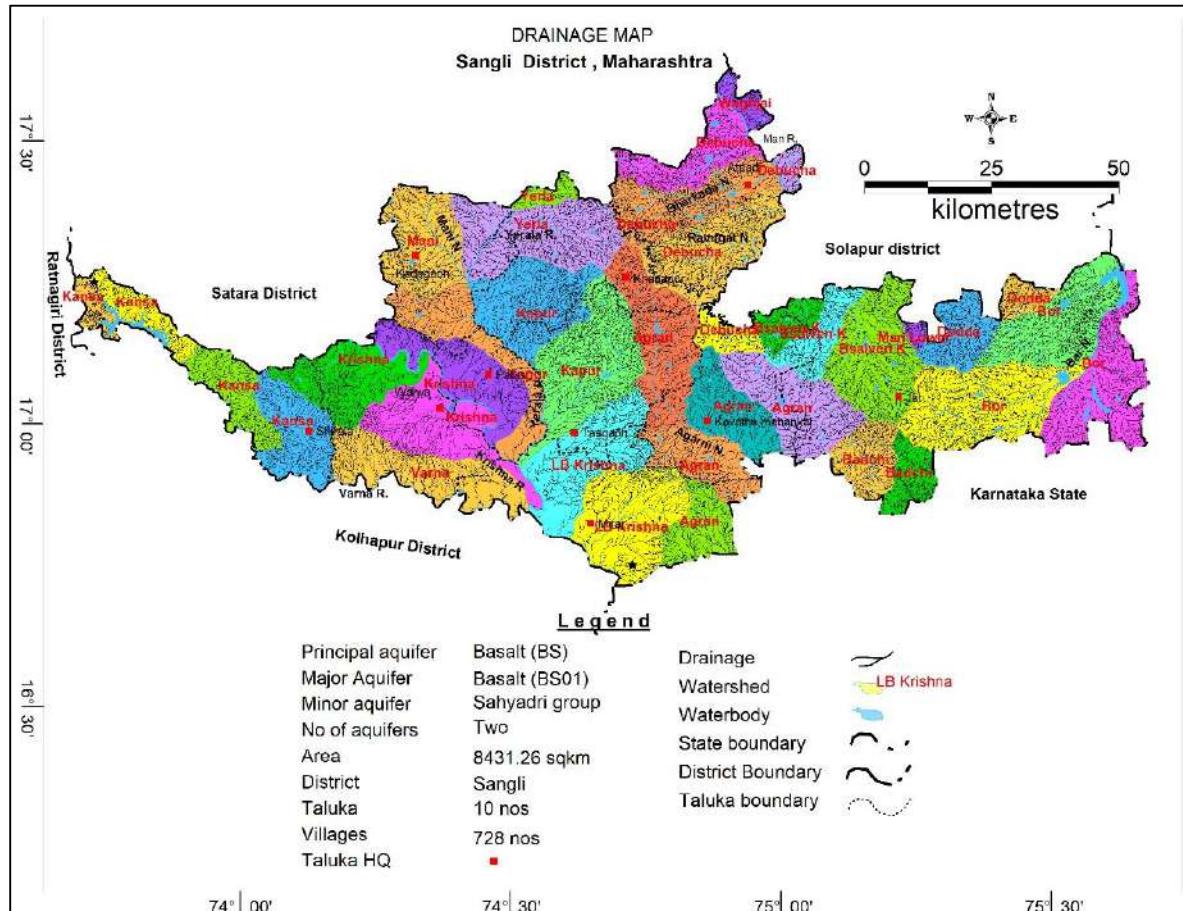

Geologically the area is covered by the basaltic flows related to Deccan Volcanic activity of Cretaceous to Eocene age. They generally exhibit step like topography and hence are known as Deccan Trap. These flows vary in thickness of individual flow from few meters to 40 meters. They extend for a considerable distance. The basaltic lava flow is almost uniform in mineralogical and chemical composition.

The basaltic flow can be classified as Compact, fine-grained, massive basalt and vesicular, amygdaloidal basalt, the vesicles are filled with secondary minerals like Quartz, chalcedony and calcite etc. Comparatively soft, friable and break more easily. The boundaries of basalt flows have been identified on the basis of the presence of red beds, change in joining and weathering pattern, ropy surface etc. Another criteria which can be used for the identification of various basaltic flows is the development of flat surface at various altitudes. These flat surfaces may be taken as flow tops. Basaltic flows are often separated by red to brown colored clayey rock known as 'red beds'. The thickness of red bed varies from few centimeters to more than 2 meters. It also has a gradational relationship with the top section of underlying flow.

In high rainfall areas and under good drainage condition on weathering of basalt, laterite is formed. During weathering process silica, alkalies and alkaline earth have been leached away leaving behind alumina, iron, manganese and titanium. Laterite shows vermiculite or pisolithic structure. Hills I parts of Shirala, Walwa and Jat taluka are capped by laterite.

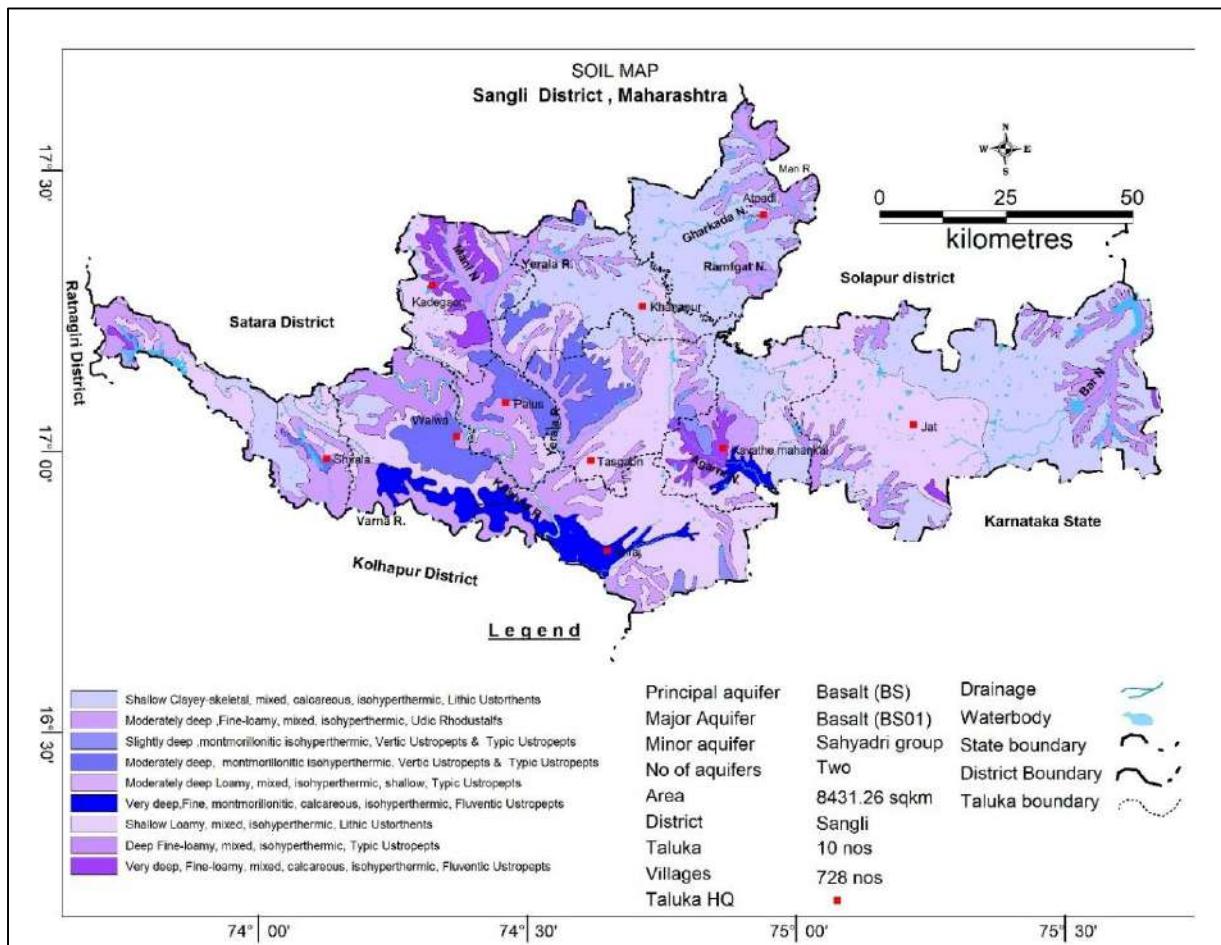

Alluvium deposited are more or less stratified deposits of gravel, sand, silt and clays deposited by streams and river. In the district, alluvial deposits are well developed along the banks of the main rivers. They vary in thickness from few meters along Warna, Morna, Yerala, Agrani, Man and Bor rivers to 10.00 to 30.00 meters along Krishna river. These deposits commonly show features like graded bedding, current bedding and cross bedding. At the base of these deposits, fine graded sand and silt are present along with kankar nodules locally known as Mann.

The highest elevation varies between 700 and 1104 m amsl. The valley plains of river Yerala flowing west north west – east south east and the river Agarni flowing northeast – south west merge in to the Krishna plains of the district. The other two parts of valley plains are 1) along the Man river in the north east of Atpadi taluka and b) along the Bor river in the eastern parts at Jath taluka. A low plateau area is located near Jath taluka covering about 150 sq. km area with another small patch located southwest. Drainage map in **Fig 1.4**

**Figure 1.4 :Drainage map**

Some parts of the district, especially the river valley areas, are occupied by the typical black soil derived from the deccan traps. All the types, though varying in quality, are fertile on the whole. The black soil contains high alumina and carbonates of calcium and magnesium with variable amount of potash, low nitrogen and phosphorus. The soil is generally porous and swells considerably on addition of water, and dries up with cracks on losing moisture. The black soil is very fertile and does not require manuring for long periods. The broadest belt of this rich soil is found in the Krishna valley. The soil of reddish-brown colour is found on the hills. This type of soil becomes fertile on proper manuring and irrigation. Soil map of the district is given in **fig 1.5**

**Figure 1.5: Soil map**

### 1.3 Climate and Rainfall

The climate of the district is characterised by general dryness during the major part of the year. Winter season is from November to end of February followed by summer season which is from March to May. The South-West monsoon season is from June to October. The climate of the district is dry except during south west monsoon period that is from June to Sept.

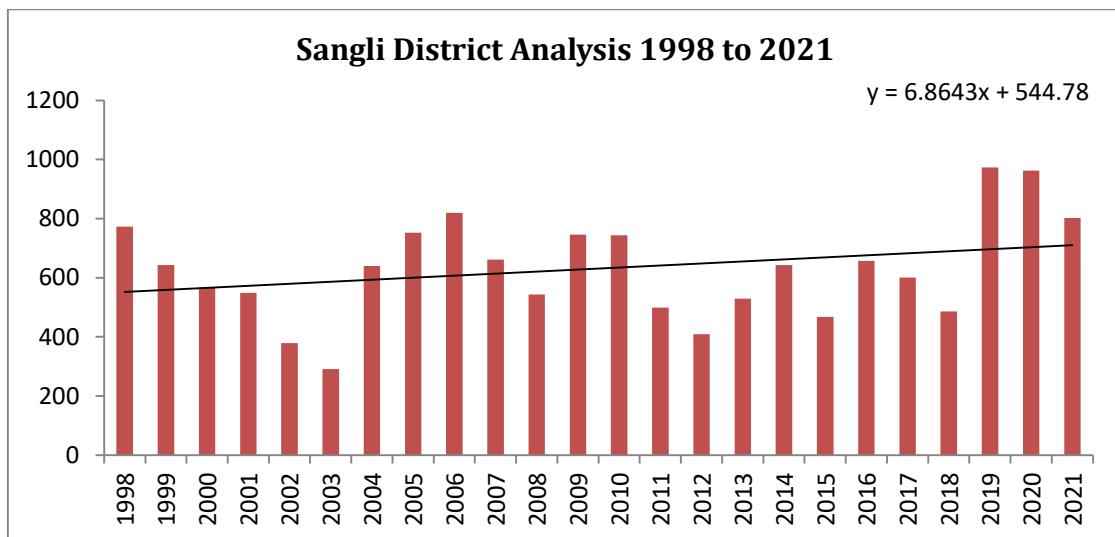

The normal rainfall of the district is 737.2 mm spread over 42 to 80 rainy days in normal condition. Long term rainfall analysis (1998-2021) and annual rainfall data of last ten years is given in **Table 1.1** and **1.2** and **Figure. 1.6**. The spatial distribution of the rainfall is given in **Figure. 1.7**.

**Table 1.1: Long-term rainfall analysis**

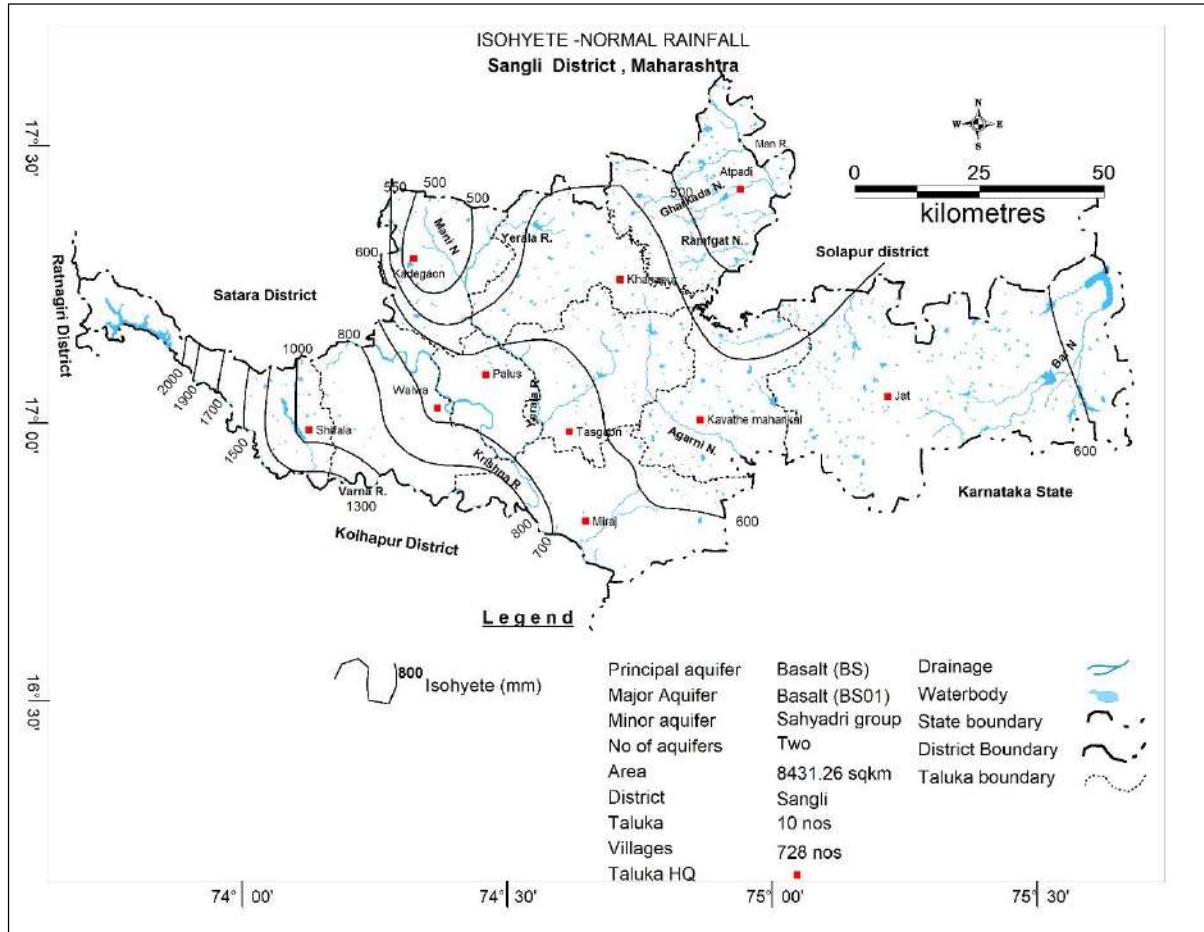

District	Period	No of years	Normal Rainfall (mm)	Std. Deviation (mm)	Coefficient of Variation (%)	Rainfall Trend (mm/year)
Sangli	1998-2021	24	737.2	233.96	28.2	6.86
CATEGORY	NUMBER OF YEARS		% OF TOTAL YEARS			
DEPARTURES						
POSITIVE	13		59			
NEGATIVE	11		50			
DROUGHTS						
MODERATE	2		9			
SEVERE	0		0			
ACUTE	0		0			
NORMAL & EXCESS R/F						
NORMAL	12		55			
EXCESS	10		45			

**Table 1.2: Annual rainfall data (2012-2021) (in mm)**

Year	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	Average Rainfall (mm)
Sangli	409	529.3	642.8	467.6	656.8	600.1	485.6	973.4	962.6	801.9	652.9

**Figure 1.6: Rainfall Analysis (1998-2021), Sangli district**

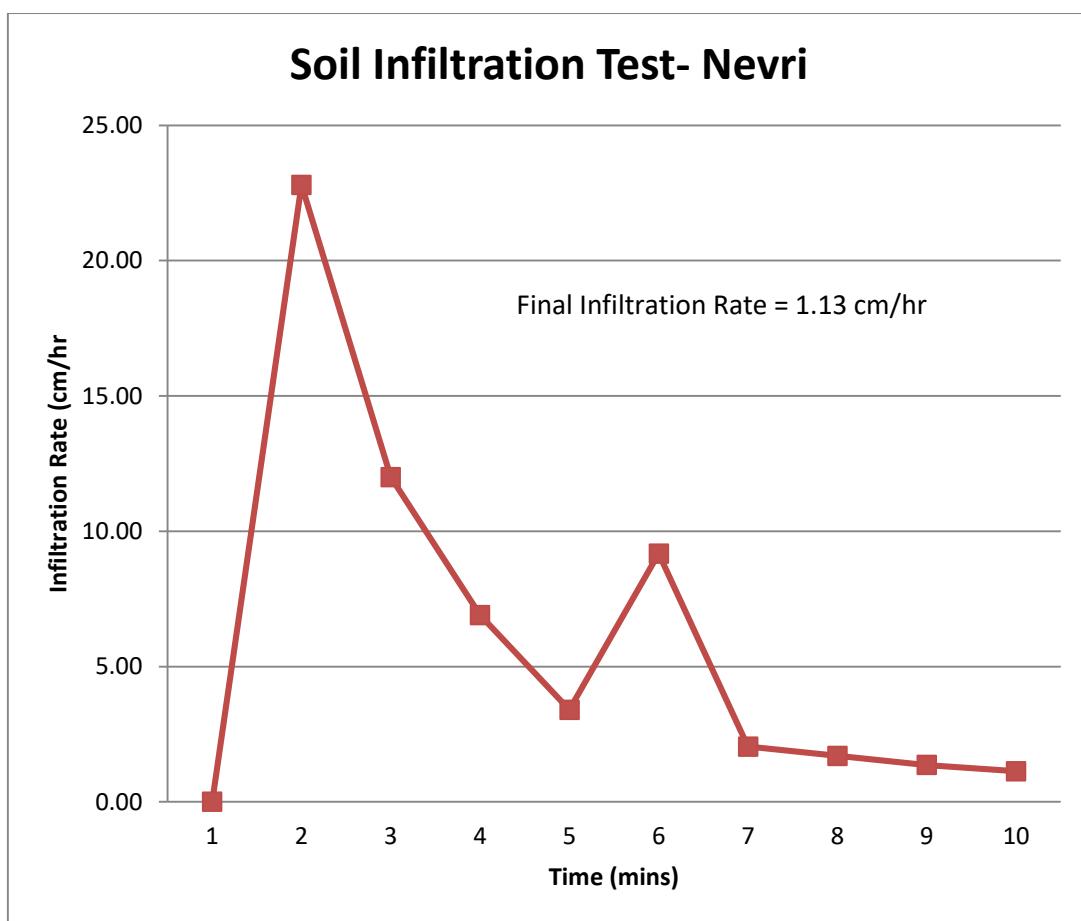

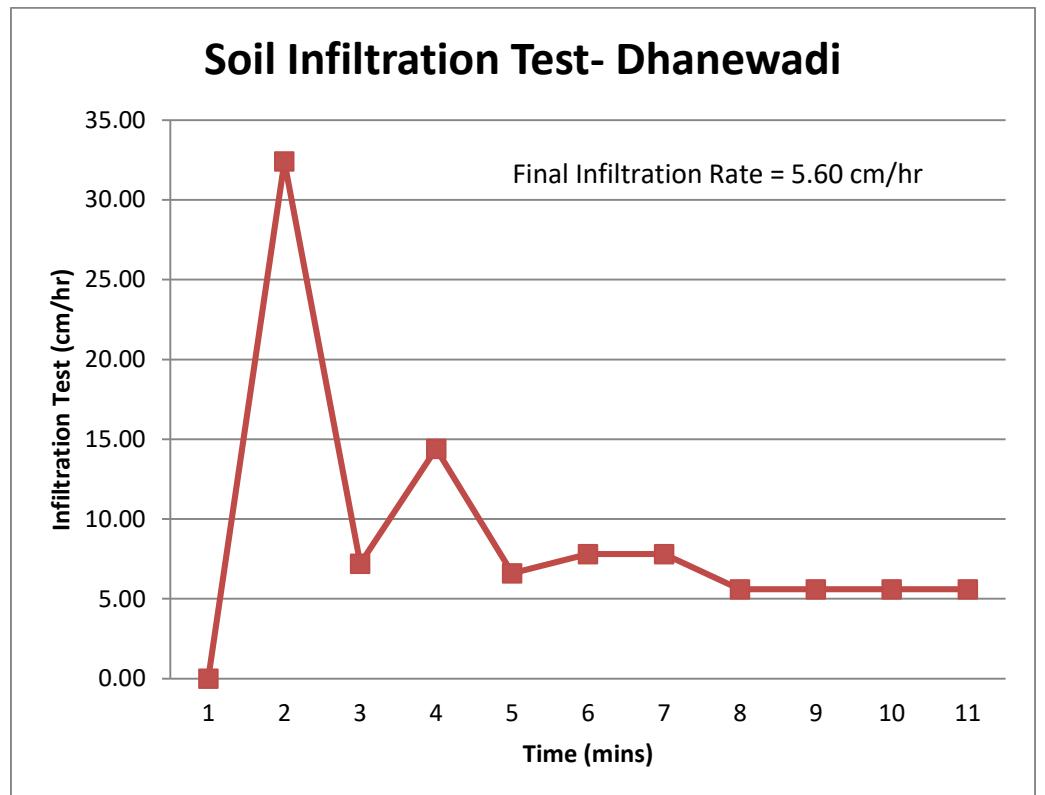

**Figure 1.7: Isohyet map of Sangli district**

#### 1.4 Soil Infiltration Tests

To estimate the actual rate of infiltration of various soil cover and their impact on recharge to ground water, 2 infiltration tests have been conducted at Dhanewadi and Nevri in various soil types. The data has been analyzed and the salient features of the infiltration tests are presented in **Table 1.3** and the details of the tests are given in **Annexure-III**.

**Table 1.3: Salient Features of Infiltration Tests.**

Sl No	Village	Date	Duration (min)	Water Level (cm agl)	Final infiltrated Water Depth(cm)	Final Infiltration Rate (cm/hr)
1	Dhanewadi	03/02/2022	105	15.5	1.40	5.60
2	Nevri	03/02/2022	122	12.4	1.70	1.13

**Figure 1.8: Soil Infiltration Tests of Sangli District**

## **2. HYDROGEOLOGY**

### **2.1 Major Aquifer Systems**

There are 2 types of aquifer systems in the area namely Alluvium and Basalt. The map showing major aquifer systems of Sangli district is shown in **Figure 2.1.**

The major part of the district is underlain by Deccan lava flows of Upper Cretaceous to Eocene Age, Where is restricted along the banks of the river.

The ground water in basaltic lava flows of Deccan trap occurs under water level and semi-confined to confined condition in deeper aquifers. The vesicular portion of different flows varies in thickness from 8 to 12 m and sometimes up to 20 m. It has primary porosity. However, the density of vesicles, their distribution, inter-connection, depth of weathering and topography of the area are decision factors for occurrence and movements of ground water in these units. The weathered and fractured trap occurring in topographic lows is the main water bearing formation in the district.

The massive portion of the basaltic flows is devoid of water but when it is weathered fractured, jointed thus forming a weaker zone then ground water occurs in it. The massive traps showing persistent spheroidal weathering and exfoliation have more ground water potential than the un weathered massive trap. However, the water carrying capacity of massive traps is not homogenous as it completely depends upon the presence of fracture and joints, their nature, distribution and their interconnection. In the district, ground water in alluvial formation occurs under water table conditions as it is very shallow in depth and spreads over a very limited area. It is observed that the saturated thickness of alluvial material comprises of silt, clay sand and gravel. The detrital material consisting of sand and gravel occurring as thin layer or as lenses in the alluvial pile sometimes forms good aquifer. However, these deposits do not form as potential aquifer in the district as compared to hard rock due to their limited areal extent.

#### **Hard Rock (Deccan Trap Basalt)**

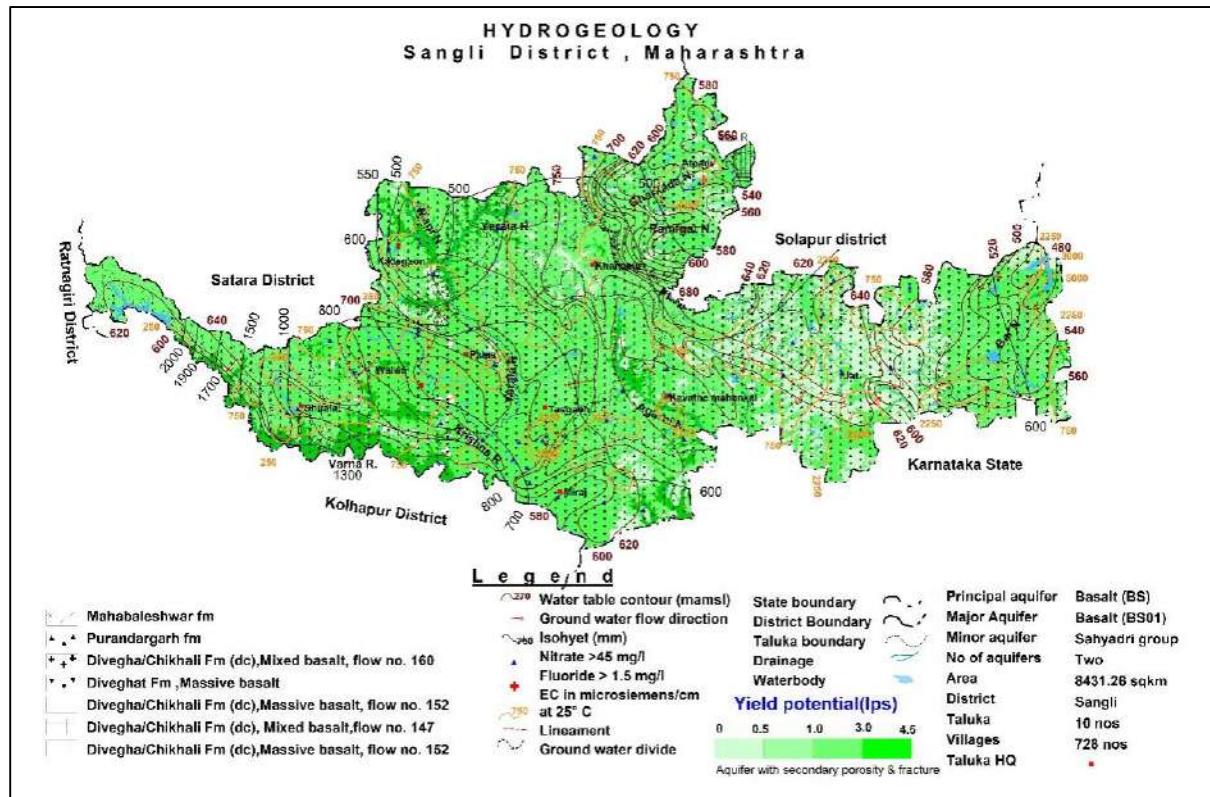

Deccan Traps are horizontally disposed thick piles of basaltic lava flows, which are apparently more or less uniform in composition. Each individual flow is a typical section, which varies from porous, weathered base to massive middle unit and becoming increasingly vesicular towards top. Each flow (lower flow and upper flow) is separated from each other by intermittent bole bed which is normally red in colour and called red bole. These bole beds comprise clay which is deposited between two lava eruptions, thus a individual flow forms a distinct hydrogeological unit as they differ in respect of capacity to receive, stock and transmit water due to the inherent physical characteristics like porosity and permeability.

The vesicular unit of each flow inter connecting vesicles, which provides more space for storage and movement of ground water. However, in "pahoehoe" type of flow, vesicles are separated and sealed, while in "aa" type of flows vesicles are concentrated in upper 20 to 40% of thickness of individual flows. These vesicles are more susceptible to weathering and therefore form good potential aquifers particularly at shallow depth. The massive unit of the flow is basically dense compact and hard and devoid of primary porosity. However, the porosity and permeability have been found to change within the flow and individual unit, from flow to flow and from place to place. Therefore, the variety of physical characteristics of basaltic units amongst themselves gives rise to varying degree of ground water productively in same places.

Ground water in these basaltic flows occurs in the weathered mantle, joints and fractures which serves as loci for accumulation. The degree of fracturing and weathering plays

dominant role in storage of ground water particularly in massive portion of these units as they lack primary porosity and permeability whereas the vesicular portion of these flows are characterised by both primary and secondary porosity and interconnection of vesicles and voids are created by tectonic disturbances. The yield potential of these formations becomes quite significant, when shallow Trappian beds are sufficiently thick and wide in areal extent.

The red bole bed occurs as top unproductive layer on each flow and forms marker horizon in prospecting ground water, as it is associated with more porous bed lying underneath.

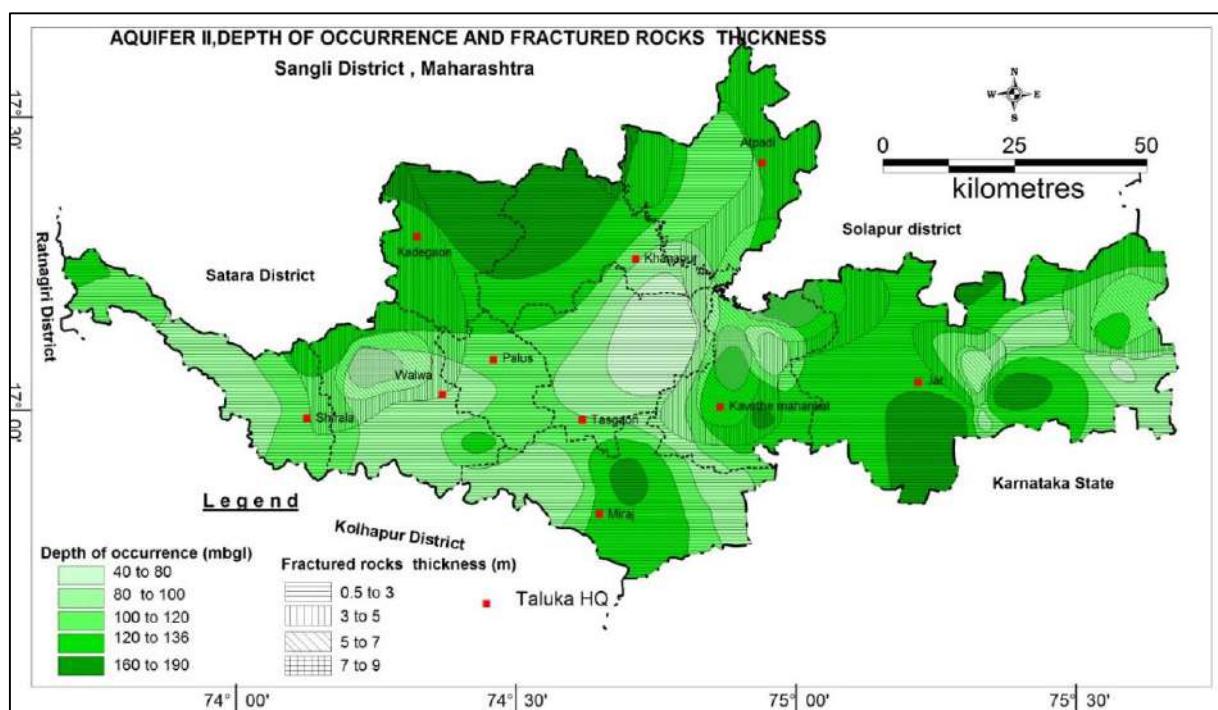

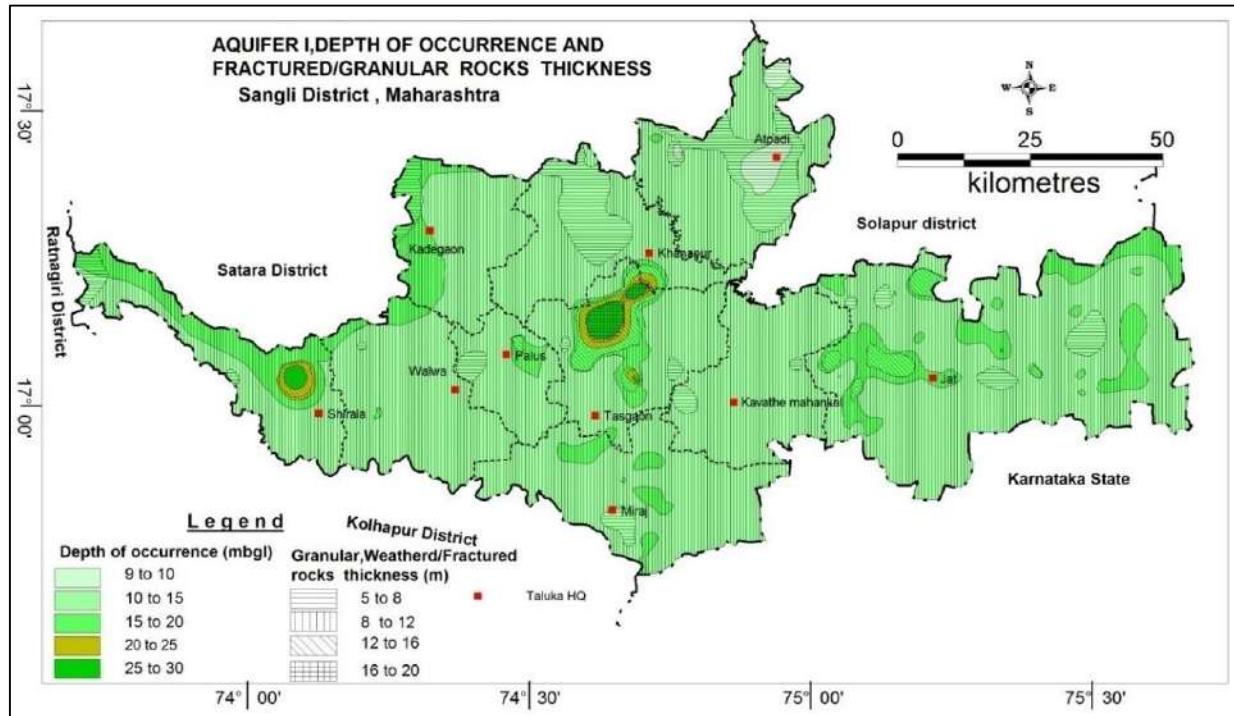

**Figure 2.1 – Hydrogeology**

### Soft Rock (Alluvium)

Alluvium deposits in Sangli district occurs in very thin and isolated pockets along the major rivers. These deposits comprises of upper layer of silty material underlain by layers of coarse detrital materials like sand and gravel with admixture of clay. The coarse detrital material occurring as thin layer or lenses form good water bearing strata while finer material do not permit movement of ground water. The thickness of these deposits in Sangli district varies from 10 to 15 m.

Deccan basalts are hydro geologically in-homogeneous rocks. The weathered and jointed /fractured parts of the rock constitute the zone of ground water storage and flow. The existence of multiple aquifers is characteristic of basalt and is indicative of wide variation in the joint/fracture intensity. The yields of well is function of the permeability and transmissivity of aquifer and it depends upon the degree of weathering and topographic setting of the aquifer. Due to wide variation in secondary openings, the potential areas for ground water are generally localized. In general Ground water occurs under phreatic/unconfined to semi-confined conditions in basalts. Shallow Aquifer generally tapped by the dug wells of 5 to 34 m

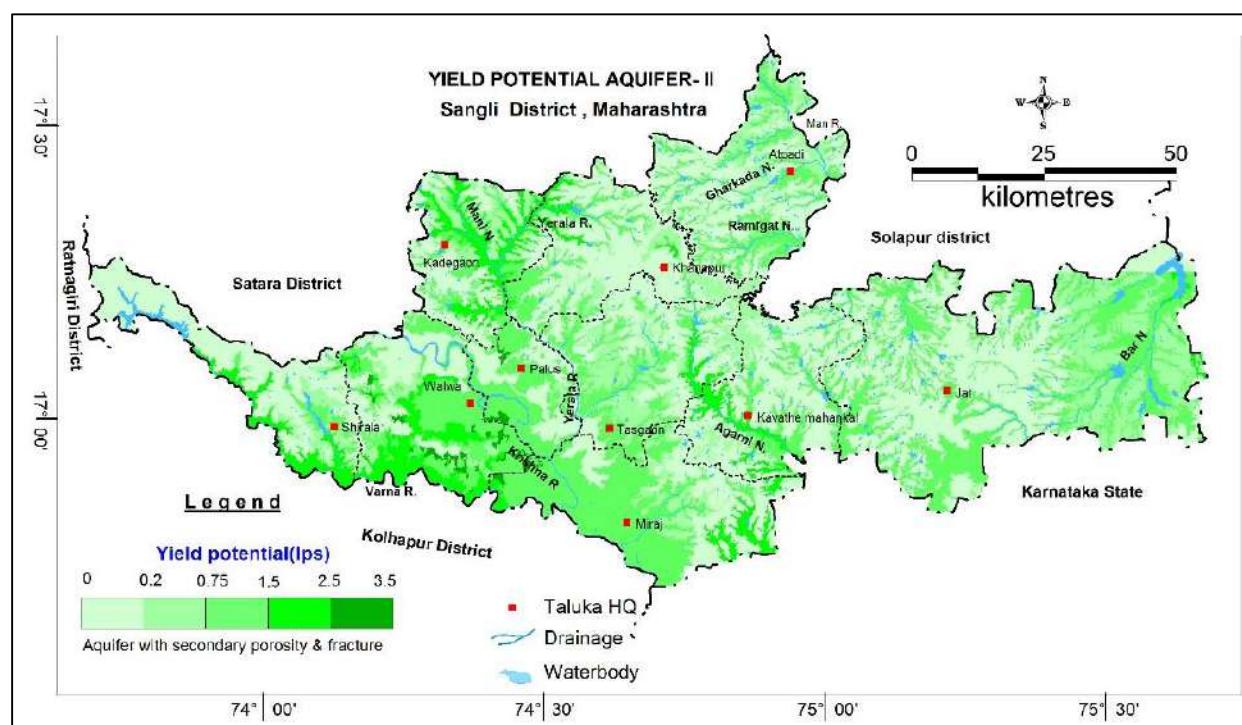

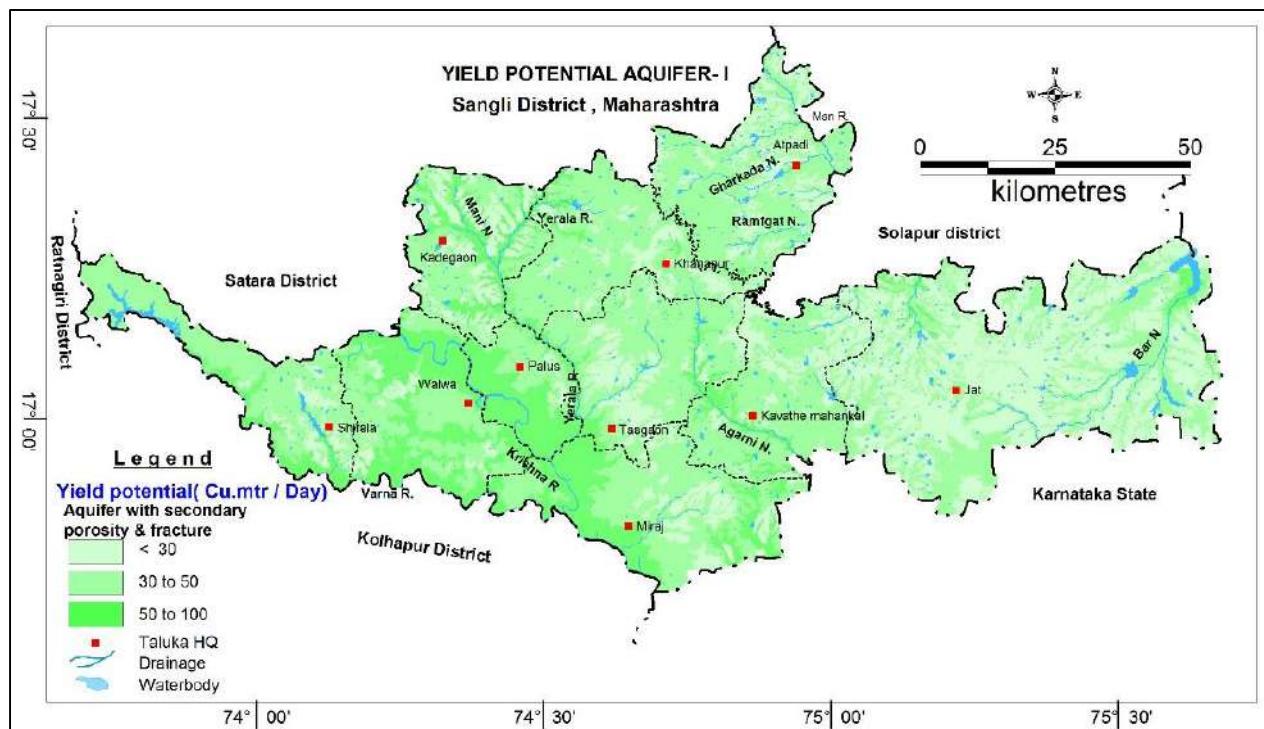

**Figure 2.1- Depth of Occurance and fractured and granular rock thikness Aquifer-I**

**Figure 2.2 – Depth of Occurance and fractured and granular rock thikness Aquifer-II**

depth, water levels range from 3.6 to 21.6 m bgl and yield varies from 10-100 m<sup>3</sup>/day. The deeper Aquifer is being tapped by borewells with depth ranging from 20-180 m bgl and the water level from 6 to 33 m bgl. Based on Ground Water Exploration, Aquifer wise characteristics are given table 5.1. Maps depicting depth of occurrence and fractured/Granular rock thickness and Aquifer wise yield potential maps are shown in **fig 2.4 and fig. 2.5**.

**Figure2.4 – Yield potential Aquifer I**

**Figure 2.5:-Yield potential Aquifer II**

## 2.2 Aquifer Parameters

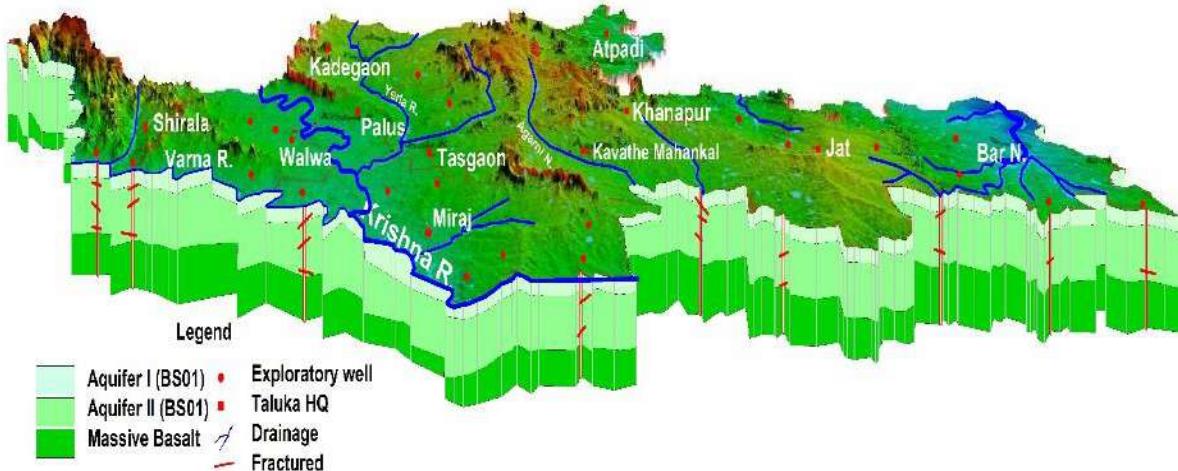

Aquifer parameters are available from ground water exploration carried out in the area of the district as well as from the pumping tests carried out on dugwells in Basaltic and Alluvial terrain. For aquifer-I, the specific capacity of the wells tapping Deccan Trap Basalt ranges between 1.7 to 18.9 lpm/m of draw down, the permeability ranges from 12 to 65 m/day and the transmissivity ranges from 2.1 to 51.86 m<sup>2</sup>/day. The specific yield ranges from 0.019 to 0.028. During the pumping tests conducted on the exploratory wells tapping aquifer-II, the transmissivity was found to vary from 10 to 90 m<sup>2</sup>/day. The storage coefficient varied between  $1.2 \times 10^{-4}$  to  $3.57 \times 10^{-4}$ .

**Table 2.2.1. Aquifer Characteristic of Sangli district**

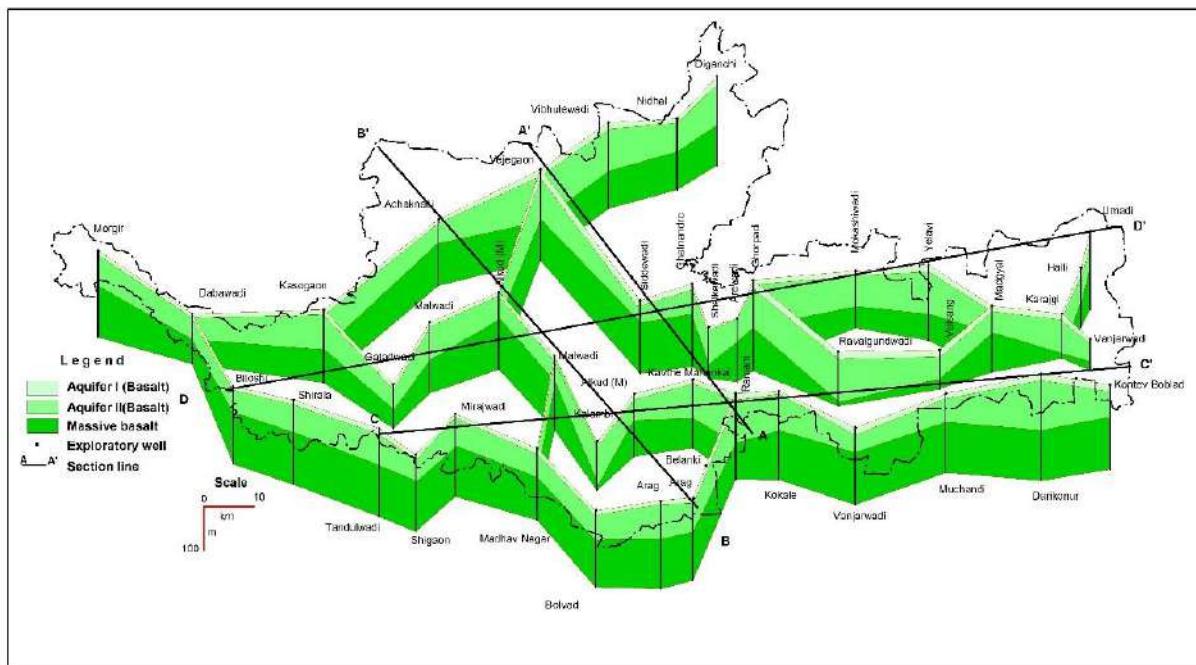

Type of Aquifer	Formation	Depth range (mbgl)	SWL (mbgl)	Fracture/ weathered Zones encountered (mbgl)	Fractured/ weathered rocks Thickness (m)	Yield (m <sup>3</sup> / Day)	Sustainability	Aquifer parameter (Transmissivity – m <sup>2</sup> /day)	Sy/S	Suitability for drinking/ irrigation
Aquifer-I	Deccan Trap- Weathered / Fractured Basalt	9-30	2.0 – 27.0	Upto 30	5 to 20	30 to 100 m <sup>3</sup> /day	1 to 2 Hours	2.1-51.86	0.019 - 0.028	Yes, suitable for both
Aquifer-II	Jointed/ Fractured Basalt	40-190	12-93	Upto 190	0.5 to 9.0	Upto 3.5 lps	0.5 to 3 hours	10.0-90.0	1.20 x 10 <sup>-4</sup> to 3.57 x 10 <sup>-4</sup>	Yes, suitable for both,

## 2.3 3-D and 2-D Aquifer Disposition

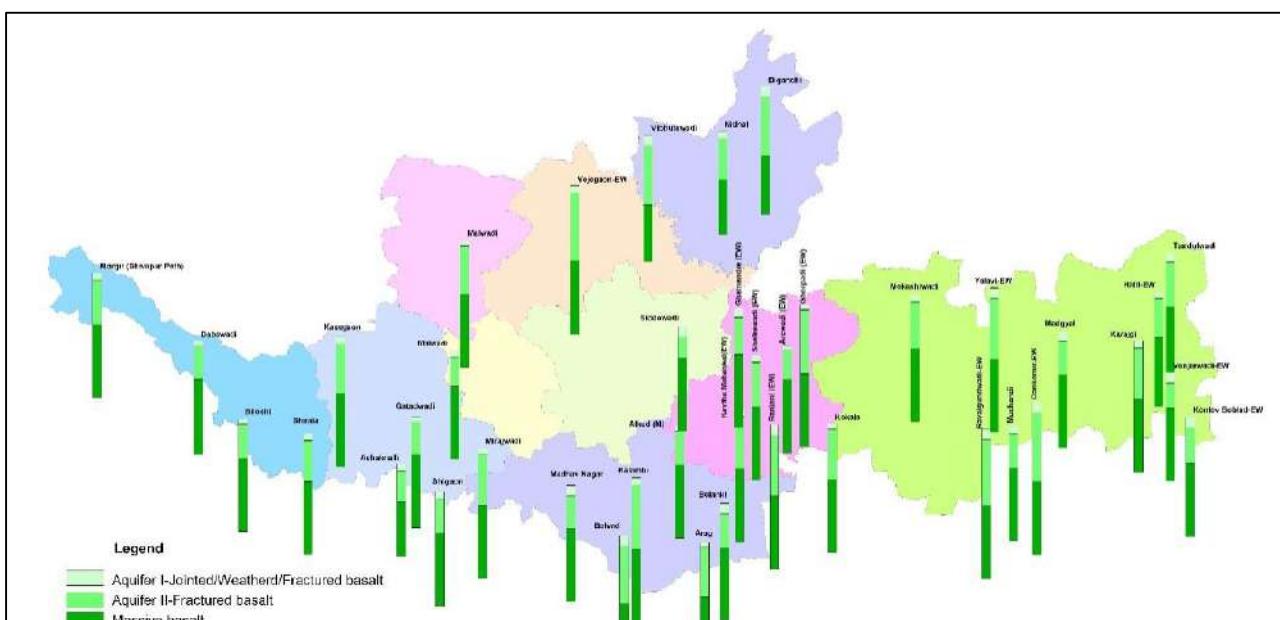

Based on the existing data, aquifer disposition in 3D, Fence diagram, and several hydrogeological sections have been prepared along section lines shown in figure 2.3.1 to 2.3.7 to understand the subsurface disposition of aquifer system.

**Fig. 2.3.1-3D Aquifer Disposition**

**Fig.2.3.7 : Lithological section D-D'**

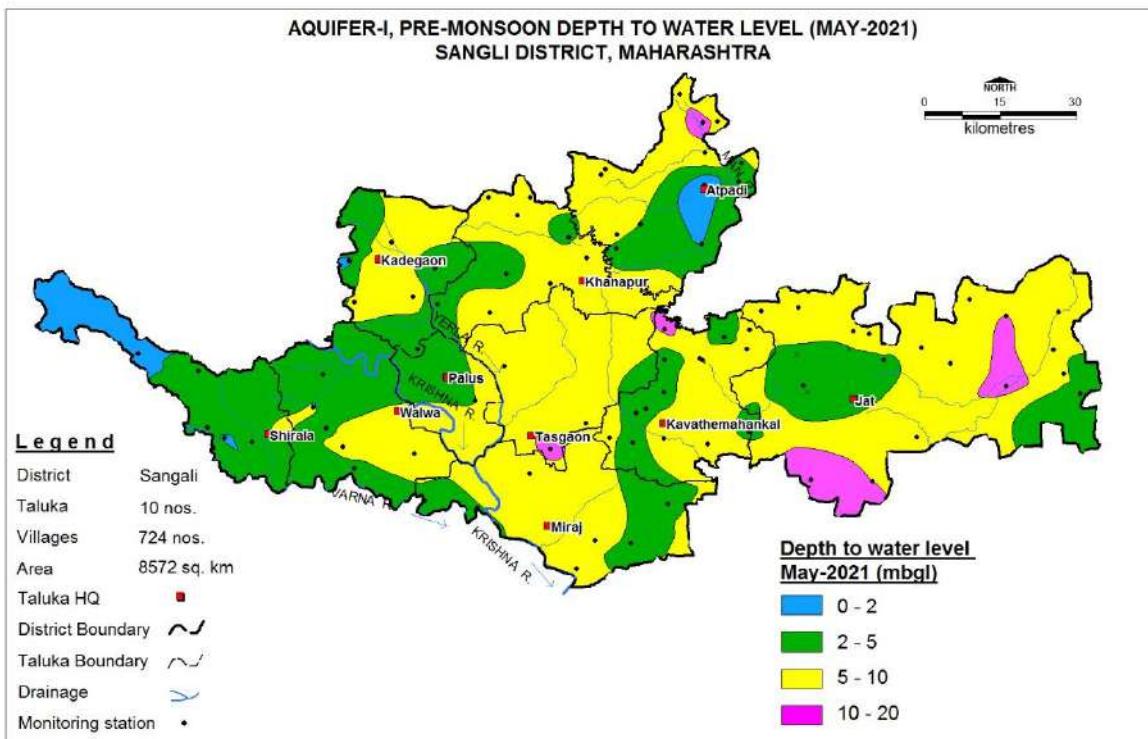

### **3.WATER LEVEL SCENARIO**

#### **3.1 DEPTH TO WATER LEVEL (AQUIFER-I/SHALLOW AQUIFER)**

Central Ground Water Board periodically monitors Ground Water monitoring wells in the Sangli district, four times a year i.e. in January, May (Premonsoon), August and November (Postmonsoon). Under NAQUIM study; the data of 86 Monitoring wells were taken from Ground water Surveys and Development Agency (GSDA), Govt. of Maharashtra. These data have been used for analysis of depth to water level of the district. Pre-monsoon and post monsoon water levels along with fluctuation during 2021 and long-term water level trends (2011-2021).

##### **3.1.1 Depth to Water Level**

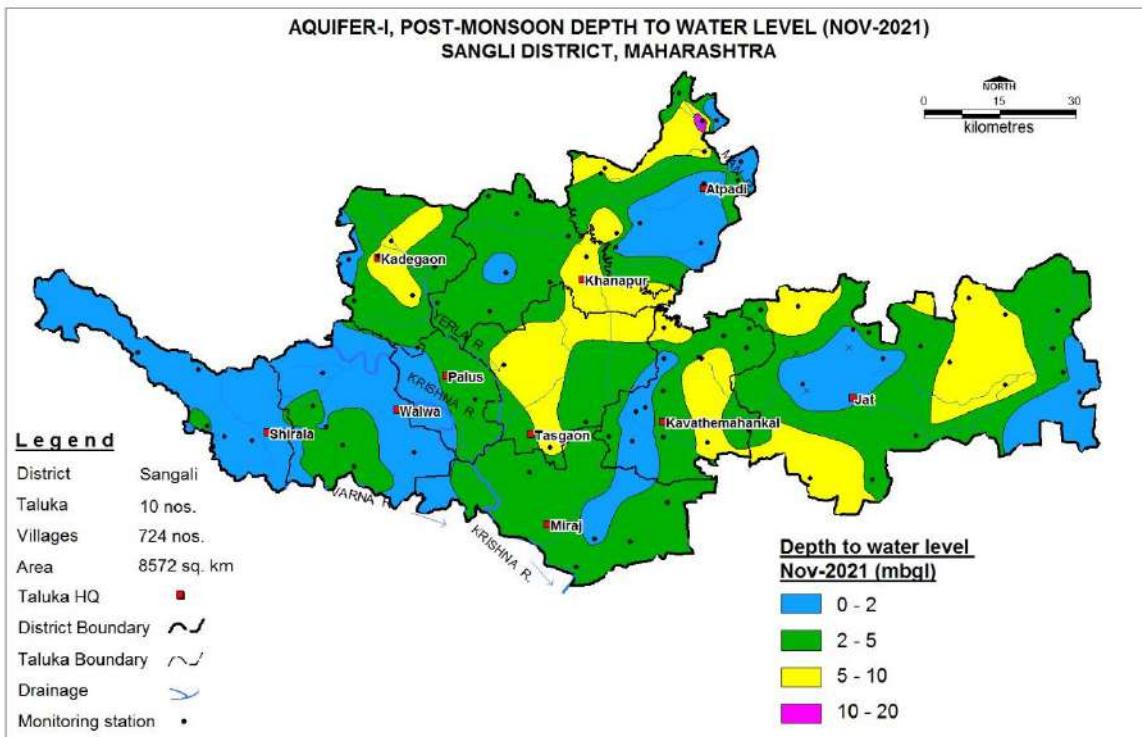

**Pre-monsoon (May-2021) :** The depth to water levels in Sangli district during May 2021 ranges between 0.30 (Atpadi village, Atpadi Taluka) and 15.50 mbgl (Pandharewadi village, Atpadi Taluka). Shallow water levels within 2 m bgl are observed in the Eastern part of Atpadi Taluka as well as in the western parts of Shirala taluka and nearby some canal command and river fed areas and also observed in Atpadi, Walwa and Kavthe Mahankal talukas and in the form of patches in Kadegaon, Khanapur and Palus and Miraj Talukas. Water levels between 2 and 5 m bgl are observed in almost 60% of the district area covering major part of Khanapur, Kavthe Mahankal, Jath Talukas and observed in smaller extent in Palus, Shirala and Tasgaon talukas. Coming from west to east the water level is going deeper. Water level between 5 to 10 mbgl are observed in parts of the Jath, Kavthe mahanka, Khanapur, Atpadi and Kadegaon talukas, predominantly in parts of Tasgaon taluka. In the Eastern and southern part of Jath taluka and in the form of patches in Kavthe mahankal, Atpadi and Tasgaon observes the water level between 10 to 20 mbgl.

**Fig 3.2.1: DTWL shallow aquifer (Premonsoon)**

### 3.1.2 Depth to Water Level

**Post monsoon (Nov-2021)** The depth to water levels in Sangli district during Nov. 2021 ranges between 0.2 (Atpadi village, Atpadi Taluka) and 12.20 mbgl (Pandharewadi village, Atpadi Taluka). Shallow water levels within 2 m bgl are observed in the Eastern as well as western parts of Shirala and Walwa talukas, predominantly and in the form of patches in Jath, Miraj, Atpadi, Khanapur talukas and nearby some canal command and river fed areas and also observed in Atpadi, Walwa and Kavthe Mahankal talukas and in the form of patches in Kadegaon, Khanapur and Palus and Miraj Talukas. Water levels between 2 and 5 m bgl are observed in major area of the district covering major part of Khanapur, Kavthe Mahankal, Jath Talukas and observed in smaller extent in Palus, Shirala and Tasgaon talukas. In post monsoon also while coming from west to east the water level is going deeper. Water level between 5 to 10 mbgl are observed in northern part of the Jath and also predominantly in parts of Kavthe Mahankal taluka and in patches in Atpadi, Kadegaon talukas. Northern part of Atpadi taluka observes the water level between 10 to 20 mbgl.

**Fig 3.2.2: DTWL Shallow aquifer (Postmonsoon)**

### 3.1.3 Seasonal Water Level Fluctuation (May-Nov. 2021):

It is observed that rise in water level has been observed in entire district in the range of 0.05 to 3.95 m.in Sangli district. Lower range of water level fluctuation observed in the recharging zone while higher water level fluctuation in the zone of discharge and potential area due to over exploitation of ground water. Major parts of the district showing water level fluctuation 0.5 to 3 m. less than 0.5 m and more than 3meter water level fluctuation recorded in isolated patches.

## 3.2 DEPTH TO WATER LEVEL (AQUIFER-II/DEEPER AQUIFER)

### 3.2.1 Premonsoon Depth to Water Level

In Deeper Aquifer-II, the pre-monsoon depth to water levels, in Sangli District during Premonsoon period, range from 12.00 (Achaknali, Walwa taluka) to 95.00 mbgl (Kalambi, Miraj taluka). The depth to water level less than 20 mbgl is observed only in isolated parts of Shirala and Jath talukas. The major parts of sangli district show depth to water level between 20 and 30 mbgl. Isolated patches are also observed in Kavathe Mahankal and Atpadi talukas of the district. The deeper water level >40 mbgl are observed in major parts of Khanapur, Tasgaon, Jath and Miraj talukas and in parts of all other talukas. The deepest water level (>50 mbgl) has been observed along the northern portion of Khanapur and and southern parts of Miraj Talukas and in isolated part of Jath and Kavathe Mahankal taluka of the district. This may be due to overexploitation of ground water in potential aquifer Zone. The premonsoon depth to water level for Aquifer –II is given in **Fig. 3.2.1**and the details are presented in **Annexure I**.

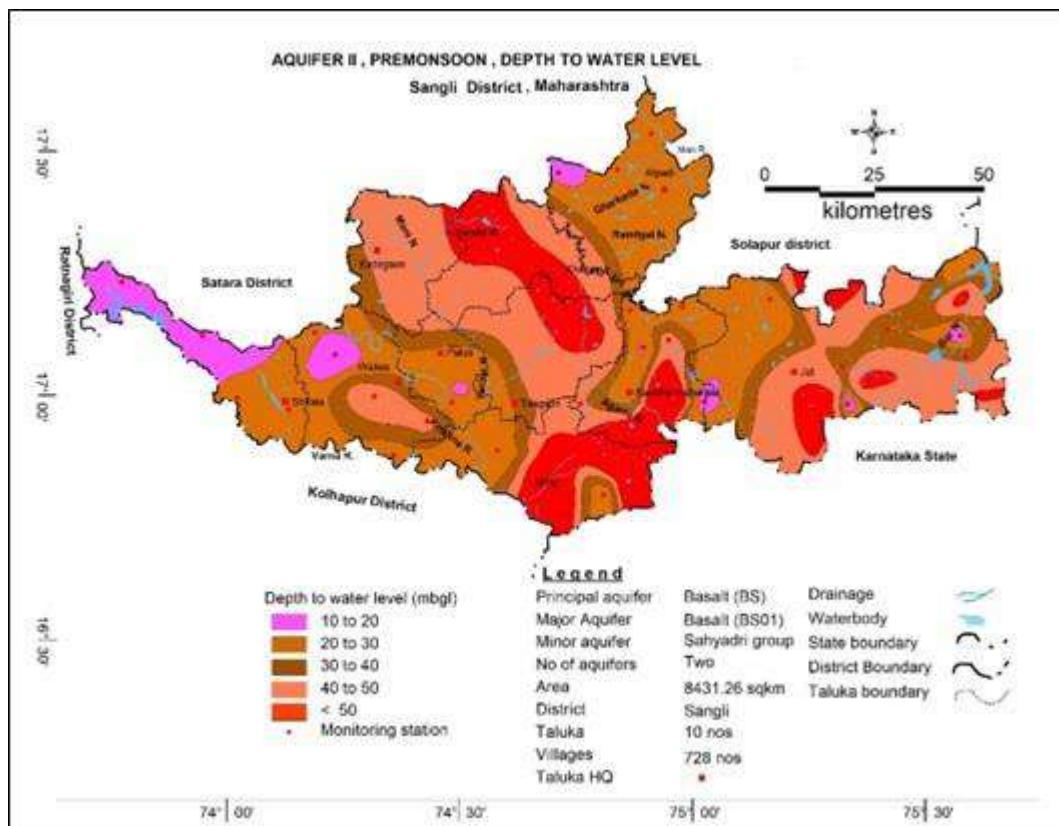

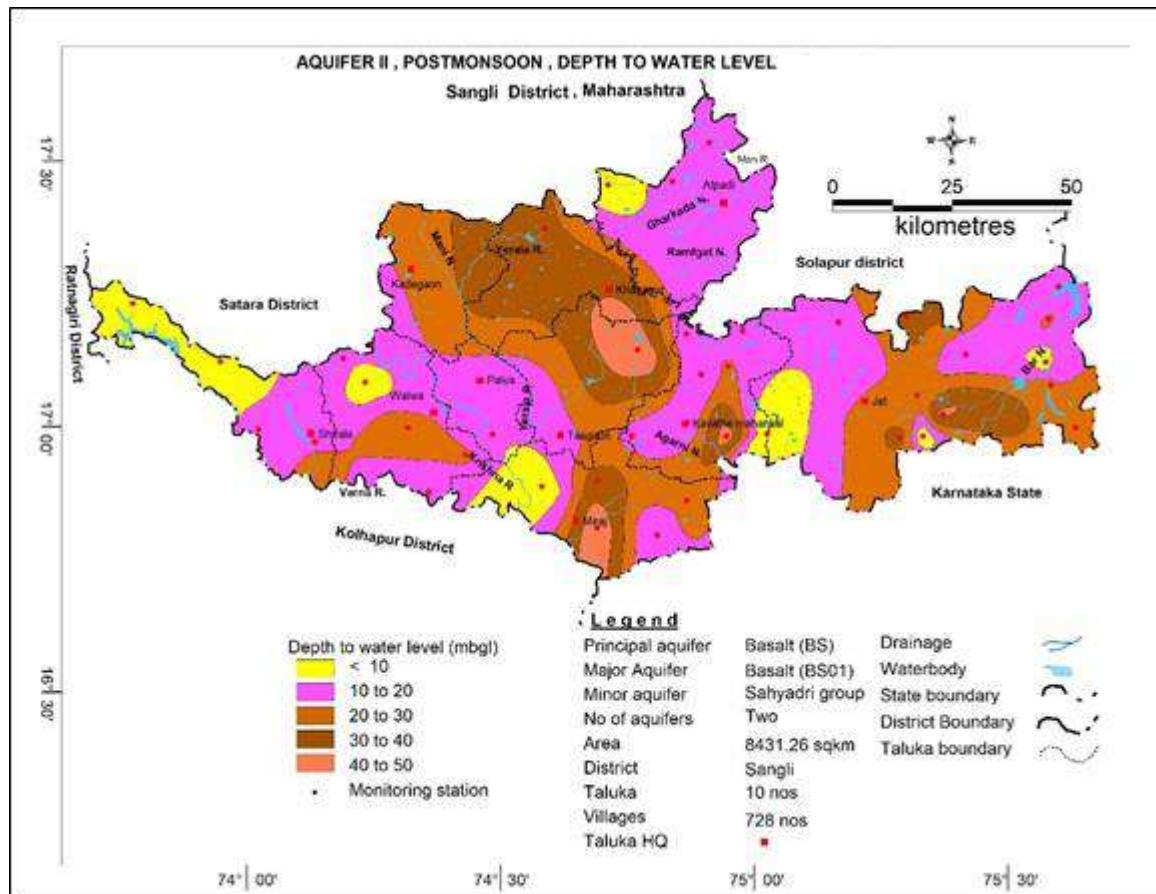

Fig 3.2.3: DTWL deeper aquifer (Premonsoon)

### 3.2.2 Post monsoon Depth to Water Level

In Aquifer-II, the post monsoon depth to water levels in Sangli District during Postmonsoon period range between 4.5 (Madhav Nagar, Miraj taluka) and 45.00 mbgl (Sidhewadi, Jath taluka). Depth to water level less than 10 m bgl has been observed in the southern and south-central part of the district and in parts of Shirala, Miraj, Jath and Atpadi talukas. The major part of the district shows deeper water levels ranging between 10 and 20 mbgl. The deepest water level of more than 20 mbgl is observed in the northern parts of Khanapur and southern parts of Miraj, central part of Jath talukas. The post monsoon depth to water level for Aquifer –II is given in Fig. 3.2.2 1 and the details are presented in Annexure I.

**Fig 3.2.4: DTWL deeper aquifer (Post Monsoon)**

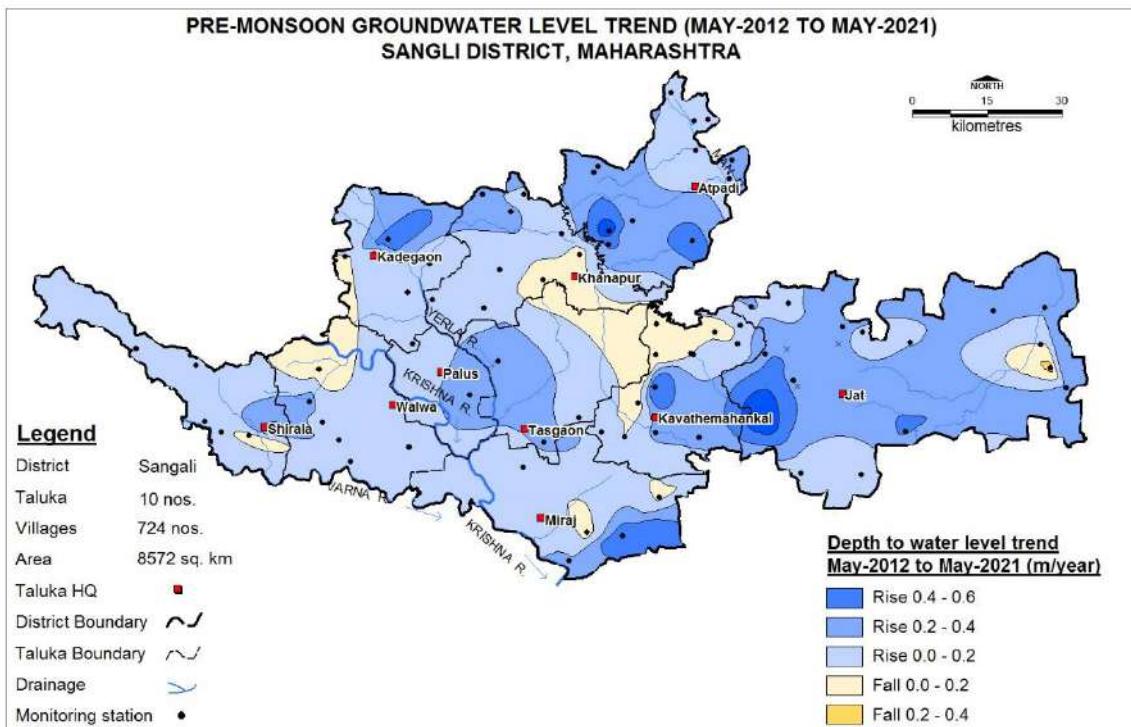

### 3.3 WATER LEVEL TREND

In Sangli district, pre-monsoon taken during 2012-2021, rise in water levels trend has been recorded at 64 stations and ranges from 0.004 (Borgi Bk, Jath taluka) to 0.71 m/year (Daflapur, Jath taluka) while falling trend was observed in 14 stations varying from 0.002 (Deshing, Kavthe Mahankal taluka) to 0.2359 m/year (Morbagi, jath taluka). During pre-monsoon, Significant decline observed in the central part of district covering Kavthe Mahankal, Tasgaon and Khanapur Talukas and in the form of patches in the eastern part covering Jath, Shirala, talukas and southern portion of the Miraj taluka. Rise in water level trend has been observed in mid-eastern part of the district covering major part of Khanapur, Kavthe Mahankal and Jath talukas. In premonsoon season, declining water level trend has been observed mostly in Central part and also in the form of isolated patches in the area. (Fig.3.3.1)

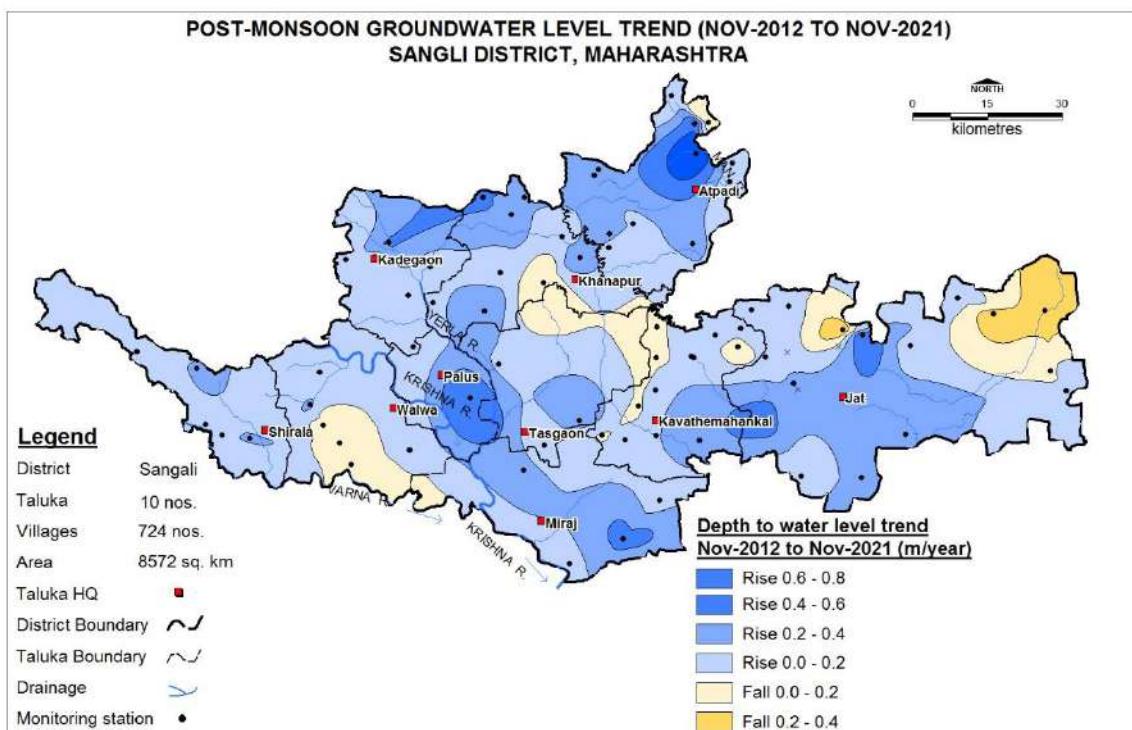

In Sangli district, post monsoon taken during 2012-2021rise in water levels rising trend has been recorded at 77 stations and it ranges between 0.0155 (Dhavadwadi, Atpadi taluka) to 0.7046 m/year (Vithalapur, Atpadi taluka) while falling trend was observed in 15 stations varying from 0.0055 (Kavathe Mahankal taluka) to 0.3197 m/year (Antral,Jath taluka).

In post monsoon season, fall in water level trend has been observed in the major parts of the district covering northern, central, eastern and southern part. Significant decline more than 0.20 to 0.40 m/year has been observed in eastern part of the district in Jath Taluka.

(Fig 3.3.2)

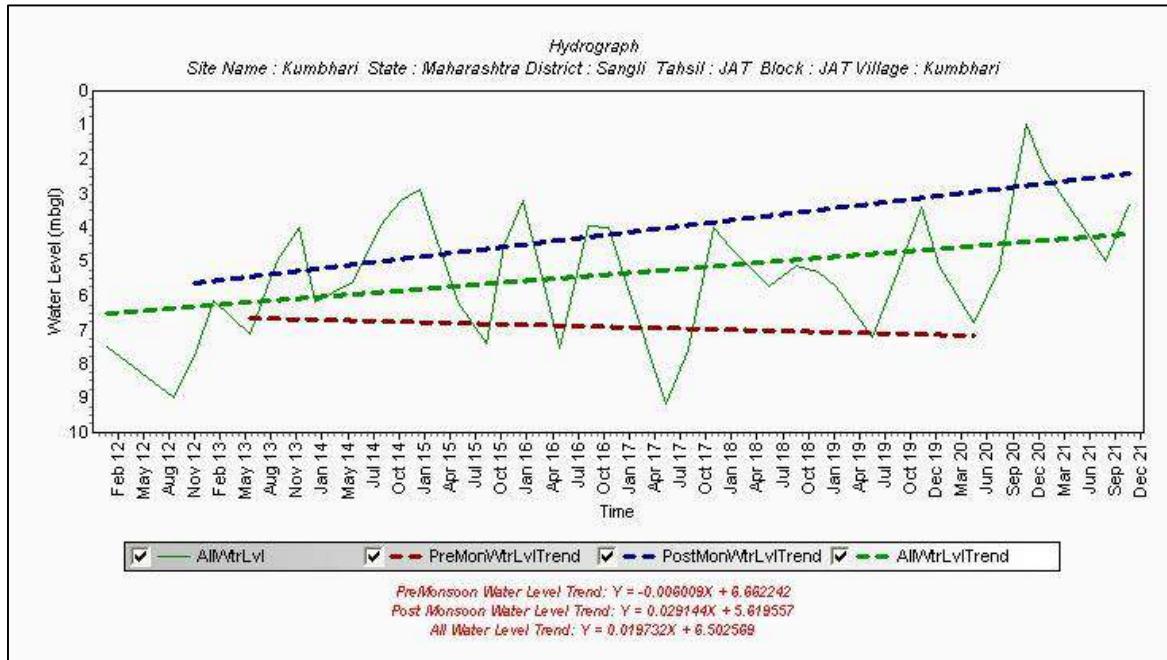

**Fig.3.3.1:Pre-monsoon decadal trend (2012-21)**

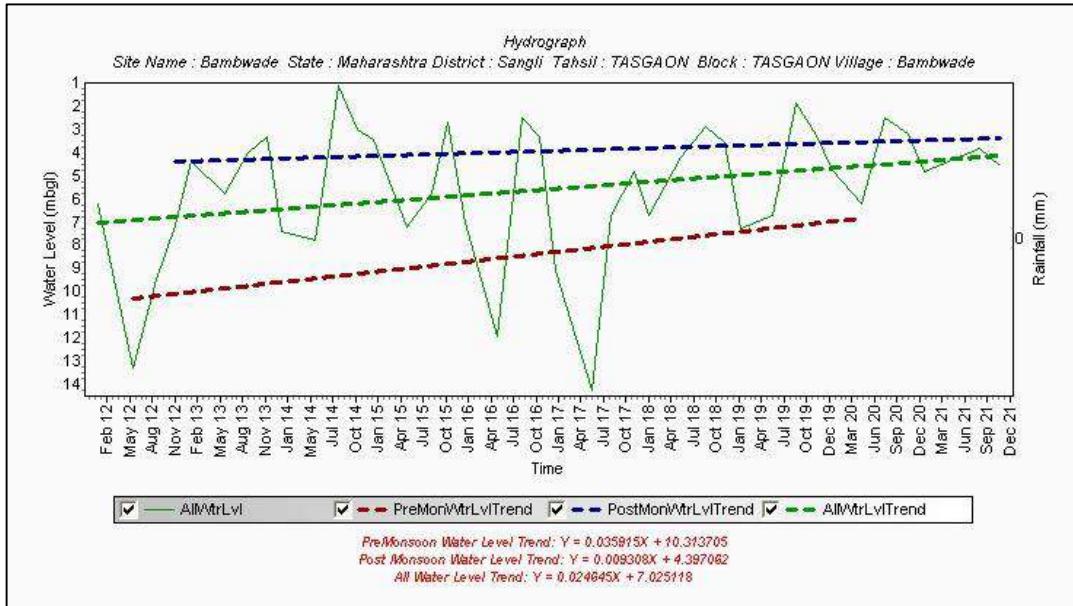

**Fig 3.3.2: Postmonsoon decadal trend (2012-21)**

### 3.4 HYDROGRAPH ANALYSIS

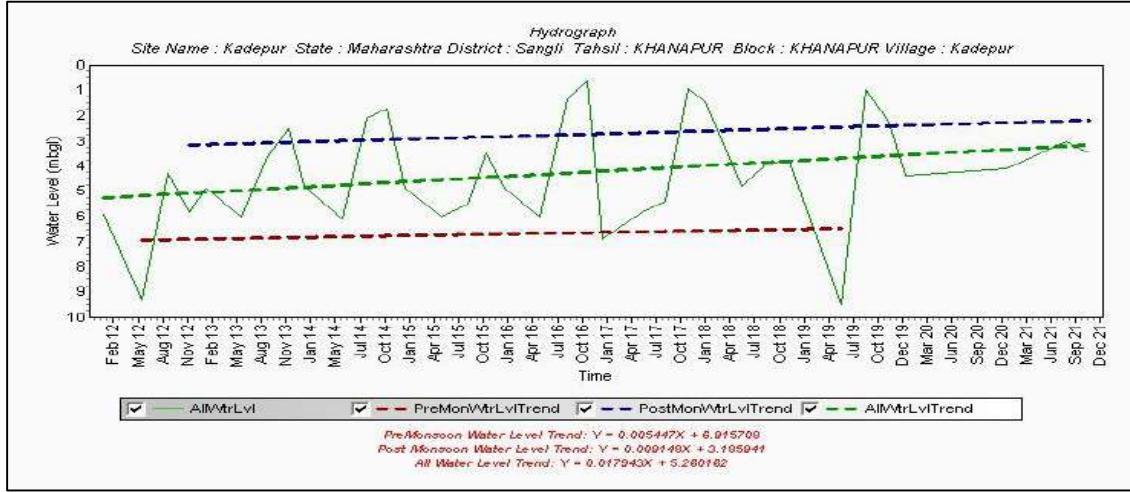

The variation in short term and long-term water level trends may be due to variation in natural recharge due to rainfall and withdrawal of groundwater for various agricultural activity, domestic requirements and industrial needs. The analysis of hydrographs show that the annual rising limbs in hydrographs indicate the natural recharge of groundwater regime due to monsoon rainfall, as the monsoon rainfall is the only natural source of water for recharge to the ground water regime (**Fig. 3.4.1 to 3.4.5**). However, continuous increase in the groundwater draft is indicated by the recessionary limb.

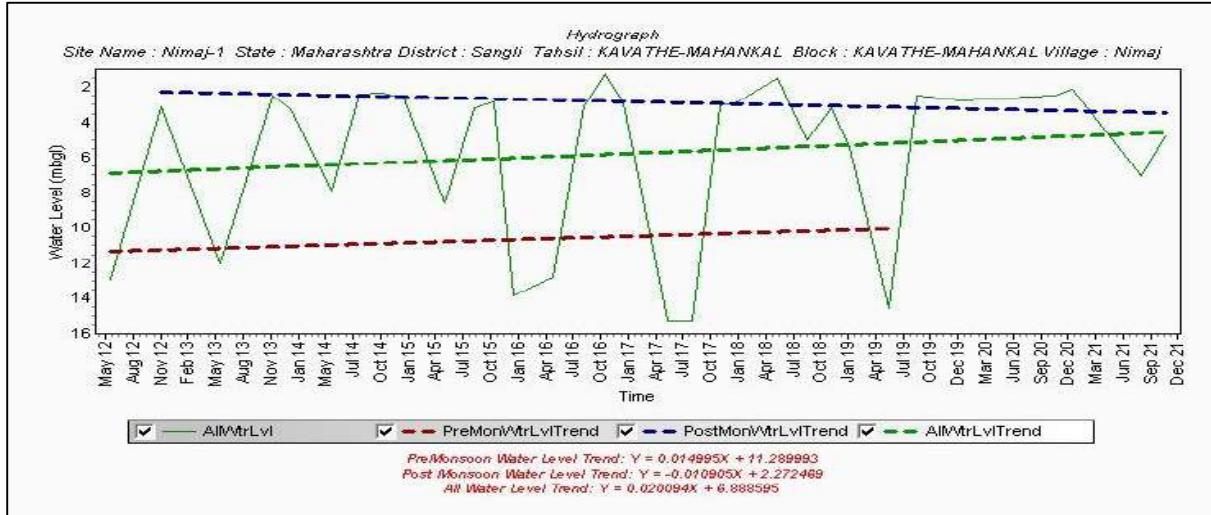

**Fig 3.4.1: Hydrograph (2012-2021), Kumbhari, Jath Taluka**

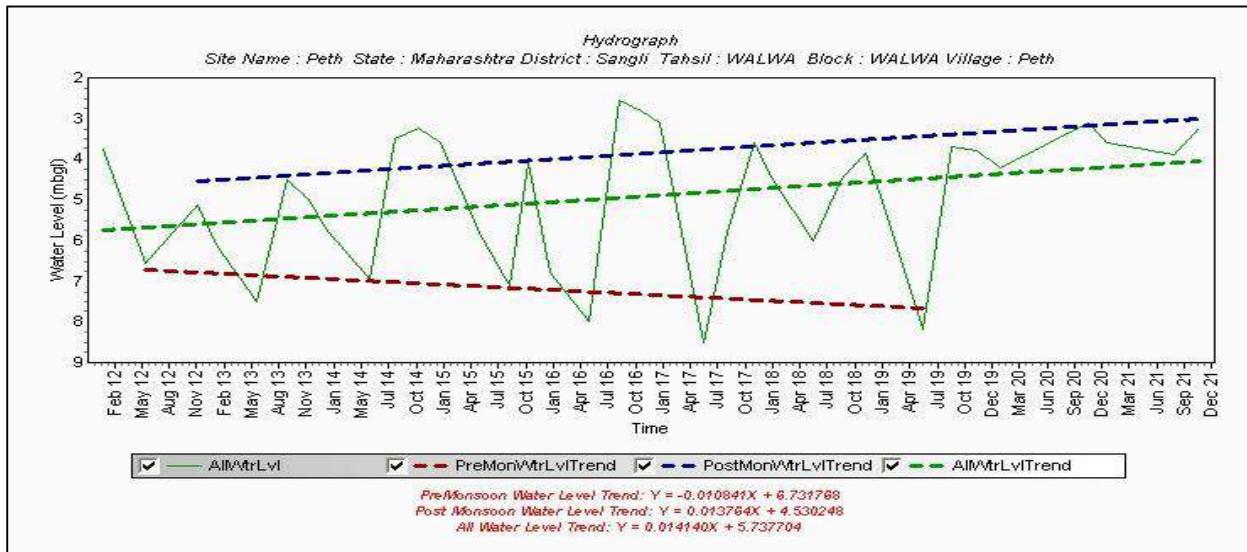

**Fig 3.4.2: Hydrograph (2012-2021), Bambwade ,Tasgaon Taluka**

**Fig 3.4.5: Hydrograph (2012-2021), Peth, Walwa Taluka**

## 4. GROUND WATER QUALITY

Water sampling is being done every year from GWM wells during pre-monsoon period (May). The data gap analysis has been carried out to find out the adequacy of information on water quality and identified additional locations,33 for shallow aquifers. Ground water quality data of 174 monitoring wells of CGWB and GSDA representing shallow aquifer representing shallow aquifer have been utilised to decipher the quality scenario of shallow aquifer. 110 exploratory wells tubewells / borewells of CGWB and GSDA representing deeper aquifer have been utilised to decipher the quality scenario of deeper aquifer. The aquifer wise ranges of different chemical constituents present in ground water are given in **table 4.1**. The details of water quality analysis are given in **Annexure VI and VII**.

**Table 4.1: Aquifer wise ranges of chemical constituents in Sangli district**

Constituents	Shallow aquifer		Deeper aquifer	
	Min	Max	Min	Max
pH	7.1	8.7	6.6	8.8
EC	130	7500	132	4170
TDS	83	4012	74	2528
TH	52	2500	30	1590
Calcium	12.8	1569	4	825
Magnesium	0	338.8	1	184
Potassium	0.1	110.8	0.1	591
Sodium	6.8	535	4	591
Carbonate	0	72	0.1	21
Bi-carbonate	34.2	1288.3	36	409
Chloride	20.6	1979	11	730
Sulphate	1	1450	1	846
Nitrate	0.1	286	0.1	654
Fluoride	0.09	3.1	0.01	6.1
Iron	0.1	1.9	0.1	128

### 4.1 ELECTRICAL CONDUCTIVITY (EC)

#### 4.1.1 Distribution of Electrical Conductivity in Shallow Aquifer:

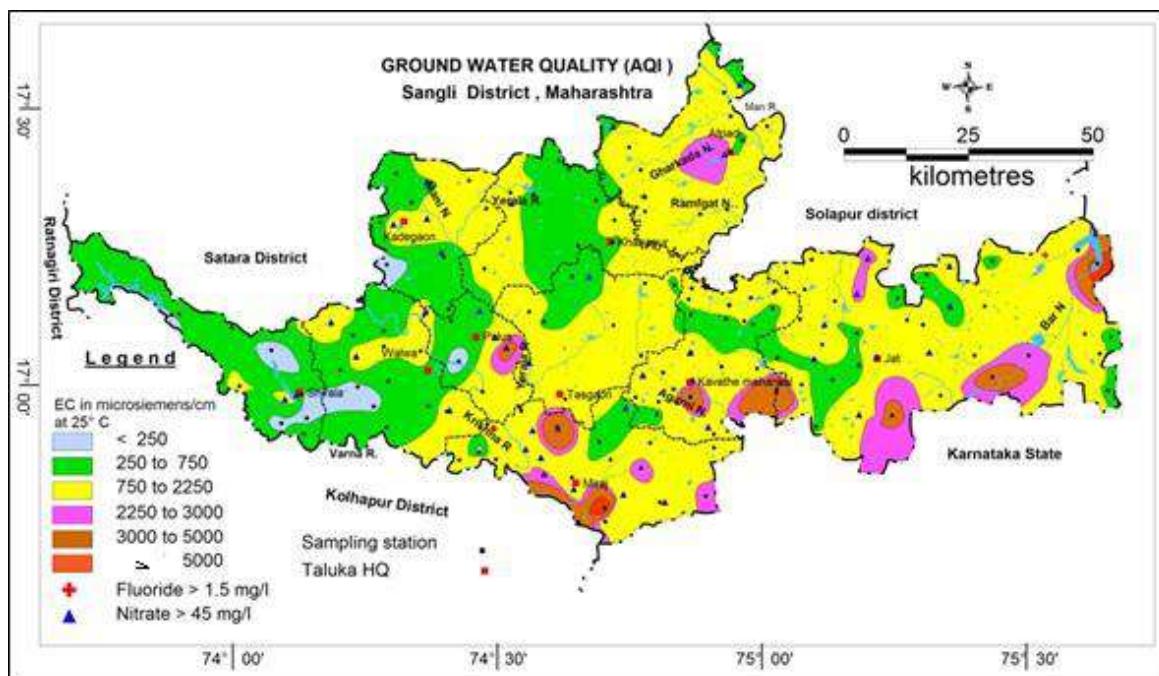

The concentration of EC in shallow aquifer varies between 138 (Shirshi & Chickalwadi, Shiratalataluka) and 7500 $\mu$ S/cm (Kavalapur, Miraj taluka). Out of 174 samples collected from dug wells, 11 samples are having EC in range of 3000 to 7500 $\mu$ S/cm and no samples having EC > 7500 $\mu$ S/cm. It is observed that the concentration of high EC >3000  $\mu$ S/cm has been observed in major parts of Miraj and Kavate Mahankal talukas and small parts of Jath taluka. The ground water is potable in the remaining parts of the district. The distribution of electrical conductivity in shallow aquifers is shown in **fig: 4.1.1** and analytical data is presented in **table 4.1.1**

#### 4.1.2 Distribution of Electrical Conductivity in Deeper Aquifer:

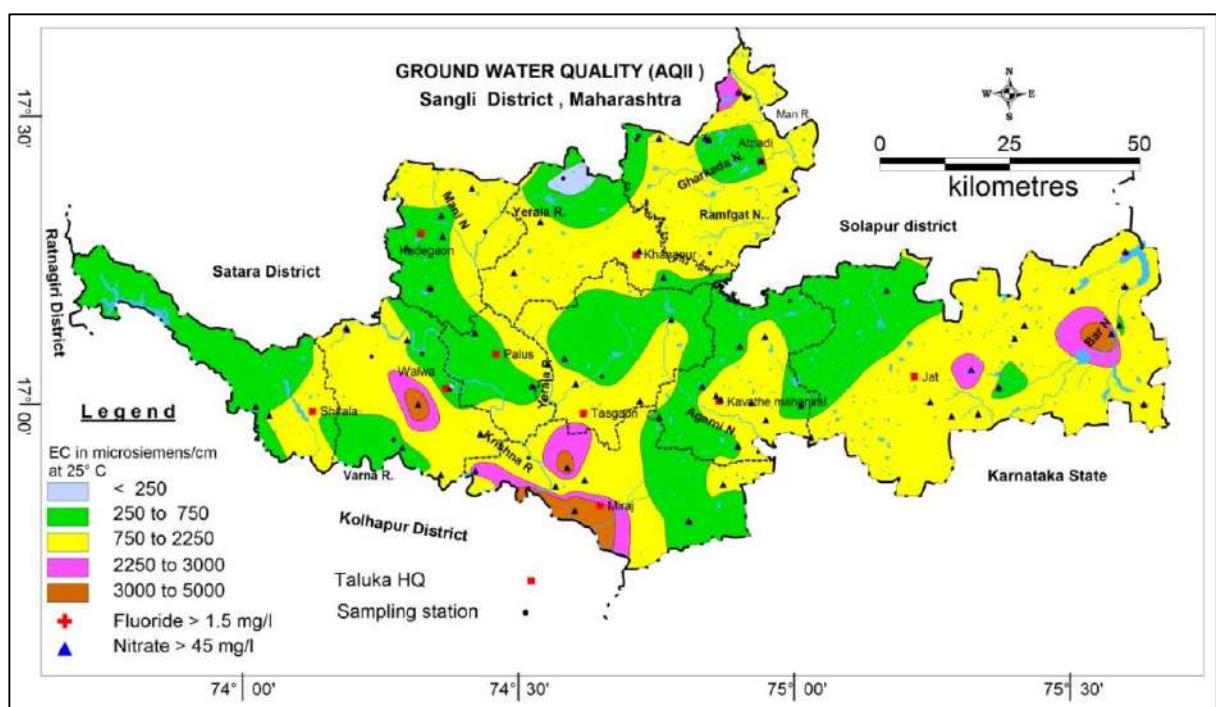

The concentration of EC in deep aquifer varies between 132 (Walkhadi, Khanapur taluka) and 4170  $\mu\text{S}/\text{cm}$  (Bamni, Miraj taluka). Out of 110 samples collected from tube wells/bore wells, 6 samples are having EC in range of 3000 to 7500  $\mu\text{S}/\text{cm}$ . It is observed that the concentration of high EC more than 3000 has been observed in southern part of Miraj taluka near Krishna river, central part of Walwa taluka and also in eastern part of Jath taluka. The ground water is potable in the remaining parts of the district. The distribution of electrical conductivity in deeper aquifers is shown in **fig: 4.1.2** and analytical data is presented in **table 4.1.1**.

**Table 4.1.1: Aquifer wise Electrical conductivity data**

S.No.	EC ( $\mu\text{S}/\text{cm}$ )	shallow aquifer		Deeper Aquifer	
		No. of samples	% of samples	No. of samples	% of samples
1	< 250	9	5	3	3
2	>250-750	53	30	40	36
3	>750-2250	94	54	55	50
4	2250-3000	7	4	6	5
5	3000-7500	11	6	6	5
6	>7500	0	0	0	0
<b>Total samples</b>		<b>174</b>	100	<b>110</b>	100

**Fig. 4.1.1 : Ground water quality, Aquifer-I**

**Fig. 4.1.2: Ground water quality, Aquifer-II**

#### 4.2 Nitrate:

Nitrogen in the form of dissolved nitrate nutrient for vegetation, and the element is essential to all life. The major contribution in ground water is from sewage, waste disposal, nitrate fertilizer and decaying of organic matter. In Sangli district nitrate concentration varies between 0.1 to 654 mg/l. As per BIS (2012) the desirable limit is 45 mg/l. In shallow aquifer, 174 samples were analysed, out of this 42 water samples show the nitrate concentration exceeded the desirable limit of 45 mg/l. The high concentration of Nitrate may be due to domestic waste and sewage in the urban and rural parts of district. In deeper aquifer, 110 wells analysed, out of this 18 water samples show that the nitrate concentration exceeded the desirable limit of 45 mg/l. The deeper aquifer are also affected by nitrate contamination, it may be due to percolation of nitrate contaminants from the ground surface as there are no other reasons for nitrate contamination in deeper aquifers. Aquifer wise nitrate concentration is given in **table 4.1.2**.

#### 4.3 Fluoride:

In shallow aquifer, concentration of fluoride ranges from 0.09 to 3.1 mg/l. out of 174 samples analyzed, only 14 samples show fluoride concentration more than 1 mg/l. In shallow aquifer, the highest concentration of fluoride is found in Nigai Bk. Village, Jath taluka (3.1 mg/l). In Deeper Aquifer, concentration of fluoride ranges from 0.01 to 6.1 mg/l. out of 110 samples analysed, 28 samples show fluoride concentration more than 1 mg/l. In Deeper aquifer, the highest concentration of fluoride is found in Daikonur(6.1 mg/l), Umadi (5.4g/l) villages of Jath taluka (6.1 mg/l). Water samples of Jath taluka is

contaminated by Fluoride and it may due to the lithological reason only. Aquifer wise fluoride concentration is given in **table 4.1.2**.

**Table 4.1.2: Aquifer wise Nitrate and Fluoride concentration in Sangli district**

S/N	Taluka	$\text{NO}_3 > 45 \text{ mg/l}$ No of samples		fluoride $> 1 \text{ mg/l}$ No of samples	
		Shallow Aquifer	Deeper Aquifer	Shallow Aquifer	Deeper Aquifer

9.	Palus	1	0	0	0
10.	Kadegaon	0	0	0	1
	<b>Grand Total</b>	42	18	14	28

#### 4.4 Suitability of Ground Water for Drinking Purpose

In shallow aquifer, 3% samples are having TDS concentration more than maximum permissible limit (MPL) and 71 % of samples have TDS concentration above the Desirable limit (DL) but below the MPL. The water from such area is not fit for drinking purpose if directly consumed without treatment. It is also seen that about 1 to 24 % samples are beyond the maximum permissible limit for the parameters like TH, Ca, Mg, Cl,  $\text{SO}_4$  and  $\text{NO}_3$  indicating that the water is not suitable for drinking purpose. Concentration of Chemical constituents in shallow Aquifer is given in **table 4.2.1**

In Deeper aquifer, 5 % samples are having TDS concentration more than maximum permissible limit (MPL) and 45 % of samples have TDS concentration above the Desirable limit (DL) but below the MPL. The water from such area is not fit for drinking purpose if directly consumed without treatment. It is also seen that about 1 to 7 % samples are beyond the maximum permissible limit for the parameters like TH, Ca, Mg, Cl,  $\text{SO}_4$  and  $\text{NO}_3$  indicating that the water is not suitable for drinking purpose. Concentration of Chemical constituents in deeper Aquifer is given in table 4.2.3

**Table 4.2.1Concentration of Chemical constituents in shallow Aquifer**

Paramete r	Drinking water Standards (IS- 10500-2012)	Total samples	Shallow aquifer, no and percentage of Samples		
			(<DL)	(DL-MPL)	(>MPL)

	DL	MPL		No	%	No	%	No	%
pH	6.5-8.5	-	174	0	0	173	99	1	1
TDS(mg/L)	500	2000	174	55	32	124	71	5	3

#### 4.5 Suitability of Ground Water for Irrigation

The water used for irrigation is an important factor in productivity of crop, its yield and quality of irrigated crops. The quality of irrigation water depends primarily on the presence of dissolved salts and their concentrations. The Electrical Conductivity (EC), Sodium Absorption Ratio (SAR) and Residual Sodium Carbonate (RSC) are the most important quality criteria, which influence the water quality and its suitability for irrigation.

##### Electrical Conductivity (EC)

The amount of dissolved ions in the water is best represented by the parameter electrical conductivity. The classification of water for irrigation based on the EC values is given in Table 4.3.1and discussed as follows:-

**Low Salinity Water (EC: 100-250  $\mu\text{S}/\text{cm}$ ):** This water can be used for irrigation with most crops on most soils with little likelihood that salinity will develop.

**Medium Salinity Water (EC: 250 – 750  $\mu\text{S}/\text{cm}$ ):** This water can be used if moderate amount of leaching occurs. Plants with moderate salt tolerance can be grown in most cases without special practices for salinity control.

**High Salinity Water (EC: 750 – 2250  $\mu\text{S}/\text{cm}$ ):** This water cannot be used on soils with restricted drainage. Even with adequate drainage, special management for salinity control may be required and plants with good salt tolerance should be selected.

**Very High Salinity Water (EC: >2250  $\mu\text{S}/\text{cm}$ ):** This water is not suitable for irrigation under ordinary condition. The soils must be permeable, drainage must be adequate, irrigation water must be applied in excess to provide considerable leaching and very salt tolerant crops should be selected.

**Table 4.3.1: Classification of Ground water for Irrigation based on EC values**

S.No.	Water Quality Type	EC	shallow aquifer		Deeper Aquifer	
		( $\mu\text{S}/\text{cm}$ )	No. of samples	% of samples	No. of samples	% of samples
1	Low Salinity Water	< 250	9	5	3	3
2	Medium Salinity Water	>250-750	54	31	41	37
3	High Salinity Water	>750-2250	94	54	54	49
4	Very High Salinity Water	>2250	17	10	12	11
<b>Total samples</b>		<b>174</b>	100		<b>110</b>	100

In shallow and deep aquifer, maximum numbers of samples fall under the category of medium to high salinity type of water. The areas where very high salinity prevails ( $>2250 \mu\text{S}/\text{cm}$ ) ground water can be used for irrigation for very high salt tolerant crops and with proper soil and crop management practices

#### Sodium Absorption Ratio (SAR)

Since Calcium and Magnesium will replace Sodium more readily than vice versa, the ratio reflects the Sodium hazard. The SAR indicates the relative activity of the Sodium ions in exchange reactions with the soil. The main problem with high sodium concentration is its effect on soil permeability; hardening of soil & water irrigation system. Sodium also contributes directly to the total salinity of the water and may be toxic to sensitive crops such as fruit trees. The higher value of SAR indicates soil structure damage.

In shallow aquifer, out of 174 samples analyzed no samples having SAR value more than 10. In deeper aquifer, out of 110 samples 1 sample is having SAR value more than 10 (Gatarwadi- Walwa taluka) The classification of ground water samples based on SAR values for its suitability for irrigation purpose is shown in **Table 4.3.2**

**Table 4.3.2: Classification of Ground water for Irrigation based on SAR values**

SAR value									
Characteristics	Quality	Good < 10		Good to Permissible 10-18		Doubtful 18-26		Bad (Unsuitable) > 26	
	Total No of GW samples	No. of Samples and percentage of Samples							
		No	%	No	%	No	%	No	%
Shallow Aquifer	174	174	100	0	0	0	0	0	0
Deeper Aquifer	110	109	99	1	1	0	0	0	0
<b>Total</b>	<b>284</b>	<b>283</b>	<b>199</b>	<b>1</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>

**Residual Sodium Carbonate (RSC):**

Residual Sodium Carbonate (RSC) is considered to be superior to SAR as a measure of sodicity particularly at low salinity levels. Calcium reacts with bi-carbonate and precipitate as  $\text{CaCO}_3$ . Magnesium salt is more soluble and so there are fewer tendencies for it to precipitate. When calcium and magnesium are lost from the water, the proportion of sodium is increased resulting in the increase in sodium hazard. This hazard is evaluated in terms of RSC. The classification of ground water samples based on RSC values for its suitability for irrigation purpose is shown in **Table 4.3.3**.

**Table 4.3.3 : Classification of Ground water for Irrigation based on RSC values.**

Characteristics	Quality	RSC values (meq/L)					
		< 1.25		1.25-2.50		> 2.50	
		Good		Doubtful		Bad (Unsuitable)	
	Total no of samples	No	%	No	%	No	%
Shallow Aquifer	174	167	96	7	4	0	0
Deeper Aquifer	110	104	94	4	4	2	2
<b>Total</b>	<b>284</b>	<b>271</b>	<b>190</b>	<b>11</b>	<b>8</b>	<b>2</b>	<b>2</b>

In shallow aquifer, it is observed that out of 174 samples only 7 samples show RSC values more than 1.25 meq/L indicating that the ground water of the area is not suitable for irrigation while in deeper aquifer, out of 110 samples only 2 samples show RSC more than 1.25 meq/L indicating that the ground water of the area is not suitable for irrigation. 2 samples of deeper aquifer namely, Landgewadi and Muchandi show RSC values more than 2.5 meq/L which is unsuitable for irrigation.

## 5. GROUND WATER RESOURCES

### 5.1 Ground Water Resources – Aquifer -I

Central Ground Water Board and Ground Water Survey and Development Agency (GSDA) have jointly estimated the ground water resources of Sangli district based on GEC-97 methodology. Taluka wise ground water resources are given in **Table 5.1.1**, and graphical representations of the resources on the map are shown in **Figure-5.1.1**

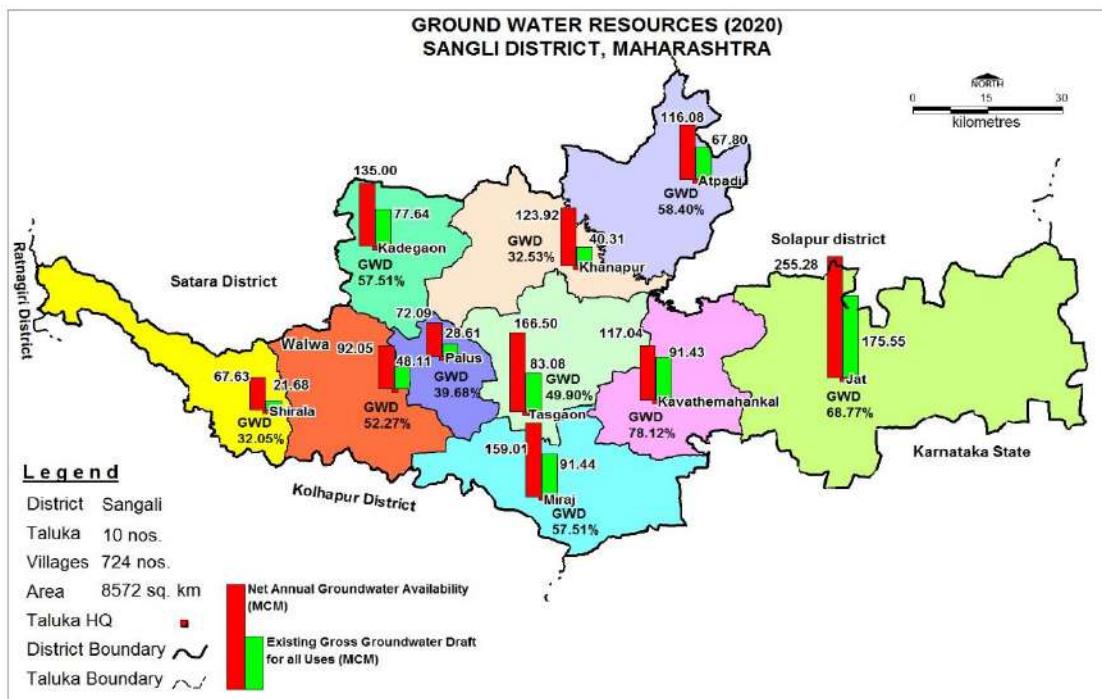

**Table 5.1.1:Ground water resources(MCM), Aquifer-I Sangli district (2020)**

Assessment Unit Name/ Block	Annual Extractable Ground Water Recharge	Current Annual Ground Water Extraction(MCM)				Annual GW Allocation for Domestic Use as on 2025	Net Ground Water Availability for future use	Stage of Ground Water Extraction(%)	Categorization (OE/Critical/Semi-critical/Safe)
		Irrigation Use	Industrial Use	Domestic Use	Total Extraction				
ATPADI	116.08	62.49	0.00	5.30	67.80	5.30	48.29	58.40	safe
JAT	255.28	168.67	0.00	6.89	175.55	6.89	79.73	68.77	safe
KADEGAON	135.00	75.25	0.00	2.39	77.64	2.39	57.36	57.51	safe
KAVATHE MAHANKAL	117.04	87.19	0.00	4.24	91.43	4.24	25.61	78.12	semi_critical
KHANAPUR	123.92	38.57	0.00	1.74	40.31	1.74	83.61	32.53	safe
MIRAJ	159.01	88.73	0.00	2.71	91.44	2.71	67.57	57.51	safe
PALUS	72.09	27.42	0.00	1.18	28.61	1.18	43.48	39.68	safe
SHIRALA	67.63	18.74	0.00	2.94	21.68	2.94	45.95	32.05	safe
TASGAON	166.50	80.68	0.00	2.40	83.08	2.40	83.42	49.90	safe
WALWA	92.05	45.21	0.00	2.90	48.11	2.90	43.94	52.27	safe
<b>Total</b>	<b>1304.60</b>	<b>692.95</b>	<b>0.00</b>	<b>32.70</b>	<b>725.65</b>	<b>32.70</b>	<b>578.95</b>	<b>55.62</b>	

It has been estimated that the Net annual ground water availability in Sangli district is 1304.60 MCM. The existing ground water draft for all uses is 725.65 MCM. The net annual ground water availability for future irrigation is 578.95 MCM. The provision for domestic and industrial water supply for year 2025 is projected as 32.70 MCM. The average stage of ground water development is 55.62% (**Table 8.1**).

The stage of ground water Extraction varies from 32.05 % (Shirala) to 78.12 % (Kavate Mahankal). Out of 10 talukas Kavate Mahankal taluka is categorised as “semi-critical”. Care should be taken before taking further development in these talukas. There is much scope of ground water development in Khanapur taluka where stage of ground water development is only 32.05 %. Thus the stage of ground water development in the district is 55.62 % that make it under “Safe” category. Talukewise wise resources computation indicate that out of 10 Talukas 1 Talukas is “semi-critical”, and 9 comes under “safe” category.

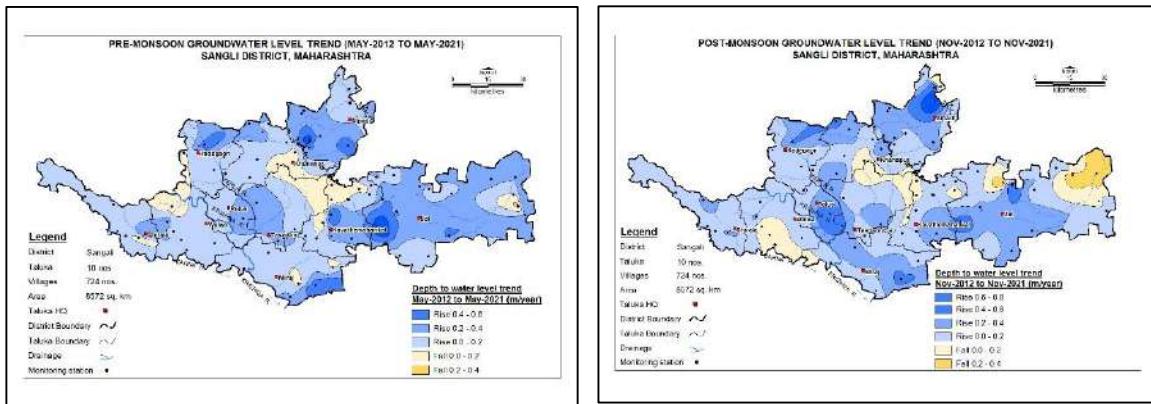

Taluka wise Ground Water Resources (March 2020) is shown in **Fig.5.1.1**.

**Fig 5.1.1: Groundwater Resources, Sangli District (2020)**

## 6. GROUND WATER RELATED ISSUES

In the district there are few Ground Water related issues which are discussed below in

details over the period of time.

The ground water exploitation has resulted in decline of water levels over the period of time. In premonsoon season, declining water level trend has been observed mostly in Central part and also in the form of isolated patches in the area. Significant decline more than 0.20 m/year has been observed in area covering major part of Jath, Khanapur Miraj and Shiral talukas. In post monsoon season, fall in water level trend has been observed in the major parts of the district covering northern, central, eastern and southern part. Significant decline more than 0.20 to 0.40 m/year has been observed in eastern part of the district in Jath Taluka.

### 6.1 Low Rainfall and Droughts

Sangli district receives low rain fall as it falls in Rain Shadow Zone (dry area on the lee side of mountains). The mountains block the passage of rain-producing weather systems casting a "shadow" of dryness behind them. The drought is observed in major part of the district.

### 6.2 Ground Water Quality

High concentration of Nitrate and Fluoride in parts of Kavthe Mahankal, Jath, Khanapur and Miraj talukas.

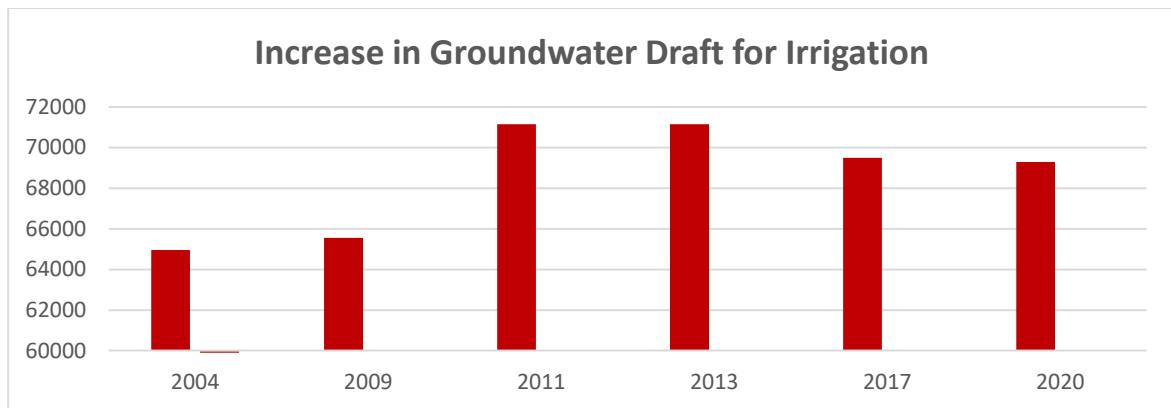

### 6.3 Low Ground Water Storage Potential

Low ground water potential areas have been identified in 7266 sq km (about 86%) in the Sangli District, where yield remains less than 50 m<sup>3</sup>/day, mostly due to limited depth of weathering and fractures in Aquifer-I (Basalt).

Limited aquifer potential of Aquifer-II (Basalt) is seen in about 5310 sq km (about 63%) in major part of the Taluka of Kavthe Mahankal and Jath of the Sangli district, having yield potential less than 1.0 lps

### 6.4 Increase in Irrigation Draft

The Irrigation Draft has increased from 64949 ham (2004) to 69295 ham (2020) has increased over the period of time from. The main reason for overdraft is intensive irrigation for cash crops.

## **7. GROUND WATER MANAGEMENT PLAN**

The management plan has been proposed to manage the ground water resources and to arrest further decline in water levels. The management plan comprises two components namely supply-side management and demand side management. The supply side Management is proposed based on surplus surface water availability and the unsaturated thickness of aquifer whereas the demand side management is proposed by use of micro irrigation techniques and change in cropping pattern.

### **7.1 SUPPLY SIDE MANAGEMENT**

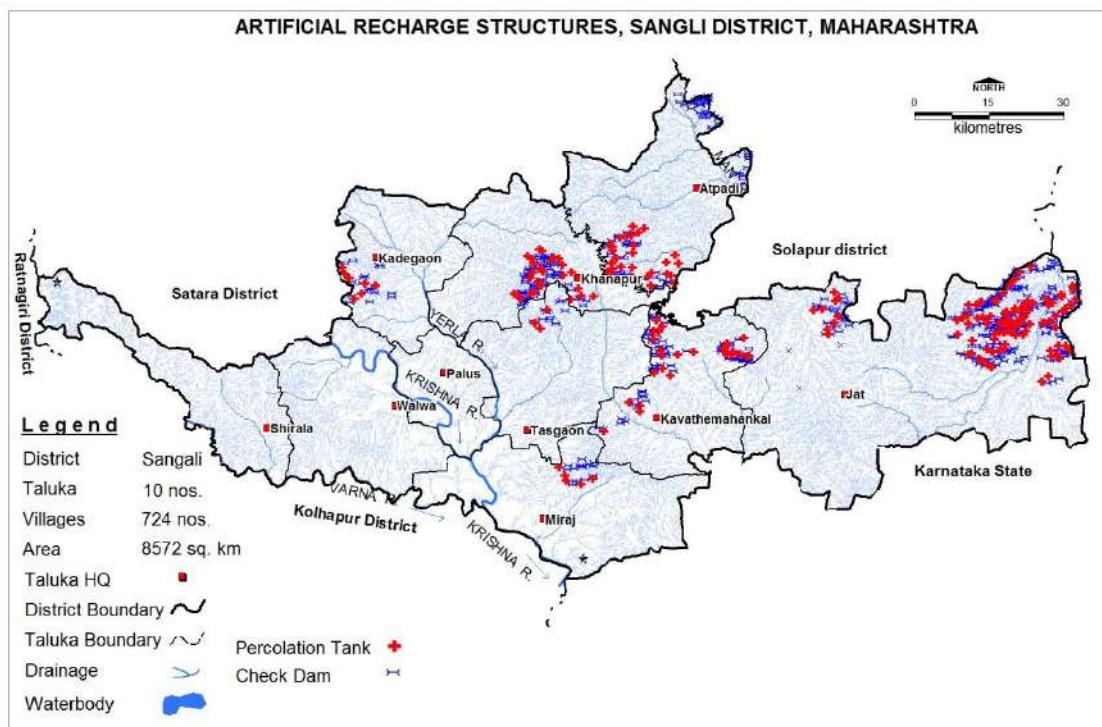

The supply side management of ground water resources can be done through the artificial recharge of surplus runoff available within river sub basins and micro watersheds. Also, it is necessary to understand the unsaturated aquifer volume available for recharge. The unsaturated volume of aquifer was computed based on the area feasible for recharge, unsaturated depth below 5 mbgl and the specific yield of the aquifer. The **table 7.1.1** gives the district wise volume available for the recharge.

**Table 7.1.1: Area feasible and volume available for Artificial Recharge**

S.N	Taluka	Geographical Area (sq. km.)	Area feasible for recharge (Sq. km)	Unsaturated Volume (MCM)
1	Atpadi	849.23	413.14	2392.06
2	Jat	2247.61	1926.51	5513.15
3	Kadegaon	569.82	53.41	94.87
4	Kavathe Mahankal	749.53	493.13	1397.13
5	Khanapur	509.18	383.21	2225.07
6	Miraj	954.06	76.15	144.85
7	Palus	314.58	0.00	0.00
8	Shirala	718.68	0.00	0.00
9	Tasgaon	893.15	549.90	47.98
10	Walwa	766.15	148.66	0.00
	Total	<b>8571.99</b>	<b>4044.11</b>	<b>11815.11</b>

The total unsaturated volume available for artificial recharge is 11815.11 MCM and it ranges from 47.98 MCM in Tasgaon taluka to 5513.15 MCM in Jath taluka. The available surplus runoff can be utilized for artificial recharge through construction of percolation tanks and Check dams at suitable sites. The number of recharge percolation tanks, and check dams are decided based on the number of suitable streams available in the district.

Thus, after taking into consideration all the factors, only 54.56 MCM of surplus water can be utilised for recharge, which is given in **table 7.1.2**. This surplus water can be utilized for constructing 546 check dams and 191 percolation tanks at suitable sites. The number of feasible artificial recharge structures was calculated by considering 0.20 MCM per percolation tanks, 0.03 MCM per check dam. This intervention should lead to recharge @ 75% efficiency of about 40.92 MCM/year. Tentative locations of these structures are given in **fig. 7.1.1** and details also given in annexure IX and X

**Figure 7.1.1: Proposed Artificial Recharge structures**

The rainwater harvesting in urban areas can be adopted in 25% of the household with 50 Sq. m roof area. A total of 4.748 MCM potential can be generated by taking 80% runoff coefficient

**Table 7.1.2: Proposed Recharge Structures**

Taluka	Geographical Area (Sqkm)	Area feasible for recharge (sq. km.)	Unsaturation Volume (MCM)	Surplus water available for AR (MCM)	Proposed number of structures	Total recharged @ 75 % efficiency (MCM)

## 7.2 DEMAND SIDE MANAGEMENT

Demand side interventions such as change in cropping pattern has not been proposed in the area cash crop cultivation drives the economy of the region. However, as discussed earlier, there is a scope for increasing areas under micro-irrigation techniques like drip irrigation (about 107.00 sq km area of sugarcane to be covered under Drip). Volume of Water expected to be saved is estimated as 60.99 MCM in sugarcane crop (Sugarcane Surface Flooding irrigation req- 2.45 m. Drip Req. - 1.88, WUE- 0.57 m) area proposed for drip irrigation is presented in **table 7.2.1**

**Table 7.2.1 Demand side intervention**

Block	Geographical Area (Sqkm)	Proposed to be covered under Drip (sq.km.)	Volume of Water expected to be saved (MCM)	Total Volume of Water expected to be saved (MCM)

#### 7.4 DEVELOPMENT PLAN

The ground water development plan is recommended to bring the stage of development upto 70%. Balance ground water resources available for ground water development after the stage of is bought up to 70% after implementing above measures is 271.39 MCM

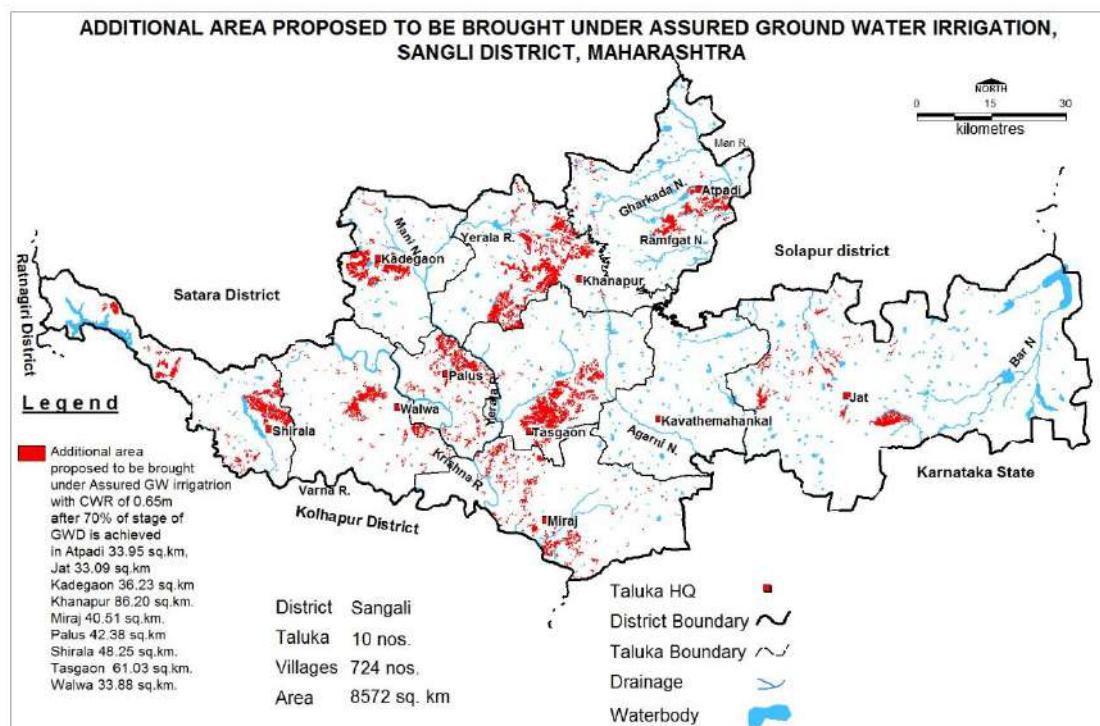

The development plan is proposed to bring stage of ground water development up to 70 % and details are given in **table 7.4.1.**and **fig 7.4.1** and the Gist of Management Plan is depicted in **Fig. 7.4.2.**

**Table 7.4.1: Ground water development plan**

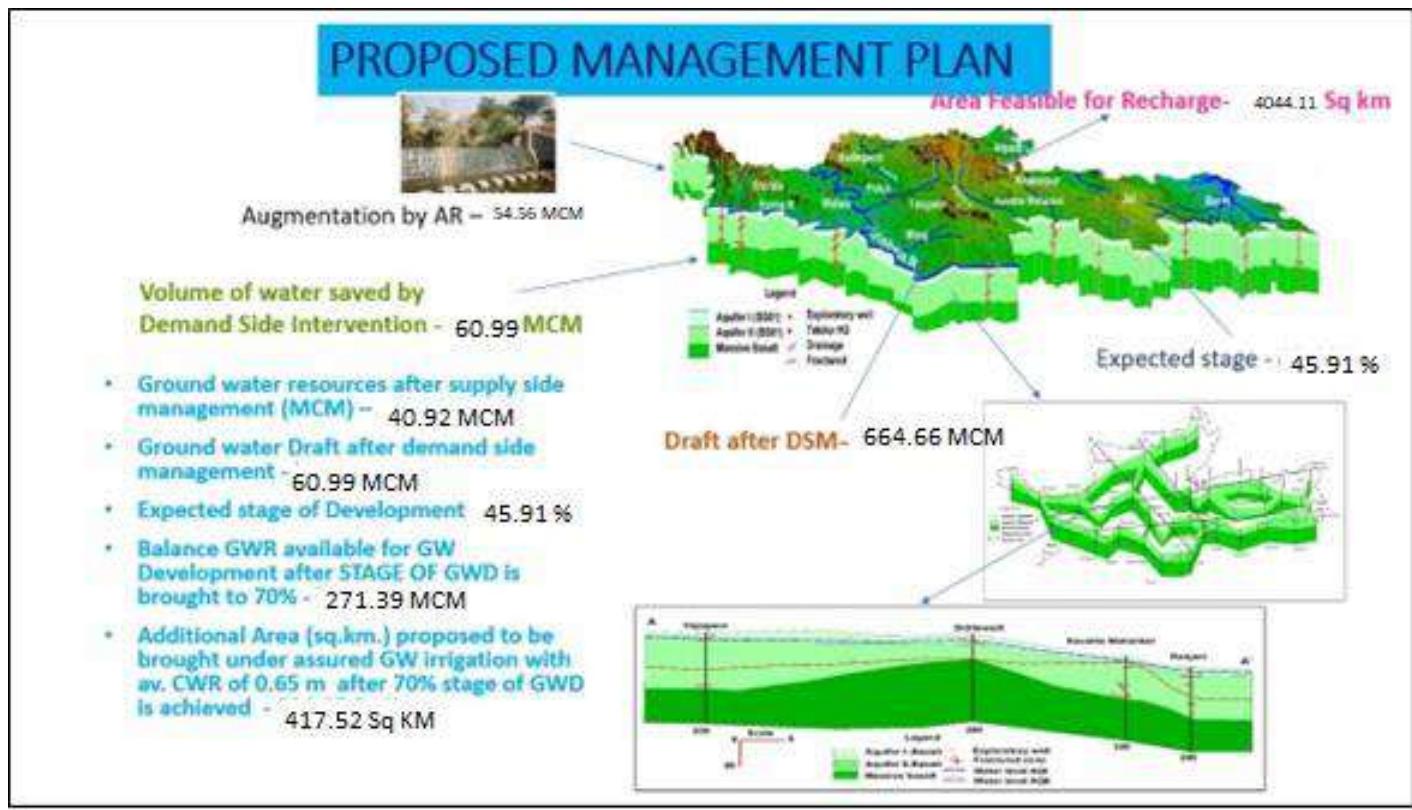

Taluka	Net Ground water availabilit y (MCM)	Ground water resources after supply side managem ent (MCM)	Ground water Draft after demand side manag ement(M CM)	Expect ed stage of Develo pment %	Balance GWR availabl e for GW Develop ment after STAGE OF GWD is brought to 70% (MCM)	Propos ed No. of DW @1.5 ham Develop ment after GWR Availa ble)	Prop osed No. of BW @1.5 ham for 10% of GWR Avail able)	Prop osed No. of BW @1.5 ham for 10% of GWR Avail able)	Additiona l Area (sq.km.) proposed to be brought under assured GW irrigation with av. **Figure 7.4.3 : Gist of Management Plan**

## **8. SUM UP**

A thorough study was carried out based on data gap analysis, data generated in-house, data acquired from State Govt. departments and GIS maps prepared for various themes. All the available data was brought on GIS platform and an integrated approach was adopted for the preparation of taluka wise aquifer maps and aquifer management plans of Sangli district.

Sangli district is one of the five districts of Pune division of Maharashtra State that form the region of Western Maharashtra, with a geographical area of 8572 sq. km. The district headquarters is located at Sangli Town. For administrative convenience, the district is divided into 10 talukas viz., Shirala, Walwa, Palus, Khanapur, Atpadi, Jat, Kadegaon, Tasgaon, Miraj and Kavathe Mahakal. There are 8 towns and 728 villages in the district out of which only 3 villages are not habited. The district has 1 Municipal Corporation, 4 Municipalities, 10 Panchayat Samities and 705 Gram Panchayats. It has a total population of 28,22,143 as per 2011 census. The major part of the district comes under Krishana basin.

Physiographically the district shows a hilly and undulating terrain, with altitude ranging between 476 and 1104 m above MSL. The average rainfall is about 586.8 mm. The district falls in drought prone areas, receives rainfall of 500 to 600 mm.

Deccan Trap Basalt of upper Cretaceous to lower Eocene age is the major rock formation in the district, whereas only a very narrow belt confined to the banks of rivers is underlain by Recent Alluvium. Alluvium and Basalt form main aquifers in the district. Two aquifer Systems in Basalt and one shallow aquifer in Alluvium (limited to river banks) are found to be prevailing in the district. Deccan basalts are hydrogeologically in-homogeneous rocks. The weathered and jointed /fractured parts of the rock, as also permeable inter-flow beds constitute the zone of ground water storage and flow.

As per earlier studies, the specific capacity of the wells tapping Deccan Trap Basalt ranges between 1.6 and 5 lps/m of draw down and the permeability ranges from 12 to 65 m/day and the transmissivity ranges from 2.1 to 51.86 m<sup>2</sup>/day. The specific yield ranges from 0.019 to 0.028. During the pumping tests conducted on the exploratory wells tapping aquifer-II, the transmissivity was found to vary from 10 to 90 m<sup>2</sup>/day. The storage coefficient varied between  $1.2 \times 10^{-4}$  to  $3.57 \times 10^{-4}$ .

The depth to water levels in Sangli district during May 2021 ranges between 0.30 (Atpadi village, Atpadi Taluka) and 15.50 mbgl (Pandharewadi village, Atpadi Taluka). The depth to water levels less than 5 mbgl are observed in the major parts of the district nearby some canal command and riverfed areas covering almost all the talukas except Tasgaon Taluka. The depth to water levels between 5 to 10 mbgl are also observed in the major parts of the district covering almost all the talukas except Palus Taluka. The depth to Water levels more than 10 mbgl are observed as patches in Atpadi and Jath talukas

The depth to water levels in Sangli district during Nov 2021 ranges between 0.2 (Atpadi village, Atpadi Taluka) and 12.20 mbgl (Pandharewadi village, Atpadi Taluka). Shallow water levels within 2 m bgl are observed in the parts of Shirala taluka and nearby some canal command and river fed areas and also observed in Atpadi, Walwa and Kavthe Mahankal talukas and in the form of patches in Kadegaon, Khanapur and Palus and Miraj Talukas. Water levels between 2 and 5 m bgl are observed in almost 60% of the district area covering major part of Khanapur, Kavthe Mahankal, Jath Talukas and observed in

smaller extent in Palus, Shirala and Tasgaon talukas. Coming from west to east the water level is going deeper. Water level between 5 to 10 mbgl are observed in northern part of the Jath and also predominantly in parts of Kavthe Mahankal taluka and in patches in Atpadi, Kadegaon talukas. Northern part of Atpadi taluka observes the water level between 10 to 20 mbgl.

In Deeper Aquifer-II, the pre-monsoon depth to water levels, in Sangli District range from 12.00 (Achaknali, Walwa taluka) to 95.00 mbgl (Kalambi, Miraj taluka). The depth to water level less than 20 mbgl is observed only in isolated parts of Shirala and Jath talukas. The major parts of Sangli district show depth to water level between 20 and 30 mbgl. During post monsoon depth to water levels range between 4.5 (Madhav Nagar, Miraj taluka) and 45.00 mbgl (Sidhewadi, Jath taluka). Depth to water level less than 10 m bgl has been observed in the southern and south-central part of the district and in parts of Shirala, Miraj, Jath and Atpadi talukas. The major part of the district shows deeper water levels ranging between 10 and 20 mbgl.

It has been estimated that the Net annual ground water availability in Sangli district is 1304.60 MCM. The existing ground water draft for all uses is 725.65 MCM. The net annual ground water availability for future irrigation is 578.95 MCM. The provision for domestic and industrial water supply for year 2025 is projected as 32.70 MCM. The average stage of ground water development is 55.62 %

The stage of ground water development varies from 32.05 % (Shirala) to 78.12 % (Kavate Mahankal). Out of 10 talukas Kavate Mahankal taluka is categorised as "semi-critical". Care should be taken before taking further development in these talukas. There is much scope of ground water development in Khanapur taluka where stage of ground water development is only 32.05 %. Thus the stage of ground water development in the district is 55.62 % that make it under "Safe" category. Talukewise wise resources computation indicate that out of 10 Talukas 1 Talukas is "semi-critical", and 9 comes under "safe" category.

Talukewise aquifer management plans have been prepared for Aquifer I (Weathered and jointed fractured Basalt) with the objective of bringing the current stage of ground water development up to 70% by adopting supply side and demand interventions. The management plan has been proposed to manage the ground water resources and to arrest further decline in water levels. The management plan comprises two components namely supply-side management and demand side management. The supply side Management is proposed based on surplus surface water availability and the unsaturated thickness of aquifer whereas the demand side management is proposed by use of micro irrigation techniques. Change in cropping pattern towards less water-intensive irrigation crops (Demand side intervention) has not been proposed in the area as cash crop cultivation drives the economy of the region. The supply side interventions include utilizing 54.56 MCM of surplus water can be utilised for recharge. This surplus water can be utilized for constructing 546 check dams and 191 percolation tanks at suitable sites.

This supply side intervention should lead to recharge (@ 75% efficiency) of about 40.92 MCM/year. The demand side interventions include proposal to bring 100 % ground water irrigated about 107.00 sq km area of sugarcane is proposed to be covered under Drip. Volume of Water expected to be saved is estimated as 60.99 MCM in sugarcane crop

Balance ground water resources available for ground water development is 271.39 MCM after the stage of ground water development is brought down to 70% after

implementing demand side management, which can bring additional 417.2 sq. km. area under assured ground water irrigation.

These interventions also need to be supported by regulation of deeper aquifer and hence it is recommended to regulate/ban deeper tubewells/borewells of more than 60 m depth in these talukas, so that the deeper ground water resources are protected for future generation and also serve as ground water sanctuary in times of distress/drought. Capacity building activities need to be aggressively propagated to establish the institutional framework for participatory ground water management.
